

USER GUIDE

Essential Studio

for EJ2 TypeScript

Version - v24.1.41 | Release Date - December 18, 2023

RadioButton	53
Label and size in EJ2 JavaScript Radio button control	53
Label	53
Size	54
See Also	55
Accessibility in EJ2 JavaScript Radio button control	55
WAI-ARIA attributes	56
Keyboard interaction	57
Ensuring accessibility	57
See also	57
How To	57
Customize radiobutton appearance in EJ2 JavaScript Radio button control	57
Name and value in form submit in EJ2 JavaScript Radio button control	60
Right to left in EJ2 JavaScript Radio button control	62
Set the disabled state in EJ2 JavaScript Radio button control	63
Ej1 api migration in EJ2 JavaScript Radio button control	65
Properties	65
Methods	66
Events	66
Range Navigator	67
Getting started in EJ2 JavaScript Range navigator control	67
Dependencies	67
Setup for Local Development	67
Configuring System JS	67
Add Range Navigator to the Project	68
Run the Application	69
Module Injection	70
Populate Range Navigator with Data	70
Enable Tooltip	71
Selecting range in EJ2 JavaScript Range navigator control	72
Lightweight in EJ2 JavaScript Range navigator control	73
See Also	74
Series types in EJ2 JavaScript Range navigator control	74
Line	74
Area	75

StepLine.....	76
Data in EJ2 JavaScript Range navigator control	77
Numeric.....	77
Logarithmic Axis	82
Date-time	85
Period selector in EJ2 JavaScript Range navigator control	88
Periods	88
Positioning period selector	89
Height.....	90
Visibility of range navigator	91
See Also	92
Labels in EJ2 JavaScript Range navigator control.....	92
Multilevel labels	92
Grouping	93
Smart labels.....	94
Label positioning	95
Labels customization.....	96
Grid tick in EJ2 JavaScript Range navigator control	97
Grid line customization	97
Tick line customization.....	98
Customization in EJ2 JavaScript Range navigator control	99
Navigator appearance.....	99
Thumb	100
Border customization.....	101
Deferred update.....	102
Allow snapping.....	104
Animation.....	105
See Also	106
Tool tip in EJ2 JavaScript Range navigator control	106
Customization	106
Label Format	107
R t l in EJ2 JavaScript Range navigator control	108
Export print in EJ2 JavaScript Range navigator control	109
Export.....	109
Print.....	110

WAI-ARIA attributes	148
Keyboard interaction	148
Ensuring accessibility	149
See also	149
Ej1 api migration in EJ2 JavaScript Range slider control	149
How To	151
Format value using slider in EJ2 JavaScript Range slider control	151
Customize the bar in EJ2 JavaScript Range slider control	157
Customize the ticks in EJ2 JavaScript Range slider control	161
ticks_slider.e-scale :nth-child(1)::before {	162
Customize the limits in EJ2 JavaScript Range slider control	166
Customize the thumb in EJ2 JavaScript Range slider control	170
square_slider.e-control.e-slider .e-handle {	171
circle_slider.e-control.e-slider .e-handle {	171
oval_slider.e-control.e-slider .e-handle {	171
Validate slider using formvalidator in EJ2 JavaScript Range slider control	174
Show slider from hidden state in EJ2 JavaScript Range slider control	181
Reversible Range Slider in EJ2 JavaScript	184
Rating	186
Precision modes in EJ2 JavaScript Rating control	186
Labels in EJ2 JavaScript Rating control	188
Label position	189
Label template	191
Tooltip in EJ2 JavaScript Rating control	192
Tooltip template	194
Tooltip customization	196
Selection in EJ2 JavaScript Rating control	198
Min value	199
Single selection	200
Show or hide reset button	202
Templates in EJ2 JavaScript Rating control	203
Empty (unrated) symbol template	203
Full (rated) symbol template	206

Using Emoji icon as rating symbol	208
Using SVG icon as rating symbol	210
Using PNG image as rating symbol	212
Events in EJ2 JavaScript Rating control	214
beforeItemRender	214
created	214
onItemHover	214
valueChanged.....	215
Appearance in EJ2 JavaScript Rating control	216
Items count	216
Disabled.....	219
Visible	221
Read only.....	224
CssClass	226
Changing icon using CssClass	234
Accessibility in EJ2 JavaScript Rating control	236
Keyboard interaction	236
ARIA attribute	237
Ribbon	237
Tabs and Groups	237
Adding Tabs.....	237
Adding Groups	238
Adding Items	240
Ribbon Items	241
Built-in items.....	242
Custom items	262
Items display Mode.....	263
Enable or disable items	266
Ribbon Layouts.....	267
Classic layout.....	267
Simplified layout	288
Minimized State	294
File Menu	296
Visibility	296
Adding menu items	298

Open submenu on click.....	300
Custom header text	302
Ribbon Backstage.....	304
Adding backstage items	304
Adding footer items	308
Adding separator.....	312
Back button	316
Backstage target.....	319
Template	323
Setting width and height.....	327
Help Pane	331
Tooltip	333
Adding Title	333
Adding Content	335
Adding Icon	336
Customization	338
Ribbon Resizing	341
Defining items allowed size	341
Defining items active size.....	343
Events.....	343
tabSelected	343
tabSelecting.....	344
ribbonCollapsing	346
ribbonExpanding	346
launcherIconClick	347
Button item events	348
CheckBox item events	350
ColorPicker item events	351
ComboBox item events	356
DropDown item events	362
SplitButton item events	367
GroupButton item events	374
FileMenu events.....	377
Backstage view events	384
RichTextEditor	385

Getting started in EJ2 JavaScript Rich text editor control.....	385
Component Initialization.....	385
Module Injection.....	394
Configure the Toolbar	394
Insert images and links.....	396
Retrieve the formatted content.....	398
Retrieve the number of characters in the Rich Text Editor	398
See Also	399
Editor modes in EJ2 JavaScript Rich text editor control	399
HTML editor	399
Markdown editor	401
See Also	403
Toolbar in EJ2 JavaScript Rich text editor control.....	403
Expand Toolbar	404
Multi-row Toolbar	405
Floating Toolbar	407
Toolbar items	408
Custom tool.....	413
Quick inline toolbar.....	418
See Also	421
Inline mode in EJ2 JavaScript Rich text editor control.....	421
Show on select/click.....	421
See Also	422
Paste cleanup in EJ2 JavaScript Rich text editor control.....	422
MS Word to HTML	422
Paste cleanup	423
Prompt dialog.....	423
Paste as plain text	423
Keep format	423
Denied tags	424
Denied attributes	424
Allowed style properties	424
Mention integration in EJ2 JavaScript Rich text editor control	426
See Also	429
Enter key in EJ2 JavaScript Rich text editor control.....	429

Enter key customization.....	429
Shift-Enter key customization	432
Styling in EJ2 JavaScript Rich text editor control	434
Font name and size	434
Custom font and size	436
Font and Background color	438
Editor content styles	440
See Also	445
Image in EJ2 JavaScript Rich text editor control	446
Upload options.....	446
Image delete	448
Insert from web	450
Dimension	451
Caption and Alt Text.....	452
Display position.....	452
Image with link.....	452
Resize	453
Drag and Drop.....	453
See Also	456
Audio in EJ2 JavaScript Rich text editor control.....	456
Configure audio tool in the toolbar	456
Insert audio from the web	458
Insert audio from local machine	458
Replacing audio.....	462
Delete audio	463
Display position.....	464
Rename audio before inserting	464
Upload audio with authentication	467
See Also	468
Video in EJ2 JavaScript Rich text editor control.....	468
Configure the video tool in the toolbar	469
Insert a video from the web.....	470
Insert video from local machine	471
Replacing video	475
Delete video	476

Dimension	477
Display position.....	478
Resize video.....	478
Rename video before inserting.....	479
Upload video with authentication	481
See Also	482
Link in EJ2 JavaScript Rich text editor control.....	483
Insert link	483
Remove Link.....	485
Auto-link.....	485
Manipulation.....	485
See Also	487
Table in EJ2 JavaScript Rich text editor control	487
Insert table	488
Quick Toolbar	489
Table Header.....	490
Insert Rows.....	490
Insert Columns	490
Set Color.....	490
Delete Table	491
Vertical Align	491
Horizontal Align.....	491
Table Styles	491
Table Properties	492
Table cell merge and split	492
Emoji Picker in EJ2 JavaScript RichTextEditor control	495
Enabling the toolbar option and custom emojis.....	495
Using the shortcut key to open the emoji picker.....	499
Navigating and selecting emojis using the keyboard.....	499
Markdown in EJ2 JavaScript Rich text editor control	499
Supported Commands	499
Markdown to HTML	501
Table.....	504
Custom format	512
See Also	514

File browser in EJ2 JavaScript Rich text editor control	514
Required additional package styles and scripts reference	514
Iframe in EJ2 JavaScript Rich text editor control	518
IFrame attributes	520
Adding external CSS/Script File	522
See Also	523
Format Painter in EJ2 JavaScript Rich Text Editor Control Syncfusion.....	524
Enabling the toolbar option for Format Painter	524
Customization of copy and paste format.....	526
Using the shortcut key to copy and paste the format	528
Form support in EJ2 JavaScript Rich text editor control	529
Render the Rich Text Editor	529
Obtain the value.....	529
See Also	531
Validation in EJ2 JavaScript Rich text editor control.....	531
Validation rules	531
Validation message	533
Custom placement of validation message	535
Style in EJ2 JavaScript Rich text editor control	537
Customizing the Rich Text Editor's content	537
Customizing the Rich Text Editor's toolbar	537
Customizing the Rich Text Editor's character count	538
Globalization in EJ2 JavaScript Rich text editor control.....	538
Localization	538
RTL.....	552
Exec command in EJ2 JavaScript Rich text editor control.....	554
Miscellaneous in EJ2 JavaScript Rich text editor control	556
Placeholder	556
Character count	558
Code view.....	560
Undo/Redo Manager	562
Prevention of cross-site scripting (XSS)	564
Resizable support.....	567
Number and Bullet Format Lists	570
Xhtml validation in EJ2 JavaScript Rich text editor control.....	571

Attributes	572
HTML Elements	572
Third party integration in EJ2 JavaScript Rich text editor control	574
Code-Mirror Integration	574
Embed.ly Integration.....	577
Keyboard support in EJ2 JavaScript Rich text editor control	578
HTML formation shortcut key.....	579
Markdown formation shortcut key.....	582
Custom key config.....	584
See Also	587
Accessibility in EJ2 JavaScript Rich text editor control	587
ARIA attributes.....	588
Keyboard interaction	590
Ensuring accessibility	592
See also	592
How To	592
Add google font in EJ2 JavaScript Rich text editor control	592
Default font in EJ2 JavaScript Rich text editor control.....	595
File size in EJ2 JavaScript Rich text editor control.....	597
Shortcut key in EJ2 JavaScript Rich text editor control.....	598
Save in EJ2 JavaScript Rich text editor control.....	600
Placeholder in EJ2 JavaScript Rich text editor control	602
Cursor in EJ2 JavaScript Rich text editor control	603
Rename images in server in EJ2 JavaScript Rich text editor control.....	605
Format code block in EJ2 JavaScript Rich text editor control	608
File attachment in EJ2 JavaScript Rich text editor control.....	610
Schedule.....	613
Getting started in EJ2 JavaScript Schedule control.....	613
Dependencies.....	613
Setup for local environment	613
Adding Syncfusion resources	614
Initialize the Scheduler.....	618
Populating appointments	619
Setting date	621
Setting view.....	621

Individual view customization	621
Module injection in EJ2 JavaScript Schedule control.....	623
Module injection	623
Scheduler interactions in EJ2 JavaScript Schedule control	624
Appointments in EJ2 JavaScript Schedule control	625
Normal events.....	625
Spanned events.....	626
All-day events.....	627
Expand all day appointments view on initial load	627
Customize the rendering of the spanned events.....	630
Recurring events	631
Event fields.....	641
Adding Custom fields	645
Customize the order of the overlapping events	647
Drag and drop appointments.....	649
Inline Appointment	663
Appointment Resizing	666
Appointment customization	672
Setting minimum height	677
Block Dates and Times	678
Readonly	681
Make specific events readonly.....	682
Restricting event creation on specific time slots	686
Differentiate the past time events.....	687
Appointments occupying entire cell	689
How to limit maximum number of events to display	690
Display tooltip for appointments.....	691
Appointment filtering	694
Appointment selection	696
Deleting multiple appointments	697
Retrieve event details from the UI of an event	697
Get the current view appointments	699
Get the entire appointment collections.....	701
Refresh appointments	703
Data binding in EJ2 JavaScript Schedule control.....	703

Binding local data	703
Binding remote data	705
Loading data via AJAX post	710
Passing additional parameters to the server	711
Handling failure actions	712
Scheduler CRUD actions.....	714
Configuring Scheduler with Google API service	718
See Also	720
Crud actions in EJ2 JavaScript Schedule control	720
Add	720
Edit	726
Delete.....	739
Drag and drop	747
Resize	749
Enabling lazy loading for appointments.....	753
See Also	756
Editor template in EJ2 JavaScript Schedule control	757
Event editor.....	757
Customizing event editor using template	769
How to customize header and footer using template	772
Quick popups	787
More events indicator and popup	796
Timezone in EJ2 JavaScript Schedule control	810
Understanding date manipulation in JavaScript.....	810
Scheduler with no timezone	810
Scheduler set to specific timezone	812
Display events on same time everywhere with no time difference	813
Set specific timezone for events	814
Add or remove timezone names to/from the timezone collection.....	816
Timezone methods	817
Views in EJ2 JavaScript Schedule control.....	819
Setting specific view on scheduler	820
View specific configuration	822
Extending view intervals	843
See Also	846

Calendar mode in EJ2 JavaScript Schedule control.....	846
Gregorian Calendar	846
Islamic Calendar	846
Resources in EJ2 JavaScript Schedule control.....	848
Resource fields.....	848
Resource data binding	849
Scheduler with multiple resources	851
Resource grouping	853
Customizing parent resource cells	863
Working with shared events	864
Simple resource header customization	866
Customizing resource header with multiple columns	869
Collapse/Expand child resources in timeline views	873
Displaying tooltip for resource headers.....	875
Choosing among resource colors for appointments.....	877
Setting different style to each resource appointments.....	879
Dynamically add and remove resources	881
Setting different working days and hours for resources	884
Hide non-working days when grouped by date.....	887
Scroll to specific resource	889
Compact view in mobile.....	890
Adaptive UI in desktop.....	892
Header rows in EJ2 JavaScript Schedule control.....	894
Display year and month rows in timeline views	896
Display week numbers in timeline views.....	897
Timeline view displaying dates of a complete year	899
Customizing the header rows using template	900
Row auto height in EJ2 JavaScript Schedule control.....	902
Calendar month view	902
Timeline views.....	903
Timeline views with multiple resources	905
Appointments occupying entire cell	907
Header bar in EJ2 JavaScript Schedule control	908
Show or Hide header bar	908
Customizing header bar using template	910

Customizing header bar using events	912
How to display the view options within the header bar popup	914
Date header customization	915
Customizing the date range text	919
Customizing header indent cells	920
Timescale in EJ2 JavaScript Schedule control	923
Setting different time slot duration	923
Customizing time cells using template	924
Hide the timescale	926
Highlighting current date and time	928
Working days in EJ2 JavaScript Schedule control	929
Set working days	929
Hiding weekend days	931
Show week numbers	932
Set working hours	935
Scheduler displaying custom hours	937
Setting start day of the week	938
Scroll to specific time and date	939
See Also	942
Cell customization in EJ2 JavaScript Schedule control	942
Setting cell dimensions in all views	942
Check for cell availability	944
Customizing cells in all the views	945
Customizing cell header in month view	949
Customizing the minimum and maximum date values	950
How to disable multiple cell and row selection in Schedule	952
State persistence in EJ2 JavaScript Schedule control	952
Exporting in EJ2 JavaScript Schedule control	953
Excel Exporting	954
Exporting calendar events as ICS file	968
Import events from other calendars	970
How to print the Scheduler element	972
Context menu in EJ2 JavaScript Schedule control	976
Dimensions in EJ2 JavaScript Schedule control	980
Auto Height and Width	980

Height and Width in pixel	981
Height and Width in percentage.....	982
See Also	984
Recurrence editor in EJ2 JavaScript Schedule control	984
Customizing the repeat type option in editor	984
Customizing the End Type Option in Editor	986
Accessing the recurrence rule string.....	987
Set specific value on recurrence editor	989
Recurrence date generation	990
Recurrence date generation in server-side.....	993
Restrict date generation with specific count	993
Localization in EJ2 JavaScript Schedule control	995
Globalization	995
Localizing the static Scheduler text.....	998
Setting date format.....	1003
Setting the time format	1005
Displaying Scheduler in RTL mode	1006
See Also	1007
Accessibility in EJ2 JavaScript Schedule control.....	1007
ARIA attributes.....	1008
Keyboard interaction	1009
Ensuring accessibility	1010
See also	1010
Scheduler styling in EJ2 JavaScript Schedule control.....	1010
Frequently asked questions in EJ2 JavaScript Schedule control.....	1012
Grouping with empty resources	1012
Not providing e-field in editor template.....	1012
Missing CSS reference	1012
QuickInfoTemplate at bottom	1013
Not processing culture files while using localization	1014
Getting instance of the Scheduler component.....	1015
Ej1 api migration in EJ2 JavaScript Schedule control	1015
Scheduler	1015
Properties.....	1015
Methods.....	1025

Events.....	1028
How To	1031
Add edit and remove events in EJ2 JavaScript Schedule control.....	1031
Set default value for event fields in EJ2 JavaScript Schedule control.....	1035
Open event editor manually in EJ2 JavaScript Schedule control.....	1039
Prevent date navigation in EJ2 JavaScript Schedule control.....	1042
Half yearly view in EJ2 JavaScript Schedule control.....	1045
Set different work hours in EJ2 JavaScript Schedule control.....	1048
Zoom in and zoom out the schedule in EJ2 JavaScript Schedule control	1049
Show entire time in responsive mode in EJ2 JavaScript Schedule control	1052
Quick info template in EJ2 JavaScript Schedule control	1054
Enable scroll option on all day section in EJ2 JavaScript Schedule control	1059
Manual refresh in EJ2 JavaScript Schedule control	1060
Sidebar	1062
Getting started in EJ2 JavaScript Sidebar control	1062
Component Initialization.....	1062
Enable backdrop	1066
Position	1068
Animate.....	1070
Close on document click	1071
Enable gestures.....	1073
See Also	1074
Custom context in EJ2 JavaScript Sidebar control	1075
Variations in EJ2 JavaScript Sidebar control	1076
Expanding types of Sidebar.....	1077
See Also	1080
Auto close in EJ2 JavaScript Sidebar control.....	1080
Docking sidebar in EJ2 JavaScript Sidebar control	1082
See Also	1084
Style in EJ2 JavaScript Sidebar control.....	1084
Customizing the sidebar.....	1084
Customizing the sidebar based on the positions	1084
Customizing the sidebar based on the active state	1085
Customizing the sidebar with dock state.....	1086
Customizing the different types of sidebar.....	1086

Customizing the backdrop of the sidebar	1087
Customizing the sidebar in the RTL direction	1087
Prevent the animation transition for the Sidebar component	1087
Accessibility in EJ2 JavaScript Sidebar component	1087
WAI-ARIA attributes	1088
Keyboard interaction	1088
Ensuring accessibility	1089
See also	1089
How To	1089
Sidebar with list view in EJ2 JavaScript Sidebar control	1089
Open and close the sidebar in EJ2 JavaScript Sidebar control	1091
Top and bottom sidebar in EJ2 JavaScript Sidebar control	1093
Multiple sidebar in EJ2 JavaScript Sidebar control	1095
Multiple sidebar in same position in EJ2 JavaScript Sidebar control	1097
Sidebar with treeview in EJ2 JavaScript Sidebar control	1099
Fixed sidebar in EJ2 JavaScript Sidebar control	1103
Sidebar with variation animation in EJ2 JavaScript Sidebar control	1109

RadioButton

Label and size in EJ2 JavaScript Radio button control

This section explains the different sizes and labels.

Label

RadioButton caption can be defined by using the [label](#) property. This reduces the manual addition of label for RadioButton. You can customize the label position before or after the RadioButton through the [labelPosition](#) property.

INDEX.TS

```
import { RadioButton } from '@syncfusion/ej2-buttons';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
//Label position - Left.
let radiobutton: RadioButton = new RadioButton({ label: 'Left Side Label',
name: 'position', labelPosition: 'Before' });
radiobutton.appendTo('#radiobutton1');
//Label position - Right.
radiobutton = new RadioButton({ label: 'Right Side Label', name: 'position',
checked: true });
radiobutton.appendTo('#radiobutton2');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 RadioButton</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
buttons/styles/material.css" rel="stylesheet">
  <link href="styles.css" rel="stylesheet">

="text/javascript"></script>
</head>
<body>

  <div id="container">
    <ul>
      <li><input type="radio" id="radiobutton1"></li>
      <li><input type="radio" id="radiobutton2"></li>
    </ul>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
```

```

    ele.style.visibility = "visible";
  }
  </script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

STYLES.CSS

```

#container {
  visibility: hidden;
}
#loader {
  color: #008cff;
  height: 40px;
  width: 30%;
  position: absolute;
  top: 45%;
  left: 45%;
}
.e-radio-wrapper {
  margin-top: 18px;
}
li {
  list-style: none;
}

```

Size

The different RadioButton sizes available are default and small. To reduce the size of the default RadioButton to small, set the [cssClass](#) property to `e-small`.

INDEX.TS

```

import { RadioButton } from '@syncfusion/ej2-buttons';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
//Small RadioButton.
let radiobutton: RadioButton = new RadioButton({ label: 'Small', name:
'size', checked: true, cssClass: 'e-small' });
radiobutton.appendTo('#radiobutton1');
//Default RadioButton.
radiobutton = new RadioButton({ label: 'Default', name: 'size' });
radiobutton.appendTo('#radiobutton2');

```

Accessibility in EJ2 JavaScript Radio button control

The Radio button component followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Radio button component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support | |

| [Section 508](#) Support | |

| Screen Reader Support | |

| Right-To-Left Support | |

| Color Contrast | |

| Mobile Device Support | |

| Keyboard Navigation Support | |

| [Accessibility Checker](#) Validation | |

| [Axe-core](#) Accessibility Validation | |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<div> - All features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

WAI-ARIA attributes

The Radio button component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Radio button component:

| Attributes | Purpose |

| --- | --- |

| **aria-disabled** | Indicates that the element is perceivable but disabled, so it is not editable or otherwise operable. |

Keyboard interaction

The Radio button component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Radio button component.

| **Press** | **To do this** |

| --- | --- |

| **UP/Left arrow** | Move and select the previous options. |

| **Down/Right arrow** | Move and select the next options. |

Ensuring accessibility

The Radio button component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Radio button component is shown in the following sample. Open the [sample](https://ej2.syncfusion.com/accessibility/Radio button.html) in a new window to evaluate the accessibility of the Radio button component with accessibility tools.

How To

Customize radiobutton appearance in EJ2 JavaScript Radio button control

You can customize the appearance of the RadioButton component by using the CSS rules. Define own CSS rules according to your requirement and assign the class name to the [cssClass](#) property.

The background and border color of the RadioButton is customized through the custom classes to create the primary, success, info, warning, and danger type of RadioButton.

INDEX.TS

```
import { RadioButton } from '@syncfusion/ej2-buttons';
// To customize RadioButton appearance
// Refer the 'e-primary' class details in 'style.css'.
let radiobutton: RadioButton = new RadioButton({ label: 'Primary', name:
'custom', cssClass: 'e-primary' });
radiobutton.appendTo('#radiobutton1');
// Refer the 'e-success' class details in 'style.css'.
radiobutton = new RadioButton({ label: 'Success', name: 'custom', cssClass:
'e-success' });
radiobutton.appendTo('#radiobutton2');
// Refer the 'e-info' class details in 'style.css'.
radiobutton = new RadioButton({ label: 'Info', name: 'custom', cssClass: 'e-
info', checked: true });
radiobutton.appendTo('#radiobutton3');
// Refer the 'e-warning' class details in 'style.css'.
radiobutton = new RadioButton({ label: 'Warning', name: 'custom', cssClass:
'e-warning' });
radiobutton.appendTo('#radiobutton4');
```

```
// Refer the 'e-danger' class details in 'style.css'.
radiobutton = new RadioButton({ label: 'Danger', name: 'custom', cssClass:
'e-danger' });
radiobutton.appendTo('#radiobutton5');
```

+ label:hover::before {
border-color: #ba330a;
}
.e-danger .e-radio + label:hover::before {
border-color: #blafaf
}

```

Name and value in form submit in EJ2 JavaScript Radio button control

The [name](#) attribute of the RadioButton is used to group RadioButton. When the RadioButton are grouped in form, the checked items [value](#) attribute will be post to server on form submit that can be retrieved through the name. The disabled RadioButton value will not be sent to the server on form submit.

In the following code snippet, Credit and Debit card is in checked state.

Now, the value that is in checked state will be sent on form submit.

INDEX.TS

```

import { Button, RadioButton } from '@syncfusion/ej2-buttons';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
//Name and Value attribute in form submit.
let radiobutton: RadioButton = new RadioButton({label: 'Credit/Debit Card',
name: 'payment', value: 'credit/debit', checked: true});
radiobutton.appendTo('#radiobutton1');
radiobutton = new RadioButton({label: 'Net Banking', name: 'payment', value:
'netbanking'});
radiobutton.appendTo('#radiobutton2');
radiobutton = new RadioButton({label: 'Cash on Delivery', name: 'payment',
value: 'cashondelivery'});
radiobutton.appendTo('#radiobutton3');

```

```

radiobutton = new RadioButton({label: 'Others', name: 'payment', value:
'others'}});
radiobutton.appendTo('#radiobutton4');
let button: Button = new Button({ isPrimary: true });
button.appendTo('#btnElement');

```

Right to left in EJ2 JavaScript Radio button control

RadioButton component has RTL support. This can be achieved by setting [enableRtl](#) as `true`.

The following example illustrates how to enable right-to-left support in RadioButton component.

INDEX.TS

```

import { RadioButton } from '@syncfusion/ej2-buttons';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
// Initialize RadioButton component.
let radiobutton: RadioButton = new RadioButton({ label: 'Option 1', name:
'default', enableRtl: true });
// Render initialized RadioButton.
radiobutton.appendTo('#element1');
radiobutton = new RadioButton({ label: 'Option 2', name: 'default',
enableRtl: true, checked: true });
radiobutton.appendTo('#element2');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

li {
  list-style: none;
}

```

Set the disabled state in EJ2 JavaScript Radio button control

RadioButton component can be enabled/disabled by giving [disabled](#) property. To disable RadioButton component, the `disabled` property can be set as `true`.

The following example illustrates how to disable a radio button and the selected one is displayed using [change](#) event.

INDEX.TS

```

import { RadioButton, ChangeEventArgs } from '@syncfusion/ej2-buttons';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
// Initialize RadioButton component.
let radiobutton: RadioButton = new RadioButton({ label: 'Option 1', name:
'default', checked: true, change: onChange });
// Render initialized RadioButton.
radiobutton.appendTo('#element1');
radiobutton = new RadioButton({ label: 'Option 2', name: 'default',
disabled: true, change: onChange });
radiobutton.appendTo('#element2');
radiobutton = new RadioButton({ label: 'Option 3', name: 'default', change:
onChange });

```

```

radiobutton.appendTo('#element3');
function onChange(args: ChangeEventArgs): void {
    document.getElementById('text').innerText = 'Selected : ' + this.label;
}

```

Ej1 api migration in EJ2 JavaScript Radio button control

This article describes the API migration process of RadioButton component from Essential JS 1 to Essential JS 2.

Properties

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| RadioButton Label | **Property:** *text*

 \$("#radiobutton").ejRadioButton({
text: "RadioButton"
 }); | **Property:** *label*

 var radioButton = new ej.buttons.RadioButton({
label: "RadioButton"
});
radioButton.appendTo("#radiobutton"); |

| Checked state | **Property:** *checked*

 \$("#radiobutton").ejRadioButton({
checked: true
 }); | **Property:** *checked*

 var radioButton = new ej.buttons.RadioButton({
checked: true
});
radioButton.appendTo("#radiobutton"); |

| Adding custom class | **Property:** *cssClass*

 \$("#radiobutton").ejRadioButton({
cssClass: "custom-class"
 }); | **Property:** *cssClass*

 var radioButton = new ej.buttons.RadioButton({
cssClass: "custom-class"
});
radioButton.appendTo("#radiobutton"); |

| Disabled state | **Property:** *enabled*

 \$("#radiobutton").ejRadioButton({
enabled: false
 }); | **Property:** *disabled*

 var radioButton = new ej.buttons.RadioButton({
disabled: true
});
radioButton.appendTo("#radiobutton"); |

| State persistence | **Property:** *enablePersistence*

 \$("#radiobutton").ejRadioButton({
enablePersistence: true
 }); | **Property:** *enablePersistence*

 var radioButton = new ej.buttons.RadioButton({
enablePersistence: true
});
radioButton.appendTo("#radiobutton"); |

| RTL | **Property:** *enableRTL*

 \$("#radiobutton").ejRadioButton({
enableRTL: true,
text: "RadioButton"
 }); | **Property:** *enableRtl*

 var radioButton = new ej.buttons.RadioButton({
enableRtl: true,
label: "RadioButton"
});
radioButton.appendTo("#radiobutton"); |

| HTML Attributes | **Property:** *htmlAttributes*

 \$("#radiobutton").ejRadioButton({
htmlAttributes : { required:"required" },
text: "RadioButton"
}); | Not applicable |

| Id property | **Property:** *id*

 \$("#radiobutton").ejRadioButton({
id: "sync"
 }); | Not applicable |

| Prefix value of Id | **Property:** *idPrefix*

 \$("#radiobutton").ejRadioButton({
idPrefix: "ej"
 }); | Not applicable |

| Name attribute | **Property:** *name*

 \$("#radiobutton").ejRadioButton({
 name: "sports"
 }); | **Property:** *name*

 var radioButton = new ej.buttons.RadioButton({
 name: "sports"
 });
 radioButton.appendTo("#radiobutton"); |

| Value attribute | **Property:** *value*

 \$("#radiobutton").ejRadioButton({
 value: "football",
 name: "sports"
 }); | **Property:** *value*

 var radioButton = new ej.buttons.RadioButton({
 value: "football",
 name: "sports"
 });
 radioButton.appendTo("#radiobutton"); |

| Size | **Property:** *size*

 \$("#radiobutton").ejRadioButton({
 size: "small"
 }); | **Property:** *cssClass*

 var radioButton = new ej.buttons.RadioButton({
 cssClass: "e-small"
 });
 radioButton.appendTo("#radiobutton"); |

| Validation rules | **Property:** *validationRules*

 \$("#radiobutton").ejRadioButton({
 validationRules: { required: true }
 }); | Not applicable |

| Validation message | **Property:** *validationMessage*

 \$("#radiobutton").ejRadioButton({
 validationRules: { required: true },
 validationMessage: { required: "Required RadioButton value" }
 }); | Not applicable |

Methods

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Destroy | **Method:** *destroy*

 \$("#radiobutton").ejRadioButton({
 text: "RadioButton"
 });
 var radioButton = \$("#radiobutton").data("ejRadioButton");
 radioButton.destroy() | **Method:** *destroy*

 var radioButton = new ej.buttons.RadioButton({
 label: "RadioButton"
 });
 radioButton.appendTo("#radiobutton");
 radioButton.destroy(); |

| Disable the RadioButton | **Method:** *disable*

 \$("#radiobutton").ejRadioButton({
 text: "RadioButton"
 });
 var radioButton = \$("#radiobutton").data("ejRadioButton");
 radioButton.disable() | Not applicable |

| Enable the RadioButton | **Method:** *enable*

 \$("#radiobutton").ejRadioButton({
 text: "RadioButton"
 });
 var radioButton = \$("#radiobutton").data("ejRadioButton");
 radioButton.enable() | Not applicable |

Events

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| BeforeChange Event | **Events:** *beforeChange*

 \$("#radiobutton").ejRadioButton({
 beforeChange: function(args) { / code block */ }
 }); | Not applicable |

| Change Event | **Events:** *change*

 \$("#radiobutton").ejRadioButton({
 change: function(args) { / code block / }
 }); | **Events:** *change*

 var radioButton = new ej.buttons.RadioButton({
 change: function(args) { / code block / }
 });
 radioButton.appendTo("#radiobutton"); |

| Create Event | **Events:** *create*

 \$("#radiobutton").ejRadioButton({
 create: function(args) { / code block / }
 }); | **Events:** *created*

 var radioButton = new ej.buttons.RadioButton({
 created: function() { / code block / }
 });
 radioButton.appendTo("#radiobutton"); |

| Destroy Event | **Events:** *destroy*

 \$("#radiobutton").ejRadioButton({
destroy:
function(args) { / code block */ }
 }); | Not applicable |

Range Navigator

Getting started in EJ2 JavaScript Range navigator control

This section explains you the steps required to create a simple range navigator and demonstrate the basic usage of the range navigator control.

Dependencies

The list of minimum dependencies required to use a range navigator are follows:

```
`javascript
|-- @syncfusion/ej2-charts
|-- @syncfusion/ej2-base
|-- @syncfusion/ej2-data
|-- @syncfusion/ej2-pdf-export
|-- @syncfusion/ej2-file-utils
|-- @syncfusion/ej2-compression
|-- @syncfusion/ej2-navigations
|-- @syncfusion/ej2-calendars
\`
```

Setup for Local Development

Clone the Essential JS 2 quickstart application project from [GitHub](https://github.com/syncfusion/quickstart), and install the necessary npm packages using the following command line scripts.

```
`javascript
git clone https://github.com/angular/quickstart.git quickstart
cd quickstart
npm install
\`
```

Configuring System JS

Syncfusion Chart packages have to be mapped in the `system.config.js` configuration file to render range navigator.

```
`javascript
System.config({
  paths: {
    'syncfusion:': './node_modules/@syncfusion/',
  },
  map: {
```

```

app: 'app',
//Syncfusion packages mapping
"@syncfusion/ej2-base": "syncfusion:ej2-base/dist/ej2-base.umd.min.js",
"@syncfusion/ej2-data": "syncfusion:ej2-data/dist/ej2-data.umd.min.js",
"@syncfusion/ej2-charts": "syncfusion:ej2-charts/dist/ej2-charts.umd.min.js",
"@syncfusion/ej2-popups": "syncfusion:ej2-popups/dist/ej2-popups.umd.min.js",
"@syncfusion/ej2-buttons": "syncfusion:ej2-buttons/dist/ej2-buttons.umd.min.js",
"@syncfusion/ej2-pdf-export": "syncfusion:ej2-pdf-export/dist/ej2-pdf-export.umd.min.js",
"@syncfusion/ej2-file-utils": "syncfusion:ej2-file-utils/dist/ej2-file-utils.umd.min.js",
"@syncfusion/ej2-compression": "syncfusion:ej2-compression/dist/ej2-compression.umd.min.js",
"@syncfusion/ej2-navigations": "syncfusion:ej2-navigations/dist/ej2-navigations.umd.min.js",
"@syncfusion/ej2-calendars": "syncfusion:ej2-calendars/dist/ej2-calendars.umd.min.js",
"@syncfusion/ej2-lists": "syncfusion:ej2-lists/dist/ej2-lists.umd.min.js",
"@syncfusion/ej2-inputs": "syncfusion:ej2-inputs/dist/ej2-inputs.umd.min.js",
"@syncfusion/ej2-svg-base": "syncfusion:ej2-svg-base/dist/ej2-svg-base.umd.min.js",
"@syncfusion/ej2-splitbuttons": "syncfusion:ej2-splitbuttons/dist/ej2-splitbuttons.umd.min.js" },
packages: {
'app': { main: 'app', defaultExtension: 'js' }
}
});
System.import('app');
`

```

Add Range Navigator to the Project

Add the HTML div element for Range Navigator into your `index.html`. [src/index.html]

```

`html
<!DOCTYPE html>
<html lang="en">
<head>
<title>EJ2 Animation</title>
<meta charset="utf-8" />
<meta name="viewport" content="width=device-width, initial-scale=1.0" />
<meta name="description" content="Typescript UI Controls" />
<meta name="author" content="Syncfusion" />

```

```

<link href="index.css" rel="stylesheet" />
<script src="https://cdnjs.cloudflare.com/ajax/libs/systemjs/0.19.38/system.js"></script>
<script src="systemjs.config.js"></script>
</head>
<body>
<!--container which is going to render the RangeNavigator-->
<div id='element'>
</div>
</body>
</html>
`

```

Now import the RangeNavigator component into your `app.ts` to instantiate a RangeNavigator and append the range navigator instance to the `#element` [src/app/app.ts].

```

`ts
import { RangeNavigator } from '@syncfusion/ej2-charts';
// initialize RangeNavigator component
let range: RangeNavigator = new RangeNavigator();
// render initialized RangeNavigator
range.appendTo('#element');
`

```

Run the Application

The quickstart project is configured to compile and run the application in the browser. Use the following command to run the application.

```

npm start
`

```

The below example shows a basic Range Navigator.

INDEX.TS

```

import { RangeNavigator } from "@syncfusion/ej2-charts";
let range: RangeNavigator = new RangeNavigator();
range.appendTo('#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">

```

```

<meta name="viewport" content="width=device-width, initial-scale=1.0">
<meta name="description" content="Typescript UI Controls">
<meta name="author" content="Syncfusion">
<link href="index.css" rel="stylesheet">

<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container" style="margin-top: 125px">
        <div id="element"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Module Injection

To create range navigator with additional features, inject the required modules. The following modules are used to extend rangenavigator's basic functionality.

- **AreaSeriesService** - Inject this module to use area series.
- **DateTimeService** - Inject this module to use date time axis.
- **RangeTooltipService** - Inject this module to show the tooltip.

Now import the above mentioned modules from chart package and inject it into the RangeNavigator component using **RangeNavigator.Inject** method.

```
`javascript
```

```
import { RangeNavigator, AreaSeries, DateTime, RangeTooltip } from '@syncfusion/ej2-charts';
```

```
RangeNavigator.Inject(AreaSeries, DateTime, RangeTooltip);
```

```
,
```

Populate Range Navigator with Data

Now, we are going to provide data to the range navigator. Add a series object to the range navigator by using **series** property. Now map the field names x and y in the JSON data to the **xName** and **yName** properties of the series, then set the JSON data to **dataSource** property.

Since the JSON contains Datetime data, set the **valueType** as **DateTime**. By default, the axis **valueType** is **Numeric**.

INDEX.TS

```
import { RangeNavigator, AreaSeries, DateTime } from "@syncfusion/ej2-charts";
RangeNavigator.Inject(AreaSeries, DateTime);
import { datasrc } from "../datasource.ts";
let range: RangeNavigator = new RangeNavigator({
  valueType: 'DateTime',
  value: [new Date('2017-09-01'), new Date('2018-02-01')],
  labelFormat: 'MMM-yy',
  series: [{
    dataSource: datasrc, xName: 'x', yName: 'y', type: 'Area',
  }],
  width: 2,
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container" style="margin-top: 125px">
    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Note: Get data from [here](#).

The sample should look like our [default](#), don't worry about the gradient color, let it takes the default color.

Enable Tooltip

The tooltip is useful to show the selected data. You can enable tooltip by setting the enable property as true in tooltip object and by injecting RangeTooltipService module using RangeNavigator.Inject(RangeTooltip) method.

INDEX.TS

```
import { RangeNavigator, AreaSeries, DateTime, RangeTooltip} from
"@syncfusion/ej2-charts";
RangeNavigator.Inject(AreaSeries, DateTime, RangeTooltip);
import { datasrc } from "../datasource.ts";
let range: RangeNavigator = new RangeNavigator({
  valueType: 'DateTime',
  value: [new Date('2017-09-01'), new Date('2018-02-01')],
  tooltip: { enable: true, displayMode: 'Always' },
  labelFormat: 'MMM-yy',
  series: [{
    dataSource: datasrc, xName: 'x', yName: 'y', type: 'Area',
width: 2,
  }],
}, '#element');
```

INDEX.HTML

```

Selecting range in EJ2 JavaScript Range navigator control

The Range Selector's left and right thumbs are used to indicate the selected range in the large collection of data. A range can be selected in the following ways:

- By dragging the thumbs.
- By tapping on the labels.
- By setting the start and the end through the `value` property.

INDEX.TS

```
import { RangeNavigator, AreaSeries, DateTime } from "@syncfusion/ej2-charts";
RangeNavigator.Inject(AreaSeries, DateTime);
import { datasrc } from "./datasource.ts";
let range: RangeNavigator = new RangeNavigator({
  valueType: 'DateTime',
  value: [new Date('2017-09-01'), new Date('2018-02-01')],
  labelFormat: 'MMM-yy',
  series: [{
    dataSource: datasrc, xName: 'x', yName: 'y', type: 'Area', width: 2,
  }],
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>

if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Lightweight in EJ2 JavaScript Range navigator control

By default, when the `dataSource` for `series` is empty, a lightweight Range Selector will be shown without Chart.

INDEX.TS

```
import { RangeNavigator, DateTime } from '@syncfusion/ej2-charts';
import { GetDateTimeData } from './datasource.ts';
RangeNavigator.Inject(DateTime);
```

```
let range: RangeNavigator = new RangeNavigator(
{
    valueType: 'DateTime',
    intervalType: 'Months',
    labelFormat: 'MMM',
    value: [new Date(2018, 4, 1), new Date(2018, 8, 1)],
    dataSource: GetDateTimeData(new Date(2018, 0, 1), new Date(2019, 0,
1)),
    xName: 'x', yName: 'y'
}, '#element');
```

Series types in EJ2 JavaScript Range navigator control

To render the data, the Range Selector supports three types of series.

<!-- markdownlint-disable MD036 -->

Line

<!-- markdownlint-disable MD036 -->

To render a line series, use series type as **Line** and inject the **LineSeries** module using the **RangeNavigator.Inject(LineSeries)** method. By default, the line series is rendered in the Range Selector.

INDEX.TS

```
import { RangeNavigator, DateTime, LineSeries } from "@syncfusion/ej2-charts";
RangeNavigator.Inject(DateTime, LineSeries);
import { datasrc } from "../datasource.ts";
let range: RangeNavigator = new RangeNavigator({
  valueType: 'DateTime',
  value: [new Date('2017-09-01'), new Date('2018-02-01')],
  labelFormat: 'MMM-yy',
  series: [{
    dataSource: datasrc, xName: 'x', yName: 'y', type: 'Line', width: 2,
  }],
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>

if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Area

To render an area series, use series type as **Area** and inject **AreaSeries** module using **RangeNavigator.Inject(AreaSeries)** method.

INDEX.TS

```
import { RangeNavigator, DateTime, AreaSeries } from "@syncfusion/ej2-charts";
RangeNavigator.Inject(DateTime, AreaSeries);
import { datasrc } from "../datasource.ts";
let range: RangeNavigator = new RangeNavigator({
  valueType: 'DateTime',
  value: [new Date('2017-09-01'), new Date('2018-02-01')],
  labelFormat: 'MMM-yy',
  series: [{
    dataSource: datasrc, xName: 'x', yName: 'y', type: 'Area', width: 2,
  }],
}, '#element');
```

INDEX.HTML

Data in EJ2 JavaScript Range navigator control

Numeric

The numeric scale is used to represent the numeric values of data in a Range Selector. By default, the **valueType** of a Range Selector is **Double**.

INDEX.TS

```

import { RangeNavigator, StepLineSeries, DateTime } from "@syncfusion/ej2-
charts";
RangeNavigator.Inject(StepLineSeries, DateTime);
import { double } from "../datasource.ts";
let range: RangeNavigator = new RangeNavigator({
  value: [12, 30],
  series: [{
    dataSource: double,

```

```

      xName: 'x', yName: 'y', type: 'StepLine', width: 2,
    }],
  }, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
  <script src="es5-datasource.js" type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container" style="margin-top: 125px">
    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Range

The minimum and the maximum of the scale will be calculated automatically based on the provided data. It can be customized by using the `minimum`, `maximum`, and `interval` properties.

INDEX.TS

```

import { RangeNavigator, StepLineSeries } from "@syncfusion/ej2-charts";
RangeNavigator.Inject(StepLineSeries);
let range: RangeNavigator = new RangeNavigator({
  minimum: 10, maximum: 160, interval: 10,
  value: [60, 100],
  series: [{
    dataSource: [
      { xData: 10, yData: 35 }, { xData: 20, yData: 28 },
      { xData: 30, yData: 34 }, { xData: 40, yData: 32 },
      { xData: 50, yData: 40 }, { xData: 60, yData: 30 },
      { xData: 70, yData: 4 }, { xData: 80, yData: 22 },
      { xData: 90, yData: 30 }, { xData: 100, yData: 43 },
      { xData: 110, yData: 60 }, { xData: 120, yData: 33 },
      { xData: 130, yData: 40 }, { xData: 140, yData: 29 },
    ]
  }]
});

```

```

    { xData: 150, yData: 10 }, { xData: 160, yData: 16 },
  ],
  xName: 'xData', yName: 'yData', type: 'StepLine', width: 2,
}],
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container" style="margin-top: 125px">
    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Label Format

The numeric labels can be formatted using the `labelFormat` property and it supports all the globalized formats.

INDEX.TS

```

import { RangeNavigator, StepLineSeries, DateTime } from "@syncfusion/ej2-
charts";
RangeNavigator.Inject(StepLineSeries, DateTime);
import { double } from "../datasource.ts";
let range: RangeNavigator = new RangeNavigator({
  labelFormat: 'n1',
  value: [12, 30],
  series: [{
    dataSource: double,
    xName: 'x', yName: 'y', type: 'StepLine', width: 2,
  }],
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
  <script src="es5-datasource.js" type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container" style="margin-top: 125px">
    <div id="element"></div>
  </div>
<script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

The following table describes the result of applying some commonly used label formats on numeric values.

<!-- markdownlint-disable MD033 -->

Label Value	Label Format property value	Result	Description
1000	n1	1000.0	The Number is rounded to 1 decimal place
1000	n2	1000.00	The Number is rounded to 2 decimal place
1000	n3	1000.000	The Number is rounded to 3 decimal place
0.01	p1	1.0%	The Number is converted to percentage with 1 decimal place
0.01	p2	1.00%	The Number is converted to percentage with 2 decimal place
0.01	p3	1.000%	The Number is converted to percentage with 3 decimal place
1000	c1	\$1,000.0	The Currency symbol is appended to number and number is rounded to 1 decimal place

1000	c2	\$1,000.00	The Currency symbol is appended to number and number is rounded to 2 decimal place
------	----	------------	--

Custom Label Format

The Range Selector also supports the Custom Label formats using the placeholders such as **{value}\$**, in which the value represents the axis label, e.g. 20\$.

INDEX.TS

```
import { RangeNavigator, StepLineSeries, DateTime } from "@syncfusion/ej2-charts";
RangeNavigator.Inject(StepLineSeries, DateTime);
import { double } from "../datasource.ts";
let range: RangeNavigator = new RangeNavigator({
  // Custom label format
  labelFormat: '{value}$',
  value: [12, 30],
  series: [{
    dataSource: double,
    xName: 'x', yName: 'y', type: 'StepLine', width: 2,
  }],
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
  <script src="es5-datasource.js" type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>

if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Logarithmic Axis

<!-- markdownlint-disable MD033 -->

The Logarithmic supports the logarithmic scale, and it is used to visualize the data when the Range Selector has numerical values in both the lower (e.g.: 10-6) and the higher (e.g.: 106) orders of the magnitude.

INDEX.TS

```
import { RangeNavigator, StepLineSeries, Logarithmic } from
"@syncfusion/ej2-charts";
RangeNavigator.Inject(StepLineSeries, Logarithmic);
let data: object[] = [];
let max: number = 100;
for (let i: number = 0; i < 100; i++) {
    data.push({
        x: Math.pow(10, i * 0.1),
        y: Math.floor(Math.random() * (80 - 30 + 1)) + 30
    });
}
let range: RangeNavigator = new RangeNavigator({
    valueType: 'Logarithmic',
    value: [4, 6],
    interval: 1,
    series: [{
        dataSource: data, xName: 'x', yName: 'y', type: 'StepLine', width:
2,
    }],
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Animation</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript UI Controls">
    <meta name="author" content="Syncfusion">
    <link href="index.css" rel="stylesheet">

    <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
    <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container" style="margin-top: 125px">
        <div id="element"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
```

```

</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

To use logarithmic scale, inject the Logarithmic module using the `RangeNavigator.Inject(Logarithmic)` method, and then set the `valueType` to `Logarithmic`.

Range

The minimum and the maximum of the Range Selector will be calculated automatically based on the provided data. It can be customized by using the `minimum`, `maximum`, and `interval` properties.

INDEX.TS

```

import { RangeNavigator, StepLineSeries, Logarithmic } from
"@syncfusion/ej2-charts";
RangeNavigator.Inject(StepLineSeries, Logarithmic);
let data: object[] = [];
let max: number = 100;
for (let i: number = 0; i < 100; i++) {
    data.push({
        x: Math.pow(10, i * 0.1),
        y: Math.floor(Math.random() * (80 - 30 + 1)) + 30
    });
}
let range: RangeNavigator = new RangeNavigator({
    valueType: 'Logarithmic',
    value: [4, 6],
    interval: 1,
    series: [{
        dataSource: data, xName: 'x', yName: 'y', type: 'StepLine', width:
2,
    }],
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Animation</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">

        <div id="element"></div>
    </div>

```

```
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Logarithmic Base

The Logarithmic Base can be customized using the `logBase` property. The default value of this property is **10**.

INDEX.TS

```
import { RangeNavigator, StepLineSeries, Logarithmic } from
"@syncfusion/ej2-charts";
RangeNavigator.Inject(StepLineSeries, Logarithmic);
let data: object[] = [];
let max: number = 100;
for (let i: number = 0; i < 100; i++) {
    data.push({
        x: Math.pow(10, i * 0.1),
        y: Math.floor(Math.random() * (80 - 30 + 1)) + 30
    });
}
let range: RangeNavigator = new RangeNavigator({
    valueType: 'Logarithmic',
    value: [4, 6],
    // logBase for logarithmic scale
    logBase: 2,
    series: [{
        dataSource: data, xName: 'x', yName: 'y', type: 'StepLine', width:
2,
    }],
}, '#element');
```

INDEX.HTML

var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Date-time

The Range Selector supports the DateTime scale and displays the DateTime values as labels in the specified format.

INDEX.TS

```

import { RangeNavigator, AreaSeries, DateTime } from "@syncfusion/ej2-
charts";
RangeNavigator.Inject(AreaSeries, DateTime);
import { datasrc } from "./datasource.ts";
let range: RangeNavigator = new RangeNavigator({
  valueType: 'DateTime',
  value: [new Date("2017-08-13"), new Date("2017-12-28")],
  series: [{
    dataSource: datasrc, xName: 'x', yName: 'y', type: 'Area', width: 2,
  }],
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>

  ="text/javascript"></script>
</head>
<body>

  <div id="container" style="margin-top: 125px">
    <div id="element"></div>
  </div>
</script>
var ele = document.getElementById('container');
if(ele) {

```

```

    ele.style.visibility = "visible";
  }
  </script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Date-time Range navigator supports date-time scale and displays date-time values as a labels in the specified format.

Interval Customization

The DateTime intervals can be customized using the `interval` and the `intervalType` properties of the Range Selector. For example, if the `interval` is set to 2 and the `intervalType` is set to years, the interval will be considered to be 2 years.

DateTime supports the following interval types:

- Auto
- Years
- Quarter
- Months
- Weeks
- Days
- Hours
- Minutes

INDEX.TS

```

import { RangeNavigator, AreaSeries, DateTime } from "@syncfusion/ej2-charts";
RangeNavigator.Inject(AreaSeries, DateTime);
import { datasrc } from "./datasource.ts";
let range: RangeNavigator = new RangeNavigator({
  valueType: 'DateTime',
  intervalType: 'Months',
  interval: 2,
  value: [new Date("2017-08-13"), new Date("2017-12-28")],
  series: [{
    dataSource: datasrc, xName: 'x', yName: 'y', type: 'Area', width: 2,
  }],
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Label Format

The `labelFormat` property is used to format and parse the date to all globalize format.

INDEX.TS

```

import { RangeNavigator, AreaSeries, DateTime } from "@syncfusion/ej2-
charts";
RangeNavigator.Inject(AreaSeries, DateTime);
import { datasrc } from "./datasource.ts";
let range: RangeNavigator = new RangeNavigator({
    valueType: 'DateTime',
    labelFormat: 'y/M/d',
    value: [new Date("2017-08-13"), new Date("2017-12-28")],
    series: [{
        dataSource: datasrc, xName: 'x', yName: 'y', type: 'Area', width: 2,
    }],
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Animation</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript UI Controls">
    <meta name="author" content="Syncfusion">
    <link href="index.css" rel="stylesheet">

    <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
    <script src="es5-datasource.js" type="text/javascript"></script>
    <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

```

```

    <div id="container" style="margin-top: 125px">
      <div id="element"></div>
    </div>
</script>
<script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

The following table shows the results of applying some common DateTime formats to the `labelFormat` property.

<!-- markdownlint-disable MD033 -->

Label Value	Label Format Property Value	Result	Description
new Date(2000, 03, 10)	EEEE	Monday	The Date is displayed in day format
new Date(2000, 03, 10)	yMd	04/10/2000	The Date is displayed in month/date/year format
new Date(2000, 03, 10)	MMM	Apr	The Shorthand month for the date is displayed
new Date(2000, 03, 10)	hm	12:00 AM	Time of the date value is displayed as label
new Date(2000, 03, 10)	hms	12:00:00 AM	The Label is displayed in hours:minutes:seconds format

Period selector in EJ2 JavaScript Range navigator control

The period selector allows to select a range with specified periods.

Periods

An array of objects that allows the users to specify pre-defined time intervals. The `interval` property specifies the count value of the button, and the `text` property specifies the text to be displayed on the button. The `intervaltype` property allows the users to customize the interval type, and it supports the following types:

- Auto
- Years
- Quarter
- Months
- Weeks
- Days
- Hours
- Minutes

- Seconds

</body></html>
```

To use the period selector feature, inject the **PeriodSelector** module using the **RangeNavigator.Inject(PeriodSelector)** method.

Positioning period selector

The **position** property allows the users to position the period selector at the **Top** or **Bottom**.

Labels in EJ2 JavaScript Range navigator control

Multilevel labels

The `labelIntersectAction` property is used to avoid overlapping of labels. The following code sample shows the setting of `labelIntersectAction` property to **Hide**.

INDEX.TS

```

import { RangeNavigator, DateTime, RangeTooltip } from '@syncfusion/ej2-
charts';
RangeNavigator.Inject(DateTime, RangeTooltip);
let data: object[] = [];
let value: number = 0; let point: object = {};
for (let j: number = 1; j < 1090; j++) {
    value += (Math.random() * 10 - 5);
    value = value < 0 ? Math.abs(value) : value;
    point = { x: new Date(2000, 0, j), y: value, z: value + 10 };
    data.push(point);
}
let range: RangeNavigator = new RangeNavigator(
{
    labelPosition: 'Outside',
    tooltip: { enable: true },
    valueType: 'DateTime',
    intervalType: 'Quarter',
    enableGrouping: true,
    value: [new Date(2001, 0), new Date(2002, 0)],
    dataSource: data,
    xName: 'x',
    yName: 'y'
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>

  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Grouping

The second level axis labels can be grouped using “groupBy” property with the following interval types:

- Auto
- Years
- Quarter
- Months
- Weeks
- Days
- Hours
- Minutes
- Seconds

INDEX.TS

```

import { RangeNavigator, DateTime, RangeTooltip } from '@syncfusion/ej2-
charts';
RangeNavigator.Inject(DateTime, RangeTooltip);
let data: object[] = [];
let value: number = 0; let point: object = {};
for (let j: number = 1; j < 1090; j++) {
  value += (Math.random() * 10 - 5);

```

```

    value = value < 0 ? Math.abs(value) : value;
    point = { x: new Date(2000, 0, j), y: value, z: value + 10 };
    data.push(point);
}
let range: RangeNavigator = new RangeNavigator(
    {
        labelPosition: 'Outside',
        tooltip: { enable: true },
        valueType: 'DateTime',
        intervalType: 'Quarter',
        enableGrouping: true,
        groupBy: 'Years',
        value: [new Date(2001, 0), new Date(2002, 0)],
        dataSource: data,
        xName: 'x',
        yName: 'y'
    }, '#element');

```

INDEX.HTML

```

Smart labels

The `labelIntersectAction` property is used to avoid overlapping of labels. The following code sample shows the setting of `labelIntersectAction` property to **Hide**.

INDEX.TS

```
import { RangeNavigator, StepLineSeries, DateTime } from "@syncfusion/ej2-charts";
RangeNavigator.Inject(StepLineSeries, DateTime);
import { datasrc } from "../datasource.ts";
let range: RangeNavigator = new RangeNavigator({
  valueType: 'DateTime',
  labelIntersectAction: 'Hide',
  labelFormat: 'y/M/d',
  value: [new Date("2017-08-13"), new Date("2017-12-28")],
  series: [{
    dataSource: datasrc, xName: 'x', yName: 'y', type: 'StepLine',
    width: 2,
  }],
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

<body>

  <div id="container" style="margin-top: 125px">
    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Label positioning

By default, the labels can be placed outside the Range Selector. It can also be placed inside the Range Selector using the `labelPosition` property.

INDEX.TS

```
import { RangeNavigator, StepLineSeries, DateTime } from "@syncfusion/ej2-charts";
RangeNavigator.Inject(StepLineSeries, DateTime);
```

```
import { datasrc } from "../datasource.ts";
let range: RangeNavigator = new RangeNavigator({
  valueType: 'DateTime',
  labelPosition: 'Inside',
  value: [new Date("2017-08-13"), new Date("2017-12-28")],
  series: [{
    dataSource: datasrc, xName: 'x', yName: 'y', type: 'StepLine',
    width: 2,
  }],
}, '#element');
```

```

Grid tick in EJ2 JavaScript Range navigator control

Grid line customization

The gridlines indicate axis divisions by drawing the chart plot. Gridlines include helpful cues to the user, particularly for large or complicated charts. The `width`, `color`, and `dashArray` of the major gridlines can be customized by using the `majorGridLines` setting.

INDEX.TS

```

import { RangeNavigator, StepLineSeries, DateTime } from "@syncfusion/ej2-
charts";
RangeNavigator.Inject(StepLineSeries, DateTime);
let range: RangeNavigator = new RangeNavigator({
    majorGridLines: {
        width: 4,
        color: 'blue',
        dashArray: '5,5'
    }
});

```

```

Tick line customization

Ticklines are the small lines which is drawn on the axis line representing the axis labels. Ticklines will be drawn outside the axis by default. The `width`, `color`, and `dashArray` of the major ticklines can be customized by using the `majorTickLines` setting.

INDEX.TS

```

import { RangeNavigator, StepLineSeries, DateTime } from "@syncfusion/ej2-
charts";
RangeNavigator.Inject(StepLineSeries, DateTime);
let range: RangeNavigator = new RangeNavigator({
  majorTickLines: {

Customization in EJ2 JavaScript Range navigator control

Navigator appearance

The Range Selector can be customized by using the `navigatorStyleSettings`. The `selectedRegionColor` property is used to specify the color for the selected region, whereas the `unselectedRegionColor` property is used to specify the color for the unselected region.

INDEX.TS

```

import { RangeNavigator, AreaSeries, DateTime, RangeTooltip } from
"@syncfusion/ej2-charts";
RangeNavigator.Inject(AreaSeries, DateTime, RangeTooltip);

```

```
import { datasrc } from "../datasource.ts";
let range: RangeNavigator = new RangeNavigator({
  valueType: 'DateTime',
  value: [new Date('2017-09-01'), new Date('2018-02-01')],
  tooltip: { enable: true },
  labelFormat: 'MMM-yy',
  navigatorStyleSettings: {
    unselectedRegionColor: 'skyblue',
    selectedRegionColor: 'pink'
  },
  series: [{
    dataSource: datasrc, xName: 'x', yName: 'y', type: 'Area', width: 2,
  }],
  '#element');

```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

  type="text/javascript"></script>
  <script src="es5-datasource.js" type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container" style="margin-top: 125px">
    <div id="element"></div>
  </div>
  <script>
  var ele = document.getElementById('container');
  if(ele) {
    ele.style.visibility = "visible";
  }
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Thumb

The thumb property allows to customize the border, fill color, size, and type of thumb. Thumbs can be of two shapes: **Circle** and **Rectangle**.

INDEX.TS

```
import { RangeNavigator, AreaSeries, DateTime, RangeTooltip } from
"@syncfusion/ej2-charts";
RangeNavigator.Inject(AreaSeries, DateTime, RangeTooltip);

```

```
import { datasrc } from "../datasource.ts";
let range: RangeNavigator = new RangeNavigator({
  valueType: 'DateTime',
  value: [new Date('2017-09-01'), new Date('2018-02-01')],
  tooltip: { enable: true },
  labelFormat: 'MMM-yy',
  navigatorStyleSettings: {
    thumb: {
      type: 'Rectangle',
      border: { width: 2, color: 'red' },
      fill: 'pink'
    }
  },
  series: [{
    dataSource: datasrc, xName: 'x', yName: 'y', type: 'Area', width: 2,
  }],
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>

if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Border customization

Using the `navigatorBorder`, the `width` and `color` of the Range Selector border can be customized.

INDEX.TS

```
import { RangeNavigator, AreaSeries, DateTime, RangeTooltip } from
"@syncfusion/ej2-charts";
RangeNavigator.Inject(AreaSeries, DateTime, RangeTooltip);
import { datasrc } from "../datasource.ts";
let range: RangeNavigator = new RangeNavigator({
  valueType: 'DateTime',
  value: [new Date('2017-09-01'), new Date('2018-02-01')],
  tooltip: { enable: true },
  labelFormat: 'MMM-yy',
  navigatorBorder: { width: 4, color: 'green' },
  series: [{
    dataSource: datasrc, xName: 'x', yName: 'y', type: 'Area', width: 2,
  }],
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">

  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container" style="margin-top: 125px">
    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Deferred update

If the `enableDeferredUpdate` property is set to **true**, then the changed event will be triggered after dragging the slider. If the `enableDeferredUpdate` is **false**, then the changed event will be triggered when dragging the slider. By default, the `enableDeferredUpdate` is set to **false**.

INDEX.TS

```
import { RangeNavigator, Chart, AreaSeries, DateTime, RangeTooltip,
IChangedEventArgs } from "@syncfusion/ej2-charts";
```

```

Chart.Inject(DateTime, AreaSeries);
RangeNavigator.Inject(AreaSeries, DateTime, RangeTooltip);
import { datasrc } from "../datasource.ts";
let chart: Chart = new Chart(
    {
        primaryXAxis: {
            valueType: 'DateTime',
            edgeLabelPlacement: 'Shift'
        },
        series: [{
            dataSource: datasrc, xName: 'x', yName: 'y', width: 2, name:
'Rate', type: 'Area'
        }],
        tooltip: { enable: true },
        height: '350', legendSettings: { visible: false },
    }
);
chart.appendTo('#Chart');
let range: RangeNavigator = new RangeNavigator({

Tool tip in EJ2 JavaScript Range navigator control

<!-- markdownlint-disable MD036 -->

The tooltip for sliders are supported by the Range Selector. Sliders are used in the Range Selector to select data from a specific range. The tooltip displays the selected start and end values.

<!-- markdownlint-disable MD013 -->

Customization

Tooltip can be customized using the following properties:

- enable - Customizes the visibility of the tooltip.
- fill - Customizes the background color of the tooltip.
- opacity - Customizes the opacity of the tooltip.
- textStyle - Customizes the font size, color, family, style, weight, alignment, and overflow of the tooltip.

INDEX.TS

```
import { RangeNavigator, AreaSeries, DateTime, RangeTooltip } from
"@syncfusion/ej2-charts";
RangeNavigator.Inject(AreaSeries, DateTime, RangeTooltip);

    <meta name="description" content="Typescript UI Controls">
    <meta name="author" content="Syncfusion">
    <link href="index.css" rel="stylesheet">

    <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
    <script src="es5-datasource.js" type="text/javascript"></script>
    <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>

```

```

<body>

  <div id="container" style="margin-top: 125px">
    <div id="element"></div>
  </div>
<script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

The following table shows the results of applying some common date and time formats to the `labelFormat` property.

<!-- markdownlint-disable MD033 -->

Label Value	Label Format Property Value	Result	Description
<code>new Date(2000, 03, 10)</code>	<code>EEEE</code>	Monday	The Date is displayed in day format
<code>new Date(2000, 03, 10)</code>	<code>yMd</code>	04/10/2000	The Date is displayed in month/date/year format
<code>new Date(2000, 03, 10)</code>	<code>MMM</code>	Apr	The Shorthand month for the date is displayed
<code>new Date(2000, 03, 10)</code>	<code>hm</code>	12:00 AM	Time of the date value is displayed as label
<code>new Date(2000, 03, 10)</code>	<code>hms</code>	12:00:00 AM	The Label is displayed in hours:minutes:seconds format

R t l in EJ2 JavaScript Range navigator control

The Range Selector supports right-to-left (RTL), which can be enabled with the `enableRtl` property.

INDEX.TS

```

import { RangeNavigator, AreaSeries, DateTime } from "@syncfusion/ej2-charts";
RangeNavigator.Inject(AreaSeries, DateTime);
import { datasrc } from "../datasource.ts";
let range: RangeNavigator = new RangeNavigator({
  valueType: 'DateTime',
  enableRtl: true,
  value: [new Date('2017-09-01'), new Date('2018-02-01')],
  labelFormat: 'MMM-yy',
  intervalType: 'Months',
  series: [{
    dataSource: datasrc, xName: 'x', yName: 'y', type: 'Area', width: 2,
  }],
}, '#element');

```

Export print in EJ2 JavaScript Range navigator control

Export

The rendered Range Selector can be exported to **JPEG, PNG, SVG**, or **PDF** format by using the **export** method in the Range Selector. This method contains the following parameters:

- **Type** - To specify the export type. The component can be exported to **JPEG, PNG, SVG**, or **PDF** format.
- **File name** - To specify the file name to export.
- **Orientation** - To specify the orientation type. This is applicable only for PDF export type.

INDEX.TS

```

Accessibility in EJ2 JavaScript Range navigator control

The Range navigator control followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Range navigator control is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support | |

| [Section 508](#) Support | |

| Screen Reader Support | |

| Right-To-Left Support | |

| Color Contrast | |

| Mobile Device Support | |

| Keyboard Navigation Support | |

| [Accessibility Checker](#) Validation | |

| [Axe-core](#) Accessibility Validation | |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<div> - All features of the control meet the requirement.</div>

<div> - Some features of the control do not meet the requirement.</div>

<div> - The control does not meet the requirement.</div>

WAI-ARIA attributes

The Range navigator control followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Range navigator control:

- region (role)
- aria-label (attribute)

Keyboard interaction

The Range navigator control followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Range navigator control.

| Press | To do this |

| --- | --- |

| Tab | Moves the focus to the Range navigator element. |

| Ctrl + P | Prints the Range navigator. |

Ensuring accessibility

The Range navigator control's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Range navigator control is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Range navigator control with accessibility tools.

Fires when right click in the RangeNavigator.	Property:rightClick\$("#rangeNavigator").ejRangeNavigator({ rightClick: () { }});	Not Applicable
Fires when double click in the RangeNavigator.	Property:doubleClick\$("#rangeNavigator").ejRangeNavigator({ doubleClick: () { }});	Not Applicable

Range Slider

Getting started in EJ2 JavaScript Range slider control

The Essential JS 2 for JavaScript (global script) is an ES5 formatted pure JavaScript framework which can be directly used in latest web browsers.

control Initialization

The Essential JS 2 JavaScript controls can be initialized by using either of the following ways.

- Using local script and style references in a HTML page.
- Using CDN link for script and style reference.

Using local script and style references in a HTML page

Step 1: Create an app folder `myapp` for Essential JS 2 JavaScript controls.

Step 2: You can get the global scripts and styles from the [Essential Studio JavaScript \(Essential JS 2\)](#) build installed location.

Syntax:

Script: `(installed location)\Syncfusion\Essential Studio\JavaScript - EJ2\{RELEASEVERSION}\Web (Essential JS 2)\JavaScript\{PACKAGENAME}\dist\global\{PACKAGE_NAME}.min.js`

Styles: `(installed location)\Syncfusion\Essential Studio\JavaScript - EJ2\{RELEASEVERSION}\Web (Essential JS 2)\JavaScript\{PACKAGENAME}\styles\material.css`

Example:

Script: `C:\Program Files (x86)\Syncfusion\Essential Studio\JavaScript - EJ2\16.3.0.17\Web (Essential JS 2)\JavaScript\ej2-inputs\dist\global\ej2-inputs.min.js`

Styles: `C:\Program Files (x86)\Syncfusion\Essential Studio\JavaScript - EJ2\16.3.0.17\Web (Essential JS 2)\JavaScript\ej2-inputs\styles\material.css`

The below located script and style file contains all Syncfusion JavaScript (ES5) UI control resources in a single file.

Scripts: `(installed location)\Syncfusion\Essential Studio\JavaScript - EJ2\{RELEASE_VERSION}\Web (Essential JS 2)\JavaScript\ej2\dist\ej2.min.js`

Styles: `(installed location)\Syncfusion\Essential Studio\JavaScript - EJ2\{RELEASE_VERSION}\Web (Essential JS 2)\JavaScript\ej2\material.css`

Step 3: Create a folder `myapp/resources` and copy/paste the global scripts and styles from the above installed location to `myapp/resources` location.

Step 4: Create a HTML page (index.html) in `myapp` location and add the Essentials JS 2 script and style references.

```
`html
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<title>Essential JS 2</title>
<!-- Essential JS 2 material theme -->
<link href="resources/material.css" rel="stylesheet" type="text/css"/>
<!-- Essential JS 2 Inputs's global and dependent script -->
<script src="resources/ej2-base.min.js" type="text/javascript"></script>
<script src="resources/ej2-inputs.min.js" type="text/javascript"></script>
</head>
<body>
</body>
</html>
`
```

Step 5: Now, add the **Slider** element and initiate the **Essential JS 2 Slider** control in the **index.html** by using following code

```
`html
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<title>Essential JS 2</title>
<!-- Essential JS 2 material theme -->
<link href="resources/material.css" rel="stylesheet" type="text/css"/>
<!-- Essential JS 2 Inputs's global and dependent script -->
<script src="resources/ej2-base.min.js" type="text/javascript"></script>
<script src="resources/ej2-inputs.min.js" type="text/javascript"></script>
</head>
<body>
<!-- Add the HTML <div> element -->
<div id='element'></div>
<script>
// Initialize Essential JS 2 JavaScript Slider control
```

```

var sliderInstance = new ej.inputs.Slider({ value: 30 });
//Render initialized Slider
sliderInstance.appendTo("#element");
</script>
</body>
</html>
`

```

Step 6: Now, run the `index.html` in web browser, it will render the **Essential JS 2 Slider** control.

Using CDN link for script and style reference

Step 1: Create an app folder `myapp` for the Essential JS 2 JavaScript controls.

Step 2: The Essential JS 2 control's global scripts and styles are already hosted in the below CDN link formats.

Syntax:

Script: `https://cdn.syncfusion.com/ej2/{PACKAGENAME}/dist/global/{PACKAGENAME}.min.js`

Styles: `https://cdn.syncfusion.com/ej2/{PACKAGE_NAME}/styles/material.css`

Example:

Script: <https://cdn.syncfusion.com/ej2/ej2-inputs/dist/global/ej2-inputs.min.js>

Styles: <https://cdn.syncfusion.com/ej2/ej2-inputs/styles/material.css>

Step 3: Create a HTML page (`index.html`) in `myapp` location and add the CDN link references. Now, add the `Slider` element and initiate the **Essential JS 2 Slider** control in the `index.html` by using following code.

INDEX.HTML

```

<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
  <head>

    <title>Essential JS 2</title>
    <!-- Essential JS 2 material theme -->
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet" type="text/css"/>
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
buttons/styles/material.css" rel="stylesheet" type="text/css"/>
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
popups/styles/material.css" rel="stylesheet" type="text/css"/>
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
inputs/styles/material.css" rel="stylesheet" type="text/css"/>
    <!-- Essential JS 2 Input's global script -->
    <script src="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/dist/global/ej2-base.min.js" type="text/javascript"></script>

```

```

<script src="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
buttons/dist/global/ej2-buttons.min.js" type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
popups/dist/global/ej2-popups.min.js" type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
inputs/dist/global/ej2-inputs.min.js" type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>
  <!-- Add the HTML <div> element -->
  <div id='element'></div>
  <script>
    // Initialize Essential JS 2 JavaScript Slider control
    var sliderInstance = new ej.inputs.Slider({value: 30});
    //Render initialized Slider
    sliderInstance.appendTo("#element");
  </script>
</body>
</html>

```

INDEX.CSS

```

#container {
  visibility: hidden;
}
#loader {
  color: #008cff;
  font-family: 'Helvetica Neue', 'calibiri';
  font-size: 14px;
  height: 40px;
  left: 45%;
  position: absolute;
  top: 45%;
  width: 30%;
}
.wrap {
  box-sizing: border-box;
  height: 140px;
  margin: 100px auto;
  padding: 30px 10px;
  width: 260px;
}

```

Step 4: Now, run the `index.html` in web browser, it will render the `Essential JS 2 Slider` control.

Need to refer dependency control styles and scripts as like above example. We can also use [CRG](#) to generate combined control styles.

See Also

[Slider Types](#)

[Slider Formatting](#)

[Orientation Slider](#)

[Ticks in Slider](#)[Tooltip in Slider](#)[Ticks in EJ2 JavaScript Range slider control](#)

The Ticks in Slider supports you to easily identify the current value/values of the Slider. It contains `smallStep` and `largeStep`. The value of the major ticks alone will be displayed in the slider. In order to enable/disable the small ticks, use the `showSmallTicks` property.

INDEX.TS

```
import { Slider } from '@syncfusion/ej2-inputs';
// Initialize Slider control
let sliderObj: Slider = new Slider({
    tooltip: { placement: 'Before', isVisible: true, showOn: 'Always' },
    value: 30,
    // Slider ticks customization
    ticks: { placement: 'After', largeStep: 20, smallStep: 10,
showSmallTicks: true }
});
// Render initialized Slider

    box-sizing: border-box;
    height: 260px;
    margin: 0 auto;
    padding: 30px 10px;
    width: 260px;
}

```

Step

When the Slider is moved, it increases/decreases the value based on the step value. By default, the value is increased/decreased by 1. Use the `step` property to change the increment step value.

INDEX.TS

```

import { Slider } from '@syncfusion/ej2-inputs';
// Initialize Slider control
let rangeObj: Slider = new Slider({
    ticks: { placement: 'After', largeStep: 20, smallStep: 10,
showSmallTicks: true },
    tooltip: { placement: 'Before', isVisible: true, showOn: 'Always' },
    value: 30,
    // Enables step
    step: 10
});
// Render initialized Slider
rangeObj.appendTo('#slider');

    margin: 0 auto;
    padding: 30px 10px;
}

```

```
width: 260px;
}
```

Min and Max

Enables the minimum/starting and maximum/ending value of the Slider, by using the `min` and `max` property. By default, the minimum value is 1 and maximum value is 100. In the following sample the slider is rendered with the min value as 100 and max value as 1000.

INDEX.TS

```
import { Slider } from '@syncfusion/ej2-inputs';
// Initialize Slider control
let rangeObj: Slider = new Slider({
    ticks: { placement: 'After', largeStep: 200, smallStep: 100,
showSmallTicks: true },
    tooltip: { placement: 'Before', isVisible: true, showOn: 'Always' },
    // Minimum value
    min: 100,
    // Maximum value
    max: 1000,
    // Slider current value
    value: 400
});
// Render initialized Slider
rangeObj.appendTo('#slider');
```

}

```

Format in EJ2 JavaScript Range slider control

The **format** feature used to customize the units of Slider values to desired format. The formatted values will also be applied to the ARIA attributes of the slider. There are two ways of achieving formatting in slider.

- Use the [format](#) API of slider which utilizes our [Internationalization](#) to format values.
- Customize using the events namely **renderingTicks** and **tooltipChange**.

INDEX.TS

```

import { Slider } from '@syncfusion/ej2-inputs';
// Initialize Slider control
let sliderObj: Slider = new Slider({
    min: 0, max: 100, step: 1, value: 30,
    // Applying currency formatting for tooltip with two decimal specifiers
    tooltip: { isVisible: true, format: 'C2' },
    // Applying currency formatting for ticks with two decimal specifiers
    ticks: { placement: 'After', format: 'C2', largeStep: 20, smallStep: 10,
    showSmallTicks: true }
});

```

```
});
// Render initialized Slider
sliderObj.appendTo('#slider');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 Slider</title>

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div class="wrap">
      <div id="slider">
      </div>
    </div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

INDEX.CSS

```
#container {
  visibility: hidden;
}
#loader {
  color: #008cff;
  font-family: 'Helvetica Neue', 'calibiri';
  font-size: 14px;
  height: 40px;
  left: 45%;
```

```

position: absolute;
top: 45%;
width: 30%;
}
.wrap {
box-sizing: border-box;
height: 260px;
margin: 0 auto;
padding: 30px 10px;
width: 460px;
}

```

Using format API

In this method, we have different predefined formatting styles like Numeric (N), Percentage (P), Currency (C) and # specifiers. In this below example we have formatted the ticks and tooltip values into percentage.

INDEX.TS

```

import { Slider } from '@syncfusion/ej2-inputs';
// Initialize Slider control
let percentObj: Slider = new Slider({
  min: 0, max: 1, value: .3, step: .01,
  // Assigning ticks values to percentage formatting
  ticks: { placement: 'After', largeStep: .2, smallStep: .1,
  showSmallTicks: true, format: 'P0' },
  // Assigning tooltip values to percentage formatting
  tooltip: { placement: 'Before', isVisible: true, showOn: 'Always',
  format: 'P0' },
});
// Render initialized Slider
percentObj.appendTo('#slider');

```

INDEX.HTML

```

type="text/javascript"></script>

```

```
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div class="wrap">
            <div id="slider">
            </div>
        </div>
    </div>
</body>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

INDEX.CSS

```
#container {
    visibility: hidden;
}
#loader {
    color: #008cff;
    font-family: 'Helvetica Neue', 'calibri';
    font-size: 14px;
    height: 40px;
    left: 45%;
    position: absolute;
    top: 45%;
    width: 30%;
}
.wrap {
    box-sizing: border-box;
    height: 260px;
    margin: 0 auto;
    padding: 30px 10px;
    width: 460px;
}
```

Using Events

In this method, we will be retrieving the values from the slider events then process them to desired formatted the values. In this sample we have customized the **ticks** values into weekdays as one formatting and **tooltip** values into day of the week as another formatting.

INDEX.TS

```
import { Slider, SliderTickEventArgs, SliderTooltipEventArgs } from
'@syncfusion/ej2-inputs';
// Initialize Slider control
let eventObj: Slider = new Slider({
    // Minimum value
```

```

min: 0,
// Maximum value
max: 6,
// Slider current value
value: 2,
// Assigning ticks data
ticks: {
    placement: 'After',
    largeStep: 1
},
renderingTicks: function (args: SliderTickEventArgs) {
    // Weekdays Array
    let daysArr: string [] =
['Sunday', 'Monday', 'Tuesday', 'Wednesday', 'Thursday', 'Friday', 'Saturday'];
    // Customizing each ticks text into weekdays
    args.text = daysArr[parseFloat(args.value as any)];
},
tooltipChange: function (args: SliderTooltipEventArgs) {
    // Customizing tooltip to display the Day (in numeric) of
the week
    args.text = 'Day ' + (Number(args.value) + 1).toString();
},
// Assigning tooltip data
tooltip: {
    placement: 'Before',
    isVisible: true
}
});
// Render initialized Slider
eventObj.appendTo('#slider');

```

}

```

Limits in EJ2 JavaScript Range slider control

The slider limits restrict the slider thumb between a particular range. This is used if higher or lower value affects the process or product where the slider is being used.

The following are the six options in the slider's limits object. Each API in the limits object is optional.

- enabled: Enables the limits in the Slider.
- minStart: Sets the minimum limit for the first handle.
- minEnd: Sets the maximum limit for the first handle.
- maxStart: Sets the minimum limit for the second handle.
- maxEnd: Sets the maximum limit for the second handle.
- startHandleFixed: Locks the first handle.
- endHandleFixed: Locks the second handle.

Default and MinRange Slider limits

There is only one handle in the Default and MinRange Slider, so minStart, minEnd, and startHandleFixed options can be used.

When the limits are enabled in the Slider, the limited area becomes darken. So you can differentiate the allowed and restricted area.

Refer to the following snippet to enable the limits in the Slider.

```
`ts
let slider = new Slider({
.....
limits: { enabled: true, minStart: 10, minEnd: 40 }
.....
});
`
```

INDEX.TS

```
import { Slider } from '@syncfusion/ej2-inputs';
// Initialization of Slider
let slider: Slider = new Slider({
  min: 0,
  max: 100,
  value: 30,
  type: 'MinRange',
  limits: { enabled: true, minStart: 10, minEnd: 40 },
  tooltip: { isVisible: true }
});
// Render initialized Slider
slider.appendTo('#slider');
```

    width: 260px;
}

```

Range Slider limits

In the range slider, both handles can be restricted and locked from the limit's object. In this sample, the first handle is limited between

10 and 40, and the second handle is limited between 60 and 90.

```
`ts
```

```
let slider = new Slider({
```

```
.....
```

```
limits: { enabled: true, minStart: 10, minEnd: 40, maxStart: 60, maxEnd: 90 }
```

.....

});

,

INDEX.TS

```
import { Slider } from '@syncfusion/ej2-inputs';
// Initialization of Slider
let slider: Slider = new Slider({
  min: 0,
  max: 100,
  type: 'Range',
  value: [30, 70],
  limits: { enabled: true, minStart: 10, minEnd: 40, maxStart: 60, maxEnd:
90 },
  tooltip: { isVisible: true }
});
// Render initialized Slider
slider.appendTo('#slider');
```

}

```

Handle lock

The movement of slider handles can be locked by enabling the startHandleFixed and endHandleFixed properties in the limit's object. In this sample, the movement of both slider handles has been locked.

`ts

```

let slider = new Slider({
  .....
  limits: { enabled: true, startHandleFixed: true, endHandleFixed: true }
  .....
});
`

```

INDEX.TS

```

import { Slider } from '@syncfusion/ej2-inputs';
// Initialization of Slider
let slider: Slider = new Slider({
  min: 0,
  max: 100,
  type: 'Range',
  value: [30, 70],
  limits: { enabled: true, startHandleFixed: true, endHandleFixed: true },

```

```

    tooltip: { isVisible: true }
});
// Render initialized Slider
slider.appendTo('#slider');

```

```

Globalization and localization in EJ2 JavaScript Range slider control

Localization

The [Localization](#) library allows you to localize default text content of the Slider. The slider control has static text on some features (like increase and decrease button) that can be changed to other cultures (Arabic, Deutsch, French, etc.) by defining the [locale](#) value and translation object.

The following list of properties and its values are used in the slider.

Locale keywords | Text

Increase | Increase

Decrease | Decrease

Loading translations

To load translation object in an application, use [load](#) function of the [L10n](#) class.

The following example demonstrates the Slider in **Deutsch** culture.

INDEX.TS

```

import { Slider } from '@syncfusion/ej2-inputs';
import { L10n } from '@syncfusion/ej2-base';
L10n.load({
  'de-DE': {
    'slider': {
      incrementTitle: 'Erhöhen, ansteigen', decrementTitle:
'verringern'
    }
  }
});
// Initialize range Slider control
let rangeObj: Slider = new Slider({
  value: [30, 70],
  type: 'Range',
  locale: 'de-DE',
  showButtons: true
});
rangeObj.appendTo('#slider');

```

Style in EJ2 JavaScript Range slider control

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

Customizing the slider track

Use the following CSS to customize the slider track.

```
,  
  
.e-control-wrapper.e-slider-container.e-horizontal .e-slider-track {  
background: #007bff;  
height: 3px;  
}  
,
```

Customizing the slider handle

Use the following CSS to customize the slider handle properties.

```
,  
  
.e-control-wrapper.e-slider-container .e-slider .e-handle {  
background-color: #f9920b;  
border-radius: 50%;  
border: 0;  
}  
,
```

Customizing the slider limits

Use the following CSS to customize the slider limits.

```
,  
  
.e-control-wrapper.e-slider-container.e-horizontal .e-limits {  
background-color: rgba(69, 100, 233, 0.46);  
}  
,
```

Customizing the slider ticks

Use the following CSS to customize the slider ticks.

```
,
.e-scale .e-tick.e-custom::before {
content: '\e967';
position: absolute;
}
,
```

Customizing the slider buttons

Use the following CSS to customize the slider buttons.

```
,
.e-control-wrapper.e-slider-container .e-slider-button {
background: #007bff;
height: 25px;
width: 25px;
}
,
```

Accessibility in EJ2 JavaScript Range Slider component

The Range Slider component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Range Slider component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support | |

| [Section 508](#) Support | |

| Screen Reader Support | |

| Right-To-Left Support | |

| Color Contrast | |

| Mobile Device Support | |

| Keyboard Navigation Support | |

| [Accessibility Checker](#) Validation | |

| [Axe-core](#) Accessibility Validation | |

```
<style>
```

```
.post .post-content img {
```

```
display: inline-block;
```

```
margin: 0.5em 0;
```

```
}
```

```
</style>
```

```
<div> - All features of the component meet the requirement.</div>
```

```
<div> - Some features of the component do not meet the requirement.</div>
```

```
<div> - The component does not meet the requirement.</div>
```

WAI-ARIA attributes

The Range Slider component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Range Slider component:

| Attributes | Purpose |

| --- | --- |

| **role=slider** | Used to convey a significant and contextual message to the user. |

| **aria-valuemin** | Indicates the Minimum value of the slider. |

| **aria-valuemax** | Indicates the Maximum value of the slider. |

| **aria-valuenow** | Indicates the current value of the slider. |

| **aria-valuetext** | Returns the current text of the slider. |

| **aria-orientation** | Indicates whether the Slider is oriented horizontally or vertically. |

| **aria-label** | Provides an accessible name for the Slider, serving as label text for the Slider's left and right buttons (for increment and decrement). |

Keyboard interaction

The Range Slider component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Range Slider component.

| **Press** | **To do this** |

| --- | --- |

| Right Arrow/Up Arrow | Increase the Slider value. |

| Left Arrow/Down Arrow | Decrease the Slider value. |

| Home | Moves to the start value (for Range Slider when the second thumb is focused and the Home key is pressed, it moves to the first thumb value). |

| <kbd>End | Moves to the end value (for Range Slider when the first thumb is focused and the End key is pressed, it moves to the second thumb value). |

| Page Up | Increases the Slider by `largeStep` value. |

| Page Down | Decreases the Slider by `largeStep` value. |

Ensuring accessibility

The Range Slider component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Range Slider component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Range Slider component with accessibility tools.

Ej1 api migration in EJ2 JavaScript Range slider control

This article describes the API migration process of Slider component from Essential JS 1 to Essential JS 2

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Max value | **Property:** `maxValue`
 `$("#slider").ejSlider({
 maxValue: 60
 });` | **Property:** `max`
 let slider: Slider = new ej.inputs.Slider({
 max : 100
 });
 slider.appendTo('#test'); |

| Min value | **Property:** `minValue`
 `$("#slider").ejSlider({
 minValue: 60
 });` | **Property:** `min`
 let slider: Slider = new ej.inputs.Slider({
 min : 10
 });
 slider.appendTo('#test'); |

| Step | **Property:** `incrementStep, largeStep, smallStep, showSmallTicks`
 `$("#slider").ejSlider({
 incrementStep: 20,
 smallStep: 5,
 largeStep: 40,
 showSmallTicks: true
 });` | **Property:** `ticks`
 let slider: Slider = new ej.inputs.Slider({
 ticks: { placement: 'After', largeStep: 20, smallStep: 10, showSmallTicks: true },
 });
 slider.appendTo('#test'); |

| Type | **Property:** `sliderType`
 `$("#slider").ejSlider({
 sliderType: ej.SliderType.Default
 });` | **Property:** `type`
 let slider: Slider = new ej.inputs.Slider({
 type: 'Range'
 });
 slider.appendTo('#test'); |

| Tooltip | **Property:** `showTooltip`
 `$("#slider").ejSlider({
 showTooltip: true
 });` | **Property:** `tooltip`
 let slider: Slider = new ej.inputs.Slider({
 tooltip: { placement: 'Before', isVisible: true, showOn: 'Always' },
 });
 slider.appendTo('#test'); |

| RTL | **Property:** *enableRTL*
 \$("#slider").ejSlider({
 enableRTL: false
 }); | **Property:** *enableRtl*
 let slider: Slider = new ej.inputs.Slider({
 enableRtl: false
 });
 slider.appendTo('#test'); |

| Custom values | **Not Applicable** | **Property:** *customValues*
 let slider: Slider = new ej.inputs.Slider({
 customValues: ['Mon', 'Tue', 'Wed'],
});
 slider.appendTo('#test'); |

| Limit the slider movement | **Not Applicable** | **Property:** *limits*
 let slider: Slider = new ej.inputs.Slider({
 type: 'MinRange',
 limits: { enabled: true, minStart: 10, minEnd: 40 }
});
 slider.appendTo('#test'); |

| Disable | **Method:** *disable*
 var slider = \$("#slider").data("ejSlider");
 slider.disable(); | **Property:** *enabled*
 let slider: Slider = new ej.inputs.Slider({
 value: 30
});
 slider.appendTo('#test');
 slider.enabled = false;
 |

| Enable | **Method:** *enable*
 var slider = \$("#slider").data("ejSlider");
 slider.enable(); | **Property:** *enabled*
 let slider: Slider = new ej.inputs.Slider({
 value: 30,
 enabled: false
});
 slider.appendTo('#test');
 slider.enabled = true;
 |

| Set Value | **Method:** *setValue(value, [enableAnimation])*
 var slider = \$("#slider").data("ejSlider");
 slider.setValue(10); | **Property:** *value*
 let slider: Slider = new ej.inputs.Slider({ });
 slider.appendTo('#test');
 slider.value = 30;
 |

| Get Value | **Method:** *getValue()*
 var slider = \$("#slider").data("ejSlider");
 slider.getValue(); | **Property:** *value*
 let slider: Slider = new ej.inputs.Slider({
 Value: 30
});
 slider.appendTo('#test');
 slider.value;
 |

| Destroy | **Not Applicable** | **Method:** *destroy()*
 let slider: Slider = new ej.inputs.Slider({});
 slider.appendTo('#test');
 slider.destroy(); |

| Change | **Event:** *change*
 \$("#slider").ejSlider({ change: function (args) {} }); | **Event:** *changed*
 let slider: Slider = new ej.inputs.Slider({
 changed: function(e: Event): void { }
 });
 slider.appendTo('#test'); |

| Create | **Event:** *create*
 \$("#slider").ejSlider({ create: function (args) {} }); | **Event:** *created*
 let slider: Slider = new ej.inputs.Slider({
 created: function(e: Event): void { }
 });
 slider.appendTo('#test'); |

| Destroy | **Event:** *destroy*
 \$("#slider").ejSlider({ destroy: function (args) {} }); | **Method:** *destroy()*
 let slider: Slider = new ej.inputs.Slider({
 value: 30
});
 slider.appendTo('#test');
 slider.destroy();
 |

| Slide | **Event:** *slide*
 \$("#slider").ejSlider({ slide: function (args) {} }); | **Event:** *change*
 let slider: Slider = new ej.inputs.Slider({
 change: function(e: Event): void { }
 });
 slider.appendTo('#test'); |

| Start | **Event:** *start*
 \$("#slider").ejSlider({ start: function (args) {} }); | **Event:** *created*
 let slider: Slider = new ej.inputs.Slider({
 created: function(e: Event): void { }
 });
 slider.appendTo('#test'); |

| Stop | **Event:** *stop*
 \$("#slider").ejSlider({ stop: function (args) {} }); | **Event:** *changed*
 let slider: Slider = new ej.inputs.Slider({
 changed: function(e: Event): void { }
 });
 slider.appendTo('#test');
 |

| Rendered Ticks | **Not Applicable** | **Event:** *renderedTicks*
 let slider: Slider = new ej.inputs.Slider({
 renderedTicks: function(e: Event): void { }
 });
 slider.appendTo('#test'); |

How To

Format value using slider in EJ2 JavaScript Range slider control

Achieve date format

The date formatting can be achieved in **ticks** and **tooltip** using **renderingTicks** and **tooltipChange** events, respectively. The process of formatting is explained in the following sample.

INDEX.TS

```
import { Slider, SliderTickEventArgs, SliderTooltipEventArgs } from
 '@syncfusion/ej2-inputs';
// Initialize slider control
let dateObj: Slider = new Slider({
  /**
   * Initialize the min and max values of the slider using JavaScript date
   functions
   * new Date (Year, Month, day, hours, minutes, seconds, milliseconds)
   */
  min: new Date("2013-06-13").getTime(),
  value: new Date("2013-06-15").getTime(),
  max: new Date("2013-06-21").getTime(),
  // 86400000 milliseconds for a day
  step: 86400000,
  tooltipChange: function (args: SliderTooltipEventArgs) {
    let totalMiliSeconds = Number(args.text);
    // Convert the current milliseconds to the respective date in
    desired format
    let custom = { year: "numeric", month: "short", day: "numeric" };
    args.text = new Date(totalMiliSeconds).toLocaleDateString("en-us",
    custom);
  },
  tooltip: {
    placement: 'Before',
    isVisible: true
  },
  renderingTicks: function (args: SliderTickEventArgs) {
    let totalMiliSeconds = Number(args.value);
    // Convert the current milliseconds to the respective date in
    desired format
    let custom = { year: "numeric", month: "short", day: "numeric" };
    args.text = new Date(totalMiliSeconds).toLocaleDateString("en-us",
    custom);
  },
  ticks: {
    placement: 'After',
    // 2 * 86400000 milliseconds for two days
    largeStep: 2 * 86400000
  },
  showButtons: true
});
// Render initialized Slider
dateObj.appendTo('#slider');
```

buttons/styles/material.css" rel="stylesheet">

<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div class="wrap">
            <div id="slider">
            </div>
        </div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

INDEX.CSS

```

#container {
    visibility: hidden;
}
#loader {
    color: #008cff;
    font-family: 'Helvetica Neue','calibiri';
    font-size: 14px;
    height: 40px;
    left: 45%;
    position: absolute;
    top: 45%;
    width: 30%;
}
.wrap {
    box-sizing: border-box;
    height: 260px;
}

```

```
margin: 0 auto;
padding: 30px 10px;
width: 460px;
}
```

Achieve time format

The time formatting can be achieved in the same manner as date formatting using `renderingTicks` and `change` events. The process of time formatting is explained in the following sample.

INDEX.TS

```
import { Slider, SliderTickEventArgs, SliderTooltipEventArgs } from
 '@syncfusion/ej2-inputs';
// Initialize slider control
let timeObj: Slider = new Slider({
  /**
   * Initialize the min and max values of the slider using JavaScript date
   functions
   * new Date (Year, Month, day, hours, minutes, seconds, milliseconds)
   */
  min: new Date(2013, 6, 13, 11).getTime(),
  max: new Date(2013, 6, 13, 17).getTime(),
  value: new Date(2013, 6, 13, 13).getTime(),
  // 3600000 milliseconds = 1 Hour
  step: 3600000,
  tooltipChange: function (args: SliderTooltipEventArgs) {
    let totalMiliSeconds = Number(args.text);
    let custom = { hour: '2-digit', minute: '2-digit' };
    args.text = new Date(totalMiliSeconds).toLocaleTimeString("en-us",
custom);
  },
  tooltip: {
    placement: 'Before',
    isVisible: true
  },
  renderingTicks: function (args: SliderTickEventArgs) {
    let totalMiliSeconds = Number(args.value);
    let custom = { hour: '2-digit', minute: '2-digit' };
    args.text = new Date(totalMiliSeconds).toLocaleTimeString("en-us",
custom);
  },
  ticks: {
    placement: 'After',
    // 2 * 3600000 milliseconds = 2 Hour
    largeStep: 2 * 3600000
  },
  showButtons: true
});
// Render initialized slider
timeObj.appendTo('#slider');
```

INDEX.HTML

```

="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div class="wrap">
            <div id="slider">
            </div>
        </div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

INDEX.CSS

```

#container {
    visibility: hidden;
}
#loader {
    color: #008cff;
    font-family: 'Helvetica Neue', 'calibiri';
    font-size: 14px;
    height: 40px;
    left: 45%;
    position: absolute;
    top: 45%;
    width: 30%;
}
.wrap {
    box-sizing: border-box;
    height: 260px;
    margin: 0 auto;

```

```
padding: 30px 10px;
width: 460px;
}
```

Customize numeric Value

The numeric values can be formatted into different decimal digits or fixed number of whole numbers or to represent units. The numeric processing is demonstrated as follows.

INDEX.TS

```
import { Slider } from '@syncfusion/ej2-inputs';
// Initialize slider control
let kilometerObj: Slider = new Slider({
    min: 0, max: 100, step: 1, value: 30,
    // Apply two decimal specifiers formatting if any decimal values are
    // processed with 'Km' text appended to the value
    tooltip: { isVisible: true, format: '##.## Km' },
    // Apply two decimal specifiers formatting if any decimal values are
    // processed with 'Km' text appended to the value
    ticks: { placement: 'After', format: '##.## Km', largeStep: 20,
    smallStep: 10, showSmallTicks: true }
});
// Render initialized slider
kilometerObj.appendTo('#slider');
// Initialize slider control
let decimalObj: Slider = new Slider({
    min: 0.1, max: .2, step: 0.01, value: 0.13,
    // Apply three decimal specifiers formatting if any decimal values are
    // processed then reset will be appened with two zero
    tooltip: { isVisible: true, format: '##.##00' },
    // Apply three decimal specifiers formatting if any decimal values are
    // processed then reset will be appened with two zero
    ticks: { placement: 'After', format: '##.##00', largeStep: 0.02,
    smallStep: 0.01, showSmallTicks: true }
});
// Render initialized slider
decimalObj.appendTo('#slider1');
// Initialize slider control
let sliderObj: Slider = new Slider({
    min: 0, max: 100, step: 1, value: 30,
    // Apply numeric formatting with two leading zero for tooltip
    tooltip: { isVisible: true, format: '00##' },
    // Apply numeric formatting with two leading zero for ticks
    ticks: { placement: 'After', format: '00##', largeStep: 20, smallStep:
10, showSmallTicks: true }
});
// Render initialized slider
sliderObj.appendTo('#slider2');
```

INDEX.HTML

```

Customize the bar in EJ2 JavaScript Range slider control

Slider appearance can be customized through CSS. By overriding the slider CSS classes, you can customize the slider bar. The slider bar can be customized with different themes. By default, slider have class name `e-slider-track` for bar. The class can be overridden with our own color values like the following code snippet.

```
.e-control.e-slider .e-slider-track .e-range {
background: linear-gradient(left, #e1451d 0, #fdff47 17%, #86f9fe 50%, #2900f8 65%, #6e00f8 74%,
#e33df9 83%, #e14423 100%);
}
```

You can also apply background color for a certain range depending upon slider values, using change event.

```
`ts
change: (args: SliderChangeEventArgs) => {
  if (args.value > 0 && args.value <= 25) {
    // Change handle and range bar color to green when
    (sliderHandle as HTMLElement).style.backgroundColor = 'green';
    (sliderTrack as HTMLElement).style.backgroundColor = 'green';
  } else if (args.value > 25 && args.value <= 50) {
    // Change handle and range bar color to royal blue
    (sliderHandle as HTMLElement).style.backgroundColor = 'royalblue';
```

```

(sliderTrack as HTMLElement).style.backgroundColor = 'royalblue';
} else if (args.value > 50 && args.value <= 75) {
// Change handle and range bar color to dark orange
(sliderHandle as HTMLElement).style.backgroundColor = 'darkorange';
(sliderTrack as HTMLElement).style.backgroundColor = 'darkorange';
} else if (args.value > 75 && args.value <= 100) {
// Change handle and range bar color to red
(sliderHandle as HTMLElement).style.backgroundColor = 'red';
(sliderTrack as HTMLElement).style.backgroundColor = 'red';
}
}
,

```

INDEX.TS

```

import { Slider, SliderChangeEventArgs } from '@syncfusion/ej2-inputs';
// Initialize Slider component
let heightSlider: Slider = new Slider({
// Set the value for slider
value: 30,
min: 0, max: 100
});
heightSlider.appendTo('#height_slider');
// Initialize Slider component
let gradientSlider: Slider = new Slider({
// Set slider minimum and maximum values
min: 0, max: 100,
// Set the initial range values for slider
value: 50,
type: 'MinRange'
});
gradientSlider.appendTo('#gradient_slider');
let sliderTrack: HTMLElement;
let sliderHandle: HTMLElement;
// Initialize Slider component
let dynamicColorSlider: Slider = new Slider({
// Set slider minimum and maximum values
min: 0, max: 100,
value: 20,
type: 'MinRange',
// Handler used for slider created event
created: () => {
sliderTrack = (document.getElementById('dynamic_color_slider')
as HTMLElement).querySelector('.e-range');
sliderHandle = (document.getElementById('dynamic_color_slider')
as HTMLElement).querySelector('.e-handle');
(sliderHandle as HTMLElement).style.backgroundColor = 'green';
(sliderTrack as HTMLElement).style.backgroundColor = 'green';
},

```

```

// Handler used for slider change event
change: (args: SliderChangeEventArgs) => {
    if (args.value > 0 && args.value <= 25) {
        // Change handle and range bar color to green when
        (sliderHandle as HTMLElement).style.backgroundColor =
'green';
        (sliderTrack as HTMLElement).style.backgroundColor =
'green';
    } else if (args.value > 25 && args.value <= 50) {
        // Change handle and range bar color to royal blue
        (sliderHandle as HTMLElement).style.backgroundColor =
'royalblue';
        (sliderTrack as HTMLElement).style.backgroundColor =

Customize the ticks in EJ2 JavaScript Range slider control

Slider view can be customized via CSS. By overriding the slider CSS classes, you can customize the ticks. The ticks in slider allows you to easily identify the current value/values of the slider. It contains [smallStep](#) and [largeStep](#). By default, slider has class `e-tick` for slider ticks. You can override the class as per your requirement. Refer to the following code snippet to render ticks.

```
`ts
.e-scale .e-tick.e-custom::before {
content: '\e967';
position: absolute;
}
`
```

Here, the color for rendered ticks has been applied through `nth-child(childnumber)`. *The color is applied to the value of the childnumber in the slider.*

```
`ts
ticks_slider .e-scale :nth-child(1)::before {
color: red;
}
`
```

INDEX.TS

```
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
import { Slider, SliderTickRenderedEventArgs, SliderTickEventArgs } from
'@syncfusion/ej2-inputs';
// Initialize slider component
let ticksSlider: Slider = new Slider({
// Set slider minimum and maximum values
min: 0, max: 100,
// Set the initial value for slider
value: 30,
// Set the step value for slider
step: 5,
// Set the type to render minRange slider
type: 'MinRange',
// Initialize ticks with placement, largeststep
ticks: { placement: 'Before', largestStep: 20 },
// Handler used to add custom class to all tick element
renderingTicks: (args: SliderTickEventArgs) => {
if (args.tickElement.classList.contains('e-large')) {
args.tickElement.classList.add('e-custom');
}
}
});
ticksSlider.appendTo('#ticks_slider');
// Initialize slider component
let customTicks: Slider = new Slider({
// Set slider minimum and maximum values
min: 0, max: 100,
// Set the initial value for slider
value: 30,
// Set the type to render minRange slider
type: 'MinRange',
// Initialize ticks with placement, largeststep, smallstep
```

```

        ticks: { placement: 'Both', largeStep: 20, smallStep: 5 },
        // Handler used to customize tick element
        renderedTicks: (args: SliderTickRenderedEventArgs) => {
            let li: any = args.ticksWrapper.getElementsByClassName('e-
large');
            let remarks: any = ['Very Poor', 'Poor', 'Average', 'Good',
'Very Good', 'Excellent'];
            for (let i: number = 0; i < li.length; ++i) {
                (li[i].querySelectorAll('.e-tick-both')[1] as
HTMLElement).innerText = remarks[i];
            }
        });
        customTicks.appendTo('#slider');

```

}

```

Customize the limits in EJ2 JavaScript Range slider control

Slider appearance can be customized via CSS. By overriding the slider CSS classes, the slider limit bar can be customized. Here, the limit bar is customized with different background color. By default, the slider has class `e-limits` for limits bar. You can override the class with our own color values as given in the following code snippet.

```

.e-slider-container.e-horizontal .e-limits {
background-color: rgba(69, 100, 233, 0.46);
}

```

INDEX.TS

```

import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
import { Slider, NumericTextBox, ChangeEventArgs } from '@syncfusion/ej2-inputs';

```

```

import { CheckBox, ChangeEventArgs as CheckBoxChange } from
 '@syncfusion/ej2-buttons';
// tslint:disable-next-line:max-func-body-length
// Initialize slider control
let minrangeObj: Slider = new Slider({
    // Set slider minimum and maximum values
    min: 0, max: 100,
    // Set the value for slider
    value: 30,
    // Set the step value
    step: 1,
    // Initialize ticks with placement, largeststep, smallstep
    ticks: { placement: 'Before', largeStep: 20, smallStep: 5,
showSmallTicks: true },
    // Set the type for slider
    type: 'MinRange',
    // Set the limit values for the slider
    limits: { enabled: true, minStart: 10, minEnd: 40 },
    // Initialize tooltip with placement and showOn
    tooltip: { isVisible: true, placement: 'Before', showOn: 'Focus' }
});
minrangeObj.appendTo('#minrange');
// Initialize slider control
let rangeObj: Slider = new Slider({
    // Set slider minimum and maximum values
    min: 0, max: 100,
    // Set the initial range values for slider
    value: [30, 70],
    // Set the step value
    step: 1,
    // Set the type to render range slider
    type: 'Range',
    // Initialize ticks with placement, largeststep, smallstep
    ticks: { placement: 'Before', largeStep: 20, smallStep: 5,
showSmallTicks: true },
    // Set the limit values for the slider
    limits: { enabled: true, minStart: 10, minEnd: 40, maxStart: 60,
maxEnd: 90 },
    // Initialize tooltip with placement and showOn
    tooltip: { isVisible: true, placement: 'Before', showOn: 'Focus' }
});
rangeObj.appendTo('#range');
// Initialize NumericTextBox
let minStart: NumericTextBox = new NumericTextBox({
    value: 10,
    min: 0,
    max: 100,
    change: minStartChange
});
minStart.appendTo('#minStart');

    value: 40,
    min: 0,
    max: 100,
    change: minEndChange
});
minEnd.appendTo('#minEnd');

```

```

let maxStart: NumericTextBox = new NumericTextBox({
    value: 60,
    min: 0,
    max: 100,
    change: maxStartChange
});
maxStart.appendTo('#maxStart');
let maxEnd: NumericTextBox = new NumericTextBox({
    value: 90,
    min: 0,
    max: 100,
    change: maxEndChange
});
maxEnd.appendTo('#maxEnd');
// Initialize Checkbox
let fixedOne: CheckBox = new CheckBox({ change: fixOne });
fixedOne.appendTo('#fixedOne');
let fixedSecond: CheckBox = new CheckBox({ change: fixSecond });
fixedSecond.appendTo('#fixedSecond');
// Eventlisteners to lock first handle of the both sliders
function fixOne(args: CheckBoxChange): void {
    minrangeObj.limits.startHandleFixed = args.checked;
    rangeObj.limits.startHandleFixed = args.checked;
}
// Eventlisteners to lock second handle of the both sliders
function fixSecond(args: CheckBoxChange): void {
    minrangeObj.limits.endHandleFixed = args.checked;
    rangeObj.limits.endHandleFixed = args.checked;
}
// Eventlisteners to change limit values for both sliders
function minStartChange(args: ChangeEventArgs): void {
    minrangeObj.limits.minStart = args.value;
    rangeObj.limits.minStart = args.value;
}
function minEndChange(args: ChangeEventArgs): void {
    minrangeObj.limits.minEnd = args.value;
    rangeObj.limits.minEnd = args.value;
}
function maxStartChange(args: ChangeEventArgs): void {
    minrangeObj.limits.maxStart = args.value;
    rangeObj.limits.maxStart = args.value;
}
function maxEndChange(args: ChangeEventArgs): void {
    minrangeObj.limits.maxEnd = args.value;
    rangeObj.limits.maxEnd = args.value;
}

Customize the thumb in EJ2 JavaScript Range slider control

Slider appearance can be customized through CSS. By overriding the slider CSS classes, you can customize the thumb. By default, slider has unique class `e-handle` for slider thumb. You can override the following class as per your requirement. Here, in the sample, the slider thumb has been customized to square, circle, oval shapes, and background image has also been customized.

```

`ts
.e-control.e-slider .e-handle {
  background-image: url('https://ej2.syncfusion.com/demos/src/slider/images/thumb.png');
  background-color: transparent;
  height: 25px;
  width: 25px;
}

```

```

square_slider.e-control.e-slider .e-handle {
border-radius: 0%;

background-color: #f9920b;

border: 0;

}

circle_slider.e-control.e-slider .e-handle {
border-radius: 50%;

background-color: #f9920b;

border: 0;

}

oval_slider.e-control.e-slider .e-handle {
height: 25px;

width: 8px;

top: 3px;

border-radius: 15px;

background-color: #f9920b;

}
,

```

INDEX.TS

```

import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
import { Slider } from '@syncfusion/ej2-inputs';
    // Initialize slider control
    let squareSlider: Slider = new Slider({
        // Set the value for slider
        value: 30,
        min: 0, max: 100
    });
    squareSlider.appendTo('#square_slider');
    // Initialize slider control
    let circleSlider: Slider = new Slider({
        // Set the value for slider
        value: 30,
        // Set slider minimum and maximum values
        min: 0, max: 100
    });
    circleSlider.appendTo('#circle_slider');
    // Initialize slider control
    let ovalSlider: Slider = new Slider({
        // Set the value for slider
        value: 30,
        // Set slider minimum and maximum values
        min: 0, max: 100
    });

```

```

ovalSlider.appendTo('#oval_slider');
// Initialize slider control
let imageSlider: Slider = new Slider({
  // Set the value for slider
  value: 30,
  // Set slider minimum and maximum values
  min: 0, max: 100,
  ticks: { placement: 'After' }
});
imageSlider.appendTo('#image_slider');

}

```

Validate slider using formvalidator in EJ2 JavaScript Range slider control

The Slider component can be validated using our [FormValidator](#). The following steps walk-through slider validation.

- Render slider component inside a form.
- Bind [changed](#) event in the slider component to validate the slider value when the value changes.
- Initialize and render FormValidator for the form using form ID.

`ts

```
// Initialize Form validation
```

```
let formObj: FormValidator;
```

```
formObj = new FormValidator("#formId", options);
```

- Set the required property in the FormValidator [rules](#) collection. Here, the [min](#) property of slider that sets the minimum value in the slider component is set, and it has hidden input as enable `validateHidden` property is set to true.

```
`ts
// Slider element
<div id="default" name="slider"></div>
// sets required property in the FormValidator rules collection
let options: FormValidatorModel = {
  rules: {
    'default': {
      validateHidden: true,
      min: [6, "You must select value greater than 5"]
    }
  }
};
```

Form validation is done either by ID or name value of the slider component. Above ID of the slider is used to validate it.

Using slider name: Render slider with name attribute. In the following code snippet, name attribute value of slider is used for form validation.

```
`ts
// Slider element
<div id="default" name="slider"></div>
// sets required property in the FormValidator rules collection
let options: FormValidatorModel = {
  rules: {
    'slider': {
      validateHidden: true,
      min: [6, "You must select value greater than 5"]
    }
  }
};
```

- Validate the form using [validate](#) method, and it validates the slider value with the defined rules collection and returns the result. If user selects the value less than the minimum value, form will not submit.

```
`ts
```

```
formObj.validate();
```

- Slider validation can be done during value changes in slider. Refer to the following code snippet.

```
`ts
```

```
// change event handler for slider
```

```
function onChanged(args: any) {
```

```
formObj.validate();
```

```
}
```

The **FormValidator** has following default validation rules, which are used to validate the Slider component.

Rules	Description	Example
max	Slider component must have value less than or equal to max number	if max: 3, 3 is valid and 4 is invalid
min	Slider component must have value greater than or equal to min number	if min: 4, 5 is valid and 2 is invalid
regex	Slider component must have valid value in regex format	if regex: '/4/', 4 is valid and 1 is invalid
range	Slider component must have value between range number	if range: [4,5], 4 is valid and 6 is invalid

Show slider from hidden state in EJ2 JavaScript Range slider control

This section demonstrates how-to render the Slider component in hidden state and make it visible in button click. We can initialize Slider in hidden state by setting the display as none.

In the sample, by clicking on the button, we can make the Slider visible from hidden state, and we must also call the [refresh](#) method of the Slider to render it properly based on its original dimensions.

INDEX.TS

```
import { Slider, SliderChangeEventArgs } from '@syncfusion/ej2-inputs';
import { Button } from '@syncfusion/ej2-buttons';
// Initialize the Button component.
let button: Button = new Button({ content: 'Button' });
// Render initialized button.
button.appendTo('#element');
// Initialize Slider Component
let defaultObj: Slider = new Slider({
    // Set slider minimum and maximum values
    // new Date(Year, Month, day, hours, minutes, seconds, milliseconds)
    min: new Date(2013, 6, 13, 11).getTime(), max: new Date(2013, 6, 13,
17).getTime(),
    // 3600000 milliseconds = 1 Hour
    step: 3600000,
    //Set buttons for slider
    showButtons: true,
    // Set the initial range values for slider
    value: new Date(2013, 6, 13, 13).getTime(),
    // Bind Tooltip change event for custom formatting
    tooltipChange: tooltipChangeHandler,
    // Initialize tooltip with placement
    tooltip: {
        placement: 'Before', isVisible: true, cssClass: 'e-tooltip-
customization'
    },
    // Bind ticks event for custom formatting
    renderingTicks: renderingTicksHandler,
    // Initialize ticks with placement, largeststep, smallstep
    ticks: {
        placement: 'After',
        // 2 * 3600000 milliseconds = 2 Hour
        largeStep: 2 * 3600000,
        smallStep: 3600000, showSmallTicks: true
    },
    // Set the type to render range slider
    type: 'MinRange'
});
defaultObj.appendTo('#slider');
function tooltipChangeHandler(args: SliderTooltipEventArgs): void {
    /**
     * toLocaleTimeString is predefined javascript date function, which is
    used to
     * customize the date in different format
     */
    let custom: { [key: string]: string } = { hour: '2-digit', minute: '2-
digit' };
    // Splitting the range values from the tooltip using space into an
    array.
    if (args.text.indexOf('-') !== -1) {
        let totalMilliSeconds: string[] = args.text.split(' ');
        // First part is the first handle value
        let firstPart: string = totalMilliSeconds[0];
```

```

        // Second part is the second handle value
        let secondPart: string = totalMilliseconds[2];
        firstPart = new Date(Number(firstPart)).toLocaleTimeString('en-us',
custom);
        secondPart = new Date(Number(secondPart)).toLocaleTimeString('en-
us', custom);
    } else {
        args.text = new Date(Number(args.text)).toLocaleTimeString('en-us',
custom);
    }
}
function renderingTicksHandler(args: SliderTickEventArgs): void {
    let totalMilliseconds: number = Number(args.value);

Reversible Range Slider in EJ2 JavaScript

You can create a Range Slider rendered with values in reverse order by setting the [min](#) property to the maximum value and the [max](#) property to the minimum value. An example of how to achieve a reversible Range Slider is shown below

INDEX.TS

```
import { Slider } from '@syncfusion/ej2-inputs';
// Initialize Slider control
let sliderObj: Slider = new Slider({
  ticks: { placement: 'Before', largeStep: 20, smallStep: 5,
showSmallTicks: true },
  tooltip: { placement: 'Before', isVisible: true, showOn: 'Always' },
  type: 'Range',
  // vertical orientation
  orientation: 'Vertical',
  // Set maximum value to min
  min: 100,
  // Set minimum value to max
  max: 0,
  // Slider current value
  value: [30, 70]
});
// Render initialized Slider
sliderObj.appendTo('#slider');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 Slider</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Essential JS 2 Slider Component">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-

inputs/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
popups/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
buttons/styles/material.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div class="wrap">
      <div id="slider">
      </div>
    </div>
  </div>
</script>
var ele = document.getElementById('container');
if(ele) {
```

```

    ele.style.visibility = "visible";
  }
  </script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

INDEX.CSS

```

#container {
  visibility: hidden;
}
#loader {
  color: #008cff;
  font-family: 'Helvetica Neue', 'calibiri';
  font-size: 14px;
  height: 40px;
  left: 45%;
  position: absolute;
  top: 45%;
  width: 30%;
}
.wrap {
  box-sizing: border-box;
  height: 260px;
  margin: 0 auto;
  padding: 30px 10px;
  width: 260px;
}

```

Reversible order can be achieved with [Horizontal](#) orientation Range Slider by setting [enableRtl](#) as true.

Rating

Precision modes in EJ2 JavaScript Rating control

You can use the [precision](#) property of the rating control to provide ratings with varying levels of precision.

The precision types of Rating are as follows:

- Full: The rating is increased in whole number increments. For example, if the current rating is 2, the next possible ratings are 3, 4, and so on.
- Half: The rating is increased in increments of 0.5 (half). For example, if the current rating is 2.5, the next possible ratings are 3, 3.5, 4, and so on.
- Quarter: The rating is increased in increments of 0.25 (quarter). For example, if the current rating is 3.75, the next possible ratings are 4, 4.25, 4.5, and so on.
- Exact: The rating is increased in increments of 0.1. For example, if the current rating is 3.9, the next possible ratings are 4, 4.1, 4.2, and so on.

INDEX.JS

```

ej.base.enableRipple(true);
// Initialize the Full precision Rating control.
var rating1 = new ej.inputs.Rating({ value: 3, precision: 'Full' });

```

```
// Initialize the Half precision Rating control.
var rating2 = new ej.inputs.Rating({ value: 2.5, precision: 'Half' });
// Initialize the Quarter precision Rating control.
var rating3 = new ej.inputs.Rating({ value: 3.75, precision: 'Quarter' });
// Initialize the Exact precision Rating control.
var rating4 = new ej.inputs.Rating({ value: 2.3, precision: 'Exact' });
// Render initialized Rating.
rating1.appendTo('#rating1');
rating2.appendTo('#rating2');
rating3.appendTo('#rating3');
rating4.appendTo('#rating4');
```

INDEX.HTML

```

```

Labels in EJ2 JavaScript Rating control

You can use the [showLabel](#) property to display a label that shows the current value of the rating. When the `showLabel` property is set to `true`, a label will be displayed.

INDEX.JS

```
ej.base.enableRipple(true);
// Initialize the Rating control.
var rating = new ej.inputs.Rating({ showLabel: true, value:3 });
// Render initialized Rating.
rating.appendTo('#rating');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>

    <span>${value} out of 5</span>
  </script>
</script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}

</script>
```

```
<script src="index.js" type="text/javascript"></script>
</body></html>
```

STYLES.CSS

```
#container {
    visibility: hidden;
}
#loader {
    color: #008cff;
    font-family: 'Helvetica Neue', 'calibiri';
    font-size: 14px;
    height: 40px;
    left: 45%;
    position: absolute;
    top: 45%;
    width: 30%;
}
.wrap {
    margin: 50px auto;
    text-align: center;
}
```

Label position

The rating control allows you to place the label on the top, bottom, left, or right side of the rating using the [labelPosition](#) property.

The following label positions are supported:

- Top: The label is placed on the top of the rating.
- Bottom: The label is placed on the bottom of the rating.
- Left: The label is placed on the left side of the rating.
- Right: The label is placed on the right side of the rating.

INDEX.JS

```
ej.base.enableRipple(true);
// Initialize the Label Position Left Rating control.
var rating1 = new ej.inputs.Rating({ value:3, showLabel:true,
labelPosition:"Left"});
// Initialize the Label Position Right Rating control.
var rating2 = new ej.inputs.Rating({ value:3, showLabel:true, });
// Initialize the Label Position Top Rating control.
var rating3 = new ej.inputs.Rating({ value:3, showLabel:true,
labelPosition:"Top" });
// Initialize the Label Position Bottom Rating control.
var rating4 = new ej.inputs.Rating({ value:3, showLabel:true,
labelPosition:"Bottom" });
// Render initialized Rating.
rating1.appendTo('#rating1');
rating2.appendTo('#rating2');
rating3.appendTo('#rating3');
rating4.appendTo('#rating4');
```

var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

STYLES.CSS

```

#container {
  visibility: hidden;
}
#loader {
  color: #008cff;
  font-family: 'Helvetica Neue', 'calibiri';
  font-size: 14px;
}

```

```

height: 40px;
left: 45%;
position: absolute;
top: 45%;
width: 30%;
}
.wrap {
margin: 50px auto;
text-align: center;
}

```

Label template

You can use the [labelTemplate](#) tag directive to specify a custom template for the **Label** of the rating. The current value of the rating will be passed as the **value** property in the template context when building the content of the label. This allows you to include dynamic information about the rating in the template.

INDEX.JS

```

ej.base.enableRipple(true);
// Initialize the Rating control.
var rating = new ej.inputs.Rating({ showLabel: true, labelTemplate:
'#labelTemplate', value:3 });
// Render initialized Rating.

Tooltip in EJ2 JavaScript Rating control

The rating control supports tooltip to show additional information in rating items by setting the [showTooltip](#) property. If enabled, the tooltip appears when the user hovers over a rating item.

INDEX.JS

```

ej.base.enableRipple(true);
// Initialize the Tooltip Rating control.
var rating = new ej.inputs.Rating({ showTooltip:true, value:3 });
// Render initialized Rating.
rating.appendTo('#rating');

```

INDEX.HTML

#loader {
    color: #008cff;
    font-family: 'Helvetica Neue','calibiri';
    font-size: 14px;
    height: 40px;
    left: 45%;
    position: absolute;
    top: 45%;
    width: 30%;
}
.wrap {

```

```

margin: 50px auto;
text-align: center;
}
/* To change the radius of the tooltip corners. */
.customtooltip.e-tooltip-wrap {
border-radius: 3px;
}
/* To change the size of the tooltip content. */
.customtooltip.e-tooltip-wrap .e-tip-content {
font-size: 14px;
}
/* To change the border color and width for tooltip. */
.customtooltip.e-tooltip-wrap.e-popup {
border: 2px solid #000000;
}
/* To change the color for arrow of the tooltip. */
.customtooltip.e-tooltip-wrap .e-arrow-tip-inner.e-tip-bottom {
border: 12px #9693
}
/* To change the top border color for arrow of the tooltip. */
.customtooltip.e-tooltip-wrap .e-arrow-tip-outer.e-tip-bottom {
border-top: 9.5px solid #000000;
}

```

Tooltip template

You can use the [tooltipTemplate](#) tag directive to specify a custom template for the tooltip of the rating. The current value of the rating will be passed as the **value** property in the template context when building the content of the tooltip. This allows you to include dynamic information about the rating in the template.

INDEX.JS

```

ej.base.enableRipple(true);
// Initialize the Show Tooltip Rating control.
var rating = new ej.inputs.Rating({ showTooltip:true, value:3,
tooltipTemplate: '#tooltipTemplate' });
// Render initialized Rating.
rating.appendTo('#rating');

```

.customtooltip.e-tooltip-wrap .e-arrow-tip-outer.e-tip-bottom {
  border-top: 9.5px solid #000000;
}

```

Tooltip customization

You can customize the appearance of the tooltips using the `cssClass` property of the rating control and by defining the custom styles for tooltip elements like the below example.

You can find more information about customizing the appearance of the tooltip in the [Tooltip Customization](#) documentation.

INDEX.JS

```

ej.base.enableRipple(true);
// Initialize the Custom Tooltip Rating control.
let rating = new ej.inputs.Rating({ cssClass: "customtooltip",
showTooltip:true, value:3 });
// Render initialized Rating.
rating.appendTo('#rating');

```

INDEX.HTML

```

  border-top: 9.5px solid #000000;
}
```

Selection in EJ2 JavaScript Rating control

The rating control allows users to rate something using a visual scale, and the selection state can be changed by the user clicking or tapping on the stars in the rating scale or through code. The rating control has a minimum value and a reset button, and provides customization options for the selected rating value and selection behavior.

INDEX.JS

```
ej.base.enableRipple(true);
// Initialize the Rating control.
var rating = new ej.inputs.Rating({ value:3 });
// Render initialized Rating.
rating.appendTo('#rating');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>

    height: 40px;
    left: 45%;
    position: absolute;
    top: 45%;
    width: 30%;
}
.wrap {
    margin: 50px auto;
    text-align: center;
}

```

Min value

You can use the [min](#) property of the rating control to set the minimum possible rating value the user can select. If you set the `min` property to 2, then you will not be able to select a rating lower than 2.

INDEX.JS

```

ej.base.enableRipple(true);
// Initialize the Rating control.
var rating = new ej.inputs.Rating({ min:2 });
// Render initialized Rating.
rating.appendTo('#rating');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

STYLES.CSS

```

#container {
    visibility: hidden;
}
#loader {
    color: #008cff;
    font-family: 'Helvetica Neue', 'calibiri';
    font-size: 14px;
    height: 40px;
    left: 45%;
    position: absolute;
    top: 45%;
    width: 30%;
}
.wrap {
    margin: 50px auto;
    text-align: center;
}

```

Single selection

You can use the [enableSingleSelection](#) property of the rating control to select only one item at a time. When the `enableSingleSelection` property is set to `true`, only the selected item will be considered to be in the selected state, while all other items will be unselected.

INDEX.JS

```
ej.base.enableRipple(true);
// Initialize the Rating control.
var rating = new ej.inputs.Rating({ value:3, enableSingleSelection:true });
// Render initialized Rating.
rating.appendTo('#rating');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Rating</title>
  <meta charset="utf-8">

Templates in EJ2 JavaScript Rating control

The rating control allows you to customize the appearance of the rating items using templates. You can use templates to specify a custom layout for the rating items, which can include any content you want. This allows you to create a more customized and interactive rating experience for the user.

The rating control supports below templates for item customization.

- [emptyTemplate](#)
- [fullTemplate](#)

Empty (unrated) symbol template

To customize the appearance of **unrated** items, you can use the **emptyTemplate** tag directive. It allows you to specify the desired custom content for the unrated items. The **value** and **index** are available in the template context for accessing information about the un-rated item.

If the **fullTemplate** is not defined, the **emptyTemplate** will be used as the default for both rated and unrated items. You can apply custom styles to differentiate between the rated and unrated states of the items.

INDEX.JS

```

ej.base.enableRipple(true);
// Initialize the Rating control.
var rating = new ej.inputs.Rating({ emptyTemplate: '#emptyTemplate', value:3
});

```

```
// Render initialized Rating.
rating.appendTo('#rating');
```

INDEX.HTML

```

```

The current value of the rating item available in the template context as `value` and in the rating item element as CSS Variable(`--rating-value`) can be used to support precision in templates.

Full (rated) symbol template

To customize the appearance of **rated** items in the rating control, you can use the `fullTemplate` tag directive. This directive allows you to specify a custom layout for the rated items, which can include any content you desire. The `value` and `index` are available in the template context for accessing information about the rated item.

INDEX.JS

```
ej.base.enableRipple(true);
// Initialize the Rating control.
var rating = new ej.inputs.Rating({ fullTemplate: '#fullTemplate',
emptyTemplate: '#emptyTemplate', value: 3 });
// Render initialized Rating.
rating.appendTo('#rating');
```

Using Emoji icon as rating symbol

You can use emojis of your choice as rating symbol by specifying them as template content within the `emptyTemplate` tag directive.

INDEX.JS

```

ej.base.enableRipple(true);
// Initialize the Rating control.
var rating = new ej.inputs.Rating({ emptyTemplate: '#emptyTemplate', value:
4, enableSingleSelection:true, enableAnimation:false });
// Render initialized Rating.

```

```
rating.appendTo('#rating');
```

INDEX.HTML

Events in EJ2 JavaScript Rating control

This section describes the rating events that will be triggered when appropriate actions are performed. The following events are available in the rating control.

[beforeItemRender](#)

The rating control triggers the [beforeItemRender](#) event before rendering each rating item. The [RatingItemEventArgs](#) passed as an event argument provides the details of the item to be rendered.

```
`js
// Initialize the Rating control.
var rating = new ej.inputs.Rating({
  beforeItemRender: (args)=> {
    //Your required action here
  }
});
// Render initialized Rating.
rating.appendTo('#rating');
```

[created](#)

The rating control triggers the [created](#) event when the rendering of the rating control is completed.

```
`js
// Initialize the Rating control.
var rating = new ej.inputs.Rating({
  created: ()=> {
    //Your required action here
  }
});
// Render initialized Rating.
rating.appendTo('#rating');
```

[onItemHover](#)

The rating control triggers the [onItemHover](#) event when the rating item is hovered. The [RatingHoverEventArgs](#) passed as an event argument provides the details of the hovered item.

```
`js
// Initialize the Rating control.
var rating = new ej.inputs.Rating({
  onItemHover: (args)=> {
```

```
//Your required action here
}
});
// Render initialized Rating.
rating.appendTo('#rating');
```

valueChanged

The rating control triggers the [valueChanged](#) event when the value of the rating is changed. The [RatingChangedEventArgs](#) passed as an event argument provides the details when value is changed.

```
`js
// Initialize the Rating control.
var rating = new ej.inputs.Rating({
valueChanged: (args)=> {
//Your required action here
}
});
// Render initialized Rating.
rating.appendTo('#rating');
```

Below example demonstrates the valueChanged event of the Rating control.

INDEX.JS

```
ej.base.enableRipple(true);
// Initialize the Rating control.
var rating = new ej.inputs.Rating({
  valueChanged: (args)=> {
    alert("Previous Value:"+args.previousValue+"\nValue:"+args.value);
  }
});
// Render initialized Rating.
rating.appendTo('#rating');
```

Appearance in EJ2 JavaScript Rating control

You can also customize the appearance of rating control.

Items count

You can specify the number of rating items using the [itemsCount](#) property.

INDEX.JS

```
ej.base.enableRipple(true);  
// Initialize the Rating control.  
var rating = new ej.inputs.Rating({itemsCount:8, value:3.0});  
// Render initialized Rating.  
rating.appendTo('#rating');
```

Disabled

You can disable the rating control by using the [disabled](#) property. When the `disabled` property is set to `true`, the rating control will be disabled and the user will not be able to interact with it and a disabled rating control may have a different visual appearance than an enabled one.

INDEX.JS

```

ej.base.enableRipple(true);
// Initialize the Rating control.
var rating = new ej.inputs.Rating({ value:3, disabled:true });
// Render initialized Rating.
rating.appendTo('#rating');

```

INDEX.HTML

Visible

You can use the [visible](#) property of the rating control to control the visibility of the control. When the **visible** property is set to **true**, the rating control will be visible on the page. When it is set to **false**, the control will be hidden.

INDEX.JS

```

ej.base.enableRipple(true);
// Initialize the Rating control.

```

```

var rating = new ej.inputs.Rating({ value:3, visible:true });
// Render initialized Rating.
rating.appendTo('#rating');
document.getElementById("btn").onclick = function () {
    rating.visible = (rating.visible) ? false : true;
};

```

.custom-icon .e-icons.e-star-filled:before {
    content: "\e702";
}

```

Read only

You can use the [readOnly](#) property of the rating control to make the control non-interactive and prevent the user from changing the rating value.

INDEX.JS

```

ej.base.enableRipple(true);
// Initialize the Rating control.
var rating = new ej.inputs.Rating({ value:3, readOnly:true });
// Render initialized Rating.
rating.appendTo('#rating');

```

content: "\e702";
}
```

CssClass

You can customize the appearance of the rating control, such as by changing its colors, fonts, sizes, or other visual aspects by using the `cssClass` property.

Changing rating symbol border color

You can change the rating icon border color in rating control, you can use the `cssClass` property and set the `text-stroke` CSS property of `.e-rating-icon` to your desired border color.

INDEX.JS

```
ej.base.enableRipple(true);
```

```
// Initialize the Rating control.
var rating = new ej.inputs.Rating({ value:3, cssClass:"custom-border" });
// Render initialized Rating.
rating.appendTo('#rating');
```

Changing rated/un-rated symbol fill color

You can customize the fill colors of rated and un-rated icons in the rating control using the `cssClass` property and the `linear-gradient` color-stops in the `background` CSS property of `.e-rating-icon`. The **first** color-stop defines the rated fill color and the **second** defines the un-rated fill color.

INDEX.JS

```

ej.base.enableRipple(true);
// Initialize the Rating control.
var rating = new ej.inputs.Rating({ value:3, cssClass:"custom-fill" });
// Render initialized Rating.
rating.appendTo('#rating');

```

INDEX.HTML

}

```

This will customize the rated fill color to `#ffe814` and un-rated fill color to `#d8d7d4`. `--rating-value` in the linear-gradient provides the current value of the rating item.

Changing the item spacing

You can change the space between the rating items in rating control, by using the `cssClass` property and setting the `margin` / `padding` CSS property of `.e-rating-item-container` to your desired size.

INDEX.JS

```

ej.base.enableRipple(true);
// Initialize the Rating control.
var rating = new ej.inputs.Rating({ value:3, cssClass:"custom-font" });
// Render initialized Rating.
rating.appendTo('#rating');

```

INDEX.HTML

```

Changing icon using CssClass

You can change the rating item icon in rating control, you can use the `cssClass` property and set the `content` CSS property of `.e-icons.e-star-filled:before` to your desired font icon.

INDEX.JS

```

ej.base.enableRipple(true);
// Initialize the Rating control.
var rating = new ej.inputs.Rating({ value: 3, cssClass: "custom-icon" });
// Render initialized Rating.
rating.appendTo('#rating');

```

Accessibility in EJ2 JavaScript Rating control

Accessibility is achieved in the rating control through **WAI-ARIA** standard and keyboard navigations. The rating control can be effectively accessed through assistive technologies such as screen readers.

Keyboard interaction

The rating control is interactive with below keyboard shortcuts.

| Keyboard shortcuts | Actions |

|-----|-----|

| Space | If a **Reset Button** is focused, resets the value to min value. |

| Arrow Up | Increases the value. |

| Arrow Left | Decreases the value and in RTL mode, increases the value. |

| Arrow Down | Decreases the value. |

| Arrow Right | Increases the value and in RTL mode, decreases the value. |

ARIA attribute

The following ARIA attributes are used in rating control based on its state.

| Properties | Functionality |

| ----- | ----- |

| role | This attribute is added to the div element to describe the actual role. |

| aria-label | Attribute provides the text label with some default description for the Rating and its items. |

| aria-valuemin | It defines the minimum value of rating. |

| aria-valuemax | It defines the maximum value of rating. |

| aria-valuenow | It defines the current value of rating. |

Ribbon

Tabs and Groups

The Ribbon control consists of a series of tabs that are organized into groups to enable quick access to specific commands or tools. Each tab contains a set of groups, and each group contains collections of items that are logically related to each other.

Adding Tabs

You can use the [tabs](#) property to add tabs to the Ribbon control and define the content of the tab header by using the [header](#) property.

INDEX.JS

```
var ribbon = new ej.ribbon.Ribbon({
  tabs: [
    {
      header: "Home"
    },
    {
      header: "Insert"
    }
  ]
});
ribbon.appendTo("#ribbon");
```

INDEX.HTML

    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Adding Groups

You can use the [groups](#) property to add groups for each tab in the Ribbon and define the name of the group header by using the [header](#) property.

INDEX.JS

```

var ribbon = new ej.ribbon.Ribbon({
  tabs: [
    {
      header: "Home",
      groups: [
        {
          header: "Clipboard"
        }
      ]
    }
  ],
});

```

```

    {
      header: "Insert",
      groups: [
        {
          header: "Tables"
        }
      ]
    }
  ]
});
ribbon.appendTo("#ribbon");

```

INDEX.HTML

```

Adding Items

You can add collections of items to each group by using the [collections](#) and [items](#) properties.

INDEX.JS

```
var tabs = [
  {
    header: "Home",
    groups: [
      {
        header: "Clipboard",
        collections: [
          {
            items: [
              {
                type: "Button",
                buttonSettings: {
                  content: "Paste",
                  iconCss: "e-icons e-paste",
                }
              },
            ],
          },
        ],
      },
      {
        items: [
          {
            type: "Button",
            buttonSettings: {
              content: "Cut",
              iconCss: "e-icons e-cut",
            }
          },
          {
            type: "Button",
            buttonSettings: {
              content: "Copy",
              iconCss: "e-icons e-copy",
            }
          },
        ],
      },
    ],
  }
];

var ribbon = new ej.ribbon.Ribbon({ tabs: tabs });
ribbon.appendTo("#ribbon");
```

```

For more information on the built-in and how to add custom Ribbon items, you can visit the [items](#) page.

Ribbon Items

Ribbon renders various built-in items based on the item [type](#) property. By default, the type property is set as **Button** which renders the Button.

Built-in items

You can render the built-in Ribbon items by using the [items](#) property, to specify the [type](#) property.

The following table explains the built-in items and their actions.

Built-in Ribbon Items	Actions
Button	Renders button as ribbon item.
CheckBox	Renders checkbox as ribbon item.
DropDown	Renders dropdownbutton as ribbon item.
SplitButton	Renders splitbutton as ribbon item.
ComboBox	Renders combobox as ribbon item.
ColorPicker	Renders color picker as ribbon item.
GroupButton	Renders groupbutton as ribbon item.

Button items

You can render the built-in button Ribbon item by setting the [type](#) property as `Button` you can render a Button item. You can also customize the button item using the [RibbonButtonSettingsModel](#), which provides options such as `iconCss`, `content`, `isToggle` and more.

Toggle button

The [isToggle](#) property can be used to define whether the button act as a toggle button or not. By default, the value is `false`.

```
`js
var tabs = [{
  header: "Home",
  groups: [{
    header: "Clipboard",
    collections: [
      {
        items: [{
          type: "Button",
          buttonSettings: {
            content: "Cut",
            iconCss: "e-icons e-cut",
            isToggle: true
          }
        }]
      }
    ]
  }]
}]
```

```

    }}
  });
  var ribbon = new ej.ribbon.Ribbon({
    tabs: tabs
  });
  ribbon.appendTo("#ribbon");
  ,

```

Checkbox items

You can render the built-in checkBox Ribbon item by setting the [type](#) property to `CheckBox`. You can also customize the checkBox item using the [RibbonCheckBoxSettingsModel](#), which provides options such as `labelPosition`, `label`, `checked` and more.

Checkbox state

You can use the [checked](#) property to handle the checked or unchecked state. By default, the value is `false`.

```

`js
var tabs = [{
  header: "Home",
  groups: [{
    header: "View",
    collections: [
      {
        items: [{
          type: "CheckBox",
          checkBoxSettings: {
            label: "Ruler",
            checked: true
          }
        }
      ]
    ]
  }
}];
var ribbon = new ej.ribbon.Ribbon({ tabs: tabs });
ribbon.appendTo("#ribbon");
,

```

Defining label

You can use the [label](#) property to add a caption for the CheckBox. The label position can be set **Before** or **After**, by using the [labelPosition](#) property. By default, the labelPosition is **After**.

```
`js
var tabs = [{
  header: "Home",
  groups: [{
    header: "View",
    collections: [
      {
        items: [{
          type: "CheckBox",
          checkBoxSettings: {
            label: "Ruler",
            labelPosition: "Before"
          }
        }
      ]
    }
  ]
}];

var ribbon = new ej.ribbon.Ribbon({ tabs: tabs });
ribbon.appendTo("#ribbon");
`
```

DropDown button items

You can render the built-in dropDown Ribbon item by setting the [type](#) property to **DropDown**. You can also customize the dropDown item through [RibbonDropDownSettingsModel](#), which provides options such as **iconCss**, **content**, **target** and more.

Target

The [target](#) property specifies the element selector to be displayed in the DropDownButton popup.

INDEX.JS

```
var tabs = [
  {
    header: "Home",
    groups: [
      {
        header: "Illustrations",
        collections: [
          {
```

```

        items: [
            {
                type: "DropDown",
                dropDownSettings: {
                    content: "Picture",
                    iconCss: "e-icons e-image",
                    target: "#pictureList"
                }
            },
        ],
    },
]
}
}
]
}
];
var list = new ej.lists.ListView({
    headerTitle: 'Insert Picture From',
    dataSource: ['Stock Images', 'This device', 'Online Images'],
    showHeader: true
});
list.appendTo('#pictureList');
var ribbon = new ej.ribbon.Ribbon({
    tabs: tabs
});
ribbon.appendTo("#ribbon");

```

```

Combobox items

You can render the built-in comboBox Ribbon item by setting the `type` property to `ComboBox`. You can also customize the comboBox item through [RibbonComboBoxSettingsModel](#), which provides options such as `allowFiltering`, `autoFill`, `index`, `sortOrder` and more.

Filtering

You can use the [allowFiltering](#) property to filter the data items. The filtering operation is initiated automatically, as soon as you start typing characters. If no match is found the value of the `noRecordsTemplate` property will be displayed. By default, the value is `false`.

```
`js
```

```
var fontStyle = ["Algerian", "Arial", "Calibri", "Cambria", "Cambria Math", "Courier New", "Candara", "Georgia"];
```

```
var tabs = [{
```

```
  header: "Home",
```

```
  groups: [{
```

```
    header: "Font",
```

```
    collections: [
```

```
    {
```

```
      items: [{
```

```
        type: "ComboBox",
```

```
        comboBoxSettings: {
```

```
          dataSource: fontStyle,
```

```
          index: 3,
```

```
          allowFiltering: true
```

```
        }
```

```
      ]
```

```
    }]
```

```
  }]
```

```
});
```

```
var ribbon = new ej.ribbon.Ribbon({ tabs: tabs });
```

```
ribbon.appendTo("#ribbon");
```

Index

You can use the [index](#) property to get or set the selected item in the combobox.

```
`js
var fontStyle = ["Algerian", "Arial", "Calibri", "Cambria", "Cambria Math", "Courier New", "Candara",
"Georgia"];
var tabs = [{
header: "Home",
groups: [{
header: "Font",
collections: [
{
items: [{
type: "ComboBox",
comboBoxSettings: {
dataSource: fontStyle,
index: 3
}
}]
}]
}];
var ribbon = new ej.ribbon.Ribbon({ tabs: tabs });
ribbon.appendTo("#ribbon");
```

SortOrder

You can use the [sortOrder](#) property to specify the order in which the DataSource should be sorted.

None	The data source is not sorted.
Ascending	The data source is sorted in ascending order.
Descending	The data source is sorted in descending order.

INDEX.JS

```
var fontStyle = ["Algerian", "Arial", "Calibri", "Cambria", "Cambria Math",
"Courier New", "Candara", "Georgia"];
```

```

var tabs = [{
  header: "Home",
  groups: [{
    header: "Font",
    collections: [
      {
        items: [{
          type: "ComboBox",
          comboBoxSettings: {
            dataSource: fontStyle,
            sortOrder: "Descending"
          }
        }]
      }
    ]
  }]
}];
var ribbon = new ej.ribbon.Ribbon({ tabs: tabs });
ribbon.appendTo("#ribbon");

```

```

Groupbutton items

You can render the built-in groupbutton Ribbon item by setting the [type](#) property to `GroupButton`. You can also customize the groupbutton item using the [RibbonGroupButtonSettingsModel](#), which provides options such as `selection` and `items`.

Items

You can render the groupbutton items by using [items](#) property. You can also customize the groupbutton items through [RibbonGroupButtonItemModel](#), which provides options such as `content`, `iconCss`, `selected` and more.

Item content

You can use the [content](#) property to define the text content for the groupbutton.

```
`js
```

```
var tabs = [{
```

```
header: "Home",
groups: [{
  header: "Paragraph",
  collections: [
    {
      items: [{
        type: "GroupButton",
        allowedSizes: ej.ribbon.RibbonItemSize.Small,
        groupButtonSettings: {
          items: [{
            iconCss: 'e-icons e-align-left',
            content: 'Align Left'
          },
          {
            iconCss: 'e-icons e-align-center',
            content: 'Align Center'
          },
          {
            iconCss: 'e-icons e-align-right',
            content: 'Align Right'
          },
          {
            iconCss: 'e-icons e-justify',
            content: 'Justify'
          }
        ]
      }
    }
  ]
}];
var ribbon = new ej.ribbon.Ribbon({ tabs: tabs });
ribbon.appendTo("#ribbon");
`
```

Icon only

You can use the [iconCss](#) property to customize the groupbutton icon. If the `iconCss` property is not defined, the groupbutton will not be rendered.

INDEX.JS

```
var tabs = [{
  header: "Home",
  groups: [{
    header: "Paragraph",
    collections: [
      {
        items: [{
          type: "GroupButton",
          allowedSizes: ej.ribbon.RibbonItemSize.Small,
          groupButtonSettings: {
            items: [{
              iconCss: 'e-icons e-align-left'
            },
            {
              iconCss: 'e-icons e-align-center'
            },
            {
              iconCss: 'e-icons e-align-right'
            },
            {
              iconCss: 'e-icons e-justify'
            }
          ]
        }
      ]
    ]
  }
}];
var ribbon = new ej.ribbon.Ribbon({ tabs: tabs });
ribbon.appendTo("#ribbon");
```

</body></html>

```

Single selection

You can set the [selection](#) property value as `RibbonGroupButtonSelection.Single` to make one selection at a time. It automatically deselects the previous choice when a different item is clicked.

INDEX.JS

```

var tabs = [{
  header: "Home",
  groups: [{
    header: "Paragraph",
    collections: [
      {
        items: [{
          type: "GroupButton",
          allowedSizes: ej.ribbon.RibbonItemSize.Small,
          groupButtonSettings: {
            selection: ej.ribbon.RibbonGroupButtonSelection.Single,
            items: [{
              iconCss: 'e-icons e-align-left',
              content: 'Align Left'
            },
            {
              iconCss: 'e-icons e-align-center',
              content: 'Align Center',
              selected: true
            },
            {
              iconCss: 'e-icons e-align-right',
              content: 'Align Right'
            },
            {
              iconCss: 'e-icons e-justify',
              content: 'Justify'
            }
          ]
        }
      ]
    }
  ]
}];
var ribbon = new ej.ribbon.Ribbon({ tabs: tabs });
ribbon.appendTo("#ribbon");

Groupbutton in simplified mode layout

In simplified mode, the groupbutton will be rendered as a dropdownbutton. The dropdownbutton icon will be updated based on the button item selected. The initial button icon will be the set, if none of the buttons are selected.

INDEX.JS

```

var tabs = [{
  header: "Home",
  groups: [{
    header: "Paragraph",
    collections: [
      {
        items: [{
          type: "GroupButton",

```

Custom items

You can customize the ribbon items with non-built-in items or HTML content by setting the [type](#) property to `Template`. This provides an option to customize the ribbon items with greater flexibility.

INDEX.JS

```
var tabs = [{
  header: "Home",
  groups: [{
    header: "Font",
    collections: [
      {
        items: [{
          type: "Template",
          itemTemplate: "#itemTemplate"
        }]
      }
    ]
  }]
}];
var ribbon = new ej.ribbon.Ribbon({ tabs: tabs });
ribbon.appendTo("#ribbon");
```

STYLES.CSS

```

.ribbonTemplate {
    display: flex;
    align-items: center;
    justify-content: center;
    cursor: pointer;
}
.ribbonTemplate.Large {
    flex-direction: column;
}
.ribbonTemplate.Large .e-icons {
    font-size: 35px;
}
.ribbonTemplate.Medium .e-icons,
.ribbonTemplate.Small .e-icons{
    font-size: 20px;
    margin: 15px 5px;
}
.ribbonTemplate.Small .text {
    display:none;
}

```

Items display Mode

You can use the [displayOptions](#) property to display the items in the Ribbon layout.

Auto	The items are displayed in all layouts based on the ribbon's overflow state.
Classic	The items are displayed only in the classic layout group.
Simplified	The items are displayed only in the simplified layout group.
Overflow	The items are displayed only in the overflow popup.

Display items in Classic only

To display the items only in the classic layout group, set the mode as `DisplayMode.Classic` in the [displayOptions](#) property.

```
`js
var tabs = [{
  header: "Home",
  groups: [{
    header: "Font",
    collections: [
      {
        items: [{
          type: "Button",
          buttonSettings: {
            content: "Cut",
            iconCss: "e-icons e-cut"
          },
          displayOptions: ej.ribbon.DisplayMode.Classic
        }
      ]
    ]
  }
  ]
  });
var ribbon = new ej.ribbon.Ribbon({ tabs: tabs });
ribbon.appendTo("#ribbon");
`
```

Display items in Simplified only

To display the items only in the simplified layout group, set the mode as `DisplayMode.Simplified` in the [displayOptions](#) property.

```
`js
var tabs = [{
```

```

header: "Home",
groups: [{
  header: "Font",
  collections: [
    {
      items: [{
        type: "Button",
        buttonSettings: {
          content: "Cut",
          iconCss: "e-icons e-cut"
        },
        displayOptions: ej.ribbon.DisplayMode.Simplified
      }]
    }
  ]
}];
var ribbon = new ej.ribbon.Ribbon({ tabs: tabs });
ribbon.appendTo("#ribbon");

```

Display items in Overflow popup only

To display the items only in the overflow, set the mode as `DisplayMode.Overflow` in the [displayOptions](#) property.

```

`js
var tabs = [{
  header: "Home",
  groups: [{
    header: "Font",
    collections: [
      {
        items: [{
          type: "Button",
          buttonSettings: {
            content: "Cut",
            iconCss: "e-icons e-cut"
          }
        }]
      }
    ]
  }
}];

```

```

},
displayOptions: ej.ribbon.DisplayMode.Overflow
}]
}]
}];
var ribbon = new ej.ribbon.Ribbon({ tabs: tabs });
ribbon.appendTo("#ribbon");
`

```

Enable or disable items

You can use the [disabled](#) property to disable a Ribbon item. It prevents the user interaction when set to **true**. By default, the value is **false**.

```

`js
var tabs = [{
  header: "Home",
  groups: [{
    header: "Clipboard",
    collections: [
      {
        items: [{
          type: "Button",
          disabled: true,
          buttonSettings: {
            content: "Cut",
            iconCss: "e-icons e-cut"
          }
        },
        {
          type: "CheckBox",
          disabled: true,
          checkBoxSettings: {
            label: "Ruler",
            checked: true
          }
        }
      ]
    }
  }
]
}
]
`

```

```

},
{
  type: "DropDown",
  disabled: true,
  dropDownSettings: {
    content: "Table",
    iconCss: "e-icons e-table"
  }
},
{
  type: "SplitButton",
  disabled: true,
  splitButtonSettings: {
    content: "Table",
    iconCss: "e-icons e-table"
  }
}
}
}
}
});
var ribbon = new ej.ribbon.Ribbon({
  tabs: tabs
});
ribbon.appendTo("#ribbon");

```

Ribbon Layouts

The Ribbon allows to customize the layout by using the [activeLayout](#) property. The Ribbon component supports the following layouts:

Classic layout

In classic layout, the Ribbon component organizes the items and groups in a traditional form by setting the [activeLayout](#) property to [Classic](#). By default, the Ribbon component renders in the [Classic](#) layout.

INDEX.JS

```

var tabs = [
  {
    header: "Home",

```

```

groups: [
  {
    header: "Clipboard",
    collections: [
      {
        items: [
          {
            type: "Button",
            buttonSettings: {
              content: "Paste",
              iconCss: "e-icons e-paste",
            }
          },
        ],
      },
      {

```

    }
    </script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Defining items size

You can use the [allowedSizes](#) property to set the allowed size for an item. The Ribbon items can be appeared in three different sizes: Large(large icon with text), Medium(small icon with text) and Small(small icon only). On resizing, the items size can be changed based on the available width of the tab content from the order of Large-> Medium-> Small and viceversa.

INDEX.JS

```

var tabs = [{
  header: "Home",
  groups: [{
    collections: [{
      items: [{
        type: 'SplitButton',
        allowedSizes: ej.ribbon.RibbonItemSize.Large,
        splitButtonSettings: {
          iconCss: 'e-icons e-paste',
          content: 'Paste',
          items: [{ text: 'Keep Source Format' }, { text: 'Merge format' },
            { text: 'Keep text only' }]
        }
      }
    ]
  }, {
    items: [{
      type: 'Button',
      allowedSizes: ej.ribbon.RibbonItemSize.Medium,
      buttonSettings: {
        content: 'Cut',
        iconCss: 'e-icons e-cut'
      }
    }, {
      type: 'Button',
      allowedSizes: ej.ribbon.RibbonItemSize.Small,
      buttonSettings: {
        content: 'Copy',
        iconCss: 'e-icons e-copy'
      }
    }
  ]
}
]
}];

<script src="index.js" type="text/javascript"></script>
</body></html>

```

When the orientation is set to **Row** a group may have a maximum of three collections each of which may contain any number of items. When the orientation is set to **Column** a group may have any number of collections, each of which may contain one large-sized item or three medium/small-sized items. If two large-sized items are specified, it automatically converts into two medium/small-sized items.

Defining group header

You can use the [header](#) property to set the name for each group header.

INDEX.JS

```

var tabs = [{
    header: "Home",
    groups: [{
        header: 'Clipboard',
        collections: [{
            items: [{
                type: 'SplitButton',
                allowedSizes: ej.ribbon.RibbonItemSize.Large,
                splitButtonSettings: {
                    iconCss: 'e-icons e-paste',
                    items: [
                        { text: 'Keep Source Format' },
                        { text: 'Merge format' },
                        { text: 'Keep text only' },
                    ],
                },
                content: 'Paste',
            }
        ]
    }]
},
],

```

```

{
  header: 'Font',
  collections: [{
    items: [{
      type: 'Button',
      buttonSettings: {
        content: 'Bold',
        iconCss: 'e-icons e-bold',
      }
    }, {
      type: 'Button',
      buttonSettings: {

        ele.style.visibility = "visible";
    }
    </script>
    <script src="index.js" type="text/javascript"></script>
</body></html>

```

Enabling group launcher icon

You can use the [showLauncherIcon](#) property to enable or disable the launcher icon for each group. By default, the property is set to `false`.

INDEX.JS

```
var tabs = [{
  header: "Home",
  groups: [{
    header: 'Clipboard',
    showLauncherIcon: true,
    collections: [{
      items: [{
        type: 'SplitButton',
        splitButtonSettings: {
          iconCss: 'e-icons e-paste',
          items: [{ text: 'Keep Source Format' }, { text: 'Merge
format' }, { text: 'Keep text only' }],
          content: 'Paste'
        }
      }
    ]
  }, {
    items: [{
      type: 'Button',
      buttonSettings: {
        content: 'Cut',
        iconCss: 'e-icons e-cut'
      }
    }, {
      type: 'Button',
      buttonSettings: {
        content: 'Copy',
        iconCss: 'e-icons e-copy'
      }
    }, {
      type: 'Button',
      buttonSettings: {
        content: 'Format Painter',
        iconCss: 'e-icons e-format-painter'
      }
    }
  ]
}]
}];
var ribbon = new ej.ribbon.Ribbon({
  tabs: tabs
});
ribbon.appendTo("#ribbon");
```

Enabling group overflow popup

You can use the [enableGroupOverflow](#) property to add a separate popup for the overflow items in the group while resizing. The overflow items will appear in the common overflow popup, located at the right end of the tab content if it is set to **false**.

```

Minimized State

You can hide the Ribbon contents and display only the tab headers by double-clicking on the tab header. In minimized state, the Ribbon control expands to its normal state when click on the tab header.

You can use the [isMinimized](#) property to change the Ribbon component to minimized state. By default, the value is `false`.

INDEX.JS

```
var tabs = [
  {
    header: "Home",

File Menu

The Ribbon control provides a built-in file menu that allows you to add menu items for performing specific actions. The file menu can be enabled by setting the [fileMenu](#) property.

Visibility

You can show the file menu by setting the [visible](#) property to `true`. By default, the file menu is hidden.

INDEX.JS

```

Ribbon Backstage

The Ribbon supports backstage view which is an addition to the traditional file menu. It displays information like application settings, user details, etc. The backstage view can be enabled by setting the [backStageMenu](#) property.

The backstage view options are displayed on the left, while the content of each option is shown on the right.

Adding backstage items

The menu items can be added to the backstage view by using the [items](#) property. You can show the backstage view by setting the [visible](#) property to `true`. By default, the backstage view is hidden.

INDEX.JS

```

var tabs = [
  {

```

Adding separator

The separators are horizontal lines used to separate the backstage view items. You can use the [separator](#) property to split the menu items.

```

Backstage target

The [target](#) property specifies the element selector in which backstage will be displayed. The target element should have the position as relative, else the backstage will be positioned nearest to the relative element. By default, the backstage is positioned to ribbon element.

<script src="index.js" type="text/javascript"></script>
</body></html>

```

Setting width and height

You can customize the height and width of the backstage view using the [height](#) and [width](#) property. By default, dimensions are set based on the content added.

INDEX.JS

```

var tabs = [
  {
    header: "Home",
    groups: [
      {
        header: "Clipboard",
        collections: [
          {
            items: [
              {

```

```

        type: "Button",
        buttonSettings: {
            content: "Paste",
            iconCss: "e-icons e-paste",
        }
    },
],
},
{
    items: [
        {
            type: "Button",
            buttonSettings: {
                content: "Cut",
                iconCss: "e-icons e-cut",
            }
        },
        {
            type: "Button",
            buttonSettings: {
                content: "Copy",
                iconCss: "e-icons e-copy",
            }
        }
    ],
}
]
}
];
var ribbon = new ej.ribbon.Ribbon({
    tabs: tabs,
    backstageMenu: {
        items: [
            { id: 'home', text: 'Home', iconCss: 'e-icons e-home', content:
'#homeContent' },

[Adding Backstage events](#)

Help Pane

The help pane is dedicated area where the users can define help contents like controlling document permissions, sharing features, and more which appears on the right side of the Ribbon. You can use the [helpPaneTemplate](#) property to set the help pane contents.

INDEX.JS

```

var tabs = [
    {
        header: "Home",
        groups: [
            {
                collections: [
                    {
                        items: [
                            {
                                type: "Button",
                                buttonSettings: {
                                    content: "Cut",
                                    iconCss: "e-icons e-cut"
                                }
                            },
                        ],
                    },
                ],
            },
        ],
    },

```

STYLES.CSS

```

.action_btn {
  margin: 0px 3px;
  border: none;
}

```

```

    color: #ffffff;
    background-color: #0d6efd;
  }

  #undo, #redo{
    padding: 0px 3px ;
  }

```

Tooltip

The Ribbon component supports tooltip to show additional information in the Ribbon items. The tooltip appears when the user hovers over a Ribbon item.

Adding Title

You can use the [title](#) property to set the tooltip title for each Ribbon item.

INDEX.JS

```

var tabs = [{
  header: "Home",
  groups: [{
    header: 'Clipboard',
    collections: [{
      items: [{
        type: 'Button',
        ribbonTooltipSettings: {
          title: 'Cut'
        },
        buttonSettings: {
          content: 'Cut',
          iconCss: 'e-icons e-cut'
        }
      }]
    }, {
      items: [{
        type: 'Button',
        ribbonTooltipSettings: {
          title: 'Copy'
        },
        buttonSettings: {
          content: 'Copy',
          iconCss: 'e-icons e-copy'
        }
      }],
      {
        type: 'Button',
        ribbonTooltipSettings: {
          title: 'Paste'
        },
        buttonSettings: {
          content: 'Paste',
          iconCss: 'e-icons e-paste'
        }
      }
    }
  ]
}];
var ribbon = new ej.ribbon.Ribbon({

```

```

    tabs: tabs
  });
  ribbon.appendTo("#ribbon");

```

INDEX.HTML

Adding Content

You can use the [content](#) property to set the tooltip content for each Ribbon item.

INDEX.JS

```
var tabs = [{
  header: "Home",
  groups: [{
    header: 'Clipboard',
    collections: [{
      items: [{
        type: 'Button',
        ribbonTooltipSettings: {
          title: 'Cut',
          content: 'Cut selected text or objects'
        },
        buttonSettings: {
          content: 'Cut',
          iconCss: 'e-icons e-cut'
        }
      },
      {
        type: 'Button',
        ribbonTooltipSettings: {
          title: 'Copy',
          content: 'Copy selected text or objects'
        },
        buttonSettings: {
          content: 'Copy',
          iconCss: 'e-icons e-copy'
        }
      }
    ],
    {
      type: 'Button',
      ribbonTooltipSettings: {
        title: 'Paste',
        content: 'Paste copied or cut content'
      },
      buttonSettings: {
        content: 'Paste',
        iconCss: 'e-icons e-paste'
      }
    }
  ]
}]
};
var ribbon = new ej.ribbon.Ribbon({
  tabs: tabs
});
ribbon.appendTo("#ribbon");

Customization

You can use the [cssClass](#) property to customize the appearance of the tooltip with your own custom styles.

INDEX.JS

```

var tabs = [{
    header: "Home",
    groups: [{
        header: 'Clipboard',
        collections: [{
            items: [{
                type: 'SplitButton',
                splitButtonSettings: {
                    iconCss: 'e-icons e-paste',

```

```

        items: [{ text: 'Keep Source Format' }, { text: 'Merge
format' }, { text: 'Keep text only' }],
        content: 'Paste'
    },
    ribbonTooltipSettings: {
        title: 'Paste',
        content: 'Insert the clipboard content where the cursor
is currently placed.',
        cssClass: 'custom-tooltip'
    }
    ]
}, {
    items: [{
        type: 'Button',
        ribbonTooltipSettings: {
            title: 'Cut',
            content: 'Places the selected text or object on the
clipboard so that you can paste it somewhere else.',
            cssClass: 'custom-tooltip'
        },
        buttonSettings: {
            content: 'Cut',
            iconCss: 'e-icons e-cut'
        }
    }, {

```

Ribbon Resizing

The Ribbon effectively resizes the ribbon elements while being resized. It extends when the ribbon size is increased and collapses when the ribbon size is decreased. The resizing can be performed in both the classic and simplified modes. Also, we have an option to resize the ribbon elements in the custom order.

In classic mode on resizing, the items size will be changed based on the available width of the tab content from the order of Large-> Medium-> Small and viceversa.

In simplified mode on resizing, the items size will be changed based on the available width of the tab content from the order of Medium-> Small and viceversa.

Defining items allowed size

You can use the [allowedSizes](#) property to maintain a constant size for an item. If `allowedSizes` is set, it keeps the size constant even when being resized.

INDEX.JS

```
var tabs = [{
  header: "Home",
  groups: [{
    header: 'Clipboard',
    collections: [{
      items: [{
        type: 'Button',
        allowedSizes: ej.ribbon.RibbonItemSize.Large,
        buttonSettings: {
          content: 'Cut',
          iconCss: 'e-icons e-cut'
        }
      }]
    }]
  }]
}];
var ribbon = new ej.ribbon.Ribbon({
  tabs: tabs
});
ribbon.appendTo("#ribbon");
```

```

Defining items active size

You can use the [activeSize](#) property to define the item size initially, before it is being resized. When resized the [activeSize](#) property is updated based on the ribbon's overflow state, which is determined by the [allowedSizes](#) property being configured. By default, the value is [Medium](#).

Events

This section describes the ribbon events that will be triggered when appropriate actions are performed. The following events are available in the ribbon control.

tabSelected

The [tabSelected](#) event is triggered after selecting the tab item.

```
`js
```

```

var tabs = [{
  header: "Home",
  groups: [{
    header: "Clipboard",
    collections: [
      {
        items: [{
          type: "Button",
          buttonSettings: {
            content: "Cut",
            iconCss: "e-icons e-cut"
          }
        }
      }
    ]
  }
}]

```

```

    }}
  }}
},
{
  header: "View",
  groups: [{
    header: "Views",
    collections: [
      {
        items: [{
          type: "Button",
          buttonSettings: {
            content: "Print Layout",
            iconCss: "e-icons e-print"
          }
        }]
      }
    ]
  }];
  var ribbon = new ej.ribbon.Ribbon({
    tabs: tabs,
    tabSelected: (args) =>{
      // Your required action here
    }
  });
  ribbon.appendTo("#ribbon");
  ,

```

[tabSelecting](#)

The [tabSelecting](#) event is triggered before selecting the tab item.

```

`js
var tabs = [{
  header: "Home",
  groups: [{

```

```
header: "Clipboard",
collections: [
{
items: [{
type: "Button",
buttonSettings: {
content: "Cut",
iconCss: "e-icons e-cut"
}
}]
}],
{
header: "View",
groups: [{
header: "Views",
collections: [
{
items: [{
type: "Button",
buttonSettings: {
content: "Print Layout",
iconCss: "e-icons e-print"
}
}]
}]
}
];
var ribbon = new ej.ribbon.Ribbon({
tabs: tabs,
tabSelecting: (args) =>{
// Your required action here
```

```

}
});
ribbon.appendTo("#ribbon");
`

```

ribbonCollapsing

The [ribbonCollapsing](#) event is triggered before collapsing the ribbon.

```

`js
var tabs = [{
  header: "Home",
  groups: [{
    header: "Clipboard",
    collections: [
      {
        items: [{
          type: "Button",
          buttonSettings: {
            content: "Cut",
            iconCss: "e-icons e-cut"
          }
        }
      ]
    }
  ]
}];
var ribbon = new ej.ribbon.Ribbon({
  tabs: tabs,
  ribbonCollapsing: (args) =>{
    // Your required action here
  }
});
ribbon.appendTo("#ribbon");
`

```

ribbonExpanding

The [ribbonExpanding](#) event is triggered before expanding the ribbon.

```

`js

```

```

var tabs = [{
  header: "Home",
  groups: [{
    header: "Clipboard",
    collections: [
      {
        items: [{
          type: "Button",
          buttonSettings: {
            content: "Cut",
            iconCss: "e-icons e-cut"
          }
        }]
      }
    ]
  }]
}];

var ribbon = new ej.ribbon.Ribbon({
  tabs: tabs,
  ribbonExpanding: (args) =>{
    // Your required action here
  }
});

ribbon.appendTo("#ribbon");

```

launcherIconClick

The [launcherIconClick](#) event is triggered when the launcher icon of the group is clicked.

```

`js
var tabs = [{
  header: "Home",
  groups: [{
    header: "Clipboard",
    showLauncherIcon: true,
    collections: [

```

```

{
  items: [{
    type: "Button",
    buttonSettings: {
      content: "Cut",
      iconCss: "e-icons e-cut"
    }
  }]
}]
});

var ribbon = new ej.ribbon.Ribbon({
  tabs: tabs,
  launcherIconClick: (args) =>{
    // Your required action here
  }
});

ribbon.appendTo("#ribbon");

```

Button item events

clicked

The [clicked](#) event is triggered when the Button is clicked.

```

`js
var tabs = [{
  header: "Home",
  groups: [{
    header: "Clipboard",
    collections: [
      {
        items: [{
          type: "Button",
          buttonSettings: {
            content: "Cut",
            iconCss: "e-icons e-cut",

```

```

clicked: () => {
// Your required action here
}
}
}}
}}
}}
}};
var ribbon = new ej.ribbon.Ribbon({ tabs: tabs });
ribbon.appendTo("#ribbon");

```

created

The [created](#) event is triggered when the Button is created.

```

`js
var tabs = [{
header: "Home",
groups: [{
header: "Clipboard",
collections: [
{
items: [{
type: "Button",
buttonSettings: {
content: "Cut",
iconCss: "e-icons e-cut",
created: () => {
// Your required action here
}
}
}
}
}
}
}];

```

```
var ribbon = new ej.ribbon.Ribbon({ tabs: tabs });
ribbon.appendTo("#ribbon");
`
```

CheckBox item events

change

The [change](#) event is triggered when the Checkbox state is changed.

```
`js
var tabs = [{
  header: "Home",
  groups: [{
    header: "View",
    collections: [
      {
        items: [{
          type: "CheckBox",
          checkBoxSettings: {
            label: "Ruler",
            checked: false,
            change: () => {
              // Your required action here
            }
          }
        }
      ]
    ]
  }
}];
var ribbon = new ej.ribbon.Ribbon({ tabs: tabs });
ribbon.appendTo("#ribbon");
`
```

created

The [created](#) event is triggered once the Checkbox is created.

```
`js
var tabs = [{
  header: "Home",
```

```

groups: [{
  header: "View",
  collections: [
    {
      items: [{
        type: "CheckBox",
        checkBoxSettings: {
          label: "Ruler",
          checked: false,
          created: () => {
            // Your required action here
          }
        }
      }]
    }
  ]
}];

var ribbon = new ej.ribbon.Ribbon({ tabs: tabs });
ribbon.appendTo("#ribbon");

```

ColorPicker item events

change

The [change](#) event is triggered while changing the colors.

```

`js
var tabs = [{
  header: "Home",
  groups: [{
    header: "Font",
    collections: [
      {
        items: [{
          type: "ColorPicker",
          colorPickerSettings: {
            value: "#fff",

```

```

change:(args) => {
// Your required action here
}
}
}}
}}
}}
}};
var ribbon = new ej.ribbon.Ribbon({ tabs: tabs });
ribbon.appendTo("#ribbon");

```

created

The [created](#) event is triggered once the ColorPicker is created.

```

`js
var tabs = [{
header: "Home",
groups: [{
header: "Font",
collections: [
{
items: [{
type: "ColorPicker",
colorPickerSettings: {
value: "#fff",
created:() => {
// Your required action here
}
}
}
}}
}}
}};
var ribbon = new ej.ribbon.Ribbon({ tabs: tabs });

```

```
ribbon.appendTo("#ribbon");
`
```

open

The [open](#) event is triggered while opening the ColorPicker popup.

```
`js
var tabs = [{
  header: "Home",
  groups: [{
    header: "Font",
    collections: [
      {
        items: [{
          type: "ColorPicker",
          colorPickerSettings: {
            value: "#fff",
            open:(args) => {
              // Your required action here
            }
          }
        }
      ]
    }
  ]
}];

var ribbon = new ej.ribbon.Ribbon({ tabs: tabs });
ribbon.appendTo("#ribbon");
`
```

select

The [select](#) event is triggered while selecting the color in picker/palette, when showButtons property is enabled.

```
`js
var tabs = [{
  header: "Home",
  groups: [{
    header: "Font",
```

```
collections: [
{
items: [{
type: "ColorPicker",
colorPickerSettings: {
value: "#fff",
select:(args) => {
// Your required action here
}
}
}]
}
}];
var ribbon = new ej.ribbon.Ribbon({ tabs: tabs });
ribbon.appendTo("#ribbon");
`
```

beforeClose

The [beforeClose](#) event is triggered before closing the ColorPicker popup.

```
`js
var tabs = [{
header: "Home",
groups: [{
header: "Font",
collections: [
{
items: [{
type: "ColorPicker",
colorPickerSettings: {
value: "#fff",
beforeClose:(args) => {
// Your required action here
}
}
}
}
}
}
}];
```

```

}
}}
}}
}}
});
var ribbon = new ej.ribbon.Ribbon({ tabs: tabs });
ribbon.appendTo("#ribbon");
`

```

beforeOpen

The [beforeOpen](#) event is triggered before opening the ColorPicker popup.

```

`js
var tabs = [{
  header: "Home",
  groups: [{
    header: "Font",
    collections: [
      {
        items: [{
          type: "ColorPicker",
          colorPickerSettings: {
            value: "#123456",
            beforeOpen:(args) => {
              // Your required action here
            }
          }
        }
      }
    ]
  }
}
}
});
var ribbon = new ej.ribbon.Ribbon({ tabs: tabs });
ribbon.appendTo("#ribbon");
`

```

beforeTileRender

The [beforeTileRender](#) event is triggered while rendering each palette tile.

```

`js
var tabs = [{
  header: "Home",
  groups: [{
    header: "Font",
    collections: [
      {
        items: [{
          type: "ColorPicker",
          colorPickerSettings: {
            value: "#123456",
            beforeTileRender:(args) => {
              // Your required action here
            }
          }
        }
      ]
    }
  ]
}];

var ribbon = new ej.ribbon.Ribbon({ tabs: tabs });
ribbon.appendTo("#ribbon");

```

ComboBox item events

change

The [change](#) event is triggered when an item in a popup is selected or when the model value is changed by the user.

```

`js
var fontStyle = ["Algerian", "Arial", "Calibri", "Cambria", "Cambria Math", "Courier New", "Candara", "Georgia"];

var tabs = [{
  header: "Home",
  groups: [{
    header: "Font",
    collections: [

```

```

{
items: [{
type: "ComboBox",
comboBoxSettings: {
dataSource: fontStyle,
index: 3,
change:(args) => {
// Your required action here
}
}
}]
}
}];
var ribbon = new ej.ribbon.Ribbon({ tabs: tabs });
ribbon.appendTo("#ribbon");
`

```

[close](#)

The [close](#) event is triggered when the popup is closed.

```

`js
var fontStyle = ["Algerian", "Arial", "Calibri", "Cambria", "Cambria Math", "Courier New", "Candara",
"Georgia"];
var tabs = [{
header: "Home",
groups: [{
header: "Font",
collections: [
{
items: [{
type: "ComboBox",
comboBoxSettings: {
dataSource: fontStyle,
index: 3,
close:(args) => {

```

```
// Your required action here
}
}
}}
}}
}}
}};
var ribbon = new ej.ribbon.Ribbon({ tabs: tabs });
ribbon.appendTo("#ribbon");
`
```

open

The [open](#) event is triggered when the popup is opened.

```
`js
var fontStyle = ["Algerian", "Arial", "Calibri", "Cambria", "Cambria Math", "Courier New", "Candara",
"Georgia"];
var tabs = [{
  header: "Home",
  groups: [{
    header: "Font",
    collections: [
      {
        items: [{
          type: "ComboBox",
          comboBoxSettings: {
            dataSource: fontStyle,
            index: 3,
            open:(args) => {
              // Your required action here
            }
          }
        }
      ]
    }
  }
}
}];
```

```
var ribbon = new ej.ribbon.Ribbon({ tabs: tabs });
ribbon.appendTo("#ribbon");
`
```

created

The [created](#) event is triggered once the Combobox is created.

```
`js
var fontStyle = ["Algerian", "Arial", "Calibri", "Cambria", "Cambria Math", "Courier New", "Candara",
"Georgia"];
var tabs = [{
  header: "Home",
  groups: [{
    header: "Font",
    collections: [
      {
        items: [{
          type: "ComboBox",
          comboBoxSettings: {
            dataSource: fontStyle,
            index: 3,
            created:() => {
              // Your required action here
            }
          }
        }]
      }
    ]
  }]
}];
var ribbon = new ej.ribbon.Ribbon({ tabs: tabs });
ribbon.appendTo("#ribbon");
`
```

filtering

The [filtering](#) event triggers on typing a character in the Combobox.

```
`js
```

```

var fontStyle = ["Algerian", "Arial", "Calibri", "Cambria", "Cambria Math", "Courier New", "Candara",
"Georgia"];
var tabs = [{
header: "Home",
groups: [{
header: "Font",
collections: [
{
items: [{
type: "ComboBox",
comboBoxSettings: {
dataSource: fontStyle,
index: 3,
allowFiltering: true,
filtering: function (e) {
// Your required action here
}
}
}
}
}
}
}];
var ribbon = new ej.ribbon.Ribbon({ tabs: tabs });
ribbon.appendTo("#ribbon");

```

select

The [select](#) event is triggered when an item in the popup is selected.

```
`js
```

```

var fontStyle = ["Algerian", "Arial", "Calibri", "Cambria", "Cambria Math", "Courier New", "Candara",
"Georgia"];
var tabs = [{
header: "Home",
groups: [{
header: "Font",

```

```
collections: [
{
items: [{
type: "ComboBox",
comboBoxSettings: {
dataSource: fontStyle,
index: 3,
select:(args) => {
// Your required action here
}
}
}]
}
}];

var ribbon = new ej.ribbon.Ribbon({ tabs: tabs });
ribbon.appendTo("#ribbon");
`
```

beforeOpen

The [beforeOpen](#) event triggers before opening the popup.

```
`js
```

```
var fontStyle = ["Algerian", "Arial", "Calibri", "Cambria", "Cambria Math", "Courier New", "Candara",
"Georgia"];

var tabs = [{
header: "Home",
groups: [{
header: "Font",
collections: [
{
items: [{
type: "ComboBox",
comboBoxSettings: {
dataSource: fontStyle,
index: 3,
```

```
beforeOpen:(args) => {  
  // Your required action here  
}  
  
}  
  
}}  
  
}}  
  
}}  
  
}};  
  
var ribbon = new ej.ribbon.Ribbon({ tabs: tabs });  
ribbon.appendTo("#ribbon");  
`
```

DropDown item events

beforeClose

The `beforeClose` event is triggered before closing the `DropDownButton` popup.

```
js
var tabs = [{
  header: "Home",
  groups: [{
    header: "Header & Footer",
    collections: [
      {
        items: [{
          type: "DropDown",
          dropDownSettings: {
            content: "Header",
            iconCss: "e-icons e-header",
            items: [{ text: "Insert Header" }, { text: "Edit Header" }, { text: "Remove Header" }],
            beforeClose:(args) => {
              // Your required action here
            }
          }
        }
      }
    ]
  }
}]
}
```

```

});
var ribbon = new ej.ribbon.Ribbon({ tabs: tabs });
ribbon.appendTo("#ribbon");
`

```

beforeOpen

The [beforeOpen](#) event is triggered before opening the Dropdown button popup.

```

`js
var tabs = [{
  header: "Home",
  groups: [{
    header: "Header & Footer",
    collections: [
      {
        items: [{
          type: "DropDown",
          dropDownSettings: {
            content: "Header",
            iconCss: "e-icons e-header",
            items: [{ text: "Insert Header" }, { text: "Edit Header" }, { text: "Remove Header" }],
            beforeOpen:(args) => {
              // Your required action here
            }
          }
        }
      ]
    }
  ]
}];
var ribbon = new ej.ribbon.Ribbon({ tabs: tabs });
ribbon.appendTo("#ribbon");
`

```

beforeItemRender

The [beforeItemRender](#) event is triggered while rendering each popup item of the Dropdown button.

```

`js
var tabs = [{

```

```

header: "Home",
groups: [{
  header: "Header & Footer",
  collections: [
    {
      items: [{
        type: "DropDown",
        dropDownSettings: {
          content: "Header",
          iconCss: "e-icons e-header",
          items: [{ text: "Insert Header" }, { text: "Edit Header" }, { text: "Remove Header" }],
          beforeItemRender:(args) => {
            // Your required action here
          }
        }
      }
    ]
  }
}];
var ribbon = new ej.ribbon.Ribbon({ tabs: tabs });
ribbon.appendTo("#ribbon");

```

[open](#)

The [open](#) event is triggered while opening the Dropdown button popup.

```

`js
var tabs = [{
  header: "Home",
  groups: [{
    header: "Header & Footer",
    collections: [
      {
        items: [{
          type: "DropDown",

```

```
dropDownSettings: {
  content: "Header",
  iconCss: "e-icons e-header",
  items: [{ text: "Insert Header" }, { text: "Edit Header" }, { text: "Remove Header" }],
  open:(args) => {
    // Your required action here
  }
}
}}
}}
}};

var ribbon = new ej.ribbon.Ribbon({ tabs: tabs });
ribbon.appendTo("#ribbon");
\
```

close

The [close](#) event is triggered while closing the Dropdown button popup.

```
`js
```

```
var tabs = [{
  header: "Home",
  groups: [{
    header: "Header & Footer",
    collections: [
      {
        items: [{
          type: "DropDown",
          dropDownSettings: {
            content: "Header",
            iconCss: "e-icons e-header",
            items: [{ text: "Insert Header" }, { text: "Edit Header" }, { text: "Remove Header" }],
            close:(args) => {
              // Your required action here
            }
          }
        }
      ]
    }
  ]
}
```

```

}
}}
}}
}}
});
var ribbon = new ej.ribbon.Ribbon({ tabs: tabs });
ribbon.appendTo("#ribbon");
`

```

created

The [created](#) event is triggered when the DropDown is created.

```

`js
var tabs = [{
  header: "Home",
  groups: [{
    header: "Header & Footer",
    collections: [
      {
        items: [{
          type: "DropDown",
          dropDownSettings: {
            content: "Header",
            iconCss: "e-icons e-header",
            items: [{ text: "Insert Header" }, { text: "Edit Header" }, { text: "Remove Header" }],
            created:() => {
              // Your required action here
            }
          }
        }
      }
    ]
  }
}
}];
var ribbon = new ej.ribbon.Ribbon({ tabs: tabs });
ribbon.appendTo("#ribbon");
`

```

`

select

The [select](#) event is triggered while selecting an action item in the Dropdown button popup.

`js

```
var tabs = [{
  header: "Home",
  groups: [{
    header: "Header & Footer",
    collections: [
      {
        items: [{
          type: "DropDown",
          dropDownSettings: {
            content: "Header",
            iconCss: "e-icons e-header",
            items: [{ text: "Insert Header" }, { text: "Edit Header" }, { text: "Remove Header" }],
            select:(args) => {
              // Your required action here
            }
          }
        }
      ]
    }
  ]
}];

var ribbon = new ej.ribbon.Ribbon({ tabs: tabs });
ribbon.appendTo("#ribbon");
`
```

SplitButton item events

beforeClose

The [beforeClose](#) event is triggered before closing the SplitButton popup.

`js

```
var tabs = [{
  header: "Home",
  groups: [{
```

```

header: "Header & Footer",
collections: [
{
items: [{
type: "SplitButton",
splitButtonSettings: {
content: "Header",
iconCss: "e-icons e-header",
items: [{ text: "Insert Header" }, { text: "Edit Header" }, { text: "Remove Header" }],
beforeClose:(args) => {
// Your required action here
}
}
}]
}
}];
var ribbon = new ej.ribbon.Ribbon({ tabs: tabs });
ribbon.appendTo("#ribbon");

```

beforeOpen

The [beforeOpen](#) event is triggered before opening the SplitButton popup.

```

`js
var tabs = [{
header: "Home",
groups: [{
header: "Header & Footer",
collections: [
{
items: [{
type: "SplitButton",
splitButtonSettings: {
content: "Header",

```

```
iconCss: "e-icons e-header",
items: [{ text: "Insert Header" }, { text: "Edit Header" }, { text: "Remove Header" }],
beforeOpen:(args) => {
// Your required action here
}
}
}}
}}
}}
}};

var ribbon = new ej.ribbon.Ribbon({ tabs: tabs });
ribbon.appendTo("#ribbon");
\
```

beforeItemRender

The `beforeItemRender` event is triggered while rendering each popup item of SplitButton

```
js
var tabs = [{
  header: "Home",
  groups: [{
    header: "Header & Footer",
    collections: [
      {
        items: [{
          type: "SplitButton",
          splitButtonSettings: {
            content: "Header",
            iconCss: "e-icons e-header",
            items: [{ text: "Insert Header" }, { text: "Edit Header" }, { text: "Remove Header" }],
            beforeItemRender:(args) => {
              // Your required action here
            }
          }
        }
      }
    ]
  }
}]
```

```

    }}
  }}
  });
  var ribbon = new ej.ribbon.Ribbon({ tabs: tabs });
  ribbon.appendTo("#ribbon");
  ,

```

open

The [open](#) event is triggered while opening the SplitButton popup.

```

`js
var tabs = [{
  header: "Home",
  groups: [{
    header: "Header & Footer",
    collections: [
      {
        items: [{
          type: "SplitButton",
          splitButtonSettings: {
            content: "Header",
            iconCss: "e-icons e-header",
            items: [{ text: "Insert Header" }, { text: "Edit Header" }, { text: "Remove Header" }],
            open:(args) => {
              // Your required action here
            }
          }
        }
      ]
    }
  ]
}];
var ribbon = new ej.ribbon.Ribbon({ tabs: tabs });
ribbon.appendTo("#ribbon");
,

```

close

The [close](#) event is triggered while closing the SplitButton popup.

```

`js
var tabs = [{
  header: "Home",
  groups: [{
    header: "Header & Footer",
    collections: [
      {
        items: [{
          type: "SplitButton",
          splitButtonSettings: {
            content: "Header",
            iconCss: "e-icons e-header",
            items: [{ text: "Insert Header" }, { text: "Edit Header" }, { text: "Remove Header" }],
            close:(args) => {
              // Your required action here
            }
          }
        }
      ]
    }
  ]
}];

var ribbon = new ej.ribbon.Ribbon({ tabs: tabs });
ribbon.appendTo("#ribbon");

```

created

The [created](#) event is triggered when the SplitButton is created.

```

`js
var tabs = [{
  header: "Home",
  groups: [{
    header: "Header & Footer",
    collections: [
      {

```

```

items: [{
  type: "SplitButton",
  splitButtonSettings: {
    content: "Header",
    iconCss: "e-icons e-header",
    items: [{ text: "Insert Header" }, { text: "Edit Header" }, { text: "Remove Header" }],
    created:() => {
      // Your required action here
    }
  }
}]
});
var ribbon = new ej.ribbon.Ribbon({ tabs: tabs });
ribbon.appendTo("#ribbon");
`

```

select

The [select](#) event is triggered while selecting an action item in the SplitButton popup.

```

`js
var tabs = [{
  header: "Home",
  groups: [{
    header: "Header & Footer",
    collections: [
      {
        items: [{
          type: "SplitButton",
          splitButtonSettings: {
            content: "Header",
            iconCss: "e-icons e-header",
            items: [{ text: "Insert Header" }, { text: "Edit Header" }, { text: "Remove Header" }],
            select:(args) => {

```

```
// Your required action here
}
}
}}
}}
}}
}};
var ribbon = new ej.ribbon.Ribbon({ tabs: tabs });
ribbon.appendTo("#ribbon");
`
```

click

The [click](#) event is triggered while clicking the primary button in the SplitButton.

```
`js
var tabs = [{
  header: "Home",
  groups: [{
    header: "Header & Footer",
    collections: [
      {
        items: [{
          type: "SplitButton",
          splitButtonSettings: {
            content: "Header",
            iconCss: "e-icons e-header",
            items: [{ text: "Insert Header" }, { text: "Edit Header" }, { text: "Remove Header" }],
            click:(args) => {
              // Your required action here
            }
          }
        }
      ]
    }
  ]
}];
```

```
var ribbon = new ej.ribbon.Ribbon({ tabs: tabs });
ribbon.appendTo("#ribbon");
,
```

GroupButton item events

beforeClick

The [beforeClick](#) event is triggered before selecting a button from the groupbutton items.

```
`js
var tabs = [{
  header: "Home",
  groups: [{
    header: "Paragraph",
    collections: [
      {
        items: [{
          type: "GroupButton",
          allowedSizes: ej.ribbon.RibbonItemSize.Small,
          groupButtonSettings: {
            selection: ej.ribbon.RibbonGroupButtonSelection.Multiple,
            items: [{
              iconCss: 'e-icons e-bold',
              content: 'Bold',

        }]
      }
    ]
  }
}];

var menuItems = [
  { text: "New", iconCss: "e-icons e-file-new", id: "new" },

```

```

{ text: "Open", iconCss: "e-icons e-folder-open", id: "Open" },
{ text: "Rename", iconCss: "e-icons e-rename", id: "rename" },
{ text: "Save as", iconCss: "e-icons e-save", id: "save" }
];
var ribbon = new ej.ribbon.Ribbon({
  tabs: tabs,
  fileMenu: {
    menuItems: menuItems,
    visible: true,
    beforeOpen: (args) => {
      // Your required action here
    }
  }
});
ribbon.appendTo("#ribbon");
`

```

beforeItemRender

The [beforeItemRender](#) event is triggered while rendering each ribbon fileMenu item.

```

`js
var tabs = [{
  header: "Home",
  groups: [{
    header: "Clipboard",
    collections: [
      {
        items: [{
          type: "Button",
          buttonSettings: {
            content: "Cut",
            iconCss: "e-icons e-cut"
          }
        }]
      }
    ]
  }
}]
`

```

```

    }]
  });
  var menuItems = [
    { text: "New", iconCss: "e-icons e-file-new", id: "new" },
    { text: "Open", iconCss: "e-icons e-folder-open", id: "Open" },
    { text: "Rename", iconCss: "e-icons e-rename", id: "rename" },
    { text: "Save as", iconCss: "e-icons e-save", id: "save" }
  ];
  var ribbon = new ej.ribbon.Ribbon({
    tabs: tabs,
    fileMenu: {
      menuItems: menuItems,
      visible: true,
      beforeItemRender: (args) => {
        // Your required action here
      }
    }
  });
  ribbon.appendTo("#ribbon");
  `

```

open

The [open](#) event is triggered when the fileMenu popup is opened.

```

`js
var tabs = [{
  header: "Home",
  groups: [{
    header: "Clipboard",
    collections: [
      {
        items: [{
          type: "Button",
          buttonSettings: {
            content: "Cut",

```

```

iconCss: "e-icons e-cut"
}
}}
}}
}};
var menuItems = [
{ text: "New", iconCss: "e-icons e-file-new", id: "new" },
{ text: "Open", iconCss: "e-icons e-folder-open", id: "Open" },
{ text: "Rename", iconCss: "e-icons e-rename", id: "rename" },
{ text: "Save as", iconCss: "e-icons e-save", id: "save" }
];
var ribbon = new ej.ribbon.Ribbon({
  tabs: tabs,
  fileMenu: {
    menuItems: menuItems,
    visible: true,
    open: (args) => {
      // Your required action here
    }
  }
});
ribbon.appendTo("#ribbon");

```

close

The [close](#) event is triggered when the fileMenu popup is closed.

```

`js
var tabs = [{
  header: "Home",
  groups: [{
    header: "Clipboard",
    collections: [
      {

```

```

items: [{
  type: "Button",
  buttonSettings: {
    content: "Cut",
    iconCss: "e-icons e-cut"
  }
}]
});

var menuItems = [
  { text: "New", iconCss: "e-icons e-file-new", id: "new" },
  { text: "Open", iconCss: "e-icons e-folder-open", id: "Open" },
  { text: "Rename", iconCss: "e-icons e-rename", id: "rename" },
  { text: "Save as", iconCss: "e-icons e-save", id: "save" }
];

var ribbon = new ej.ribbon.Ribbon({
  tabs: tabs,
  fileMenu: {
    menuItems: menuItems,
    visible: true,
    close: (args) => {
      // Your required action here
    }
  }
});

ribbon.appendTo("#ribbon");

```

select

The [select](#) event is triggered while selecting an item in the ribbon fileMenu.

```
`js
```

```

var tabs = [{
  header: "Home",

```

```

groups: [{
  header: "Clipboard",
  collections: [
    {
      items: [{
        type: "Button",
        buttonSettings: {
          content: "Cut",
          iconCss: "e-icons e-cut"
        }
      }]
    }
  ]
}];

var menuItems = [
  { text: "New", iconCss: "e-icons e-file-new", id: "new" },
  { text: "Open", iconCss: "e-icons e-folder-open", id: "Open" },
  { text: "Rename", iconCss: "e-icons e-rename", id: "rename" },
  { text: "Save as", iconCss: "e-icons e-save", id: "save" }
];

var ribbon = new ej.ribbon.Ribbon({
  tabs: tabs,
  fileMenu: {
    menuItems: menuItems,
    visible: true,
    select: (args) => {
      // Your required action here
    }
  }
});

ribbon.appendTo("#ribbon");

```

Backstage view events

backStageItemClick

The [backStageItemClick](#) event is triggered when backstage item is selected.

```
`js
var tabs = [{
  header: "Home",
  groups: [{
    header: "Clipboard",
    collections: [
      {
        items: [{
          type: "Button",
          buttonSettings: {
            content: "Cut",
            iconCss: "e-icons e-cut"
          }
        }]
      }
    ]
  }]
}];

var ribbon = new ej.ribbon.Ribbon({
  tabs: tabs,
  backstageMenu: {
    items: [
      {
        id: 'home',
        text: 'Home',
        iconCss: 'e-icons e-home',
        content: '#homeContent',
        backStageItemClick: (args) => {
          // Your required action here
        }
      }
    ],
  },
});
```

```

visible: true,
backButton: { text: 'Close' }
}
});
ribbon.appendTo("#ribbon");
`

```

RichTextEditor

Getting started in EJ2 JavaScript Rich text editor control

The Essential JS 2 for JavaScript (global script) is an ES5 formatted pure JavaScript framework which can be directly used in latest web browsers.

Component Initialization

The Essential JS 2 JavaScript components can be initialized by using either of the following ways.

- Using local script and style references in a HTML page.
- Using CDN link for script and style reference.

Using local script and style references in a HTML page

Step 1: Create an app folder `myapp` for Essential JS 2 JavaScript components.

Step 2: You can get the global scripts and styles from the [Essential Studio JavaScript \(Essential JS 2\)](#) build installed location.

Syntax:

Script: `(installed location)/Syncfusion/Essential Studio/{RELEASEVERSION}/Essential JS 2/{PACKAGENAME}/dist/global/{PACKAGE_NAME}.min.js`

Styles: `(installed location)/Syncfusion/Essential Studio/{RELEASEVERSION}/Essential JS 2/{PACKAGENAME}/styles/material.css`

Example:

Script: `C:/Program Files (x86)/Syncfusion/Essential Studio/15.4.30/Essential JS 2/ej2-richtexteditor/dist/global/ej2-richtexteditor.min.js`

Styles: `C:/Program Files (x86)/Syncfusion/Essential Studio/15.4.30/Essential JS 2/ej2-richtexteditor/styles/material.css`

Step 3: Create a folder `myapp/resources` and copy/paste the global scripts and styles from the above installed location to `myapp/resources` location.

Step 4: Create a HTML page (index.html) in `myapp` location and add the Essentials JS 2 script and style references.

```
`html
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<title>Essential JS 2 Rich Text Editor</title>
<!-- Essential JS 2 material theme -->
<link href="resources/material.css" rel="stylesheet" type="text/css"/>
<!-- Essential JS 2 Rich Text Editor's global script -->
<script src="resources/ej2-richtexteditor.min.js" type="text/javascript"></script>
</head>
<body>
</body>
</html>
`
```

Step 5: Now, add the `textarea` element and initiate the `Essential JS 2 Rich Text Editor` component in the `index.html` by using following code

```
`html
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<title>Essential JS 2 Rich Text Editor</title>
<!-- Essential JS 2 material theme -->
<link href="resources/material.css" rel="stylesheet" type="text/css"/>
<!-- Essential JS 2 Rich Text Editor's global script -->
<script src="resources/ej2-richtexteditor.min.js" type="text/javascript"></script>
</head>
<body>
<!--Element which will render as RTE-->
<textarea id="defaultRTE">
</textarea>
<script>
// initialize Rich Text Editor component
var RichTextEditor = new ej.richtexteditor.RichTextEditor();
```

```
// Render initialized Rich Text Editor.
RichTextEditor.appendTo('#defaultRTE');
</script>
</body>
</html>
`
```

Step 6: Now, run the `index.html` in web browser, it will render the **Essential JS 2 Rich Text Editor** component.

Using CDN link for script and style reference

Step 1: Create an app folder `myapp` for the Essential JS 2 JavaScript components.

Step 2: The Essential JS 2 component's global scripts and styles are already hosted in the below CDN link formats.

Syntax:

Script: `http://cdn.syncfusion.com/ej2/{PACKAGENAME}/dist/global/{PACKAGENAME}.min.js`

Styles: `http://cdn.syncfusion.com/ej2/{PACKAGE_NAME}/styles/material.css`

Example:

Script: <http://cdn.syncfusion.com/ej2/ej2-richtexteditor/dist/global/ej2-richtexteditor.min.js>

Styles: <http://cdn.syncfusion.com/ej2/ej2-richtexteditor/styles/material.css>

Step 3: Create a HTML page (`index.html`) in `myapp` location and add the CDN link references. Now, add the `textarea` element and initiate the **Essential JS 2 Rich Text Editor** component in the `index.html` by using following code.

```
`html
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<title>Essential JS 2 Rich Text Editor</title>
<!-- Essential JS 2 material theme -->
<link href="http://cdn.syncfusion.com/ej2/ej2-base/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-richtexteditor/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-buttons/styles/material.css" rel="stylesheet"
type="text/css"/>
```

```

<link href="http://cdn.syncfusion.com/ej2/ej2-inputs/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-lists/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-navigations/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-popups/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-splitbuttons/styles/material.css" rel="stylesheet"
type="text/css"/>
<!-- Essential JS 2 Rich Text Editor's global script -->
<script src="http://cdn.syncfusion.com/ej2/ej2-richtexteditor/dist/global/ej2-richtexteditor.min.js"
type="text/javascript"></script>
</head>
<body>
<!--Element which will render as RTE-->
<textarea id="defaultRTE">
</textarea>
<script>
// initialize Rich Text Editor component
var RichTextEditor = new ej.richtexteditor.RichTextEditor();
// Render initialized Rich Text Editor.
RichTextEditor.appendTo('#defaultRTE')
</script>
</body>
</html>

```

Step 4: Now, run the `index.html` in web browser, it will render the **Essential JS 2 Rich Text Editor** component.

Initialize from textarea

Initialize the Rich Text Editor on a textarea.

Now, add an HTML textarea element to act as the Rich Text Editor element in `index.html` using the following code.

```
[src/index.html]
```

```
`html
<!DOCTYPE html>
```

```

<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<title>Essential JS 2</title>
<!-- Essential JS 2 material theme -->
<link href="http://cdn.syncfusion.com/ej2/ej2-base/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-richtexteditor/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-buttons/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-inputs/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-lists/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-navigations/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-popups/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-splitbuttons/styles/material.css" rel="stylesheet"
type="text/css"/>
<!-- Essential JS 2 Rich Text Editor's global script -->
<script src="http://cdn.syncfusion.com/ej2/ej2-richtexteditor/dist/global/ej2-richtexteditor.min.js"
type="text/javascript"></script>
</head>
<body>
<!--Element which will render as RTE-->
<textarea id="defaultRTE"></textarea>
</body>
</html>
`

```

Place the following Rich Text Editor code in the `index.js` file.

```

[src/index.js]
`javascript
// initialize Rich Text Editor component
var defaultRTE = new ej.richtexteditor.RichTextEditor({});
// render initialized Rich Text Editor

```

```
defaultRTE.appendTo("#defaultRTE");
```

```
,
```

Output will be displayed as follows

INDEX.JS

```
// initialize Rich Text Editor component
var defaultRTE = new ej.richtexteditor.RichTextEditor({});
// render initialized Rich Text Editor
defaultRTE.appendTo("#defaultRTE");
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 Rich Text Editor</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">

type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <textarea id="defaultRTE"></textarea>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
```

```
</body></html>
```

Initialize from ` ` element

Rich Text Editor can be initialized on div element as shown below

[src/index.html]

```
`html
<!DOCTYPE html>
<html lang="en">
<head>
<title>Essential JS 2 Rich Text Editor</title>
<!-- Essential JS 2 material theme -->
<link href="http://cdn.syncfusion.com/ej2/ej2-base/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-richtexteditor/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-buttons/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-inputs/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-lists/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-navigations/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-popups/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-splitbuttons/styles/material.css" rel="stylesheet"
type="text/css"/>
<!-- Essential JS 2 Rich Text Editor's global script -->
<script src="http://cdn.syncfusion.com/ej2/ej2-richtexteditor/dist/global/ej2-richtexteditor.min.js"
type="text/javascript"></script>
</head>
<body>
<!--Element which will render as RTE-->
<div id="defaultRTE">
<p>The Rich Text Editor component is WYSIWYG ("what you see is what you get") editor that provides
the best user experience to create and update the content.Users can format their content using
standard toolbar commands.</p>
```

```

<p><b>Key features:</b></p>
<ul><li><p>Provides IFRAME and DIV modes</p></li>
<li><p>Capable of handling markdown editing.</p></li>
<li><p>Contains a modular library to load the necessary functionality on demand.</p></li>
<li><p>Provides a fully customizable toolbar.</p></li>
<li><p>Provides HTML view to edit the source directly for developers.</p></li>
<li><p>Supports third-party library integration.</p></li>
<li><p>Allows preview of modified content before saving it.</p></li>
<li><p>Handles images, hyperlinks, video, hyperlinks, uploads, etc.</p></li>
</ul>
</div>
<script>
// initialize Rich Text Editor component
var RichTextEditor = new ej.richtexteditor.RichTextEditor({
height: '340px'
});
// Render initialized Rich Text Editor.
RichTextEditor.appendTo('#defaultRTE')
</script>
</body>
</html>
`

```

Initialize from `<IFRAME>` element

The Rich Text Editor's content is placed in an iframe and isolated from the rest of the page.

Initialize the Rich Text Editor on div element and set the `enable` field of `iframeSettings` property to true.

```
[src/index.html]
```

```

`html
<!DOCTYPE html>
<html lang="en">
<head>
<title>Essential JS 2 Rich Text Editor</title>

  }
});
// Render initialized Rich Text Editor.
RichTextEditor.appendTo('#defaultRTE')
</script>
</body>
</html>
`
```

Module Injection

To create Rich Text Editor with additional features, inject the required modules. The following modules are used to extend Rich Text Editor's basic functionality.

- **Toolbar** - Inject this module to use Toolbar feature.
- **Link** - Inject this module to use link feature in Rich Text Editor.
- **Image** - Inject this module to use image feature in Rich Text Editor.
- **Table** - Inject this module to use table feature in Rich Text Editor.
- **Count** - Inject this module to use character count in Rich Text Editor.
- **HtmlEditor** - Inject this module to use Rich Text Editor as html editor.
- **MarkdownEditor** - Inject this module to use Rich Text Editor as markdown editor.
- **QuickToolbar** - Inject this module to use quick toolbar feature for the target element.
- **Resize** - Inject this module to use resize feature in Rich Text Editor.
- **FileManager** - Inject this module to use file browser feature in Rich Text Editor.
- **PasteCleanup** - Inject this module to use paste cleanup feature in Rich Text Editor.
- **FormatPainter** - Inject this module to use format painter feature in Rich Text Editor.
- **EmojiPicker** - Inject this module to use emoji picker feature in Rich Text Editor.

These modules should be injected into the Rich Text Editor using the **RichTextEditor.Inject** method.

Configure the Toolbar

Configure the toolbar with the tools using items field of the [toolbarSettings](#) property as your application requires.

INDEX.JS

```
// initialize Rich Text Editor component
var defaultRTE = new ej.richtexteditor.RichTextEditor({toolbarSettings: {
  items: ['Bold', 'Italic', 'Underline', 'StrikeThrough',
    'FontName', 'FontSize', 'FontColor', 'BackgroundColor',
    'LowerCase', 'UpperCase', '|'],
```

```

        'Formats', 'Alignments', 'OrderedList', 'UnorderedList',
        'Outdent', 'Indent', '|',
        'CreateLink', 'Image', '|', 'ClearFormat', 'Print',
        'SourceCode', 'FullScreen', '|', 'Undo', 'Redo']
    });
    // render initialized Rich Text Editor
    defaultRTE.appendTo('#defaultRTE');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

| and **-** can insert a vertical and horizontal separator lines in the toolbar.

Insert images and links

The [image](#) module inserts an image into Rich Text Editor's content area, and the [link](#) module links external resources such as website URLs, to selected text in the Rich Text Editor's content, respectively.

The link inject module adds a link icon to the toolbar and the image inject module adds an image icon to the toolbar.

Specifies the items to be rendered in the quick toolbar based on the target element such image, link and text element. The quick toolbar opens to customize the element by clicking the target element.

INDEX.JS

```

// initialize Rich Text Editor component
var defaultRTE = new ej.richtexteditor.RichTextEditor({
    //Define the quicktoolbar items for image
    quickToolbarSettings: {
        image: [
            'Replace', 'Align', 'Caption', 'Remove', 'InsertLink',
            'OpenImageLink', '-',
            'EditImageLink', 'RemoveImageLink', 'Display', 'AltText',
            'Dimension'
        ],
    },

```

Retrieve the formatted content

To retrieve the editor contents, use [value](#) property of Rich Text Editor.

```
`ts
```

```
var rteValue = defaultRTE.value;
```

```
,
```

Or, you can use the public method, [getHtml](#) to retrieve the Rich Text Editor content.

```
`ts
```

```
var rteValue = defaultRTE.getHtml();
```

```
,
```

To fetch the Rich Text Editor's text content, use [getText](#) method of Rich Text Editor.

```
`ts
```

```
var rteValue = defaultRTE.getText();
```

```
,
```

Retrieve the number of characters in the Rich Text Editor

To get the maximum number of characters in the Rich Text Editor's content, use [getCharCount](#)

```
`ts
```

```
let rteCount: number = defaultRTE.getCharCount();
```

You can refer to our [JavaScript Rich Text Editor](#) feature tour page for its groundbreaking feature representations. You can also explore our [JavaScript Rich Text Editor example](#) that shows how to render the rich text editor tools.

Editor modes in EJ2 JavaScript Rich text editor control

The Rich Text Editor component used to create and edit the content and return valid HTML markup or markdown (MD) of the content. It supports the following two editing formation.

- HTML Editor
- Markdown Editor

HTML editor

Rich Text Editor is a WYSIWYG editing control for formatting the word content as HTML.

The HTML editing mode is the default mode in Rich Text Editor to format the content through the available toolbar items to return the valid HTML markup. Set the [editorMode](#) property as **HTML**.

To create Rich Text Editor with HTML editing feature, inject the [htmleditor](#) module to the Rich Text Editor using the `RichTextEditor.Inject(HtmlEditor)` method.

INDEX.TS

```
import { RichTextEditor, Toolbar, Link, Image, HtmlEditor } from
 '@syncfusion/ej2-richtexteditor';
RichTextEditor.Inject(Toolbar, Link, Image, HtmlEditor);
// initialize RichTextEditor component
let defaultRTE: RichTextEditor = new RichTextEditor({
  value: `

The Rich Text Editor component is WYSIWYG ("what you see is
what you get") editor that provides the best user experience to create and
update the content.Users can format their content using standard toolbar
commands.</p>
  <p><b>Key features:</b></p>

Toolbar in EJ2 JavaScript Rich text editor control

The Rich Text Editor toolbar contains a collection of tools such as bold, italic, and text alignment buttons that are used to format the content. However, in most integrations, you can customize the toolbar configurations easily to suit your needs.

To create Rich Text Editor with Markdown editing feature, inject the [Toolbar](#) module to the Rich Text Editor using the `RichTextEditor.Inject(Toolbar)` method.

The Rich Text Editor allows you to configure different types of toolbar using [toolbarSettings.type](#) property. The types of toolbar are:

1. Expand

2. MultiRow

Expand Toolbar

The default mode of [toolbarSettings.type](#) it will hide the overflowing items in the next row. By clicking the expand arrow, view the overflowing toolbar items.

INDEX.TS

```
import { RichTextEditor, Toolbar, HtmlEditor } from '@syncfusion/ej2-richtexteditor';
RichTextEditor.Inject(Toolbar, HtmlEditor);
let defaultRTE: RichTextEditor = new RichTextEditor({
    height: 340,
    value: `<p>The Rich Text Editor component is WYSIWYG ("what you see is what you get") editor that provides the best user experience to create and update the content.Users can format their content using standard toolbar commands.</p>

Floating Toolbar

By default, toolbar is float at the top of the Rich Text Editor on scrolling. It can be customized by specifying the offset of the floating toolbar from documents top position using [floatingToolbarOffset](#).

Enable or disable the floating toolbar using [enableFloating](#) of the [toolbarSettings](#) property.

INDEX.TS

```
import { RichTextEditor, Toolbar, HtmlEditor } from '@syncfusion/ej2-richtexteditor';
import { CheckBox, ChangeEventArgs } from '@syncfusion/ej2-buttons';
RichTextEditor.Inject(Toolbar, HtmlEditor);
let defaultRTE: RichTextEditor = new RichTextEditor({
  height: 340,
  toolbarSettings: {
    enableFloating: false
  },
  value: `<p>The Rich Text Editor component is WYSIWYG ("what you see is what you get") editor that provides the best user experience to create and update the content.Users can format their content using standard toolbar commands.</p>
  <p><b>Key features:</b></p>
  <ul><li><p>Provides &#60;IFRAME&#62; and &#60;DIV&#62; modes</p></li>

Toolbar items

The following table lists the tools available in the toolbar.

Name	Icons	Summary	Initialization
Undo		Allows to undo the actions.	toolbarSettings: { items: ['Undo']}
Redo		Allows to redo the actions.	toolbarSettings: { items: ['Redo']}
Alignment		Align the content with left, center, and right margin.	toolbarSettings: { items: ['Alignments']}

	OrderedList		Create a new list item(numbered). toolbarSettings: { items: ['OrderedList']}
	UnorderedList		Create a new list item(bulleted). toolbarSettings: { items: ['UnorderedList']}
	Indent		Allows to increase the indent level of the content. toolbarSettings: { items: ['Indent']}
	Outdent		Allows to decrease the indent level of the content. toolbarSettings: { items: ['Outdent']}
	Hyperlink		Creates a hyperlink to a text or image to a specific location in the content. toolbarSettings: { items: ['CreateLink']}
	Images		Inserts an image from an online source or local computer. toolbarSettings: { items: ['Image']}
	LowerCase		Change the case of selected text to lower in the content. toolbarSettings: { items: ['LowerCase']}
	UpperCase		Change the case of selected text to upper in the content. toolbarSettings: { items: ['UpperCase']}
	SubScript		Makes the selected text as subscript (lower). toolbarSettings: { items: ['SubScript']}
	SuperScript		Makes the selected text as superscript (higher). toolbarSettings: { items: ['SuperScript']}
	Print		Allows to print the editor content. toolbarSettings: { items: ['Print']}
	FontName		Defines the fonts that appear under the Font Family DropDownList from the Rich Text Editor's toolbar. toolbarSettings: { items: ['FontName']}
	FontSize		Defines the font sizes that appear under the Font Size DropDownList from the Rich Text Editor's toolbar. toolbarSettings: { items: ['FontSize']}
	FontColor		Specifies an array of colors can be used in the colors popup for font color. toolbarSettings: { items: ['FontColor']}
	BackgroundColor		Specifies an array of colors can be used in the colors popup for background color. toolbarSettings: { items: ['BackgroundColor']}
	Format		An Object with the options that will appear in the Paragraph Format dropdown from the toolbar. toolbarSettings: { items: ['Formats']}
	StrikeThrough		Apply double line strike through formatting for the selected text. toolbarSettings: { items: ['StrikeThrough']}

| ClearFormat |  | The clear format tool is useful to remove all formatting styles (such as bold, italic, underline, color, superscript, subscript, and more) from currently selected text. As a result, all the text formatting will be cleared and return to its default formatting styles. | toolbarSettings: { items: ['ClearFormat']} |

| FullScreen |  | Stretches the editor to the maximum width and height of the browser window. | toolbarSettings: { items: ['FullScreen']} |

| SourceCode |  | Rich Text Editor includes the ability for users to directly edit HTML code via “Source View”. If you made any modification in Source view directly, synchronize with Design view. | toolbarSettings: { items: ['SourceCode']} |

| NumberFormatList |  | Allows to create list items with various list style types(numbered). | toolbarSettings: { items: ['NumberFormatList']} |

| BulletFormatList |  | Allows to create list items with various list style types(bulleted). | toolbarSettings: { items: ['BulletFormatList']} |

| JustifyLeft |  | Allows each line to begin at the same distance from the editor’s left-hand side. | toolbarSettings: { items: ['JustifyLeft']} |

| JustifyCenter |  | There is an even space on each side of each line since the text is not aligned to the left or right margins. | toolbarSettings: { items: ['JustifyCenter']} |

| JustifyRight |  | Allows each line to end at the same distance from the editor’s right-hand side. | toolbarSettings: { items: ['JustifyRight']} |

| JustifyFull |  | The text is aligned with both right and left margins. | toolbarSettings: { items: ['JustifyFull']} |

| Bold |  | Text that is thicker and darker than usual. | toolbarSettings: { items: ['Bold']} |

| Italic |  | Shows a text that is leaned to the right. | toolbarSettings: { items: ['Italic']} |

| Underline |  | The underline is added to the selected text. | toolbarSettings: { items: ['Underline']} |

| ClearAll |  | Removes all styles that have been applied to the selected text. | toolbarSettings: { items: ['ClearAll']} |

| Cut |  | Removes the text from its current location and places it into the clipboard. | toolbarSettings: { items: ['Cut']} |

| Copy |  | The selected item is copied and pasted into the clipboard. | toolbarSettings: { items: ['Copy']} |

| Paste |  | Allows you to insert a clipboard item into a specific location. | toolbarSettings: { items: ['Paste']} |

| OpenLink |  | To open the URL link that is attached to the selected text. | toolbarSettings: { items: ['OpenLink']} |

| EditLink |  | Allows you to change the URL that has been attached to a specific item. | toolbarSettings: { items: ['EditLink']} |

| CreateTable |  | Create a table with defined columns and rows. | toolbarSettings: { items: ['CreateTable']} |

| RemoveTable |  | Removes the selected table and its contents. | toolbarSettings: { items: ['TableRemove']} |

| Replace |  | Replace the selected image with another image. | toolbarSettings: { items: ['Replace']} |

| Align |  | The image can be aligned to the right, left, or center. | toolbarSettings: { items: ['Align']} |

| Remove |  | Allows to remove the selected image from the editor. | toolbarSettings: { items: ['Remove']} |

| OpenImageLink |  | Opens the link that is attached to the selected image. | toolbarSettings: { items: ['OpenImageLink']} |

| EditImageLink |  | Allows to edit the link that is attached to the selected image. | toolbarSettings: { items: ['EditImageLink']} |

| RemoveImageLink |  | Removes the link that is attached to the selected image. | toolbarSettings: { items: ['RemoveImageLink']} |

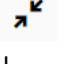

| InsertLink |  | Allows users to add a link to a particular item. | toolbarSettings: { items: ['InsertLink']} |

| Display |  | Allows you to choose whether an image should be shown inline or as a block. | toolbarSettings: { items: ['Display']} |

| AltText |  | To display image description when an image on a Web page cannot be displayed. | toolbarSettings: { items: ['AltText']} |

| Dimension |  | Allows you to customize the image's height and width. | toolbarSettings: { items: ['Dimension']} |

| Maximize |  | Stretches the editor to the maximum width and height of the browser window. | toolbarSettings: { items: ['Maximize']} |

| Minimize |  | Shrinks the editor to the default width and height. | toolbarSettings: { items: ['Minimize']} |

| Preview |  | Allows to see how the editor's content looks in a browser. | toolbarSettings: { items: ['Preview']} |

| InsertCode |  | Represents preformatted text which is to be presented exactly as written in the HTML file. | toolbarSettings: { items: ['InsertCode']} |

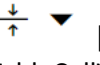

| RemoveLink |  | Allows you to remove the applied link from the selected item. | toolbarSettings: { items: ['RemoveLink']} |

| TableHeader |  | Allows you to add a table header. | toolbarSettings: { items: ['TableHeader']} |

| TableColumns |  | Shows the dropdown to insert a column or delete the selected column. | toolbarSettings: { items: ['TableColumns']} |

| TableRows |  | Shows the dropdown to insert a row or delete the selected row. | toolbarSettings: { items: ['TableRows']} |

| TableCellHorizontalAlign |  | Allows the table cell content to be aligned horizontally. | toolbarSettings: { items: ['TableCellHorizontalAlign']} |

| TableCellVerticalAlign |  | Allows the table cell content to be aligned vertically. | toolbarSettings: { items: ['TableCellVerticalAlign']} |

| TableEditProperties |  | Allows you to change the table width, padding, and cell spacing styles. | toolbarSettings: { items: ['TableEditProperties']} |

Note: The Paste toolbar button action will not work and the clipboard will be restricted due to some limitations in the browser. Pasting copied contents into the Rich Text Editor can be done by using the Ctrl+V keyboard command.

By default, tools will be arranged in following order.

```
items: ['Bold', 'Italic', 'Underline', '|', 'Formats', 'Alignments', 'OrderedList', 'UnorderedList', '|', 'CreateLink', 'Image', '|', 'SourceCode', 'Undo', 'Redo']
```

The tools order can be customized as per application requirement. If you are not specifying any tools order, the editor will create the toolbar with default items.

Custom tool

The Rich Text Editor allows you to configure your own commands to its toolbar using the [toolbarSettings](#) property. The command can be plain text, icon, or HTML template. The order and the group can also be defined where the command should be included. Bind the action to the command by getting its instance.

This sample shows how to add your own commands to the toolbar of the Rich Text Editor. The "Ω" command is added to insert special characters in the editor. By clicking the "Ω" command, it will show the special characters list, and then choose the character to be inserted in the editor.

The following code snippet illustrates custom tool with tooltip text which will be included in [items](#) field of the [toolbarSettings](#) property.

In the following sample, once Rich Text Editor control is created, the concern event will be [created](#) the Dialog component can be rendered and target as RTE content.

```
`javascript
{
  tooltipText: 'Insert Symbol',
  undo: true,
  click: function() {
  },
  template: '<button class="e-tbar-btn e-btn" tabindex="-1" id="custom_tbar" style="width:100%"><div
class="e-tbar-btn-text" style="font-weight: 500;"> &#937;</div></button>'
}
`
```

Click the Ω command to show the special characters list, and then choose the character to be inserted in the editor.

</style>
<script>
var ele = document.getElementById('container');
if(ele) {
ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

The focus will be lost while rendering the required component for the custom toolbar, causing it to render outside the Rich Text Editor and triggering a blur event. During that time, proper functionality will not be achievable. Therefore, it is recommended to set the cssClass property or class as `e-rte-elements` in the dependency component.

Quick inline toolbar

Quick commands are opened as context-menu on clicking the corresponding element. The commands must be passed as string collection to image, text, and link attributes of the [quickToolbarSettings](#) property.

| Target Element | Default Quick Toolbar items |

|-----|-----|

| image | 'Replace', 'Align', 'Caption', 'Remove', 'InsertLink', 'Display', 'AltText', 'Dimension'. |

| link | 'Open', 'Edit', 'UnLink'. |

| text | null
 (Any toolbar [items](#) in the Rich Text Editor can be configured here). |

| table | 'TableHeader', 'TableRows', 'TableColumns', 'BackgroundColor', 'TableRemove', 'Alignments', 'TableCellVerticalAlign', 'Styles'. |

Custom tool can be added to the corresponding quick toolbar, using [quickToolbarSettings](#) property.

The following sample demonstrates the option to insert the image to the Rich Text Editor content as well as option to rotate the image through the quick toolbar. The image rotation functionalities have been achieved through the [toolbarClick](#) event.

INDEX.TS

```
import { RichTextEditor, Toolbar, Link, Image, HtmlEditor, QuickToolbar }
from '@syncfusion/ej2-richtexteditor';
RichTextEditor.Inject(Toolbar, Link, Image, HtmlEditor, QuickToolbar);
let defaultRTE: RichTextEditor = new RichTextEditor({
  height: 340,
  quickToolbarSettings: {
    image: [
      'Replace', 'Align', 'Caption', 'Remove', 'InsertLink',
      'OpenImageLink', '-',
      'EditImageLink', 'RemoveImageLink', 'Display', 'AltText',
      'Dimension'
    ]
  },
  toolbarSettings: {
    items: ['Bold', 'Italic', 'Underline', 'StrikeThrough',
      'FontName', 'FontSize', 'FontColor', 'BackgroundColor',
      'LowerCase', 'UpperCase', '|',
      'Formats', 'Alignments', 'OrderedList', 'UnorderedList',
      'Outdent', 'Indent', '|',
      'CreateLink', 'Image', '|', 'ClearFormat', 'Print',
      'SourceCode', 'FullScreen', '|', 'Undo', 'Redo']
  }
});
defaultRTE.appendTo('#defaultRTE');
```

Inline mode in EJ2 JavaScript Rich text editor control

This is the inline example for the Rich Text Editor. For this you must set the [inlineMode](#) property.

Inline edition allows you to select any editable element or click the element on the page and edit it in-place.

Inline editing is a true WYSIWYG formation and on the contrary to Rich Text Editor HTML/MD editing, the styles that are used for edited content comes directly from the document stylesheet. This means that inline editors ignore the default Rich Text Editor content styles.

Show on select/click

Enabling the [onSelection](#) option of [inlineMode](#) makes the inline Rich Text Editor to appear. You can select the text in the editable area otherwise the inline Rich Text Editor will be appear once click into the editable area.

INDEX.TS

```
import { RichTextEditor, Toolbar, HtmlEditor, QuickToolbar } from
 '@syncfusion/ej2-richtexteditor';
RichTextEditor.Inject(Toolbar, HtmlEditor, QuickToolbar);
let defaultRTE: RichTextEditor = new RichTextEditor({
  inlineMode: {
    enable: true,
    onSelection: true
  }
});
defaultRTE.appendTo('#defaultRTE');
```

Paste cleanup in EJ2 JavaScript Rich text editor control

The Rich Text Editor allows you to reduce the effort while converting the Microsoft Word content to HTML format with format and styles.

MS Word to HTML

By default, Rich Text Editor consider the following processes on paste content from Microsoft Word.

List conversion: The list elements copied from the Microsoft Word document contains paragraph tags with styles and classes. The list elements are converted to standard HTML list elements by referring the styles and class names in the paragraph tags.

Converting style: The styles of the elements copied from the Microsoft Word document are converted to standard CSS styles and added as inline styles for each respective element.

Tags and comments: The Microsoft Word specific XML tags and comments are removed when cleanup on paste.

Paste cleanup

You can control the formatting and styles on pasting the content to the editor using the `pasteCleanup` settings property. The following settings are available to clean up the content:

API	Description	Default Value	Type
<code>prompt</code>	To invoke prompt dialog with paste options on pasting the content in editor.	false	boolean
<code>plainText</code>	To paste the content as plain text.	false	boolean
<code>keepFormat</code>	To keep the same format with copied content.	true	boolean
<code>deniedTags</code>	To ignore the tags when pasting HTML content.	null	string[]
<code>deniedAttrs</code>	To paste the content by filtering out these attributes from the content.	null	string[]
<code>allowedStyleProps</code>	To paste the content by accepting these style attributes and removing other style attributes.	['background', 'background-color', 'border', 'border-bottom', 'border-left', 'border-radius', 'border-right', 'border-style', 'border-top', 'border-width', 'clear', 'color', 'cursor', 'direction', 'display', 'float', 'font', 'font-family', 'font-size', 'font-weight', 'font-style', 'height', 'left', 'line-height', 'margin', 'margin-top', 'margin-left', 'margin-right', 'margin-bottom', 'max-height', 'max-width', 'min-height', 'min-width', 'overflow', 'overflow-x', 'overflow-y', 'padding', 'padding-bottom', 'padding-left', 'padding-right', 'padding-top', 'position', 'right', 'table-layout', 'text-align', 'text-decoration', 'text-indent', 'top', 'vertical-align', 'visibility', 'white-space', 'width']	string[]

Rich Text Editor features are segregated into individual feature-wise modules. To use paste cleanup, inject paste cleanup module using the `RichTextEditor.Inject(PasteCleanup)`.

Prompt dialog

When `prompt` is set to true, pasting the content in the editor will open a dialog box that contains three options `Keep`, `Clean`, and `Plain Text` as radio buttons:

1. **Keep**: Radio button to keep the same format with copied content.
2. **Clean**: Radio button to clear all the style formats with copied content.
3. **Plain Text**: Radio button to paste the copied content as plain text without any formatting or style (including the removal of all tags).

When `prompt` value is set true, the API properties `plainText` and `keepFormat` will not be considered for processing when pasting the content.

Paste as plain text

When `plainText` is set to true, the copied content will be converted as plain text by removing all the HTML tags and styles applied to it and only the plain text is pasted in the editor.

When `plainText` value is set true, the API property `prompt` should be set to false, and `keepFormat` will not be considered for processing when pasting the content.

Keep format

When `keepFormat` is set to true, the copied content will maintain all the style formatting allowed in the `allowedStyleProps` on pasting the content in the editor.

When `keepFormat` is set to false, the style in the copied content will be removed without considering the allowed styles in the `allowedStyleProps` when pasting the content in the editor.

When `keepFormat` value is set true, the API property [prompt](#) and [plainText](#) should be set to false.

Denied tags

When `deniedTags` values are set, the tags that matches the 'denied tags' list will be removed on pasting the copied content in the editor. For Example,

1. `'a'`: Paste the content by filtering out anchor tags.
2. `'a[!href]'`: Paste the content by filtering out anchor tags that do not have the 'href' attribute.
3. `'a[href, target]'`: Paste the content by filtering out anchor tags that have the 'href' and 'target' attributes.

Denied attributes

When the `deniedAttrs` values are set, the attributes that matches the 'denied attributes' list will be removed on pasting the copied content in the editor. For Example,

`'id', 'title'`: This will remove the attributes 'id' and 'title' from all tags.

Allowed style properties

By default, the following basic styles are allowed on pasting the content to the editor.

`['background', 'background-color', 'border', 'border-bottom', 'border-left', 'border-radius', 'border-right', 'border-style', 'border-top', 'border-width', 'clear', 'color', 'cursor', 'direction', 'display', 'float', 'font', 'font-family', 'font-size', 'font-weight', 'font-style', 'height', 'left', 'line-height', 'margin', 'margin-top', 'margin-left', 'margin-right', 'margin-bottom', 'max-height', 'max-width', 'min-height', 'min-width', 'overflow', 'overflow-x', 'overflow-y', 'padding', 'padding-bottom', 'padding-left', 'padding-right', 'padding-top', 'position', 'right', 'table-layout', 'text-align', 'text-decoration', 'text-indent', 'top', 'vertical-align', 'visibility', 'white-space', 'width']`

When you configure `allowedStyleProps`, the styles, which matches the 'allowed style properties' list are allowed, all other style properties will be removed on pasting the content in the editor.

For Example,

`allowedStyleProps: ['color', 'margin']`: This will allow only the style properties 'color' and 'margin' in each pasted element.

In the following example, the paste cleanup related settings are explained with its module configuration

INDEX.TS

```
import { RichTextEditor, Toolbar, HtmlEditor, PasteCleanup } from
 '@syncfusion/ej2-richtexteditor';
RichTextEditor.Inject(Toolbar, HtmlEditor, PasteCleanup);
let defaultRTE: RichTextEditor = new RichTextEditor({
  value: `<p>Rich Text Editor is a WYSIWYG editing control which will
  reduce the effort for users while trying to express their formatting word
  content as HTML or Markdown format.</p>
    <p><b>Paste Cleanup properties:</b></p>

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Note: The Paste toolbar button action will not work and the clipboard will be restricted due to some limitations in the browser. Pasting copied contents into the Rich Text Editor can be done by using the Ctrl+V keyboard command.

Mention integration in EJ2 JavaScript Rich text editor control

By integrating the [Mention](#) control with a Rich Text Editor, users can easily mention or tag other users or objects from the suggested list without having to manually type out their names or other identifying information.

The [target](#) property of the Mention control allows you to specify the ID of the content editable div element within the Rich Text Editor that you want to bind the Mention control to. This allows you to enable the Mention functionality within the Rich Text Editor, so that users can mention or tag other users or objects from the suggested list while editing the text.

When the user types the @ symbol followed by a character, the Rich Text Editor will display a list of suggestions for items that the user can select from. The user can then select an item from the list by clicking on it, or by typing the name of the item they want to tag.

In the following sample, configured the following properties with popup dimensions.

- [allowSpaces](#) - Allow to continue search action if user enter space after mention character while searching.
- [suggestionCount](#) - The maximum number of items that will be displayed in the suggestion list.
- [itemTemplate](#) - Used to display the customized appearance in suggestion list.

Enter key in EJ2 JavaScript Rich text editor control

Rich Text Editor allows to customize the tag that is inserted when pressing the enter key and shift + enter key in the Rich Text Editor.

Enter key customization

By default, the `<p>` tag will be created while pressing the enter key. The enter key can be customized by using the [enterKey](#) property, where the possible tags that can be used to customize are `<p>`, `<div>`, and `
`.

When the enter key is customized with any of the possible values, pressing the enter key in the editor will create a new tag that is configured. Also, when the enter key is configured the default value of the Rich Text Editor will also change respectively with the configured values.

```

Shift-Enter key customization

By default, the `
` tag will be created while pressing the shift + enter key. The shift + enter key can be customized by using the [shiftEnterKey](#) property where the possible tags that can be used to customize are `
`, `<p>`, `<div>`.

When the shift + enter key is customized with any of the possible values, pressing the shift + enter key in the editor will create a new tag that is configured. Also, when the shift + enter key is configured the default value of the Rich Text Editor will change respectively with the configured values.

Styling in EJ2 JavaScript Rich text editor control

Font name and size

By default, the editor is initialized with font name and font size as **null**. To change it, select a different font name and font size from the drop-down in the editor's toolbar.

To apply different font style for section of the content, select the text that you would like to change, and select a required font style from the drop-down to apply the changes to the selected text.

FontName DropDowns

The following table list the default font name and width of the [fontname](#) dropdown and available list of font names.

Default Key	Default Value
-----	-----
font name	null
width	65px
items	{ text: 'Segoe UI', value: 'Segoe UI' }, { text: 'Arial', value: 'Arial,Helvetica,sans-serif' }, { text: 'Courier New', value: 'Courier New,Courier,monospace' }, { text: 'Georgia', value: 'Georgia,serif' }, { text: 'Impact', value: 'Impact,Charcoal,sans-serif' }, { text: 'Lucida Console', value: 'Lucida Console,Monaco,monospace' }, { text: 'Tahoma', value: 'Tahoma,Geneva,sans-serif' }, { text: 'Times New Roman', value: 'Times New Roman,Times,serif' }, { text: 'Trebuchet MS', value: 'Trebuchet MS,Helvetica,sans-serif' }, { text: 'Verdana', value: 'Verdana,Geneva,sans-serif' }

FontSize DropDowns

The following table list the default font size and width of the [fontsize](#) dropdown and available list of font size.

Default Key	Default Value
-----	-----
font size	null
width	35px.
items	{ text: '8', value: '8pt' }, { text: '10', value: '10pt' }, { text: '12', value: '12pt' }, { text: '14', value: '14pt' }, { text: '18', value: '18pt' }, { text: '24', value: '24pt' }, { text: '36', value: '36pt' }.

The following sample demonstrates the option to add the font name and font size tools to the toolbar as well as modify the default [width](#) of the tools.

Font and Background color

To apply font color or background color for a selected content of Rich Text Editor, use font color and background color tools.

Rich Text Editor support to provide customs font color and background color with existing list through the [colorCode](#) field of [fontColor](#) and [backgroundColor](#).

The FontColor and BackgroundColor property has two [mode](#) Picker and Palette. Palette mode has predefined set of [colorCode](#) and in the picker mode, more colors has been provided. Through [modeSwitcher](#), you can able to switch between these two options.

INDEX.TS

```

import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
import { RichTextEditor, Toolbar, Link, Image, HtmlEditor, QuickToolbar }
from '@syncfusion/ej2-richtexteditor';
RichTextEditor.Inject(Toolbar, Link, Image, HtmlEditor, QuickToolbar);

Editor content styles

By default, The content styles of Rich Text Editor are not returned while retrieving HTML value from the editor. So, the styles are not applied when using the HTML value outside of the editor. To get the styles to Rich Text Editor's content for your application, You can copy and use the below styles directly in your application. The styles listed below which used in the UI elements of the Rich Text Editor.

Make sure to add a CSS class 'e-rte-content' to the content container.

```
,  
.e-rte-content p {  
margin: 0 0 10px;  
margin-bottom: 10px;  
}  
.e-rte-content li {  
margin-bottom: 10px;  
}  
.e-rte-content h1 {  
font-size: 2.17em;  
font-weight: 400;  
line-height: 1;  
margin: 10px 0;  
}  
.e-rte-content h2 {  
font-size: 1.74em;  
font-weight: 400;  
margin: 10px 0;  
}  
.e-rte-content h3 {  
font-size: 1.31em;  
font-weight: 400;  
margin: 10px 0;  
}  
.e-rte-content h4 {
```

```
font-size: 1em;
font-weight: 400;
margin: 0;
}
.e-rte-content h5 {
font-size: 00.8em;
font-weight: 400;
margin: 0;
}

Image in EJ2 JavaScript Rich text editor control

Rich Text Editor allows to insert images from online source as well as local computer where you want to insert the image in your content. For inserting the image to the Rich Text Editor, the following list of options have been provided in the [insertImageSettings](#)

Options	Description
----- -----	
allowedTypes	Specifies the extensions of the image types allowed to insert on bowering and passing the extensions with comma separators. For example, pass allowedTypes as .jpg and .png.
display	Sets the default display for an image when it is inserted in to the Rich Text Editor. Possible options are: 'inline' and 'break'.
width	Sets the default width of the image when it is inserted in the Rich Text Editor.
height	Sets the default height of the image when it is inserted in the Rich Text Editor.
saveUrl	Provides URL to map the action result method to save the image.
path	Specifies the location to store the image.

Rich Text Editor features are segregated into individual feature-wise modules. To use image and link tool, inject image module using the `RichTextEditor.Inject(Image)`.

Upload options

Through the `browse` option, select the image from the local machine and insert into the Rich Text Editor content.

If the path field is not specified in the [insertImageSettings](#), the image will be transferred into base 64 and blob url for the image will be created and the generated url will be set to the src property of `` tag.

`ts

```

```

,

If you want to insert a lot of tiny images in the editor and don't want a specific physical location for saving images, you can opt to save format as Base64.

In the following sample, the image has been loaded from the local machine and it will be saved in the given location.

Image delete

To remove an image from the Rich Text Editor content, select the image and click **Remove** tool from the quick toolbar. It will delete the image from the Rich Text Editor content as well as from the service location if the `removeUrl` is given.

Once you select the image from the local machine, the URL for the image will be generate. From there, you can remove the image from the service location by clicking the cross icon.

The following sample explains, how to configure `removeUrl` to remove a saved image from the remote service location, when the following image remove actions are performed:

- `delete` key action.
- `backspace` key action.
- Removing uploaded image file from the insert image dialog.
- Deleting image using the quick toolbar `remove` option.

```

Insert from web

To insert an image from the online source like Google, Ping, etc., you should enable the image tool on the editor's toolbar. By default, the image tool opens a simple dialog which allows you to insert an image from online source.

Dimension

Sets the default width and height of the image when it is inserted in the Rich Text Editor using [width](#) and [height](#) of [insertImageSettings](#).

Through the [quickToolbar](#), also you can change the width and height using [Change Size](#) option. Once click into the option. The Image Size dialog will open as below. In that specify the width and height of the image in pixel.

Caption and Alt Text

Image caption and alternative text can be specified for the Inserted image in the Rich Text Editor through the [quickToolbar](#) options such as Image Caption and Alternative Text.

Through the Alternative Text option, set the alternative text for the image, when the image is not upload successfully into the Rich Text Editor.

By clicking the Image Caption, the image will get wrapped in an image element with a caption. Then, you can type caption content inside the Rich Text Editor.

Display position

Sets the default display for an image when it is inserted in the Rich Text Editor using [display](#) field in [insertImageSettings](#). It has two possible options: `inline` and `break`.

```
`ts
let defaultRTE: RichTextEditor = new RichTextEditor({
insertImageSettings: {
display: 'inline'
}
});
defaultRTE.appendTo('#defaultRTE');
```

Image with link

The hyperlink itself can be an image in Rich Text Editor. If the image given as hyperlink, the remove, edit, and open link will be added to the quick toolbar of image. For further details about link, see the [link documentation](#).

Resize

Rich text editor has a built-in image inserting support. The resize points will be appearing on each corner of image when focus. So, users can resize the image using mouse points or thumb through the resize points easily. Also, the resize calculation will be done based on aspect ratio.

Drag and Drop

By default, the Rich Text Editor allows you to insert images by drag-and-drop from the local file system such as Windows Explorer into the content editor area. And, you can upload the images to the server before inserting into the editor by configuring the `saveUrl` property. The images can be repositioned anywhere within the editor area by dragging and dropping the image.

In the following sample, you can see feature demo.

INDEX.TS

```
import { RichTextEditor, Toolbar, Image, Link, HtmlEditor, QuickToolbar,
NodeSelection } from '@syncfusion/ej2-richtexteditor';
RichTextEditor.Inject(Toolbar, Image, Link, HtmlEditor, QuickToolbar );
let defaultRTE: RichTextEditor = new RichTextEditor({
    insertImageSettings : {
        saveUrl : 'https://aspnetmvc.syncfusion.com/services/api/uploadbox/Save'
    }
});
defaultRTE.appendTo('#defaultRTE');
```

```

Drag and drop with specific extension images

You can allow the specific images alone to be uploaded using the the allowedTypes property. By default, the Rich Text Editor allows the JPG, JPEG, and PNG formats. You can configure this formats as follows.

```
`ts
```

```
insertImageSettings: {
```

```
  allowedTypes: ['.jpg']
```

```
}
```

```
,
```

Prevent drag and drop action

You can prevent drag-and-drop action by setting the actionBegin argument cancel value to true. The following code shows how to prevent the drag-and-drop.

```
`ts
```

```
actionBegin: function (args: any): void {
```

```
  if(args.type === 'drop' || args.type === 'dragstart') {
```

```
    args.cancel =true;
```

```
}
```

```
}
,
```

Audio in EJ2 JavaScript Rich text editor control

The Rich Text Editor allows you to insert audio from online sources and local computers and then insert them into your content. You can insert the audio with the following list of options in the [insertAudioSettings](#) property.

Options	Description
-----	-----
allowedTypes	Specifies the extensions of the audio types allowed to insert on bowering and passing the extensions with comma separators. For example, pass allowedTypes as .mp3, .wav, .m4a and .wma.
layoutOption	Sets the default display for audio when it is inserted into the Rich Text Editor. Possible options are: Inline and Break.
saveFormat	Sets the default save format of the audio element when inserted. Possible options are: Blob and Base64.
saveUrl	Provides URL to map the action result method to save the audio.
removeUrl	Provides URL to map the action result method to remove the audio.
path	Specifies the location to store the audio.

Configure audio tool in the toolbar

You can add an audio tool in the Rich Text Editor toolbar using the [toolbarSettings](#) [items](#) property.

To configure the Audio toolbar item, refer to the below code.

INDEX.JS

```
/**
 * Rich Text Editor - RemoveUrl sample
 */
var defaultRTE = new ej.richtexteditor.RichTextEditor({
  insertAudioSettings: {
    saveUrl: 'https://ej2.syncfusion.com/services/api/uploadbox/Save',
    removeUrl:
'https://ej2.syncfusion.com/services/api/uploadbox/Remove'
  },
  toolbarSettings: {
    items: ['Audio']
  }
});
defaultRTE.appendTo('#defaultRTE');
```

INDEX.HTML

```

```

Insert audio from the web

You can insert audio from either the hosted link or the local machine, by clicking the audio button in the editor's toolbar. On clicking the audio button, a dialog opens, which allows you to insert audio from the web URL.

Insert from web URL

By default, the audio tool opens the audio dialog, allowing you to insert audio from an online source. Inserting the URL will be added to the `src` attribute of the `<source>` tag.

Insert audio from local machine

You can use the `browse` option on the audio dialog, to select the audio from the local machine and insert it into the Rich Text Editor content.

If the path field is not specified in the [insertAudioSettings](#), the audio will be converted into the `Blob` URL or `Base64` and inserted inside the Rich Text Editor.

Restrict audio upload based on size

You can restrict the audio uploaded from the local machine when the uploaded audio file size is greater than the allowed size by using the [fileUploading](#) event.

The file size in the argument will be returned in **bytes**.

In the following illustration, the audio size has been validated before uploading, and it is determined whether the audio has been uploaded or not.

```
`ts
<script>
var defaultRTE = new new ej.richtexteditor.RichTextEditor({
toolbarSettings: {
items: ['Audio']
},
insertAudioSettings: {
saveUrl: "https://aspnetmvc.syncfusion.com/services/api/uploadbox/Save",
path: "../Files/"
},
fileUploading: onFileUpload
});
defaultRTE.appendTo('#defaultRTE');
function onFileUpload (args) {
var sizeInBytes = args.fileData.size;
var fileSize = 500000;
if (fileSize < sizeInBytes) {
args.Cancel = true;
}
}
</script>
`
```

Server-side action

The selected audio can be uploaded to the required destination using the controller action below. Map this method name in [insertAudioSettings.saveUrl](#) and provide the required destination path through [insertAudioSettings.path](#) properties.

If you want to insert lower-sized audio files in the editor and don't want a specific physical location for saving the audio, you can opt to save the format as **Base64**.

In the following code blocks, the audio module has been injected and can insert the audio files saved in the specified path.

```
`ts
<script>
var defaultRTE = new ej.richtexteditor.RichTextEditor({
toolbarSettings: {
items: ['Audio']
},
insertAudioSettings: {
saveUrl: "[SERVICEHOSTEDPATH]/api/uploadbox/SaveFiles",
path: "[SERVICEHOSTEDPATH]/Files/"
}
});
defaultRTE.appendTo('#defaultRTE');
</script>
`

`c#

```
hostingEnv = env;
}
public IActionResult Index()
{
    return View();
}
[AcceptVerbs("Post")]
public void SaveFiles(IList<IFormFile> UploadFiles)
{
    try
    {
        foreach (IFormFile file in UploadFiles)
        {
            if (UploadFiles != null)
            {
                string filename = ContentDispositionHeaderValue.Parse(file.ContentDisposition).FileName.Trim("");
                filename = hostingEnv.WebRootPath + "\\Files" + $"@\"{filename}\"";
                // Create a new directory, if it does not exists
                if (!Directory.Exists(hostingEnv.WebRootPath + "\\Files"))
                {
                    Directory.CreateDirectory(hostingEnv.WebRootPath + "\\Files");
                }
                if (!System.IO.File.Exists(filename))
                {
                    using (FileStream fs = System.IO.File.Create(filename))
                    {
                        file.CopyTo(fs);
                        fs.Flush();
                    }
                    Response.StatusCode = 200;
                }
            }
        }
    }
}
```

```

}
catch (Exception)
{
    Response.StatusCode = 204;
}
}

[ResponseCache(Duration = 0, Location = ResponseCacheLocation.None, NoStore = true)]
public IActionResult Error()
{
    return View(new ErrorViewModel { RequestId = Activity.Current?.Id ?? HttpContext.TraceIdentifier });
}
}
}
,

```

Audio save format

The audio files can be saved as **Blob** or **Base64** URL by using the [insertAudioSettings.saveFormat](#) property, which is of enum type, and the generated URL will be set to the **src** attribute of the **<source>** tag.

The default **saveFormat** property is set to **Blob** format.

```

`html
<audio>
<source src="blob:http://ej2.syncfusion.com/3ab56a6e-ec0d-490f-85a5-f0aeb0ad8879"
type="audio/mp3" >
</audio>
<audio>
<source src="data:audio/mp3;base64,iVBORw0KGgoAAAANSUHEUgAAADAAAAAwCAYAAABXAvmHA"
type="audio/mp3" >
</audio>
,

```

Replacing audio

Once an audio file has been inserted, you can change it using the Rich Text Editor [quickToolbarSettings](#) **audioReplace** option. You can replace the audio file using the web URL or the browse option in the audio dialog.

Delete audio

To remove audio from the Rich Text Editor content, select the audio and click the `audioRemove` button from the quick toolbar. It will delete the audio from the Rich Text Editor content as well as from the service location if the [insertAudioSettings.removeUrl](#) is given.

Once you select the audio from the local machine, the URL for the audio will be generated. You can remove the audio from the service location by clicking the cross icon.

Display position

Sets the default display property for audio when it is inserted in the Rich Text Editor using the [insertAudioSettings.layoutOption](#) property. It has two possible options: `Inline` and `Break`. When updating the display positions, it updates the audio elements' layout position.

The default `layoutOption` property is set to `Inline`.

```
`ts
var defaultRTE = new ej.richtexteditor.RichTextEditor({
insertAudioSettings: {
layoutOption: 'Inline'
}
});
defaultRTE.appendTo('#defaultRTE');
```

Rename audio before inserting

You can use the [insertAudioSettings](#) property, to specify the server handler to upload the selected audio. Then by binding the [fileUploadSuccess](#) event, you can receive the modified file name from the server and update it in the Rich Text Editor's insert audio dialog.

```

`html
<div id='defaultRTE'>

<p>The Rich Text Editor is WYSIWYG ("what you see is what you get") editor useful to create and edit
content, and return the valid <a href="https://ej2.syncfusion.com/home/" target="blank">HTML
markup</a> or <a href="https://ej2.syncfusion.com/home/" target="blank">markdown</a> of the
content</p>

</div>
`
`ts
<script>
var defaultRTE = new ej.richtexteditor.RichTextEditor({
toolbarSettings: {
items: ['Audio']
},
insertAudioSettings: {
saveUrl: "[SERVICEHOSTEDPATH]/api/uploadbox/Rename",
path: "[SERVICEHOSTEDPATH]/Files/"
},
fileUploadSuccess: onFileUploadSuccess
});
defaultRTE.appendTo('#defaultRTE');
function onFileUploadSuccess (args) {
alert("Get the new file name here");
if (args.e.currentTarget.getResponseHeader('name') != null) {
args.file.name = args.e.currentTarget.getResponseHeader('name');
var filename = document.querySelectorAll(".e-file-name")[0];
filename.innerHTML = args.file.name.replace(document.querySelectorAll(".e-file-type")[0].innerHTML,
"");
filename.title = args.file.name;
}
}
</script>
`

```

To configure server-side handler, refer to the below code.

```
`c#
int x = 0;
string file;
[AcceptVerbs("Post")]
public void Rename()
{
    try
    {
        var httpPostedFile = System.Web.HttpContext.Current.Request.Files["UploadFiles"];
        fileName = httpPostedFile.FileName;
        if (httpPostedFile != null)
        {
            var fileSave = System.Web.HttpContext.Current.Server.MapPath("~/Files");
            if (!Directory.Exists(fileSave))
            {
                Directory.CreateDirectory(fileSave);
            }
            var fileName = Path.GetFileName(httpPostedFile.FileName);
            var fileSavePath = Path.Combine(fileSave, fileName);
            while (System.IO.File.Exists(fileSavePath))
            {
                fileName = "rteFiles" + x + "-" + fileName;
                fileSavePath = Path.Combine(fileSave, fileName);
                x++;
            }
            if (!System.IO.File.Exists(fileSavePath))
            {
                httpPostedFile.SaveAs(fileSavePath);
                HttpResponseMessage Response = System.Web.HttpContext.Current.Response;
                Response.Clear();
                Response.Headers.Add("name", fileName);
                Response.ContentType = "application/json; charset=utf-8";
                Response.StatusDescription = "File uploaded succesfully";
            }
        }
    }
}
```

```

Response.End();
}
}
}
catch (Exception e)
{
    HttpResponseMessage Response = System.Web.HttpContext.Current.Response;
    Response.Clear();
    Response.ContentType = "application/json; charset=utf-8";
    Response.StatusCode = 204;
    Response.Status = "204 No Content";
    Response.StatusDescription = e.Message;
    Response.End();
}
}
,

```

Upload audio with authentication

You can add additional data with the audio uploaded from the Rich Text Editor on the client side, which can even be received on the server side by using the [fileUploading](#) event and its `customFormData` argument, you can pass parameters to the controller action. On the server side, you can fetch the custom headers by accessing the form collection from the current request, which retrieves the values sent using the POST method.

By default, it doesn't support the `UseDefaultCredentials` property; we need to manually append the default credentials with the upload request.

```

`ts
<script>
var defaultRTE = new ej.richtexteditor.RichTextEditor({
toolbarSettings: {
items: ['Audio']
},
insertAudioSettings: {
saveUrl: "[SERVICEHOSTEDPATH]/api/uploadbox/SaveFiles",
path: "[SERVICEHOSTEDPATH]/Files/"
},
fileUploading: onFileUpload

```

```

});
defaultRTE.appendTo('#defaultRTE');
function onFileUpload (args) {
var accessToken = "Authorization_token";
// adding custom Form Data
args.customFormData = [{ 'Authorization': accessToken }];
}
</script>
`c#
public void SaveFiles(IList<IFormFile> UploadFiles)
{
string currentPath = Request.Form["Authorization"].ToString();
}

```

Video in EJ2 JavaScript Rich text editor control

The Rich Text Editor allows you to insert videos from online sources and local computers and then insert them into your content. You can insert the video with the following list of options in the [insertVideoSettings](#) property.

Options	Description
-----	-----
allowedTypes	Specifies the extensions of the video types allowed to insert on bowering and passing the extensions with comma separators. For example, pass allowedTypes as <code>.mp4</code> , <code>.mov</code> , <code>.wmv</code> and <code>.avi</code> .
layoutOption	Sets the default display for a video when it is inserted into the Rich Text Editor. Possible options are: <code>Inline</code> and <code>Break</code> .
saveFormat	Sets the default save format of the video element when inserted. Possible options are: <code>Blob</code> and <code>Base64</code> .
width	Sets the default width of the video when it is inserted in the Rich Text Editor.
minWidth	Sets the minWidth of the video element when it is inserted in the Rich Text Editor.
maxWidth	Sets the maxWidth of the video element when it is inserted in the Rich Text Editor.

- | height | Sets the default height of the video when it is inserted in the Rich Text Editor.
- | minHeight | Sets the minHeight of the video element when it is inserted in the Rich Text Editor.
- | maxHeight | Sets the maxHeight of the video element when it is inserted in the Rich Text Editor.
- | saveUrl | Provides URL to map the action result method to save the video.
- | removeUrl | Provides URL to map the action result method to remove the video.
- | path | Specifies the location to store the video.
- | resize | Sets the resizing action for the video element.
- | resizeByPercent | Sets the percentage values for the video element with the resizing action.

Configure the video tool in the toolbar

You can add the **video** tool in the Rich Text Editor toolbar using the **toolbarSettings** [items](#) property.

To configure the **Video** toolbar item, refer to the below code.

INDEX.JS

```
/**
 * Rich Text Editor - RemoveUrl sample
 */
var defaultRTE = new ej.richtexteditor.RichTextEditor({
  insertVideoSettings: {
    saveUrl: 'https://ej2.syncfusion.com/services/api/uploadbox/Save',
    removeUrl:
    'https://ej2.syncfusion.com/services/api/uploadbox/Remove'
  },
  toolbarSettings: {
    items: ['Video']
  }
});
defaultRTE.appendTo('#defaultRTE');
```

```

Insert a video from the web

You can insert a video from either the hosted link or the local machine by clicking the video button in the editor's toolbar. On Clicking the Video button, a dialog opens which allows you to insert video from the Embedded URL or web URL.

Insert from embed URL

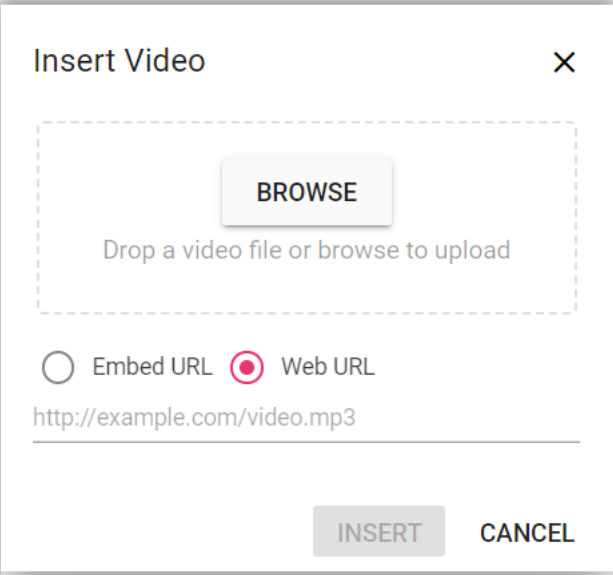

The insert video dialog opens with the **Embed URL** option as default which allows you to insert an embedded URL.

The dialog box is titled "Insert Video" with a close button (X) in the top right corner. It features a dashed rectangular area containing a "BROWSE" button and the text "Drop a video file or browse to upload". Below this, there are two radio buttons: "Embed URL" (which is selected, indicated by a red dot) and "Web URL". Under the "Embed URL" option, there is a text input field with the placeholder text "Paste Embed URL here". At the bottom of the dialog, there are two buttons: "INSERT" and "CANCEL".

Insert from web URL

You can switch to **Web URL** by selecting the web URL check box. Inserting with the web URL option will add the video URL as the `src` attribute of the `<source>` tag.

The dialog box is titled "Insert Video" with a close button (X) in the top right corner. It features a dashed rectangular area containing a "BROWSE" button and the text "Drop a video file or browse to upload". Below this, there are two radio buttons: "Embed URL" and "Web URL" (which is selected, indicated by a red dot). Under the "Web URL" option, there is a text input field containing the example URL "http://example.com/video.mp3". At the bottom of the dialog, there are two buttons: "INSERT" and "CANCEL".

Insert video from local machine

You can use the **browse** option on the video dialog, to select the video from the local machine and insert it into the Rich Text Editor content.

If the path field is not specified in the [insertVideoSettings](#), the video will be converted into the **Blob** URL or **Base64** and inserted inside the Rich Text Editor.

Restrict video upload based on size

You can restrict the video uploaded from the local machine when the uploaded video file size is greater than the allowed size by using the [fileUploading](#) event.

The file size in the argument will be returned in **bytes**.

In the following example, the video size has been validated before uploading and determined whether the video has been uploaded or not.

```
`ts
<script>
var defaultRTE = new ej.richtexteditor.RichTextEditor({
toolbarSettings: {
items: ['Video']
},
insertVideoSettings: {
saveUrl: "https://aspnetmvc.syncfusion.com/services/api/uploadbox/Save",
path: "../Files/"
},
fileUploading: onFileUpload
});
defaultRTE.appendTo('#defaultRTE');
function onFileUpload (args) {
var sizeInBytes = args.fileData.size;
var fileSize = 500000;
if (fileSize < sizeInBytes) {
args.Cancel = true;
}
}
</script>
`
```

Server-side action

The selected video can be uploaded to the required destination using the controller action below. Map this method name in [insertVideoSettings.saveUrl](#) and provide the required destination path through [insertVideoSettings.path](#) properties.

If you want to insert lower-sized video files in the editor and don't want a specific physical location for saving the video, you can save the format as **Base64**.

In the following code blocks, the video module has been injected and can insert the video files saved in the specified path.

```
`ts
<script>
var defaultRTE = new ej.richtexteditor.RichTextEditor({
toolbarSettings: {
items: ['Video']
},
insertVideoSettings: {
saveUrl: "[SERVICEHOSTEDPATH]/api/uploadbox/SaveFiles",
path: "[SERVICEHOSTEDPATH]/Files/"
}
});
defaultRTE.appendTo('#defaultRTE');
</script>
`
```

```
`c#
using System;
using System.IO;
using FileUpload.Models;
using System.Diagnostics;

namespace FileUpload.Controllers
{
public class HomeController : Controller
{
private IHostingEnvironment hostingEnv;
public HomeController(IHostingEnvironment env)
{
```

```
hostingEnv = env;
}
public IActionResult Index()
{
    return View();
}
[AcceptVerbs("Post")]
public void SaveFiles(IList<IFormFile> UploadFiles)
{
    try
    {
        foreach (IFormFile file in UploadFiles)
        {
            if (UploadFiles != null)
            {
                string filename = ContentDispositionHeaderValue.Parse(file.ContentDisposition).FileName.Trim("");
                filename = hostingEnv.WebRootPath + "\\Files" + $"@\"{filename}\"";
                // Create a new directory, if it does not exists
                if (!Directory.Exists(hostingEnv.WebRootPath + "\\Files"))
                {
                    Directory.CreateDirectory(hostingEnv.WebRootPath + "\\Files");
                }
                if (!System.IO.File.Exists(filename))
                {
                    using (FileStream fs = System.IO.File.Create(filename))
                    {
                        file.CopyTo(fs);
                        fs.Flush();
                    }
                    Response.StatusCode = 200;
                }
            }
        }
    }
}
```

```

}
catch (Exception)
{
    Response.StatusCode = 204;
}
}

[ResponseCache(Duration = 0, Location = ResponseCacheLocation.None, NoStore = true)]
public IActionResult Error()
{
    return View(new ErrorViewModel { RequestId = Activity.Current?.Id ?? HttpContext.TraceIdentifier });
}
}
}
,

```

Video save format

The video files can be saved as **Blob** or **Base64** URL by using the [insertVideoSettings.saveFormat](#) property, which is of enum type, and the generated URL will be set to the **src** attribute of the **<source>** tag.

The default **saveFormat** property is set to **Blob** format.

```

`ts
<video>
<source src="blob:http://ej2.syncfusion.com/3ab56a6e-ec0d-490f-85a5-f0aeb0ad8879"
type="video/mp4" >
</video>
<video>
<source src="data:video/mp4;base64,iVBORw0KGgoAAAANSUhEUgAAADAAAAAwCAYAAABXAvmHA"
type="video/mp4" >
</video>
,

```

Replacing video

Once a video file has been inserted, you can replace it using the Rich Text Editor [quickToolbarSettings](#) **videoReplace** option. You can replace the video file either by using the embedded URL or the web URL and the browse option in the video dialog.

Edit Video

BROWSE

Drop a video file or browse to upload

☒ Embed URL ☐ Web URL

Paste Embed URL here

UPDATE

CANCEL

Edit Video

BROWSE

Drop a video file or browse to upload

☐ Embed URL ☒ Web URL

http://example.com/video.mp3

UPDATE

CANCEL

Delete video

To remove a video from the Rich Text Editor content, select the video and click the `videoRemove` button from the quick toolbar. It will delete the video from the Rich Text Editor content as well as from the service location if the [insertVideoSettings.removeUrl](#) is given.

Once you select the video from the local machine, the URL for the video will be generated. You can remove the video from the service location by clicking the cross icon.

Dimension

Set the default width, minWidth, height, and minHeight of the video element, when it is inserted in the Rich Text Editor using the [width](#), [minWidth](#), [height](#), [minHeight](#) properties.

Through the [quickToolbarSettings](#), also you can change the width and height using the **Change Size** button. Once you click on the button, the video size dialog will open as below. In that, specify the width and height of the video in pixels.

Display position

Sets the default display property for the video when it is inserted in the Rich Text Editor using the [insertVideoSettings.layoutOption](#) property. It has two possible options: **Inline** and **Break**. When updating the display positions, it updates the video elements' layout position.

The default **layoutOption** property is set to **Inline**.

```
`ts
<script>
var defaultRTE = new ej.richtexteditor.RichTextEditor({
insertVideoSettings: {
layoutOption: 'Inline'
}
});
defaultRTE.appendTo('#defaultRTE');
</script>
`
```

Resize video

The Rich Text Editor has built-in video resizing support, which is enabled for the video elements added. The resize points will appear on each corner of the video when focusing so users can easily resize the video using mouse points or thumb through the resize points. Also, the resize calculation will be done based on the aspect ratio.

You can disable the resize action by configuring **false** for the [insertVideoSettings.resize](#) property.

If the [minWidth](#) and [minHeight](#) properties are configured, the video resizing does not shrink below the specified values.

Rename video before inserting

You can use the [insertVideoSettings](#) property, to specify the server handler to upload the selected video. Then by binding the [fileUploadSuccess](#) event, you can receive the modified file name from the server and update it in the Rich Text Editor's insert video dialog.

```
`html
```

```
<div id='defaultRTE'>
```

```
<p>The Rich Text Editor component is WYSIWYG ("what you see is what you get") editor that provides the best user experience to create and update the content.Users can format their content using standard toolbar commands.</p>

```

```
`
```

```
`ts
```

```
<script>
```

```
var defaultRTE = new ej.richtexteditor.RichTextEditor({
  toolbarSettings: {
    items: ['Video']
  },
  insertVideoSettings: {
    saveUrl: "[SERVICEHOSTEDPATH]/api/uploadbox/Rename",
    path: "[SERVICEHOSTEDPATH]/Files/"
  },
  fileUploadSuccess: onFileUploadSuccess
});
defaultRTE.appendTo('#defaultRTE');
function onFileUploadSuccess (args) {
```

```

alert("Get the new file name here");
if (args.e.currentTarget.getResponseHeader('name') != null) {
    args.file.name = args.e.currentTarget.getResponseHeader('name');
    var filename = document.querySelectorAll(".e-file-name")[0];
    filename.innerHTML = args.file.name.replace(document.querySelectorAll(".e-file-type")[0].innerHTML,
    "");
    filename.title = args.file.name;
}
}
</script>
`

```

To configure server-side handler, refer to the below code.

```

`c#
int x = 0;
string file;
[AcceptVerbs("Post")]
public void Rename()
{
    try
    {
        var httpPostedFile = System.Web.HttpContext.Current.Request.Files["UploadFiles"];
        fileName = httpPostedFile.FileName;
        if (httpPostedFile != null)
        {
            var fileSave = System.Web.HttpContext.Current.Server.MapPath("~/Files");
            if (!Directory.Exists(fileSave))
            {
                Directory.CreateDirectory(fileSave);
            }
            var fileName = Path.GetFileName(httpPostedFile.FileName);
            var fileSavePath = Path.Combine(fileSave, fileName);
            while (System.IO.File.Exists(fileSavePath))
            {

```

```

fileName = "rteFiles" + x + "-" + fileName;
fileSavePath = Path.Combine(fileSave, fileName);
x++;
}
if (!System.IO.File.Exists(fileSavePath))
{
    httpPostedFile.SaveAs(fileSavePath);
    HttpResponseMessage Response = System.Web.HttpContext.Current.Response;
    Response.Clear();
    Response.Headers.Add("name", fileName);
    Response.ContentType = "application/json; charset=utf-8";
    Response.StatusDescription = "File uploaded succesfully";
    Response.End();
}
}
}
catch (Exception e)
{
    HttpResponseMessage Response = System.Web.HttpContext.Current.Response;
    Response.Clear();
    Response.ContentType = "application/json; charset=utf-8";
    Response.StatusCode = 204;
    Response.Status = "204 No Content";
    Response.StatusDescription = e.Message;
    Response.End();
}
}
,

```

Upload video with authentication

You can add additional data with the video uploaded from the Rich Text Editor on the client side, which can even be received on the server side by using the [fileUploading](#) event and its `customFormData` argument, you can pass parameters to the controller action. On the server side, you can fetch the custom headers by accessing the form collection from the current request, which retrieves the values sent using the POST method.

By default, it doesn't support the `UseDefaultCredentials` property, you can manually append the default credentials with the upload request.

```
`ts
<script>
var defaultRTE = new ej.richtexteditor.RichTextEditor({
toolbarSettings: {
items: ['Video']
},
insertVideoSettings: {
saveUrl: "[SERVICEHOSTEDPATH]/api/uploadbox/SaveFiles",
path: "[SERVICEHOSTEDPATH]/Files/"
},
fileUploading: onFileUpload
});
defaultRTE.appendTo('#defaultRTE');
function onFileUpload (args) {
var accessToken = "Authorization_token";
// adding custom Form Data
args.customFormData = [{ 'Authorization': accessToken }];
}
</script>
`c#
public void SaveFiles(IList<IFormFile> UploadFiles)
{
string currentPath = Request.Form["Authorization"].ToString();
}
```

Link in EJ2 JavaScript Rich text editor control

A hyperlink can be insert into the editor for quick access to the related information. The hyperlink itself can be a text or an image.

Insert link

Point the cursor anywhere within the editor where you would like to insert the link. It is also possible to select a text or an image within the editor and can be converted to the hyperlink. Click the Insert HyperLink tool on the toolbar. The Insert Link Dialog will be open. The dialog has the following options.

Rich Text Editor features are segregated into individual feature-wise modules. To use image and link tool, inject link module using the `RichTextEditor.Inject(Link)`.

- | Options | Description |
|-------------------------|---|
| Web Address | Type or paste the destination for the link you are creating |
| Display Text | Type or edit the required text that you want to display text for the link |
| Tooltip | To display additional helpful information when you place the pointer on the hyperlink, type the required text in the "Tooltip" field. |
| Open Link in New Window | Specify whether, the given link will be open in new window or not |

The Rich Text Editor link tool validates the URLs, as you type them in Web Address. URLs considered invalid will be highlighted with red color by clicking the insert button in the `Insert Link` dialog.

Table in EJ2 JavaScript Rich text editor control

Rich Text Editor allows to insert table of content in edit panel and provide options to add, edit, and remove the table as well as perform other table related action. For inserting the table to the Rich Text Editor, the following list of options have been provided in the [tableSettings](#)

Options	Description	Default Value
minWidth	Sets the default minWidth of the table.	0
maxWidth	Sets the default maxWidth of the table.	null
resize	Enable resize feature in table.	true

| styles | This is an array of key value pair, on each pair, key should be name of styling and value is class name. this list will be shown on quick toolbar options to change the styles of table on designing like dashed, double bordered. | [TableStyleItems](#) |

| width | Sets the default width of the table. | 100% |

Rich Text Editor features are segregated into individual feature-wise modules. To use table tool, inject image module using the `RichTextEditor.Inject(Table)`.

Insert table

Using the `table` toolbar option, select a number of rows and columns to be inserted over the table grid and insert table into Rich Text Editor content using the mouse.

Tables can also be inserted through the `Insert Table` option in the pop-up where the number of rows and columns can be provided manually, and this is the default way in devices.

In the following sample, the table has been injected from table module.

INDEX.TS

```
import { RichTextEditor, Toolbar, Image, Link, HtmlEditor, QuickToolbar,
NodeSelection, Table } from '@syncfusion/ej2-richtexteditor';

Quick Toolbar

Quick toolbar is opened by clicking the table. It has different sets of commands to be performed on the table which increases the feasibility to edit the table easily.

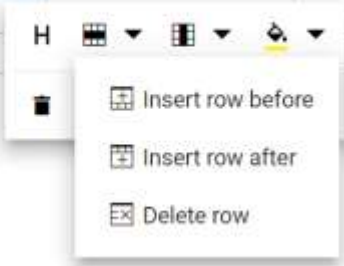

To use quick toolbar, inject the quick toolbar module using the `RichTextEditor.Inject(QuickToolbar)`.

Table Header

Table Header command is available with quick toolbar option through which the header row can be added or removed from the inserted table. The following image illustrates the table header.

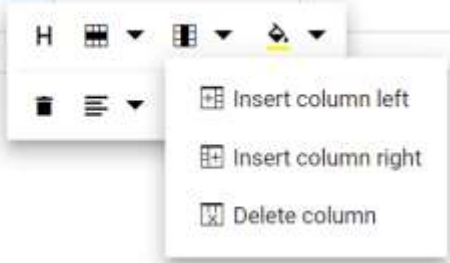

Insert Rows

Rows can be inserted above or below the required table cell through the quick toolbar. Also, focused row can be deleted. The following screenshot shows the available options of the row item.

Insert Columns

Columns can be inserted to the left or right side of the required table cell through the quick toolbar. Also, the focused column can be deleted. The following screenshot shows the available options of the column item.

Set Color

The background color can be set for each table cell through the **background color** command available with quick toolbar.

Delete Table

Using the delete item in the quick toolbar, users can delete the entire table.

Vertical Align

Text inside the table can be aligned to top, middle, or bottom using the [tableCellVerticalAlign](#) tool of the quick toolbar.

Horizontal Align

Text inside the table can be aligned left, right, or center using the [tableCellHorizontalAlign](#) tool of the quick toolbar.

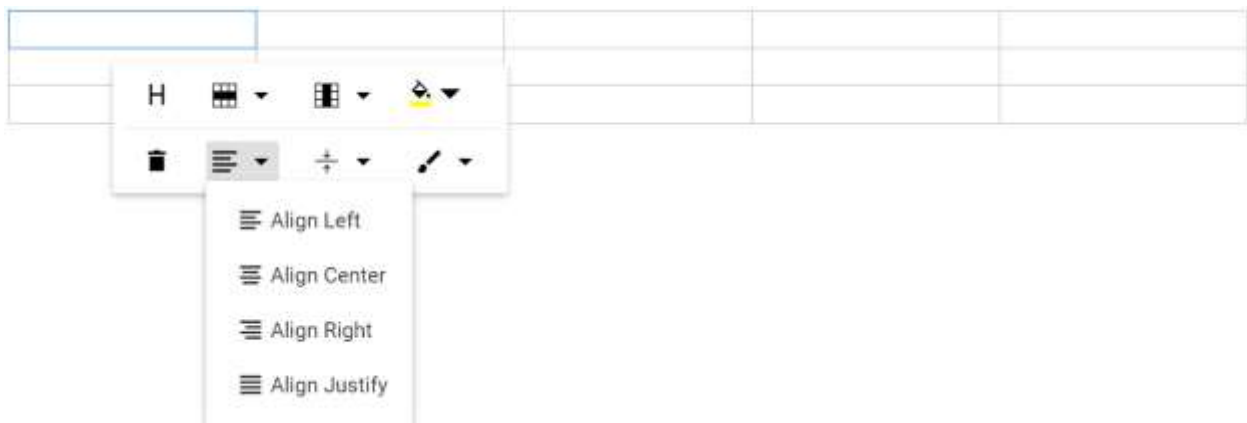

Table Styles

Table styles provided for class name should be appended to a table element. It helps to design the table in specific CSS styles when inserting in the editor.

By Default, provides Dashed border and Alternate rows.

Dashed border: Applies the dashed border to the table.

Alternate border: Applies the alternative background to the table.

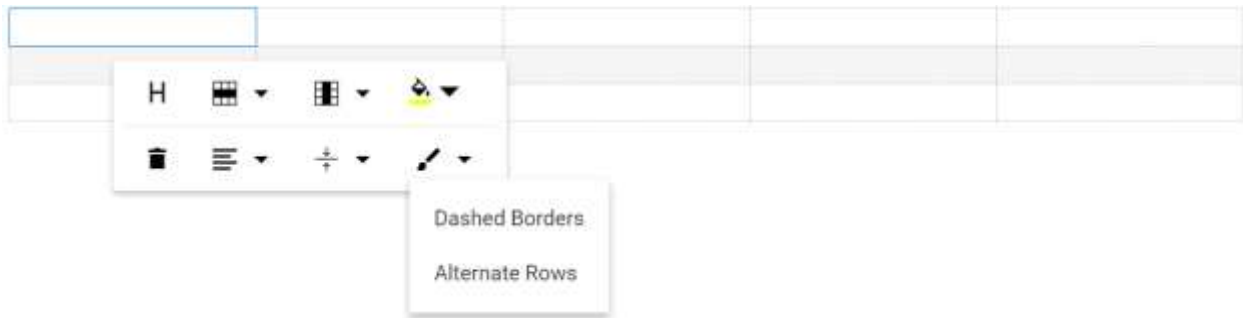

Table Properties

Sets the default width of the table when it is inserted in the Rich Text Editor using the width of [tableSettings](#).

Using the quick toolbar, users can change the width, cell padding, and cell spacing in the selected table using the properties option.

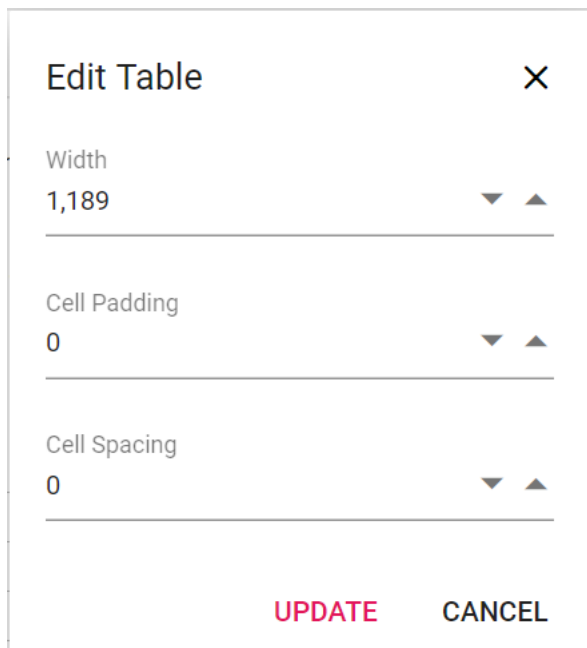

Table cell merge and split

The Rich Text Editor allows users to change the appearance of the tables by splitting or merging the table cells.

TableCell item should be configured in the Table [quickToolbarSettings](#) Property to show the merge/split icons while selecting the table cells

Table cell merge

The table cell merge feature allows you to merge two or more row and column cells into a single cell with its contents.

The following image explains the table merge action.

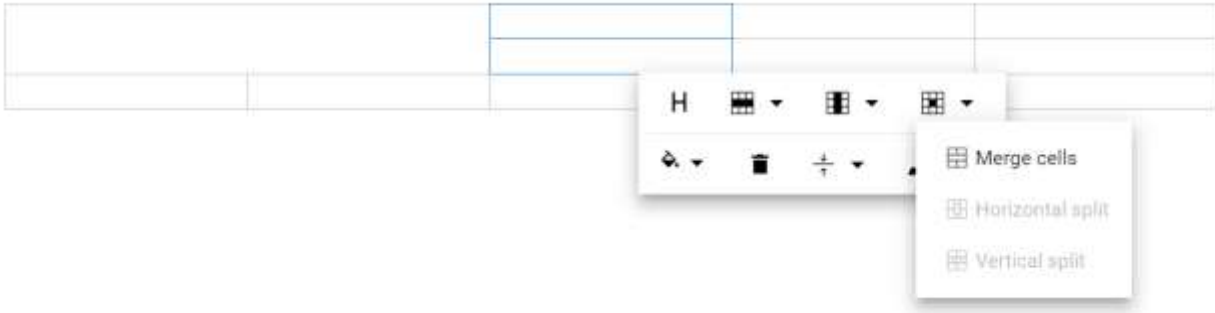

Table cell split

The table cell split feature allows you to a selected cell can be split both horizontally and vertically.

The following image explains the table split action.

Emoji Picker in EJ2 JavaScript RichTextEditor control

An emoji picker is a tool that allows users to add emojis or emoticons to their text easily. Typically, it is a small window or panel that displays a variety of emojis arranged in different categories, such as smileys, animals, food, and so on. Users can select the desired emoji by clicking on it or typing its name in a search bar.

Enabling the toolbar option and custom emojis.

Add the **EmojiPicker** tool to the toolbar of the RichTextEditor by utilizing the **toolbarSettings items** property.

By default, a predefined set of emojis is configured. However, you can customize these icons according to your needs. To achieve this, utilize the [emojiPickerSettings](#) property.

```
`ts
```

```
<script>
```

```
var defaultRTE: RichTextEditor = new ej.richtexteditor.RichTextEditor({
```

```
toolbarSettings: {
```

```
items: ['EmojiPicker']
```

```
},
```

```
emojiPickerSettings: {
```

```
iconsSet: [{name: 'Smilies & People', code: '1F600', iconCss: 'e-emoji',
```

```
icons: [{ code: '1F600', desc: 'Grinning face' },
```

```
{ code: '1F603', desc: 'Grinning face with big eyes' },
```

```
{ code: '1F604', desc: 'Grinning face with smiling eyes' },
```

```
{ code: '1F606', desc: 'Grinning squinting face' },
```

```
{ code: '1F605', desc: 'Grinning face with sweat' },
```

```
{ code: '1F602', desc: 'Face with tears of joy' },
```

```
{ code: '1F923', desc: 'Rolling on the floor laughing' },
```

```
{ code: '1F60A', desc: 'Smiling face with smiling eyes' }]
```

```
}, {
```

```
name: 'Animals & Nature', code: '1F435', iconCss: 'e-animals',
```

```
icons: [{ code: '1F436', desc: 'Dog face' },
```

```
{ code: '1F431', desc: 'Cat face' },
```

```
{ code: '1F42D', desc: 'Mouse face' },
{ code: '1F439', desc: 'Hamster face' },
{ code: '1F430', desc: 'Rabbit face' },
{ code: '1F98A', desc: 'Fox face' }]
}, {
name: 'Food & Drink', code: '1F347', iconCss: 'e-food-and-drinks',
icons: [{ code: '1F34E', desc: 'Red apple' },
{ code: '1F34C', desc: 'Banana' },
{ code: '1F347', desc: 'Grapes' },
{ code: '1F353', desc: 'Strawberry' },
{ code: '1F35E', desc: 'Bread' },
{ code: '1F950', desc: 'Croissant' },
{ code: '1F955', desc: 'Carrot' },
{ code: '1F354', desc: 'Hamburger' }]
}, {
name: 'Activities', code: '1F383', iconCss: 'e-activities',
icons: [{ code: '26BD', desc: 'Soccer ball' },
{ code: '1F3C0', desc: 'Basketball' },
{ code: '1F3C8', desc: 'American football' },
{ code: '26BE', desc: 'Baseball' },
{ code: '1F3BE', desc: 'Tennis' },
{ code: '1F3D0', desc: 'Volleyball' },
{ code: '1F3C9', desc: 'Rugby football' }]
}, {
name: 'Travel & Places', code: '1F30D', iconCss: 'e-travel-and-places',
icons: [{ code: '2708', desc: 'Airplane' },
{ code: '1F697', desc: 'Automobile' },
{ code: '1F695', desc: 'Taxi' },
{ code: '1F6B2', desc: 'Bicycle' },
{ code: '1F68C', desc: 'Bus' }]
}, {
name: 'Objects', code: '1F507', iconCss: 'e-objects', icons: [{ code: '1F4A1', desc: 'Light bulb' },
{ code: '1F526', desc: 'Flashlight' },
```

```

{ code: '1F4BB', desc: 'Laptop computer' },
{ code: '1F5A5', desc: 'Desktop computer' },
{ code: '1F5A8', desc: 'Printer' },
{ code: '1F4F7', desc: 'Camera' },
{ code: '1F4F8', desc: 'Camera with flash' },
{ code: '1F4FD', desc: 'Film projector' }}
}, {
name: 'Symbols', code: '1F3E7', iconCss: 'e-symbols', icons: [{ code: '274C', desc: 'Cross mark' },
{ code: '2714', desc: 'Check mark' },
{ code: '26A0', desc: 'Warning sign' },
{ code: '1F6AB', desc: 'Prohibited' },
{ code: '2139', desc: 'Information' },
{ code: '267B', desc: 'Recycling symbol' },
{ code: '1F6AD', desc: 'No smoking' }]
}]
}
});
defaultRTE.appendTo('#defaultRTE');
</script>
`

```

Additionally, you have the option to customize the icons of toolbar items using the [iconCss](#) and [code](#) properties. The `iconCSS` property allows you to define a custom CSS class for the toolbar item icon, while the `code` property enables you to specify the Unicode character code for the icon.

When both `iconCSS` and `code` properties are provided, the `iconCSS` property takes precedence in determining the appearance of the toolbar item icon.

Additionally, you have the option to enhance the user experience by implementing a filtering feature for efficiently managing a large dataset of emojis. By setting the [showSearchBox](#) property to true (which is the default value), users will be able to utilize a search box to filter the displayed emojis according to their preferences.

The following code example shows how to add the emoji picker tool in the RichTextEditor.

INDEX.JS

```

/**
 * Rich Text Editor - Emoji picker sample
 */
var defaultRTE = new ej.richtexteditor.RichTextEditor({
  toolbarSettings: {

```

```

        items: ['Bold', 'Italic', 'Underline', '|', 'Formats', 'Alignments',
'OrderedList',
        'UnorderedList', '|', 'CreateLink', 'Image', '|', 'SourceCode',
'EmojiPicker',
        '|', 'Undo', 'Redo']
    },
});
defaultRTE.appendTo('#emojiPickerRTE');

```

INDEX.HTML

```

```

Using the shortcut key to open the emoji picker

Quickly access the emoji picker by simply pressing the colon (:) key while typing a word prefix in an editor, allowing for instant emoji selection and display. Moreover, continue typing in the editor after the colon (:) to filter and refine your search for the desired emojis.

![JavaScript Rich Text Editor Emoji Picker shortcut](../images/javascript-richtexteditor-emoji-picker-shortcut.png)

Navigating and selecting emojis using the keyboard

The emoji picker popup offers keyboard navigation options, allowing you to move the emoji focus from one emoji to another. The following keys are used for navigation:

Arrow keys: Use the arrow keys (up, down, left, right) to move the emoji focus in the corresponding direction.

Enter: Press Enter key to select the currently focused emoji.

Escape: Press Escape to close the emoji picker popup without selecting an emoji.

Markdown in EJ2 JavaScript Rich text editor control

When you format the word in Markdown format, you should add Markdown syntax to the word to indicate the words and phrases that looks different from each other.

Rich Text Editor supports markdown editing when the [editorMode](#) set as **markdown** and using both *keyboard interaction* and *toolbar action*, you can apply the formatting to text.

To create Rich Text Editor with Markdown editing feature, inject the [MarkdownEditor](#) module to the Rich Text Editor using the `RichTextEditor.Inject(MarkdownEditor)` method.

Supported Commands

The Javascript Markdown editor supports the following commands to format the markdown content:

Commands	Syntax	Description
Bold	Sample content for bold text .	For bold, add or to front and back of the text. For order list, precede each line with a number.
Italic	Sample content for <i>Italic text</i> .	For Italic, add * or _ to front and back of the text.
Bold and Italics	Sample content for <i>bold and Italic text</i> .	For bold and Italics, add * to the front and back of the text.
Heading 1	# Heading 1 content	For heading 1, add # to start of the line.
Heading 2	## Heading 2 content	For heading 2, add ## to start of the line.
Heading 3	### Heading 3 content	For heading 3, add ### to start of the line.
Heading 4	#### Heading 4 content	For heading 4, add #### to start of the line.
Heading 5	##### Heading 5 content	For heading 5, add ##### to start of the line.

| Heading 6 | ##### Heading 6 content | For heading 6, add ##### to start of the line. |

| Line Break | First line
Second line | For line break, press enter two times (or) add
 in between the first and the second line. |

| Blockquotes | > Blockquotes text | For blockquotes, add > to start of the line. |

| Strike Through | Sample content for ~~strike through text~~. | For strike through, add ~ to front and back of the text. |

| Code (Single line) | \Single line code\ | For single line code, add ` to front and back of the text. |

| Code block (Multi Line) | \\
Multi line code text
Multi line code text
\\ | For multiple line code, add \\ in the new line before and after the content. |

| Subscript | _{Subscript text} | For subscript, add _{to the front and} to the back of the text. |

| Superscript | ^{Superscript text} | For superscript, add ^{to the front and} to the back of the text. |

| Ordered List | 1. First
1. Second | For ordered list, preceding one or more lines of text with 1. |

| Unordered List | *First*
second | For unordered list, preceding one or more lines of text with *. |

| Links | **Link text without title text**
`Link text`
Link text with title text
[Link text](URL, "title text") | Create an inline link by wrapping link text in brackets [], and then wrapping the URL as first parameter and title as second parameter in the parentheses ().
Note: The title text is optional, if needed it can be given manually. |

| Table | | Heading 1 | Heading 2 |
|-----|-----|
| Col A1 | Col A2 |
| Col B1 | Col B2 | | Create a table using the pipes and underscores as given in the syntax to create 2 x 2 table. |

| Horizontal Line | *(three asterix in new line)*
(or)
(three underscores in new line) | **For horizontal line, add or** to the start of the new line. |

| Image | | Create an image by wrapping the image source in parentheses (). |

| Image with alternate text | ![alternate text](URL path) | Create an image with alternate text by wrapping an alternative text in brackets [], and then link of the image source in parentheses ().
Note: When inserting the image using toolbar, the alternate text cannot be provided that needs to be given manually. |

| Escape tick marks supported | Sample text content with **bold and not bold text can be in the same line.** | In the syntax, the whole content is made as bold where the content not bold can be made as normal text by adding the bold syntax to the start and end of the respective text. Likewise you can do the same for various inline commands. |

| Escape Character | \ (any syntax) | Escape any markdown syntax by prefix \ to the syntax.
Example:
Bold text|

| HTML Entities | Copyright: © - ©
Trade mark: ™ - ™
Registered: ® - ®
Ampersand: & - &
Less than: <

<
Greater than: > - > | For HTML entities, add & and ; to the front and back of the respective entities. |

The above listed commands alone are supported in Syncfusion Markdown editor. For other unsupported commands, you can achieve using the HTML tags in Markdown editor. The foot notes, definitions, math, and check list markdown syntax are also not supported.

Markdown to HTML

The Rich Text Editor allows you to preview markdown changes immediately using preview. In this sample, the third-party library [Marked](#) is used to convert markdown into HTML content.

This sample demonstrates how to preview markdown changes in Rich Text Editor. Type or edit the display text, and apply format to view the preview of markdown. The [actionComplete](#) event can be used to convert Markdown to HTML.

This sample demonstrates how to preview markdown changes in Rich Text Editor. Type or edit the display text and apply format to view the preview of markdown.

Table

Rich Text Editor allows to insert Markdown table in edit panel with 2 X 2 rows and columns along with the heading.

To use table tool, add the **CreateTable** item in toolbar items.

Insert table

To insert the table in Rich Text Editor, click the **table** toolbar option to insert the table into Rich Text Editor content and this is the default way in all the devices.

Please refer the below sample and code snippets to add the table in Markdown editor

        height: inherit;
        padding: 8px;
        height: 100%;
    }

    .e-rte-content .e-content.e-pre-source {
        width: 100%;
    }

    .highcontrast .e-richtexteditor textarea.e-content {
        border-right: 1px solid #fff;
    }

    .sb-header {
        z-index: 100;
    }
</style>
```

```
<script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Custom format

The Rich Text Editor allows you to customize the markdown syntax by overriding its default syntax. Configure the customized markdown syntax using the [formatter](#) property.

This sample demonstrates how to customize tags of markdown formatting.

For example, apply **+** to Unordered list, apply **1., 2., 3.** to Ordered list, for bold, **__**, and for italic **_**.

INDEX.TS

```
import { RichTextEditor, Toolbar, Link, Image, MarkdownFormatter,
MarkdownEditor, QuickToolbar } from '@syncfusion/ej2-richtexteditor';
RichTextEditor.Inject(Toolbar, Link, Image, MarkdownEditor, QuickToolbar);
let defaultRTE: RichTextEditor = new RichTextEditor({
  height: 340,
  toolbarSettings: {
    items: ['Bold', 'Italic', 'StrikeThrough', '|',
      'Formats', 'OrderedList', 'UnorderedList', '|',
      'CreateLink', 'Image', '|', 'Undo', 'Redo']
  },
  editorMode: 'Markdown',
  formatter: new MarkdownFormatter({
    listTags: { 'OL': '1., 2., 3.', 'UL': '+ ' },
    formatTags: {
      'Blockquote': '> '
    },
    selectionTags: { 'Bold': '__', 'Italic': '_' }
  })
});
defaultRTE.appendTo('#defaultRTE');
```

In Rich Text Editor , you click the toolbar buttons to format the words and
the changes are visible immediately.
Markdown is not like that. When you format the word in Markdown format, you
need to add Markdown syntax to the word to indicate which words
and phrases should look different from each other
Rich Text Editor supports markdown editing when the editorMode set as
**markdown** and using both *keyboard interaction* and *toolbar action*, you
can apply the formatting to text.
We can add our own custom formation syntax for the Markdown formation,
[sample link] (https://ej2.syncfusion.com/home/).
The third-party library <b>Marked</b> is used in this sample to convert
markdown into HTML content

File browser in EJ2 JavaScript Rich text editor control

Rich Text Editor allows to browse and insert an image in the edit panel using the file browser. File browser allows the users to browse and select a file or folder from the file system and it supports various cloud services.

Required additional package styles and scripts reference

Following packages style and script (local or CDN) reference additionally required to use the file browser feature in Rich Text Editor.

- ej2-data
- ej2-layouts
- ej2-grids
- ej2-filemanager

Map the above packages style and script reference in sample as like below

```

The following example explains about how to configure the file browser within the Rich Text Editor component.

- Configure the **FileManager** toolbar item in the **toolbarSettings** API items property.
- Set **enable** property as true on **fileManagerSettings** property to make the file browser in the Rich Text Editor to appear on the **FileManager** toolbar click action.

INDEX.JS

```

/**
 * Rich Text Editor - File browser sample
 */
var hostUrl = 'https://ej2-aspcore-service.azurewebsites.net/';
var defaultRTE = new ej.richtexteditor.RichTextEditor({
  fileManagerSettings: {
    enable: true,
    path: '/Pictures/Food',
    ajaxSettings: {
      url: hostUrl + 'api/FileManager/FileOperations',
      getImageUrl: hostUrl + 'api/FileManager/GetImage',
      uploadUrl: hostUrl + 'api/FileManager/Upload',
      downloadUrl: hostUrl + 'api/FileManager/Download'
    }
  }
});

```

```

    },
    toolbarSettings: {
        items: ['FileManager']
    }
});
defaultRTE.appendTo('#defaultRTE');

Iframe in EJ2 JavaScript Rich text editor control

When the [iframeSettings](#) option is enabled, the Rich Text Editor creates the iframe element as the content area on control initialization; it is used to display and editing the content. In Content area, the editor displays only the body tag of a `<iframe>` document.

INDEX.TS

```

import { RichTextEditor, Toolbar, Link, Image, HtmlEditor, QuickToolbar }
from '@syncfusion/ej2-richtexteditor';
RichTextEditor.Inject(Toolbar, Link, Image, HtmlEditor, QuickToolbar);
// initialize Rich Text Editor component
let defaultRTE: RichTextEditor = new RichTextEditor({
    height: 340,
    iframeSettings: {
        enable: true
    }
});
// render initialized Rich Text Editor
defaultRTE.appendTo('#defaultRTE');

```

Adding external CSS/Script File

The editor offers you to add external CSS file to style the `<iframe>` element. Easily change the appearance of editor's content using an external CSS file using `styles` field in `iframeSettings` property.

Likewise, add the external script file to the `<iframe>` element using `scripts` field of `iframeSettings` to provide the additional functionalities to the Rich Text Editor.

INDEX.TS

```
import { RichTextEditor, Toolbar, Link, Image, HtmlEditor, QuickToolbar }
from '@syncfusion/ej2-richtexteditor';
RichTextEditor.Inject(Toolbar, Link, Image, HtmlEditor, QuickToolbar);
// initialize Rich Text Editor component
let defaultRTE: RichTextEditor = new RichTextEditor({
    height: 340,

Format Painter in EJ2 JavaScript Rich Text Editor Control | Syncfusion

A format painter is a tool that allows you to copy the formatting from a piece of text and apply it to another one. Format Painter can be accessed via the toolbar or the keyboard shortcuts. The format painter can copy the formatting of a single word or a whole paragraph. The format painter can be customized using the [formatPainterSettings](#) property.

Enabling the toolbar option for Format Painter

You can add the **FormatPainter** tool in the Rich Text Editor using the **toolbarSettings** [items](#) property.

By double-clicking the format painter toolbar button, **sticky mode** will be enabled. In sticky mode, the format painter will be disabled when the user clicks the **Escape** key again.

The following code example shows how to add the format painter tool in the Rich Text Editor.

INDEX.JSS

```
/**
 * Rich Text Editor - Format Painter sample
 */
var defaultRTE = new ej.richtexteditor.RichTextEditor({
  toolbarSettings: {
    items: ['FormatPainter', 'ClearFormat', 'Bold', 'Italic',
'Underline', '|', 'Formats', 'Alignments',
'OrderedList', 'UnorderedList', '|', 'CreateLink', 'Image', '|',
'SourceCode', 'Undo', 'Redo']
  },
});
defaultRTE.appendTo('#formatPainterRTE');
```

      <h3><strong>Format Painter</strong></h3>
      <p>
        A Format Painter is a Rich Text Editor feature allowing users to quickly
        <span style="background-color: rgb(198, 140, 83);"><strong>copy</strong></span>
        and
        <span style="background-color: rgb(198, 140, 83);"><strong>paste</strong></span>
        formatting from one text to another. With a rich text editor, utilize the format painter as follows:
      </p>
      <ul>
        <li>
          Select the text whose format you want to copy.
        </li>
        <li>
          Click on the <strong><em>Format Painter</em></strong> button in the toolbar. It may look like a paintbrush icon.
        </li>
        <li>
          The cursor will change to a <strong>paintbrush</strong> icon. Click and drag the cursor over the text you want to apply the copied format.
        </li>
        <li>
          Release the mouse button to apply the format.
        </li>
      </ul>
      <p>
        Using the format painter in a rich text editor can save you time when formatting a large document, You can quickly copy and apply formatting to <span style="background-color: rgb(198, 140, 83);"><strong>multiple sections</strong></span>.
        It's a helpful tool for anyone who works with text editing regularly, such as writers, editors, and content creators.
      </p>
    </div>
  </div>
</body>
</html>
<script>
  var ele = document.getElementById('container');
  if(ele) {
    ele.style.visibility = "visible";
  }
</script>

```

```

</script>
<script src="index.js" type="text/javascript"></script>
</body>
</html>

```

Customization of copy and paste format

You can customize the format painter tool in the Rich Text Editor using the `formatPainterSettings` property.

The `allowedFormats` property helps you to specify tag names that allow the formats to be copied from the selected text. For instance, you can include formats from the selected text using tags like `p`; `h1`; `h2`; `h3`; `div`; `ul`; `ol`; `li`; `span`; `strong`; `em`; `code`. The following example demonstrates how to customize this functionality.

Similarly, with the `deniedFormats` property, you can utilize the selectors to prevent specific formats from being pasted onto the selected text. The table below illustrates the selectors and their respective usage.

Type	Description	Selector	Usage
()	Class Selector	<code>h3(e-rte-block-blue-text)</code>	The class name <code>e-rte-block-blue-text</code> of H3 element is not copied.
[]	Attribute Selector	<code>span\[title]</code>	The title attribute of span element is not copied.
{ }	Style Selector	<code>span{background-color, color}</code>	The background-color and color styles of span element is not copied.

Using the `deniedFormats` property following styles are denied copying from the selected text such as `h3(e-rte-block-blue-text){background-color,padding}[title]`; `li{color}`; `span(e-inline-text-highlight){color}[title]`; `strong{color}(e-rte-strong-bg)`.

INDEX.JS

```

/**
 * Rich Text Editor - Format Painter sample
 */
var defaultRTE = new ej.richtexteditor.RichTextEditor({
  toolbarSettings: {
    items: ['FormatPainter', 'ClearFormat', 'Bold', 'Italic',
    'Underline', '|', 'Formats', 'Alignments',
    'OrderedList', 'UnorderedList', '|', 'CreateLink', 'Image', '|',
    'SourceCode', 'Undo', 'Redo']
  },
  formatPainterSettings: {
    allowedFormats: 'p;h1;h2;h3;div;ul;ol;li;span;strong;em;code;',
    deniedFormats: 'h3(e-rte-block-blue-text){background-
    color,padding,color}[title]; li{color}; span(e-inline-text-
    highlight){color}[title]; strong{color}(e-rte-strong-bg);',
  }
});

```

```
});
defaultRTE.appendTo('#formatPainterRTE');
```

editing regularly, such as writers, editors, and content creators.
    </p>
</div>
</div>
<script>
    var ele = document.getElementById('container');
    if(ele) {
        ele.style.visibility = "visible";
    }
</script>
<script src="index.js" type="text/javascript"></script>
</body>
</html>

```

Using the shortcut key to copy and paste the format

You can use the following shortcut keys to copy and paste the format in the Rich Text Editor.

Actions	Keyboard shortcuts	Description
Copy the format	Alt + Shift + c	Copy the selection format or current range.
Pate the format	Alt + Shift + v	Paint the copied format.
Escape	Esc	Remove the previously copied format and disable the sticky mode.

The format painter retains the formatting after application making it possible to apply the same formatting multiple times by using the Alt + Shift + v keyboard shortcut.

Additionally, You can perform the format painter actions programmatically using the [executeCommand](#) public method.

Form support in EJ2 JavaScript Rich text editor control

The following sample demonstrates how to get the Rich Text Editor value in button click.

Render the Rich Text Editor

Render the Rich Text Editor in form.

```
`ts
<form id="myForm" class="form-vertical">
<div class="form-group">
<textarea id="defaultRTE" name="defaultRTE" required maxlength="100" minlength="20" data-msg-
containerid="dateError"> </textarea>
<div id="dateError" style="padding-top: 10px"></div>
</div>
<div style="text-align: center">
<button id="validateSubmit" class="samplebtn e-control e-btn" type="submit" data-
ripple="true">Submit</button>
<button id="resetbtn" class="samplebtn e-control e-btn" type="reset" data-
ripple="true">Reset</button>
</div>
</form>
`
```

Obtain the value

Upon submitting the form, the `getValue` method will be triggered. Through the `FormData` class, get the Rich Text Editor value.

INDEX.TS

```
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
import { RichTextEditor, Toolbar, Link, Image, HtmlEditor, Count,
QuickToolbar } from '@syncfusion/ej2-richtexteditor';
import { FormValidator } from '@syncfusion/ej2-inputs';
RichTextEditor.Inject(Toolbar, Link, Image, HtmlEditor, Count,
QuickToolbar);
let defaultRTE: RichTextEditor = new RichTextEditor({ showCharCount: true,
maxLength: 100, placeholder: 'Type something' });
defaultRTE.appendTo('#defaultRTE');
let formObject = new FormValidator('#form-element');
document.getElementById('validateSubmit').onclick = function () {
    getValue();
}
function getValue() {
    let form = document.getElementById('form-element');
    let formData = new FormData(form);
    let rteValue = formData.get('defaultRTE');
    alert(rteValue); //Store the value to the data base.
}
```

Validation in EJ2 JavaScript Rich text editor control

Validation rules

The Rich Text Editor provides the functionality of character count and its validation. So, you can validate the Rich Text Editor's value on form submission by applying validationRules and validationMessage to the Rich Text Editor.

Rules	Description
required	Requires value for the Rich Text Editor control.
minlength	Requires the value to be of given minimum characters count.
maxlength	Requires the value to be of given maximum characters count.

This sample is used to validate form using the obtrusive Validation. Type the values in Rich Text Editor and the form enables the validation with the formvalidator rules by clicking on the submit externally. All rules are validated by the formvalidator rules.

INDEX.TS

```

import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
/**
 * Rich Text Editor default sample
 */
import { RichTextEditor, Toolbar, Link, Image, HtmlEditor, Count,
QuickToolbar } from '@syncfusion/ej2-richtexteditor';
import { FormValidator } from '@syncfusion/ej2-inputs';
RichTextEditor.Inject(Toolbar, Link, Image, HtmlEditor, Count,
QuickToolbar);
import { Button } from '@syncfusion/ej2-buttons';
let button: Button;

        <div style="text-align: center">
            <button id="validateSubmit">Submit</button>
            <button id="resetbtn" class="samplebtn e-control e-btn"
type="reset" data-ripple="true">Reset</button>
        </div>
    </form>
</div>
</div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Validation message

The default error message for a rule can be customizable by defining it along with the concern rule object as follows.

In the following sample, customize the error message along with the concern rule.

INDEX.TS

```

import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
import { RichTextEditor, Toolbar, Link, Image, HtmlEditor, Count,

Style in EJ2 JavaScript Rich text editor control

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

Customizing the Rich Text Editor's content

Use the following CSS to customize the default Rich Text Editor's content properties like font-family, font-size and color.

`css

/ To change font family and font size /

```

.e-richtexteditor .e-rte-content .e-content,
.e-richtexteditor .e-source-content .e-content {
font-size: 20px;
font-family: Segoe ui;
}

```

/ To change font color and content background /

```

.e-richtexteditor .e-rte-content,
.e-richtexteditor .e-source-content {
background: seashell;
color: blue;
}

```

`

Customizing the Rich Text Editor's toolbar

Use the following CSS to customize the default color in the Rich Text Editor's toolbar icon.

`css

/ To change font color for toolbar icon /

```

.e-richtexteditor .e-rte-toolbar .e-toolbar-item .e-icons,
.e-richtexteditor .e-rte-toolbar .e-toolbar-item .e-icons:active {
color: red;
}

```

/ To change font color for toolbar button /

```
.e-toolbar .e-tbar-btn,
.e-toolbar .e-tbar-btn:active,
.e-toolbar .e-tbar-btn:hover {
color: red;
}
```

/ To change font color for toolbar button in active state/

```
.e-richtexteditor .e-rte-toolbar .e-toolbar-item .e-dropdown-btn.e-active .e-icons, .e-richtexteditor .e-
rte-toolbar .e-toolbar-item .e-dropdown-btn.e-active .e-rte-dropdown-btn-text {
color: red;
}
```

/ To change font color for expanded toolbar items /

```
.e-richtexteditor .e-rte-toolbar .e-toolbar-extended .e-toolbar-item .e-tbar-btn .e-icons,
.e-toolbar.e-extended-toolbar .e-toolbar-extended .e-toolbar-item .e-tbar-btn {
color: red;
}
```

`

Customizing the Rich Text Editor's character count

Use the following CSS to customize the default color in the Rich Text Editor's character count.

`css

/ To change font color, font family, font size and opacity /

```
.e-richtexteditor .e-rte-character-count {
color: red;
font-family: segoe ui;
font-size: 18px;
opacity: 00.54;
padding-bottom: 2px;
padding-right: 14px;
}
```

`

Globalization in EJ2 JavaScript Rich text editor control

Localization

The Rich Text Editor provides an option to localize its strings; it is used to adapting the editor to a particular local language. By default, the editor will use the **US English (en-US)** as its language. Please find the table with a list of keys and their corresponding values for the default language (en-US).

```
`ts
'en-US': {
  'richtexteditor': {
    'alignments': 'Alignments',
    'justifyleft': 'JustifyLeft',
    'justifycenter': 'JustifyCenter',
    'justifyright': 'Justify Right',
    'justifyfull': 'Justify Full',
    'formats': 'Formats',
    'fontname': 'Font Name',
    'fontsize': 'Font Size',
    'fontcolor': 'Font Color',

[enableRtl](#) property will not change based on [locale](#) property.

Exec command in EJ2 JavaScript Rich text editor control

In Rich Text Editor, `execCommand` used to perform command for the modification of content in editable area.

The `execCommand` will perform the following commands.

Commands	Description	Code snippets
----- ----- -----		
bold	Bold the selected content in the Rich Text Editor.	<code>rteObj.executeCommand('bold');</code>
italic	The selected text will be italics.	<code>rteObj.executeCommand('italic');</code>
underline	Underline the selected text in the Rich Text Editor.	<code>rteObj.executeCommand('underline');</code>
strikeThrough	Apply single line strike through formatting for the selected text.	<code>rteObj.executeCommand('strikeThrough');</code>
superscript	Makes the selected text as superscript (higher).	<code>rteObj.executeCommand('superscript');</code>
subscript	Makes the selected text as subscript (lower).	<code>rteObj.executeCommand('subscript');</code>
uppercase	Change the case of selected text to upper in the content.	<code>rteObj.executeCommand('uppercase');</code>
lowercase	Change the case of selected text to lower in the content.	<code>rteObj.executeCommand('lowercase');</code>
fontColor	Apply the specified font color for the selected text.	<code>rteObj.executeCommand('fontColor', 'yellow');</code>
fontName	Apply the specified font name for the selected text.	<code>rteObj.executeCommand('fontName', 'Arial');</code>
fontSize	Apply the specified font size for the selected text.	<code>rteObj.executeCommand('fontSize', '10pt');</code>
formatBlock	Apply the specified format styles for the selected text.	<code>rteObj.executeCommand('formatBlock', 'H1');</code>

| backColor | Apply the specified background color the selected text. |
`rteObj.executeCommand('backColor', 'red');`|

| justifyCenter | Align the content with center margin. | `rteObj.executeCommand('justifyCenter');`|

| justifyFull | Align the content with justify margin. | `rteObj.executeCommand('justifyFull');`|

| justifyLeft | Align the content with left margin. | `rteObj.executeCommand('justifyLeft');`|

| justifyRight | Align the content with right margin. | `rteObj.executeCommand('justifyLeft');`|

| undo | Allows to undo the actions. | `rteObj.executeCommand('undo');`|

| createLink | Creates a hyperlink to a text or image to a specific location in the content. |
`rteObj.executeCommand('createLink',{ text: 'Links', url: 'http://', title : 'Link' });`|

| indent | Allows to increase the indent level of the content. | `rteObj.executeCommand('indent');`|

| insertHTML | Insert the html content to the current cursor position. |
`rteObj.executeCommand('insertHTML', 'inserted an html');`|

| insertOrderedList | Create a new list item(numbered). |
`rteObj.executeCommand('insertOrderedList');`|

| insertUnorderedList | Create a new list item(bulleted). |
`rteObj.executeCommand('insertUnorderedList');`|

| outdent | Allows to decrease the indent level of the content. |
`rteObj.executeCommand('outdent');`|

| redo | Allows to redo the actions | `rteObj.executeCommand('redo');`|

| removeFormat | remove all formatting styles (such as bold, italic, underline, color, superscript, subscript, and more) from currently selected text. |
`rteObj.executeCommand('removeFormat');`|

| insertText | Insert text to the current cursor position. | `rteObj.executeCommand('insertText', 'inserted a text');`|

| insertImage | Insert an image to the current cursor position. |
`rteObj.executeCommand('insertImage', { url: 'https://ej2.syncfusion.com/javascript/demos/src/rich-text-editor/images/RTEImage-Feather.png', cssClass: 'rte-img' });`|

| copyFormatPainter | Copy the format of selected text and apply it to another text. |
`rteObj.executeCommand('copyFormatPainter', formatPainterSettings);`|

| applyFormatPainter | Apply the copied format to the selected text. |
`rteObj.executeCommand('applyFormatPainter');`|

| escapeFormatPainter | Remove the previously copied format and disable the sticky mode |
`rteObj.executeCommand('escapeFormatPainter');`|

Note: The 'ExecuteCommand' public method is not supported in Syncfusion Markdown Editor

Miscellaneous in EJ2 JavaScript Rich text editor control

Placeholder

Specifies the placeholder for the Rich Text Editor's content used when the Rich Text Editor body is empty through the [placeholder](#) property.

Through the `e-rte-placeholder` class to define our custom font family, font color, and styles to the placeholder text.

```
`ts
.e-richtexteditor .e-rte-placeholder {
font-family: monospace;
}
```

The below sample demonstrates the placeholder option in Rich Text Editor.

INDEX.TS

```
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
/**
 * Rich Text Editor default sample
 */
import { RichTextEditor, Toolbar, Link, Image, HtmlEditor, QuickToolbar,
Count } from '@syncfusion/ej2-richtexteditor';
RichTextEditor.Inject(Toolbar, Link, Image, HtmlEditor, QuickToolbar,
Count);
let defaultRTE: RichTextEditor = new RichTextEditor({ placeholder: 'Type
Something' });
defaultRTE.appendTo('#defaultRTE');
```

```

Character count

The Rich Text Editor automatically counts the number of characters in the content are while typing using the [showCharCount](#) property. The characters count displayed at the bottom of the editor. You can limit the number of characters in your content using the [maxLength](#) property. By default, the editor sets the characters limit value is infinity.

The character count color will be modified based on the characters in the Rich Text Editor.

| Status | Description |

|-----|-----|

| normal | Till 70% of given maxLength count reach, character count color is black. |

| warning | Once the number of character count in the Rich Text Editor reached 70% of given maxLength count, the character count color will be orange, indicating that, the Rich Text Editor value going to reach the maximum count. |

| error | Once the number of character count in the Rich Text Editor reached 90% of given maxLength count, the character count color will be red, indicating that, the Rich Text Editor value reached the maximum count. |

To create Rich Text Editor with [showCharCount](#) feature, inject the Count module to the RTE using the `RichTextEditor.Inject(Count)` method.

INDEX.TS

```

Code view

Rich Text Editor includes the ability for users to directly edit HTML code via **Source View** in the text area. If you made any modification in Source view directly, the changes will be reflected in the Rich Text Editor's content. So, the users will have more flexibility over the content they have created.

Undo/Redo Manager

Undo and redo tools allow you to edit the text by disregard/cancel the recently made changes and restore it to previous state. It is a useful tool to restore the performed action which got changed by mistake. By default, upto 30 actions can be undo/redo in the editor.

To undo and redo operations, do one of the following:

- Press the undo/redo button on the toolbar
- Press the **Ctrl + Z**/**Ctrl + Y** combination on the keyboard

Customize the undo/redo step count using [undoRedoSteps](#) property. By default, undo/redo actions take **300ms** time interval for store the action to the **undoRedoManager**. The time interval can be customized by using the [undoRedoTimer](#).

```

Prevention of cross-site scripting (XSS)

The Rich Text Editor allows the users to edit the content with security by preventing cross-site scripting (XSS). By default, provided built-in support to remove the elements from editor content, which cause XSS attack. The editor removes the elements based on the attributes if it is possible to execute script.

In the following sample, removed script tag and onmouseover attribute from content of the Rich Text Editor.

INDEX.TS

```

import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
/**
 * Prevention of XSS attack sample
 */
import { RichTextEditor, Toolbar, Link, Image, HtmlEditor, QuickToolbar }
from '@syncfusion/ej2-richtexteditor';
RichTextEditor.Inject(Toolbar, Link, Image, HtmlEditor, QuickToolbar);

```

```
let rteValue: string = `<div onmouseover='javascript:alert(1) '>Prevention of
Cross Sit Scripting (XSS) </div> <script>alert('hi')</script>`;
let defaultRTE: RichTextEditor = new RichTextEditor({
    value: rteValue
});
defaultRTE.appendTo('#defaultRTE');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
    <title>Essential JS 2 Rich Text Editor</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">

="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="defaultRTE">
        </div>
    </div>
    <script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
    </script>
    <script src="index.js" type="text/javascript"></script>
</body></html>
```

It is only applicable to editorMode as HTML.

Custom cross-site scripting

You can also filter the elements and attributes additionally, which cause the XSS attack through [beforeSanitizeHtml](#) event. Return the value from the event argument `helper` function to apply in the editor. To prevent the built-in support and make own cross-site scripting rules, set `cancel` argument to true.

The following sample demonstrates how to filter `script` tag from value.

INDEX.TS

```
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
/**
 * Custom cross-site scripting sample
 */
import { RichTextEditor, Toolbar, Link, Image, HtmlEditor, QuickToolbar,
BeforeSanitizeHtmlArgs } from '@syncfusion/ej2-richtexteditor';

RichTextEditor.Inject(Toolbar, Link, Image, HtmlEditor, QuickToolbar);
let rteValue: string = `<div>Prevention of Cross Sit Scripting (XSS) </div>
<script>alert('hi')</script>`;
let defaultRTE: RichTextEditor = new RichTextEditor({
    value: rteValue,
    beforeSanitizeHtml: (e: BeforeSanitizeHtmlArgs) => {
        e.helper = (value: string) => {
            e.cancel = true;
            let temp: HTMLElement = document.createElement('div');
            temp.innerHTML = value;
            let scriptTag: HTMLElement = temp.querySelector('script');
            if (scriptTag) {
                detach(scriptTag);
            }
            return temp.innerHTML;
        }
    }
});
defaultRTE.appendTo('#defaultRTE');
```

    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Resizable support

This feature allows the editor to be resized dynamically. The users can enable or disable this feature using the `enableResize` property in the Rich Text Editor. If `enableResize` is set to true, the Rich Text Editor component creates grip at the bottom right corner, which allows resizing the component in the diagonal direction. The following sample demonstrates the resizable feature.

Enabling the resizable support

To render the Rich Text Editor in the resizable mode, set the `enableResize` property to true. The above feature is built as module and hence the `Resize` module needs to be included in your application.

INDEX.TS

```

import { RichTextEditor, Toolbar, Link, Image, HtmlEditor, QuickToolbar,
Resize } from '@syncfusion/ej2-richtexteditor';
RichTextEditor.Inject(Toolbar, Link, Image, HtmlEditor, QuickToolbar,
Resize);
let defaultRTE: RichTextEditor = new RichTextEditor({
    enableResize: true
});
defaultRTE.appendTo('#defaultRTE');

```

INDEX.HTML

```

Specifying the Minimum and Maximum width and height for Resize

To have a restricted resizable area for the Rich Text Editor, you need to specify the min-width, max-width, min-height, and max-height CSS properties for the control's wrapper element. By default, the control is capable of resizing upto the current viewport. The `e-richtexteditor` CSS class will be available in the component's wrapper and can be used for applying the above mentioned styles.

```
`css
```

```
.e-richtexteditor {
min-width: 200px;
max-width: 800px;
```

```

min-height: 100px;
max-height: 300px;
}
,

```

INDEX.TS

```

import { RichTextEditor, Toolbar, Link, Image, HtmlEditor, QuickToolbar,
Resize } from '@syncfusion/ej2-richtexteditor';
RichTextEditor.Inject(Toolbar, Link, Image, HtmlEditor, QuickToolbar,
Resize);
let defaultRTE: RichTextEditor = new RichTextEditor({
    enableResize: true
});
defaultRTE.appendTo('#defaultRTE');
```

INDEX.HTML

</body></html>

```

Number and Bullet Format Lists

This feature allows the user to change the appearance of the Numbered and Bulleted lists. Users can also apply different numbering or bullet formats lists such as lowercase greek, upper Alpha, square and circles. You can also customize the style type of the lists to be populated in the dropdown from the toolbar by using the `numberFormatList` and `bulletFormatList` properties in the Rich Text Editor.

INDEX.TS

```

import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
/**
 * Rich Text Editor default sample
 */
import { RichTextEditor, Toolbar, Link, Image, HtmlEditor, QuickToolbar }
from '@syncfusion/ej2-richtexteditor';
RichTextEditor.Inject(Toolbar, Link, Image, HtmlEditor, QuickToolbar);
let defaultRTE: RichTextEditor = new RichTextEditor({
    toolbarSettings: {
        items: ['NumberFormatList', 'BulletFormatList']},
});
defaultRTE.appendTo('#defaultRTE');

```

Xhtml validation in EJ2 JavaScript Rich text editor control

The editor provides an option to validate the source content of the Rich Text Editor against the XHTML standard using the 'enableXhtml' property. When you enter or modify content in the editor, it continuously checks the XHTML source content and removes elements and attributes that are not valid.

The editor checks the following settings on validation:

Attributes

- Must be specified in lowercase.
- Proper use of quotation marks around the attributes.
- Must be valid attributes for corresponding HTML element.
- All the required attributes must be included in the HTML element.

HTML Elements

- Must be in lowercase.
- All opening tags must be closed.
- Allows only the valid HTML elements.
- Elements must be properly nested.
- All elements must have one root element.
- Should not use inline elements inside the block elements.

INDEX.TS

```
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
/**
 * Rich Text Editor default sample
 */
import { RichTextEditor, Toolbar, Link, Image, HtmlEditor, QuickToolbar }
from '@syncfusion/ej2-richtexteditor';
RichTextEditor.Inject(Toolbar, Link, Image, HtmlEditor, QuickToolbar);
let defaultRTE: RichTextEditor = new RichTextEditor({enableXhtml : true });
defaultRTE.appendTo('#defaultRTE');
```

Third party integration in EJ2 JavaScript Rich text editor control

The Rich Text Editor can be integrated with third-party to suite the application scenario.

Code-Mirror Integration

Rich Text Editor comes with a basic HTML source editor through view-source property. [Code mirror](#) plugin can be used to highlight the syntax of HTML. CodeMirror plugin for Rich Text Editor makes editing of HTML source code with a pleasant experience.

Import necessary CSS and JS files of CodeMirror to the HTML page.

Required JS files of code mirror.

```

`ts
<script src="scripts/CodeMirror/codemirror.js" type="text/javascript"></script>
<script src="scripts/CodeMirror/javascript.js" type="text/javascript"></script>
<script src="scripts/CodeMirror/css.js" type="text/javascript"></script>
<script src="scripts/CodeMirror/htmlmixed.js" type="text/javascript"></script>
,

```

Required CSS file of code mirror.

```

`ts
<link href="scripts/CodeMirror/codemirror.min.css" rel="stylesheet" />
,

```

Add a custom icon for HTML source editor in the toolbar of Rich Text Editor using template option of [toolbarSettings](#) and define the code mirror plugins, and then pass the Rich Text Editor content as argument in [actionComplete](#) event.

INDEX.TS

```

import { addClass, removeClass, Browser } from '@syncfusion/ej2-base';
import { RichTextEditor, Toolbar, Link, Image, Count, HtmlEditor,
QuickToolbar } from '@syncfusion/ej2-richtexteditor';
RichTextEditor.Inject(Toolbar, Link, Image, Count, HtmlEditor,
QuickToolbar);
import { createElement } from '@syncfusion/ej2-base';
let defaultRTE: RichTextEditor = new RichTextEditor({ toolbarSettings: {
    items: ['SourceCode']},
    showCharCount: true,
    actionComplete: actionCompleteHandler});
defaultRTE.appendTo('#defaultRTE');
let myCodeMirror: any;
function mirrorConversion(e?: any): void {
    let textArea: HTMLElement = defaultRTE.contentModule.getEditPanel() as
HTMLElement;
    let id: string = defaultRTE.getID() + 'mirror-view';

```

```

    let mirrorView: HTMLElement = defaultRTE.element.querySelector('#' + id)
    as HTMLElement;
    let charCount: HTMLElement = defaultRTE.element.querySelector('.e-rte-
character-count') as HTMLElement;
    if (e.targetItem === 'Preview') {
        textArea.style.display = 'block';
        mirrorView.style.display = 'none';
        textArea.innerHTML = myCodeMirror.getValue();
        charCount.style.display = 'block';
    } else {
        if (!mirrorView) {
            mirrorView = createElement('div', { className: 'e-content' });
            mirrorView.id = id;
            textArea.parentNode.appendChild(mirrorView);
        } else {
            mirrorView.innerHTML = '';
        }
        textArea.style.display = 'none';
        mirrorView.style.display = 'block';
        renderCodeMirror(mirrorView, defaultRTE.value);
        charCount.style.display = 'none';
    }
}
function renderCodeMirror(mirrorView: HTMLElement, content: string): void {
    myCodeMirror = CodeMirror(mirrorView, {
        value: content,
        lineNumbers: true,
        mode: 'text/html',
        lineWrapping: true,
    });
}
function actionCompleteHandler(e: any): void {
    if (e.targetItem && (e.targetItem === 'SourceCode' || e.targetItem ===
'Preview')) {
        this.sourceCodeModule.getPanel().style.display = 'none';
        mirrorConversion(e);
    } else {
        setTimeout(() => {
            defaultRTE.toolbarModule.refreshToolbarOverflow(); }, 400);
    }
}
}

```

Embed.ly Integration

Rich Text Editor easily integrate with [Embed.ly](#) which is probably the best service when it comes to embed the rich content such as Twitter, Facebook, Instagram and lots of other publishing platform embeds.

`ts

```
<script src="https://cdn.embedly.com/widgets/platform.js" charset="UTF-8"></script>
```

In the following sample, the [Embed.ly](#) class `embedly-card` has been added to `<a>` tag in [actionComplete](#) event.

INDEX.TS

```

import { RichTextEditor, Toolbar, Link, Image, Count, HtmlEditor,
QuickToolbar } from '@syncfusion/ej2-richtexteditor';
RichTextEditor.Inject(Toolbar, Link, Image, Count, HtmlEditor,
QuickToolbar);
let defaultRTE: RichTextEditor = new RichTextEditor({
    placeholder: "Click link icon in toolbar to add the desired link",
    toolbarSettings: {
        items: ['createLink'],
        actionComplete: function(args) {
            if (<String>args.requestType === 'Links') {
                if (args.elements[0].parentNode &&
(<Element>args.elements[0].parentNode).tagName === 'A') {
                    var emberEle=document.createElement('blockquote'); // to add
the link
                    emberEle.setAttribute('class', 'embedly-card'); // to add the
class
                    emberEle.appendChild(args.elements[0].parentElement);
                    emberEle.appendChild(document.createElement('p'));
                    args.range.insertNode(emberEle); // add the link description
to the rte content
                }
            }
        }
    });
defaultRTE.appendTo('#defaultRTE');
```

Keyboard support in EJ2 JavaScript Rich text editor control

The editor has full keyboard accessibility that includes shortcuts to open and other actions with toolbar items, drop-down lists, and dialogs.

HTML formation shortcut key

You can use the following key shortcuts when the Rich Text Editor renders with **HTML** [editMode](#).

| Actions | Keyboard shortcuts |

|-----|-----|

| Toolbar focus | Alt + f10 |

| Insert link | Ctrl + k |

| Insert image | Ctrl + Shift + i |

| Insert audio | Ctrl + Shift + a |

| Insert video | Ctrl + Alt + v |

| Insert table | Ctrl + Shift + e |

| Undo | Ctrl + z |

| Redo | Ctrl + y |

| Copy | Ctrl + c |

| Cut | Ctrl + x |

| Paste | Ctrl + v |

| Bold | Ctrl + b |

| Italic | Ctrl + i |

| Underline | Ctrl + u |

| Strikethrough | Ctrl + Shift + s |

| Uppercase | Ctrl + Shift + u |

| Lowercase | Ctrl + Shift + l |

| Superscript | Ctrl + Shift + = |

| Subscript | Ctrl + = |

      In Rich Text Editor , you click the toolbar buttons to format the words and
      the changes are visible immediately.
      Markdown is not like that. When you format the word in Markdown format, you
      need to add Markdown syntax to the word to indicate which words
      and phrases should look different from each other
      Rich Text Editor supports markdown editing when the editorMode set as
      **markdown** and using both *keyboard interaction* and *toolbar action*, you
      can apply the formatting to text.
      We can add our own custom formation syntax for the Markdown formation,
      [sample link] (https://ej2.syncfusion.com/home/).
      The third-party library <b>Marked</b> is used in this sample to convert
      markdown into HTML content

Accessibility in EJ2 JavaScript Rich text editor control

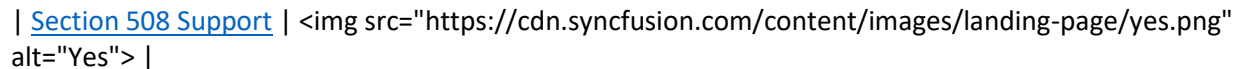

The Rich Text Editor component has been designed, keeping in mind the WAI-ARIA specifications, and applies the WAI-ARIA roles, states, and properties. This component is characterized by complete ARIA accessibility support that makes it easy for people who use assistive technologies (AT) or those who completely rely on keyboard navigation

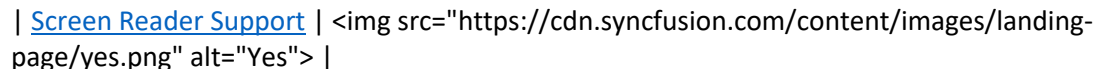

The accessibility compliance for the Rich Text Editor component is outlined below.

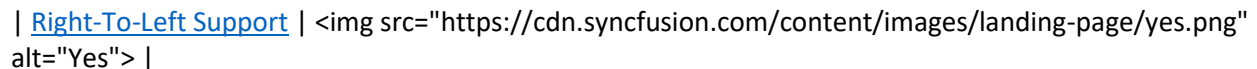

| [Accessibility Criteria](#) | [Compatibility](#) |

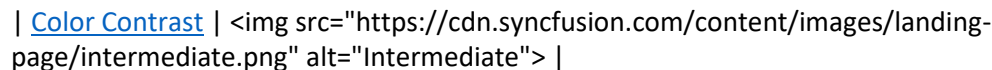

| -- | -- |

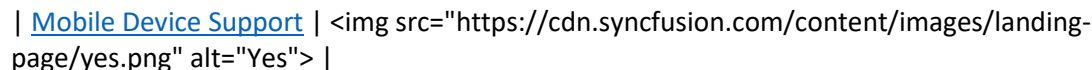

| [WCAG 2.2 Support](#) |  alt="Yes" > |

| [Section 508 Support](#) |  alt="Yes" > |

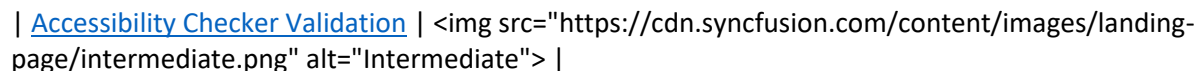

| [Screen Reader Support](#) |  alt="Yes" > |

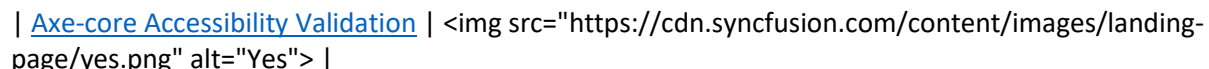

| [Right-To-Left Support](#) |  alt="Yes" > |

| [Color Contrast](#) |  alt="Intermediate" > |

| [Mobile Device Support](#) |  alt="Yes" > |

| [Keyboard Navigation Support](#) |  alt="Yes" > |

| [Accessibility Checker Validation](#) |  alt="Intermediate" > |

| [Axe-core Accessibility Validation](#) |  alt="Yes" > |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<div> - All features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

ARIA attributes

- The toolbar of Rich Text Editor, assigned the role of **Toolbar** and has the following list of ARIA attribute.

| Property | Functionalities |

| --- | --- |

| role="toolbar" | This attribute added to the ToolBar element describes the actual role of the element. |

| aria-orientation | Indicates the ToolBar orientation. Default value is **horizontal**. |

| aria-haspopup | Indicates the popup mode of the Toolbar. Default value is false. When popup mode is enabled, attribute value has to be changed to **true**. | |

| aria-disabled | Indicates the disabled state of the ToolBar. |

| aria-owns | Identifies an element to define a visual, functional, or contextual parent/child relationship between DOM elements when the DOM hierarchy cannot represent the relationship. In the Rich Text Editor, the attribute contains the ID of the Rich Text Editor to indicate the popup as a child element. |

For further details of Toolbar ARIA attributes, refer the [accessibility of Toolbar](#) documentation.

The Rich Text Editor element is assigned the role of **application**.

| Property | Functionalities |

| --- | --- |

| role="application" | This attribute added to the Rich Text Editor element describes the actual role of the element. |

| aria-disabled | Indicates the disabled state of the ToolBar. |

Keyboard interaction

The Rich Text Editor component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Rich Text Editor component.

HTML formation shortcut key

You can use the following key shortcuts when the Rich Text Editor renders with HTML edit mode.

| Actions | Keyboard shortcuts |

|-----|-----|

| Toolbar focus | Alt + f10 |

| Insert link | Ctrl + k |

| Insert image | Ctrl + Shift + i |

| Insert table | Ctrl + Shift + e |

| Undo | Ctrl + z |

| Redo | Ctrl + y |

| Copy | Ctrl + c |

| Cut | Ctrl + x |

| Paste | Ctrl + v |

| Bold | Ctrl + b |

| Italic | Ctrl + i |

Underline	Ctrl + u
Strikethrough	Ctrl + Shift + s
Uppercase	Ctrl + Shift + u
Lowercase	Ctrl + Shift + l
Superscript	Ctrl + Shift + =
Subscript	Ctrl + =
Indents	Ctrl +]
Outdents	Ctrl + [
HTML source	Ctrl + Shift + h
Fullscreen	Ctrl + Shift + f
Exit Fullscreen	Esc
Justify center	Ctrl + e
Justify full	Ctrl + j
Justify left	Ctrl + l
Justify right	Ctrl + r
Clear format	Ctrl + Shift + r
Ordered list	Ctrl + Shift + o
Unordered list	Ctrl + Alt + o
Format Painter Copy	Alt + Shift + c
Format Painter Paste	Alt + Shift + v
Format Painter Escape	Esc

Markdown formation shortcut key

You can use the following key shortcuts when the Rich Text Editor renders with Markdown edit mode

| Actions | Keyboard shortcuts |

|-----|-----|

Toolbar focus	Alt + f10
Insert link	Ctrl + k
Insert image	Ctrl + Shift + i
Insert table	Ctrl + Shift + e
Undo	Ctrl + z
Redo	Ctrl + y
Copy	Ctrl + c

- | Cut | Ctrl + x |
- | Paste | Ctrl + v |
- | Bold | Ctrl + b |
- | Italic | Ctrl + i |
- | Strikethrough | Ctrl + Shift + s |
- | Uppercase | Ctrl + Shift + u |
- | Lowercase | Ctrl + Shift + l |
- | Superscript | Ctrl + Shift + = |
- | Subscript | Ctrl + = |
- | Fullscreen | Ctrl + Shift + f |
- | Ordered list | Ctrl + Shift + o |
- | Unordered list | Ctrl + Alt + o |

Ensuring accessibility

The Rich Text Editor component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Rich Text Editor component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Rich Text Editor component with accessibility tools.

How To

Add google font in EJ2 JavaScript Rich text editor control

To use web fonts in Rich Text Editor, it is not needed for the web fonts to be present in local machine.

To add the web fonts to Rich Text Editor, we need to refer the web font links and add the font names in the [fontFamily](#) property.

INDEX.TS

```
import { RichTextEditor, Toolbar, Link, Image, Count, HtmlEditor,
QuickToolbar } from '@syncfusion/ej2-richtexteditor';
RichTextEditor.Inject(Toolbar, Link, Image, Count, HtmlEditor,
QuickToolbar);
let defaultRTE: RichTextEditor = new RichTextEditor({
  fontFamily: {
    items: [
      {text: "Segoe UI", value: "Segoe UI", class: "e-segoe-ui",
command: "Font", subCommand: "FontName"},
      {text: "Roboto", value: "Roboto", command: "Font", subCommand:
"FontName"},
      // here font is added
    ]
  }
});
```

```

        {text: "Great vibes", value: "Great Vibes,cursive", command:
"Font", subCommand: "FontName"},// here font is added
        {text: "Noto Sans", value: "Noto Sans", command: "Font",
subCommand: "FontName"},
        {text: "Impact", value: "Impact,Charcoal,sans-serif", class: "e-
impact", command: "Font", subCommand: "FontName"},
        {text: "Tahoma", value: "Tahoma,Geneva,sans-serif", class: "e-
tahoma", command: "Font", subCommand: "FontName"},
    ]
},
toolbarSettings: {
    items: ['Bold', 'Italic', 'Underline', 'StrikeThrough','|',
'FontName', 'FontSize', 'FontColor', 'BackgroundColor',
'LowerCase', 'UpperCase', '|',
'Formats', 'Alignments', 'OrderedList', 'UnorderedList',
'Outdent', 'Indent', '|',
'CreateLink', 'Image', '|', 'ClearFormat', 'Print',
'SourceCode', 'FullScreen', '|', 'Undo', 'Redo']
},
});
defaultRTE.appendTo('#defaultRTE');
```

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

The below font style links are referred in the page.

`ts

<link rel="stylesheet" href="http://fonts.googleapis.com/css?family=Roboto">

<link rel="stylesheet" href="http://fonts.googleapis.com/css?family=Great+Vibes">

,

In the above sample, you can see that we have added two Google web fonts (Roboto and Great vibes) to Rich Text Editor.

Default font in EJ2 JavaScript Rich text editor control

By using [default](#) property, you can change the default font-family of the Rich Text Editor. To change the font-family of the Rich Text Editor content while loading, we need to give the font-family in the style section with the help of [cssClass](#) property.

INDEX.TS

```
import { RichTextEditor, Toolbar, Link, Image, Count, HtmlEditor,
QuickToolbar } from '@syncfusion/ej2-richtexteditor';
RichTextEditor.Inject(Toolbar, Link, Image, Count, HtmlEditor,
QuickToolbar);
let defaultRTE: RichTextEditor = new RichTextEditor({
  fontFamily: {
    default: "Noto Sans", // to define default font-family
    items: [
      {text: "Segoe UI", value: "Segoe UI", class: "e-segoe-ui",
command: "Font", subCommand: "FontName"},
      {text: "Noto Sans", value: "Noto Sans", command: "Font",
subCommand: "FontName"},
      {text: "Impact", value: "Impact,Charcoal,sans-serif", class: "e-
impact", command: "Font", subCommand: "FontName"},
      {text: "Tahoma", value: "Tahoma,Geneva,sans-serif", class: "e-
tahoma", command: "Font", subCommand: "FontName"},
    ]
  },
  toolbarSettings: {
    items: ['Bold', 'Italic', 'Underline', 'StrikeThrough', '|',

</body></html>

```

File size in EJ2 JavaScript Rich text editor control

By using the Rich text editor's **imageUploading** event, you can get the image size before uploading and restrict the image to upload, when the given image size is greater than the allowed size.

In the following, we have validated the image size before uploading and determined whether the image has been uploaded or not.

INDEX.TS

```
import { RichTextEditor, Toolbar, Image, Link, HtmlEditor, QuickToolbar,
NodeSelection } from '@syncfusion/ej2-richtexteditor';
import { UploadingEventArgs } from '@syncfusion/ej2-inputs';
RichTextEditor.Inject(Toolbar, Image, Link, HtmlEditor, QuickToolbar );
let defaultRTE: RichTextEditor = new RichTextEditor({
    height: 400,
    toolbarSettings: {
        items: ['Undo', 'Redo', '|',
                'Bold', 'Italic', 'Underline', 'StrikeThrough', '|',
                'FontName', 'FontSize', 'FontColor', 'BackgroundColor', '|',
                'SubScript', 'SuperScript', '|',
                'LowerCase', 'UpperCase', '|',
                'Formats', 'Alignments', '|', 'OrderedList',
                'UnorderedList', '|',
                'Indent', 'Outdent', '|', 'Image', '|', 'SourceCode',
                '|', 'ClearFormat', 'Print']
    },
    insertImageSettings: {
        saveUrl:
            "https://aspnetmvc.syncfusion.com/services/api/uploadbox/Save",
        path: "../Images/"
    },
    imageUploading: onImageUploading
});
defaultRTE.appendTo("#defaultRTE");
function onImageUploading(args: UploadingEventArgs): void {
    console.log("file is uploading");
    let imgSize = 500000;
    let sizeInBytes: number = args.fileData.size;
    if ( imgSize < sizeInBytes ) {
        args.cancel = true;
    }
}
```

<script src="index.js" type="text/javascript"></script>
</body></html>

```

Shortcut key in EJ2 JavaScript Rich text editor control

It can be achieved by using [formatter](#) property. We need to create `customformatterModel` to configure the `keyConfig` using `IHtmlFormatterModel` class and assign the same to the formatter property. Here, `ctrl+q` is configured to open the `Insert Hyperlink` dialog.

INDEX.TS

```

import { RichTextEditor, Toolbar, Link, Image, Count, IHtmlFormatterModel,
HTMLFormatter, HtmlEditor, QuickToolbar } from '@syncfusion/ej2-
richtexteditor';
RichTextEditor.Inject(Toolbar, Link, Image, Count, HtmlEditor,
QuickToolbar);
let customHTMLModel: IHtmlFormatterModel = { // formatter is used to
configure the custom key
    keyConfig: {
        'insert-link': 'ctrl+q', // configure the desired key
    }
};

```

```

    }
  };
  let defaultRTE: RichTextEditor = new RichTextEditor({
    formatter: new HTMLFormatter(customHTMLModel), // to configure custom
    key
  });
  defaultRTE.appendTo('#defaultRTE');

```

INDEX.HTML

```

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

We need to import `IHtmlFormatterModel` and `HTMLFormatter` to configure the shortcut key.

Save in `EJ2 JavaScript Rich text editor control`

To achieve this, we need to bind the `keydown` event to the Rich Text Editor content and capture the `ctrl + s` key press using its `keyCode`.

In the `keydown` event handler, the `updateValue` method is called to update the `value` property and then we can save the content in the required database using the same.

INDEX.TS

```

import { RichTextEditor, Toolbar, Link, Image, Count, HtmlEditor,
QuickToolbar } from '@syncfusion/ej2-richtexteditor';
RichTextEditor.Inject(Toolbar, Link, Image, Count, HtmlEditor,
QuickToolbar);
let defaultRTE: RichTextEditor = new RichTextEditor({});
defaultRTE.appendTo('#defaultRTE');
defaultRTE.contentModule.getDocument().addEventListener("keydown", function(e
: any):void{
    if(e.key === 's' && e.ctrlKey===true){
        e.preventDefault(); // to prevent default ctrl+s action
        defaultRTE.updateValue(); // to update the value after editing
        let value: any= defaultRTE.value; // you can get the RTE content to
save in the desired database
    }
});

```

INDEX.HTML

```

Cursor in EJ2 JavaScript Rich text editor control

This can be achieved by using `setRange` method in the Rich Text Editor using `NodeSelection` instance. In this below sample, we have passed the text node (specific location in Rich Text Editor content) in `setStart` method and passed the range in `setRange` method of Rich Text Editor.

INDEX.TS

```

import { addClass, removeClass, Browser, isNullOrUndefined } from
'@syncfusion/ej2-base';
import { RichTextEditor, NodeSelection, Toolbar, Link, Image, Count,
HtmlEditor,
    QuickToolbar, ActionBeginEventArgs, IToolsItems } from '@syncfusion/ej2-
richtexteditor';
RichTextEditor.Inject(Toolbar, Link, Image, Count, HtmlEditor,
QuickToolbar);
let defaultRTE: RichTextEditor = new RichTextEditor({
    placeholder: 'Type Something',
});
defaultRTE.appendTo('#defaultRTE');
document.getElementById('btn').onclick = function() {
    let element: Element =
defaultRTE.contentModule.getDocument().getElementById("key");

```

```
let selectioncursor: NodeSelection = new NodeSelection();
let range: Range = document.createRange();
range.setStart(element, 1); // to set the range
selectioncursor.setRange(document, range); // to set the cursor
}
```

Rename images in server in EJ2 JavaScript Rich text editor control

By using the [insertImageSettings](#) property, you can specify the server handler to upload the selected images. Then you can bind the [imageUploadSuccess](#) event, to receive the modified file name from the server and update it in the Rich Text Editor's insert image dialog.

`html

```
<div id='defaultRTE'>
```

```

insertImageSettings: {
saveUrl: "[SERVICEHOSTEDPATH]/api/uploadbox/Rename",
path: "../Images/"
},
imageUploadSuccess: onImageUploadSuccess
});
defaultRTE.appendTo('#defaultRTE');
function onImageUploadSuccess (args: any) {
alert("Get the new file name here");
if (args.e.currentTarget.getResponseHeader('name') != null) {
args.file.name = args.e.currentTarget.getResponseHeader('name');
let filename: any = document.querySelectorAll(".e-file-name")[0];
filename.innerHTML = args.file.name.replace(document.querySelectorAll(".e-file-type")[0].innerHTML, "");
filename.title = args.file.name;
}
}

```

```
}  
,
```

To configure server-side handler, refer the below code.

```
`c#  
int x = 0;  
string file;  
[AcceptVerbs("Post")]  
public void Rename()  
{  
    try  
    {  
        var httpPostedFile = System.Web.HttpContext.Current.Request.Files["UploadFiles"];  
        imageFile = httpPostedFile.FileName;  
        if (httpPostedFile != null)  
        {  
            var fileSave = System.Web.HttpContext.Current.Server.MapPath("~/Images");  
            if (!Directory.Exists(fileSave))  
            {  
                Directory.CreateDirectory(fileSave);  
            }  
            var fileName = Path.GetFileName(httpPostedFile.FileName);  
            var fileSavePath = Path.Combine(fileSave, fileName);  
            while (System.IO.File.Exists(fileSavePath))  
            {  
                imageFile = "rtImage" + x + "-" + fileName;  
                fileSavePath = Path.Combine(fileSave, imageFile);  
                x++;  
            }  
            if (!System.IO.File.Exists(fileSavePath))  
            {  
                httpPostedFile.SaveAs(fileSavePath);  
                HttpResponseMessage Response = System.Web.HttpContext.Current.Response;  
                Response.Clear();
```

```

Response.Headers.Add("name", imageFile);
Response.ContentType = "application/json; charset=utf-8";
Response.StatusDescription = "File uploaded succesfully";
Response.End();
}
}
}
catch (Exception e)
{
    HttpResponseMessage Response = System.Web.HttpContext.Current.Response;
    Response.Clear();
    Response.ContentType = "application/json; charset=utf-8";
    Response.StatusCode = 204;
    Response.Status = "204 No Content";
    Response.StatusDescription = e.Message;
    Response.End();
}
}
,

```

Format code block in EJ2 JavaScript Rich text editor control

You can configure code block formatting as a separate toolbar button by adding the **InsertCode** keyword within the [toolbarSettings](#) items property.

The InsertCode button has a toggle state to apply code block formatting to the editor and remove code block formatting from the editor.

The following sample demonstrates how to config the InsertCode button in toolbar and set the background color to “pre” tag for highlighting the code block.

INDEX.TS

```

import { RichTextEditor, Toolbar, Link, Image, HtmlEditor, QuickToolbar }
from '@syncfusion/ej2-richtexteditor';
RichTextEditor.Inject(Toolbar, Link, Image, HtmlEditor, QuickToolbar);
let defaultRTE: RichTextEditor = new RichTextEditor({
    toolbarSettings: {
        items: ['InsertCode']
    }
});
defaultRTE.appendTo('#defaultRTE');
```

INDEX.HTML

```

```

File attachment in EJ2 JavaScript Rich text editor control

The Rich Text Editor allows you to attach a file based on the file upload. You can attach your files using the file upload or drag-and-drop from your local path. When the file upload gets success, the attachment link inserts into the content.

In the below sample, configure the saveUrl and path properties to achieve file attachments.

1. saveUrl: Provides service URL to save the files.
2. path: Specifies the location to store the image.

The following sample illustrates how to attach a file in the Rich Text Editor.

```
`ts
```

```
import { RichTextEditor, Toolbar, Link, Image, Count, HtmlEditor, QuickToolbar, NodeSelection } from
 '@syncfusion/ej2-richtexteditor';
```

```
RichTextEditor.Inject(Toolbar, Link, Image, Count, HtmlEditor, QuickToolbar, NodeSelection);
```

```
import { Uploader } from '@syncfusion/ej2-inputs';
```

```
let selection: NodeSelection = new NodeSelection();
```

```
let range: Range;
```

```
let saveSelection: NodeSelection;
```

```
let defaultRTE: RichTextEditor = new RichTextEditor({
```

```
    insertImageSettings: {
```

```
        saveUrl: "[SERVICEHOSTEDPATH]/api/uploadbox/Save",
```

```
        path: "../Files/"
```

```
    }
```

```
});
```

```
defaultRTE.appendTo("#defaultRTE");
```

```
let uploadObj: Uploader = new Uploader({
```

```
    asyncSettings: {
```

```

saveUrl: "[SERVICEHOSTEDPATH]/api/uploadbox/Save",
},
dropArea: defaultRTE.inputElement,
success: onUploadSuccess
});
uploadObj.appendTo("#fileupload");
function onUploadSuccess(args: any): void {
(defaultRTE.contentModule.getEditPanel() as HTMLElement).focus();
range = selection.getRange(document);
saveSelection = selection.save(range, document);
let fileUrl: any =
document.URL + defaultRTE.insertImageSettings.path + args.file.name;
if (defaultRTE.formatter.getUndoRedoStack().length === 0) {
defaultRTE.formatter.saveData();
}
saveSelection.restore();
defaultRTE.executeCommand('createLink', { url: fileUrl, text: fileUrl, selection: saveSelection });
defaultRTE.formatter.saveData();
defaultRTE.formatter.enableUndo(defaultRTE);
this.clearAll();
}
`

```

To configure server-side handler, refer the below code.

```

`c#
int x = 0;
string file;
[AcceptVerbs("Post")]
public void Save()
{
try
{
var httpPostedFile = System.Web.HttpContext.Current.Request.Files["UploadFiles"];
file = httpPostedFile.FileName;

```

```
if (httpPostedFile != null)
{
    Console.WriteLine(System.Web.HttpContext.Current.Server.MapPath("~/Files"));
    var fileSave = System.Web.HttpContext.Current.Server.MapPath("~/Files");
    if (!Directory.Exists(fileSave))
    {
        Directory.CreateDirectory(fileSave);
    }
    var fileName = Path.GetFileName(httpPostedFile.FileName);
    var fileSavePath = Path.Combine(fileSave, fileName);
    while (System.IO.File.Exists(fileSavePath))
    {
        file = "rte" + x + "-" + fileName;
        fileSavePath = Path.Combine(fileSave, file);
        x++;
    }
    if (!System.IO.File.Exists(fileSavePath))
    {
        httpPostedFile.SaveAs(fileSavePath);
        HttpResponseMessage Response = System.Web.HttpContext.Current.Response;
        Response.Clear();
        Response.Headers.Add("name", file);
        Response.ContentType = "application/json; charset=utf-8";
        Response.StatusDescription = "File uploaded succesfully";
        Response.Headers.Add("url", fileSavePath);
        Response.End();
    }
}
catch (Exception e)
{
    HttpResponseMessage Response = System.Web.HttpContext.Current.Response;
    Response.Clear();
```

```
Response.ContentType = "application/json; charset=utf-8";
Response.StatusCode = 204;
Response.Status = "204 No Content";
Response.StatusDescription = e.Message;
Response.End();
}
}
`
```

Schedule

Getting started in EJ2 JavaScript Schedule control

This section briefly explains how to create the [JavaScript Scheduler](#) component and configure its available functionalities in a JavaScript application.

Dependencies

The following list of dependencies are required to use the Scheduler component in your application.

```
`javascript
|-- @syncfusion/ej2-schedule
|-- @syncfusion/ej2-base
|-- @syncfusion/ej2-buttons
|-- @syncfusion/ej2-calendars
|-- @syncfusion/ej2-data
|-- @syncfusion/ej2-dropdowns
|-- @syncfusion/ej2-excel-export
|-- @syncfusion/ej2-inputs
|-- @syncfusion/ej2-lists
|-- @syncfusion/ej2-popups
|-- @syncfusion/ej2-navigations
`
```

Setup for local environment

Refer the following steps for setup your local environment.

Step 1: Create a root folder `myapp` for your application.

Step 2: Create `myapp/resources` folder to store local scripts and styles files.

Step 3: Create `myapp/index.js` and `myapp/index.html` files for initializing Essential JS 2 Scheduler control.

Adding Syncfusion resources

The Essential JS 2 Scheduler control can be initialized by using either of the following ways.

- Using local scripts and styles.
- Using CDN links for scripts and styles.

Using local scripts and styles

You can get the global scripts and styles from the [Essential Studio JavaScript \(Essential JS 2\)](#) build installed location.

After installing the Essential JS 2 product build, you can copy the Scheduler and its dependency scripts and style files into the `resources/scripts` and `resources/styles` folder respectively.

Refer the below location from where the Scheduler's script and styles can be referenced.

Syntax:

Script: **(installed location)/Syncfusion/Essential Studio/{RELEASEVERSION}/Essential JS 2/{PACKAGENAME}/dist/global/{PACKAGE_NAME}.min.js**

Styles: **(installed location)/Syncfusion/Essential Studio/{RELEASEVERSION}/Essential JS 2/{PACKAGENAME}/styles/material.css**

Example:

Script: **C:/Program Files (x86)/Syncfusion/Essential Studio/15.4.30/Essential JS 2/ej2-schedule/dist/global/ej2-schedule.min.js**

Styles: **C:/Program Files (x86)/Syncfusion/Essential Studio/15.4.30/Essential JS 2/ej2-schedule/styles/material.css**

After copying the files, you can refer the Scheduler's scripts and styles into the `index.html` file.

The below html code example shows the dependency of Scheduler.

```
<!DOCTYPE html>
<html xmlns="https://www.w3.org/1999/xhtml">
<head>
<title>Essential JS 2 Scheduler</title>
<!-- Essential JS 2 Scheduler's dependent material theme -->
<link href="resources/base/styles/material.css" rel="stylesheet" type="text/css"/>
<link href="resources/buttons/styles/material.css" rel="stylesheet" type="text/css"/>
<link href="resources/calendars/styles/material.css" rel="stylesheet" type="text/css"/>
<link href="resources/dropdowns/styles/material.css" rel="stylesheet" type="text/css"/>
```

```

<link href="resources/inputs/styles/material.css" rel="stylesheet" type="text/css"/>
<link href="resources/splitbuttons/styles/material.css" rel="stylesheet" type="text/css"/>
<link href="resources/lists/styles/material.css" rel="stylesheet" type="text/css"/>
<link href="resources/popups/styles/material.css" rel="stylesheet" type="text/css"/>
<link href="resources/navigations/styles/material.css" rel="stylesheet" type="text/css"/>
<!-- Essential JS 2 Scheduler's material theme -->
<link href="resources/schedule/styles/material.css" rel="stylesheet" type="text/css"/>
<!-- Essential JS 2 Scheduler's dependent scripts -->
<script src="resources/scripts/ej2-base.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-inputs.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-calendars.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-file-utils.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-buttons.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-lists.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-data.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-navigations.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-popups.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-dropdowns.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-splitbuttons.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-compression.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-excel-export.min.js" type="text/javascript"></script>
<!-- Essential JS 2 Scheduler's global script -->
<script src="resources/scripts/ej2-schedule.min.js" type="text/javascript"></script>
</head>
<body>
</body>
</html>

```

Using CDN links for scripts and styles

Using CDN link, you can directly refer the Scheduler's script and styles into the `index.html` file.

Refer the Scheduler's CDN links as given below.

Syntax:

Script:

https://cdn.syncfusion.com/ej2/{RELEASEVERSION}/{PACKAGENAME}/dist/global/{PACKAGE_NAME}.min.js

Styles: <https://cdn.syncfusion.com/ej2/{RELEASEVERSION}/{PACKAGENAME}/styles/material.css>

Example:

Script: <https://cdn.syncfusion.com/ej2/20.3.56/ej2-schedule/dist/global/ej2-schedule.min.js>

Styles: <https://cdn.syncfusion.com/ej2/20.3.56/ej2-schedule/styles/material.css>

The below html code example shows the dependency of Scheduler with `ej2-schedule.min.js`.

`html

```
<!DOCTYPE html>
<html xmlns="https://www.w3.org/1999/xhtml">
<head>
<title>Essential JS 2 Scheduler</title>

dropdowns.min.js" type="text/javascript"></script>

<script src="https://cdn.syncfusion.com/ej2/{RELEASE_VERSION}/ej2-splitbuttons/dist/global/ej2-
splitbuttons.min.js" type="text/javascript"></script>

<script src="https://cdn.syncfusion.com/ej2/{RELEASE_VERSION}/ej2-compression/dist/global/ej2-
compression.min.js" type="text/javascript"></script>

<script src="https://cdn.syncfusion.com/ej2/{RELEASE_VERSION}/ej2-excel-export/dist/global/ej2-excel-
export.min.js" type="text/javascript"></script>

<!-- Essential JS 2 Scheduler's global script -->

<script src="https://cdn.syncfusion.com/ej2/{RELEASE_VERSION}/ej2-schedule/dist/global/ej2-
schedule.min.js" type="text/javascript"></script>

</head>

<body>

<!-- Add the HTML <div> element for scheduler -->

<div id="Schedule"></div>

<script src="index.js" type="text/javascript"></script>

</body>
```

```
</html>
```

```
,
```

Place the following Scheduler code in the `index.js` file.

```
`javascript
ej.schedule.Schedule.Inject(ej.schedule.Day, ej.schedule.Week, ej.schedule.WorkWeek,
ej.schedule.Month, ej.schedule.Agenda);
var scheduleObj = new ej.schedule.Schedule();
scheduleObj.appendTo('#Schedule');
,
```

Initialize the Scheduler

Now, you can start adding Scheduler control in the application. For getting started, add a `div` element for Scheduler control in `index.html`. Then refer the `index.js` file into the `index.html` file.

In this document context we are going to use `ej2.min.js` which includes all the Essential JS 2 components and its dependent scripts.

```
`html
<!DOCTYPE html>
<html xmlns="https://www.w3.org/1999/xhtml">
<head>
<title>Essential JS 2 Scheduler</title>
<!-- Essential JS 2 Scheduler's dependent material theme -->
<link href="https://cdn.syncfusion.com/ej2/ej2-base/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="https://cdn.syncfusion.com/ej2/ej2-buttons/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="https://cdn.syncfusion.com/ej2/ej2-calendars/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="https://cdn.syncfusion.com/ej2/ej2-dropdowns/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="https://cdn.syncfusion.com/ej2/ej2-inputs/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="https://cdn.syncfusion.com/ej2/ej2-splitbuttons/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="https://cdn.syncfusion.com/ej2/ej2-lists/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="https://cdn.syncfusion.com/ej2/ej2-popups/styles/material.css" rel="stylesheet"
type="text/css"/>
```

```

<link href="https://cdn.syncfusion.com/ej2/ej2-navigations/styles/material.css" rel="stylesheet"
type="text/css"/>
<!-- Essential JS 2 Scheduler's material theme -->
<link href="https://cdn.syncfusion.com/ej2/ej2-schedule/styles/material.css" rel="stylesheet"
type="text/css"/>
<!-- Essential JS 2 all script -->
<script src="https://cdn.syncfusion.com/ej2/dist/ej2.min.js" type="text/javascript"></script>
</head>
<body>
<!-- Add the HTML <div> element for scheduler -->
<div id="Schedule"></div>
<script src="index.js" type="text/javascript"></script>
</body>
</html>
`

```

Place the following Scheduler code in the `index.js` file.

```

`javascript
var scheduleObj = new ej.schedule.Schedule();
scheduleObj.appendTo('#Schedule');
`

```

Populating appointments

To populate the empty Scheduler with appointments, define either the local JSON data or remote data through the `dataSource` property available within the `eventSettings` option. To define any appointments, start and end time fields are mandatory. In the following example, you can see the appointment defined with default fields such as Id, Subject, StartTime and EndTime.

```

`ts
var scheduleObj = new ej.schedule.Schedule({
height: '550px',
selectedDate: new Date(2018, 1, 15),
eventSettings: {
dataSource: [{
id: 1,
subject: 'Meeting',
startTime: new Date(2018, 1, 15, 10, 0),
endTime: new Date(2018, 1, 15, 12, 30)
}
]
}
}
)
`

```

```

    }}
  }
});
scheduleObj.appendTo('#Schedule');
`

```

You can also provide different names to these default fields, for which the custom names of those fields must be mapped appropriately within `fields` property as shown below.

```

`ts
var data = [{
  Id: 2,
  EventName: 'Meeting',
  StartTime: new Date(2018, 1, 15, 10, 0),
  EndTime: new Date(2018, 1, 15, 12, 30),
  IsAllDay: false,
  Status: 'Completed',
  Priority: 'High'
}];
var scheduleObj = new ej.schedule.Schedule({
  height: '550px',
  selectedDate: new Date(2018, 1, 15),
  eventSettings: {
    dataSource: data,
    fields: {
      id: 'Id',
      subject: { name: 'EventName' },
      isAllDay: { name: 'IsAllDay' },
      startTime: { name: 'StartTime' },
      endTime: { name: 'EndTime' },
    }
  }
});
scheduleObj.appendTo('#Schedule');
`

```

The other fields available in Scheduler can be referred from [here](#).

Setting date

Scheduler usually displays the system date as its current date. To change the current date of Scheduler with specific date, define the `selectedDate` property.

```
`ts
var scheduleObj = new ej.schedule.Schedule({
height: '550px',
selectedDate: new Date(2018, 1, 15)
});
scheduleObj.appendTo('#Schedule');
`
```

Setting view

Scheduler displays `Week` view by default. To change the current view, define the applicable view name to the `currentView` property. The applicable view names are,

- Day
- Week
- Workweek
- Month
- Year
- Agenda
- MonthAgenda
- TimelineDay
- TimelineWeek
- TimelineWorkWeek
- TimelineMonth
- TimelineYear

```
`ts
var scheduleObj = new ej.schedule.Schedule({
height: '550px',
selectedDate: new Date(2018, 1, 15),
currentView: 'Month'
});
scheduleObj.appendTo('#Schedule');
`
```

Individual view customization

Each individual Scheduler views can be customized with its own options such as setting different start and end hour on Week and Work Week views, whereas hiding the weekend days on Month view alone.

This can be achieved by defining views property to accept the array of object type, where each object depicts the individual view customization.

Now, run the application in the browser using the following command.

```
,
npm start
,
```

The output will display the Scheduler with the specified view configuration.

INDEX.JS

```
ej.schedule.Schedule.Inject(ej.schedule.Week, ej.schedule.WorkWeek,
ej.schedule.Month);
var scheduleObj = new ej.schedule.Schedule({
  width: '100%',
  height: '550px',
  selectedDate: new Date(2018, 1, 15),
  views: [{ option: 'Week', startHour: '07:00', endHour: '15:00'},
          { option: 'WorkWeek', startHour: '10:00', endHour: '18:00'},
          { option: 'Month', showWeekend: false }],
  eventSettings: { dataSource: scheduleData }
});
scheduleObj.appendTo('#Schedule');
```

INDEX.HTML

```

    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

You can also explore our [JavaScript Scheduler example](#) that shows how to use the toolbar buttons to play with Scheduler functionalities.

Module injection in EJ2 JavaScript Schedule control

The crucial step on creating a Scheduler with required views, is to import and inject the required modules. The modules that are available on Scheduler to work with its related functionalities are as follows.

- **Day** - Inject this module to work with day view.
- **Week** - Inject this module to work with week view.
- **WorkWeek** - Inject this module to work with work week view.
- **Month** - Inject this module to work with month view.
- **Agenda** - Inject this module to work with agenda view.
- **MonthAgenda** - Inject this module to work with month agenda view.
- **TimelineViews** - Inject this module to work with timeline day, timeline week, and timeline work week views.
- **TimelineMonth** - Inject this module to work with timeline month view.
- **DragAndDrop** - Inject this module to allow drag and drop of appointments on Scheduler.
- **Resize** - Inject this module for enabling the resize functionality of appointments on Scheduler.
- **ExcelExport** - Inject this module for exporting the Scheduler events data as excel file format.
- **ICalendarExport** - Inject this module for exporting the Scheduler events data to an ICS file.
- **ICalendarImport** - Inject this module for importing the Scheduler events data from an ICS file.

Module injection

The required modules should be injected into the Scheduler using the `ej.schedule.Schedule.Inject` method of Scheduler within the `index.js` file as shown below. On doing so, only the injected module functionalities will be loaded and can be worked with Scheduler.

[myapp/index.js]

```
`ts
```

```
ej.schedule.Schedule.Inject(ej.schedule.Day, ej.schedule.Week, ej.schedule.WorkWeek,
ej.schedule.Month, ej.schedule.Agenda, ej.schedule.MonthAgenda);
`
```

Note: This module injection is not necessary in JavaScript.

You can refer to our [JavaScript Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [JavaScript Scheduler example](#) to know how to present and manipulate data.

Scheduler interactions in EJ2 JavaScript Schedule control

The following table describes the Scheduler actions and also illustrates how those actions are carried out through mouse and touch interactions on Scheduler.

Actions	Mouse interaction	Touch interaction
Single click or tap on cells	Single click on a cell to select a cell. Tapping on it again will open the new event editor window.	Single tapping on cells, will display a + icon on the cell. Tapping on it again will open the new event editor window.
Multiple cell selection	Single click on a cell and drag the selection to other cells to enable multiple cell selection. No multiple cell selection is allowed using touch gestures.	
Event selection	Single click on an event to select it. Tap holding on events, select an event and opens a small popup at the top holding the options to edit or delete. The popup also displays the selected event's subject.	
Multiple event selection and deletion	Pressing Ctrl key and altogether single clicking on multiple events one after the other will enable multiple event selection. Pressing Delete key after event selection will delete all the selected events. Tap hold an event to select it, which opens a small popup at the top holding the options to edit or delete. As a continuation of this action, keep on single tapping on other events, to enable multiple event selection. Also, the popup displayed at the top remains in opened state, showing the count of the number of selected events. Pressing Delete option from the popup will delete all the selected events.	
Date navigation	Clicking on the previous or next date navigation icons in the header bar allows you to navigate between dates. Swiping the scheduler view port to the left or right will allow you to navigate between the dates on touch devices. You can prevent the swiping action by disabling allowSwiping property. NOTE: Swiping does not work when horizontal scroller present in the Scheduler. You can also make use of the previous and next navigation icons at the header bar to navigate.	
View navigation	Click on an event and try moving it over the Scheduler to enable drag and drop action. The view options are available within the popup options at the top right extreme end of the header bar and you can choose the view from it.	
Drag and drop	Click on an event and try moving it over the Scheduler to enable drag and drop action. Tap hold the event and try moving it over the Scheduler to enable drag and drop action.	
Event resizing	Hover the mouse across the extremities or edges of the Scheduler events and when the mouse pointer changes into resize handler, now click and start resizing an event to the desired time range. Touch the event extremities and start resizing the events directly.	

| Tooltip | Hover the mouse pointer over the events or resource header and the tooltip will be displayed. | Tap holding the events will open the tooltip on events. |

| Open editor window | Double click on cells or events to open the editor window. | Double click on cells or events to open the editor window. Single tap on cells, which displays a **+** icon on the cell. Now, tap on it again to open the new event editor window. To open the editor on events, single tap on it and then click on the edit icon to open the editor window in **Edit** mode. |

| Open quick info popup | Single clicking on a cell will open a quick popup prompting for new event creation. Single clicking on an event will open a popup displaying event information along with the option to edit and delete it. | No quick info popup is available while single tapping on cells. Single tapping on events, opens the popup showing event information. |

You can refer to our [JavaScript Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [JavaScript Scheduler example](#) to know how to present and manipulate data.

Appointments in EJ2 JavaScript Schedule control

Appointments can be anything that are scheduled for a specific time period. It can be created on varied time range and each appointments are categorized based on this range. The Scheduler events can be categorized as,

- Normal events
- Spanned events
- All-day events
- Recurring events

Normal events

Represents an appointment that is created for any specific time interval within a day.

Creating a normal event

The following example depicts how to define a normal event on the Scheduler, with event data being loaded from simple JSON data.

INDEX.TS

```
import { Schedule, Day, Week, TimelineViews, Month, Agenda } from
 '@syncfusion/ej2-schedule';
let data: object [] = [{
  Subject: 'Paris',
  StartTime: new Date(2018, 1, 15, 10, 0),
  EndTime: new Date(2018, 1, 15, 12, 30)
}];
Schedule.Inject(Day, Week, TimelineViews, Month, Agenda);
let scheduleObj: Schedule = new Schedule({
  height: '550px',
  selectedDate: new Date(2018, 1, 15),
  views: ['Day', 'Week', 'TimelineWeek', 'Month', 'Agenda'],
  eventSettings: {
    dataSource: data
  }
});
scheduleObj.appendTo('#Schedule');
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>Schedule Typescript Component</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript Schedule Control">

type="text/javascript"></script>
  <script src="es5-datasource.js" type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="Schedule"></div>
  </div>
<script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Spanned events

Represents an appointment that is created for more than 24 hours, and usually displayed on the all-day row. Also, represents another type of appointment that is created for more than one day but less than 24 hours, and usually displayed appropriately on both the days.

For example, if an appointment is created for two days say from November 25, 2018 – 11.00 PM to November 26, 2018 2.00 AM but less than 24 hours time interval, then the appointment is split into two partitions and will be displayed on both the days.

All-day events

Represents an appointment that is created for an entire day such as holiday events. It is usually displayed separately in an all-day row, a separate row for all-day appointments below the date header section. In Timeline views, the all-day appointments displays in the working space area, and no separate all-day row is present in that view.

To change normal appointment into all-day event, set `isAllDay` field to true.

Hide all-day row events

You can make use of the CSS customization to prevent the display of all-day row appointments on the Scheduler UI.

```
`ts
<style>
.e-schedule .e-date-header-wrap .e-schedule-table thead {
display: none;
}
</style>
`
```

You can also enable scroller for all-day row, please [refer](#) here to know more.

Expand all day appointments view on initial load

When you have larger number of appointments in all-day view, you can show all all-day events using `dataBound` event on at initial load. So, user don't have to click the toggle to expand all-day events.

INDEX.TS

```
import {Schedule, Day, Week, TimelineViews, Month, Agenda, DragAndDrop} from
'@syncfusion/ej2-schedule';
let data: object[] = [
  {
    EndTime: new Date(2022, 4, 4, 0, 0),

Customize the rendering of the spanned events

By default, Scheduler will renders the spanned events (appointment with more than 24 hours duration) in the all-day row by setting `AllDayRow` will the default type renders to the `spannedEventPlacement` option within the `eventSettings` property. Now we can customize rendering of the that events inside the work cells itself by modifying the `spannedEventPlacement` option as `TimeSlot`. In this following example, shows how to render the spanned appointments inside the work cells as follows.

INDEX.TS

```

import { Schedule, Day, Week, WorkWeek, Month, Agenda } from
'@syncfusion/ej2-schedule';
let data: object [] = [{
    Id: 1,

```

Recurring events

Represents an appointment that is created for a certain time interval and occurring repeatedly on a daily, weekly, monthly or yearly basis at the same time interval based on the provided recurrence rule. Usually, the recurring events are indicated by a repeat marker added at the bottom-right position.

Creating a recurring event

The following example depicts how to create a recurring event on Scheduler with the specific recurrence rule. In the following example, an event is made to repeat on daily mode and ends after 5 occurrences.

INDEX.TS

```
import { Schedule, Day, Week, TimelineMonth, Month, Agenda } from
 '@syncfusion/ej2-schedule';
let data: object [] = [{
    Id: 1,
    Subject: 'Paris',
    StartTime: new Date(2018, 1, 15, 10, 0),
    EndTime: new Date(2018, 1, 15, 12, 30),
    IsAllDay: false,
    RecurrenceRule: 'FREQ=DAILY;INTERVAL=1;COUNT=5'
}];
Schedule.Inject(Day, Week, TimelineMonth, Month, Agenda);
let scheduleObj: Schedule = new Schedule({
    height: '550px',
    selectedDate: new Date(2018, 1, 15),
    views: ['Day', 'Week', 'TimelineMonth', 'Month', 'Agenda'],
    eventSettings: {
        dataSource: data
    }
});
scheduleObj.appendTo('#Schedule');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Schedule Typescript Component</title>
  <meta charset="utf-8">

<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="Schedule"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Adding exceptions

A few instance of the recurrence series can be excluded on specific dates, by adding those exceptional dates to the `recurrenceException` field. These date values should be given in the ISO date time format with no hyphens(-) separating the date elements.

For example, 22nd February 2018 can be represented as 20180222. Also, the time part being represented in UTC format needs to add "Z" after the time portion with no space. "07:30:00 UTC" is therefore represented as "073000Z".

INDEX.TS

```

import { Schedule, Day, Week, WorkWeek, Month, Agenda } from
 '@syncfusion/ej2-schedule';
let data: object [] = [{
    Id: 1,
    Subject: 'Paris',
    StartTime: new Date(2018, 0, 28, 10, 0),
    EndTime: new Date(2018, 0, 28, 12, 30),
    IsAllDay: false,
    RecurrenceRule: 'FREQ=DAILY;INTERVAL=1;COUNT=8',
    RecurrenceException: '20180129T043000Z,20180131T043000Z,20180202T043000Z'
}];
Schedule.Inject(Day, Week, WorkWeek, Month, Agenda);
let scheduleObj: Schedule = new Schedule({
    height: '550px',
    selectedDate: new Date(2018, 0, 28),
    eventSettings: {
        dataSource: data
    }
});
scheduleObj.appendTo('#Schedule');

Editing an occurrence from a series

To dynamically edit a particular occurrence from an event series and display it on the initial load of Scheduler, the edited occurrence needs to be added as a new event to the `dataSource` collection, with an additional `recurrenceID` field defined to it. The `recurrenceID` field of edited occurrence usually maps the ID value of the parent event.

In this example, a recurring instance that displays on the date 30th Jan 2018 is edited with different timings. Therefore, this particular date is excluded from the parent recurring event that repeats from 28th January 2018 to 4th February 2018. This can be done by adding the `recurrenceException` field with the excluded date value on the parent event. Also, the edited occurrence event which is created as a new event should carry the `recurrenceID` field pointing to the parent event's `Id` value.

INDEX.TS

```
import { Schedule, Day, Week, WorkWeek, Month, Agenda } from
 '@syncfusion/ej2-schedule';
let data: object [] = [{
    Id: 1,
    Subject: 'Scrum Meeting',
    StartTime: new Date(2018, 0, 28, 10, 0),
    EndTime: new Date(2018, 0, 28, 12, 30),
    IsAllDay: false,
    RecurrenceRule: 'FREQ=DAILY;INTERVAL=1;COUNT=8',
    RecurrenceException: '20180130T043000Z'
},
{
    Id: 2,
    Subject: 'Scrum Meeting',
    StartTime: new Date(2018, 0, 30, 9, 0),
    EndTime: new Date(2018, 0, 30, 10, 30),
    Description: "Meeting time changed based on team activities.",
    RecurrenceID: 1
}
];
Schedule.Inject(Day, Week, WorkWeek, Month, Agenda);
let scheduleObj: Schedule = new Schedule({
    height: '550px',
    selectedDate: new Date(2018, 0, 28),
    eventSettings: {
        dataSource: data
    }
});
scheduleObj.appendTo('#Schedule');
```

}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Edit only the current and following events

To edit only the current and following events enable the property `editFollowingEvents` within `eventSettings` property. The edited occurrence needs to be added as a new event to the `dataSource` collection, with an additional `followingID` field defined to it. The `followingID` field of edited occurrence usually maps the ID value of the immediate parent event.

In this example, a recurring instance that displays on the date 30th Jan 2018 and its following dates are edited with different subject. Therefore, this particular date and its following dates are excluded from the parent recurring event that repeats from 28th January 2018 to 4th February 2018. This can be done by updating the `recurrenceRule` field with the until date value on the parent event. Also, the edited events which is created as a new event should carry the `followingID` field pointing to the immediate parent event's `Id` value.

INDEX.TS

Recurrence options and rules

Events can be repeated on a daily, weekly, monthly or yearly basis based on the recurrence rule which accepts the string value. The following details should be assigned to the `recurrenceRule` property to generate the recurring instances.

- Repeat type - daily/weekly/monthly/yearly.
- How many times it needs to be repeated?
- The interval duration.
- The time period to render the appointment, etc.

There are four repeat types available namely,

- **Daily** - Creates the recurring instances on daily basis.
- **Weekly** - Creates the recurring instances on weekly basis for the selected days.
- **Monthly** - Creates the recurring instances on monthly basis for the selected months and other provided recurrence criteria.
- **Yearly** - Creates the recurring instances on yearly basis.

Recurrence properties

The properties based on which the recurrence appointments are created with its respective time period are depicted in the following table. Also, the valid rule string can be referred from [iCalendar](#) specifications.

Refer [iCalendar](#) specifications for valid recurrence rule string.

Property	Purpose	Example
FREQ	Maintains the repeat type (Daily, Weekly, Monthly, Yearly) value of the appointment.	FREQ=DAILY;INTERVAL=1
INTERVAL	Maintains the interval value of the appointments. When you create the daily appointment at an interval of 2, the appointments are rendered on the days Monday, Wednesday and Friday (Creates an appointment on all days by leaving the interval of one day gap).	FREQ=DAILY;INTERVAL=2
COUNT	It holds the appointment's count value. When the COUNT value is 10, then 10 instances of appointments are created in the recurrence series.	FREQ=DAILY;INTERVAL=1;COUNT=10
UNTIL	This property holds the end date value (in ISO format) denoting when the recurrence actually ends.	FREQ=DAILY;INTERVAL=1;UNTIL=20180530T041343Z;
BYDAY	It holds the day value(s), representing on which the appointments actually renders. Create the weekly appointment, and select the day(s) from the day options (Monday/Tuesday/Wednesday/Thursday/Friday/Saturday/Sunday). When Monday is selected, the first two letters of the selected day "MO" is saved in the BYDAY property. When multiple days are selected, the values are separated by commas.	FREQ=WEEKLY;INTERVAL=1;BYDAY=MO,WE;COUNT=10

| BYMONTHDAY | This property is used to store the date value of the Month, while creating the Month recurrence appointment. When you create a Monthly recurrence appointment for every 3rd day of the month, then BYMONTHDAY holds the value 3 and creates the appointment on 3rd day of every month. | FREQ=MONTHLY;BYMONTHDAY=3;INTERVAL=1;COUNT=10|

| BYMONTH | This property is used to store the index value of the selected Month while creating the yearly appointments. When you create the yearly appointment on June month, the index value of June month 6 will get stored in the BYMONTH field. The appointment is created on every 6th month of a year. | FREQ=YEARLY;BYMONTHDAY=16;BYMONTH=6;INTERVAL=1;COUNT=10|

| BYSETPOS | This property is used to store the index value of the week. When you create the monthly appointment in second week of a month, the index value of the second week (2) is stored in BYSETPOS. | FREQ=MONTHLY;BYDAY=MO;BYSETPOS=2;COUNT=10|

The default recurrence related validation has been included for recurrence appointments similar to the one available in Outlook. The validation usually occurs during the recurrence appointment creation, editing, drag and drop or resizing of the recurrence appointments and also if any single occurrence changes.

Daily Frequency

| Description | Example |

|-----|-----|

| Daily recurring event that never ends | FREQ=DAILY;INTERVAL=1 |

| Daily recurring event that ends after 5 occurrences | FREQ=DAILY;INTERVAL=1;COUNT=5 |

| Daily recurring event that ends exactly on 12/12/2018 |
FREQ=DAILY;INTERVAL=1;UNTIL=20181212T041343Z |

| Daily event that recurs on alternative days and repeats for 10 occurrences |
FREQ=DAILY;INTERVAL=2;COUNT=10 |

Weekly Frequency

| Description | Example |

|-----|-----|

| Weekly recurring event that repeats on every Monday, Wednesday and Friday and never ends |
FREQ=WEEKLY;INTERVAL=1;BYDAY=MO,WE,FR |

| Repeats every week Thursday and ends after 10 occurrences | FREQ=WEEKLY;INTERVAL=1;BYDAY=TH;
COUNT=10 |

| Repeats every week Monday and ends on 12/12/2018 | FREQ=WEEKLY;INTERVAL=1;BYDAY=MO;
UNTIL=20181212T041343Z |

| Repeats on Monday, Wednesday and Friday of alternative weeks and ends after 10 occurrences |
FREQ=WEEKLY;INTERVAL=2;BYDAY=MO,WE,FR;COUNT=10 |

Monthly Frequency

| Description | Example |

|-----|-----|

| Monthly recurring event that repeats on every 15th day of a month and never ends | FREQ=MONTHLY;
BYMONTHDAY=15;INTERVAL=1 |

| Monthly recurring event that repeats on every 16th day of a month and ends after 10 occurrences |
FREQ=MONTHLY;BYMONTHDAY=16;INTERVAL=1;COUNT=10 |

| Repeats every 17th day of a month and ends on 12/12/2018 | FREQ=MONTHLY;BYMONTHDAY=17;
INTERVAL=1;UNTIL=20181212T041343Z |

| Repeats every 2nd Friday of a month and never ends | FREQ=MONTHLY;BYDAY=FR;BYSETPOS=2;
INTERVAL=1 |

| Repeats every 4th Wednesday of a month and ends after 10 occurrences |
FREQ=MONTHLY;BYDAY=WE; BYSETPOS=4;INTERVAL=1;COUNT=10 |

| Repeats every 4th Friday of a month and ends on 12/12/2018 |
FREQ=MONTHLY;BYDAY=FR;BYSETPOS=4; INTERVAL=1;UNTIL=20181212T041343Z; |

Yearly Frequency

| Description | Example |

|-----|-----|

| Yearly event that repeats on every 15th day of December month and never ends | FREQ=YEARLY;
BYMONTHDAY=15;BYMONTH=12;INTERVAL=1 |

| Event that repeats on every 10th day of December month and ends after 10 occurrences |
FREQ=YEARLY; BYMONTHDAY=10;BYMONTH=12;INTERVAL=1;COUNT=10 |

| Repeats on every 12th day of December month and ends on 12/12/2025 |
FREQ=YEARLY;BYMONTHDAY=12; BYMONTH=12;INTERVAL=1;UNTIL=20251212T041343Z |

| Repeats on every 3rd Friday of December month and never ends |
FREQ=YEARLY;BYDAY=FR;BYMONTH=12; BYSETPOS=3;INTERVAL=1 |

| Repeats on every 3rd Tuesday of December month and ends after 10 occurrences | FREQ=YEARLY;
BYDAY=TU;BYMONTH=12;BYSETPOS=3;INTERVAL=1;COUNT=10 |

| Repeats on every 4th Wednesday of December month and ends on 12/12/2028 |
FREQ=YEARLY;BYDAY=WE; BYMONTH=12;BYSETPOS=4;INTERVAL=1;UNTIL=20281212T041343Z |

Recurrence Validation

The built-in validation support has been added by default for recurring appointments during its creation, edit, drag and drop or resize action. The following are the possible validation alerts that displays on Scheduler while creating or editing the recurring events.

| Validation messages | Description |

|-----|-----|

| The recurrence pattern is not valid. | This alert will raise, when the selected recurrence rule value is not a valid one. For example, when you try to select the end date value (using **Until** option) for a recurring event, which occurs before the start date, an alert will popup out saying that the chosen pattern is invalid. |

| The changes made to specific instances of this series will be cancelled and those events will match the series again. | This alert will raise, when you try to edit the whole series, whose occurrence might have been already edited. For example, If there are five occurrences and one of the occurrence is already edited. Now, when you try to edit the entire series, you will get this validation alert. |

| The duration of the event must be shorter than how frequently it occurs. Shorten the duration, or change the recurrence pattern in the recurrence event editor. | This validation will occur, if the event duration is longer than the selected frequency. For example, if you create a recurring appointment with two days duration in **Daily** frequency with no intervals set to it, you may get this alert. |

| Some months have fewer than the selected date. For these months, the occurrence will fall on the last date of the month. | When you try to create a recurring appointment on 31st of every month, where few months won't have 31 days and in this scenario, you will get this alert. |

| Two occurrences of the same event cannot occur on the same day. | This validation will occur, when you try to edit or move any single occurrence to some other date, where another occurrence of the same event is already present. |

Event fields

The Scheduler dataSource usually holds the event instances, where each of the instance includes a collection of appropriate [fields](#). It is mandatory to map these fields with the equivalent fields of database, when remote data is bound to it. When the local JSON data is bound, then the field names defined within the instances needs to be mapped with the scheduler event fields correctly.

To create an event on Scheduler, it is enough to define the **startTime** and **endTime**. Also **id** field becomes mandatory to process CRUD actions on appropriate events.

Built-in fields

The built-in fields available on Scheduler event object are as follows.

Field name	Description
id	The id field needs to be defined as mandatory and this field usually assigns a unique ID value to each of the events.
subject	The subject field is optional, and usually assigns the summary text to each of the events.
startTime	The startTime field defines the start time of an event and it is mandatory to provide it for any of the valid event objects.
endTime	The endTime field defines the end time of an event and it is mandatory to provide the end time for any of the valid event objects.
starttimezone	It maps the starttimezone field from the dataSource and usually accepts the valid IANA timezone names. It is assumed that the value provided for this field is taken into consideration while processing the startTime field. When this field is not mapped with any timezone names, then the events will be processed based on the timezone assigned to the Scheduler.
endtimezone	It maps the endtimezone field from the dataSource and usually accepts the valid IANA timezone names. It is assumed that the value provided for this field is taken into consideration while processing the endTime field. When this field is not mapped with any timezone names, then the events will be processed based on the timezone assigned to the Scheduler.
location	It maps the location field from the dataSource and the location text value will be displayed over the events.
description	It maps the description field from the dataSource and denotes the event description which is optional.

| isAllDay | The `isAllDay` field is mapped from the `dataSource` and is used to denote whether an event is created for an entire day or for specific time alone. Usually, an event with `isAllDay` field set to true will be considered as an all-day event. |

| recurrenceID | It maps the `recurrenceID` field from `dataSource` and usually holds the ID value of the parent recurrence event. This field is applicable only for the edited occurrence events. |

| recurrenceRule | It maps the `recurrenceRule` field from `dataSource` and holds the recurrence rule value in a string format. Also, it uniquely identifies whether the event belongs to a recurring type or normal ones. |

| recurrenceException | It maps the `recurrenceException` field from `dataSource` and is used to hold the collection of exception dates, on which the recurring occurrences needs to be excluded. The `recurrenceException` should be specified in UTC format. |

| isReadOnly | It maps the `isReadOnly` field from `dataSource`. It is mainly used to make specific appointments as readonly when set to true. |

| isBlock | It maps the `isBlock` field from `dataSource`. It is used to block the particular time ranges in the Scheduler and prevents the event creation on those time slots. |

Binding different field names

When the fields of event instances has the default mapping name, it is not mandatory to map them manually. If a Scheduler's `dataSource` holds the events collection with different field names, then it is necessary to map them with its equivalent field name within the `eventSettings` property.

INDEX.TS

```
import { Schedule, Day, Week, WorkWeek, Month, Agenda } from
'@syncfusion/ej2-schedule';
let data: object [] = [{
  TravelId: 2,
  TravelSummary: 'Paris',
  DepartureTime: new Date(2018, 1, 15, 10, 0),
  ArrivalTime: new Date(2018, 1, 15, 12, 30),
  FullDay: false,
  Source: 'London',
  Comments: 'Summer vacation planned for outstation.',
  Origin: 'Asia/Yekaterinburg',
  Destination: 'Asia/Yekaterinburg'
}];
Schedule.Inject(Day, Week, WorkWeek, Month, Agenda);
let scheduleObj: Schedule = new Schedule({
  height: '550px',
  selectedDate: new Date(2018, 1, 15),
  eventSettings: {
    dataSource: data,
    fields: {
      id: 'TravelId',
      subject: { name: 'TravelSummary' },
      isAllDay: { name: 'FullDay' },
      location: { name: 'Source' },
      description: { name: 'Comments' },
      startTime: { name: 'DepartureTime' },
      endTime: { name: 'ArrivalTime' },
      starttimezone: { name: 'Origin' },
```

```

        endTimezone: { name: 'Destination' }
    }
});
scheduleObj.appendTo('#Schedule');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

The mapper field `id` is of string type and has no additional validation options, whereas all other fields are of `Object` type and has additional options.

Event field settings

Each field of the Scheduler events are provided with additional settings such as options to set default value, to map with appropriate data source fields, to validate every event fields and to provide label values for those fields in the event window.

Options	Description
default	Accepts the default value to the applicable fields (Subject, Location and Description), when no values are provided to them from dataSource.
name	Accepts the field name to be mapped from the dataSource fields.
title	Accepts the label values to be displayed for the fields of event editor.
validation	Defines the validation rules to be applied on the event fields within the event editor.

In following example, the Subject field in event editor will display its appropriate label as **Summary**. When no subject value is provided while saving an event, then the appointment will be saved with the default subject value as **Add Summary**.

INDEX.TS

```
import { Schedule, Day, Week, WorkWeek, Month, Agenda } from
 '@syncfusion/ej2-schedule';
let data: object [] = [{
    TravelId: 2,
    TravelSummary: 'Paris',
    DepartureTime: new Date(2018, 1, 15, 10, 0),

    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Adding Custom fields

Apart from the default Scheduler fields, the user can include 'n' number of custom fields for appointments. The following code example shows how to include two custom fields namely **Status** and **Priority** within event collection. It is not necessary to bind the custom fields within the `eventSettings`. However, those additional fields can be accessed easily, for internal processing as well as from application end.

INDEX.TS

```

import { Schedule, Day, Week, WorkWeek, Month, Agenda } from
'@syncfusion/ej2-schedule';
let data: object [] = [{
    Id: 2,

```

```

        Subject: 'Meeting',
        StartTime: new Date(2018, 1, 15, 10, 0),
        EndTime: new Date(2018, 1, 15, 12, 30),
        IsAllDay: false,
        Status: 'Completed',
        Priority: 'High'
    }];
Schedule.Inject(Day, Week, WorkWeek, Month, Agenda);
let scheduleObj: Schedule = new Schedule({
    height: '550px',
    selectedDate: new Date(2018, 1, 15),
    eventSettings: {
        dataSource: data,
        fields: {
            id: 'Id',
            subject: { name: 'Subject' },
            isAllDay: { name: 'IsAllDay' },
            startTime: { name: 'StartTime' },
            endTime: { name: 'EndTime' }
        }
    }
});
scheduleObj.appendTo('#Schedule');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>Schedule Typescript Component</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">

    type="text/javascript"></script>
    <script src="es5-datasource.js" type="text/javascript"></script>
    <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
    ="text/javascript"></script>

```

```

</head>
<body>

    <div id="container">
        <div id="Schedule"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Customize the order of the overlapping events

By default, the scheduler will render the overlapping events based on the start and end time. Now we can customize the order of the overlapping events based on the custom fields by using the `sortComparer` property grouped under the `eventSettings` property. The following code example shows how to sort the appointments based on the custom field as follows.

INDEX.TS

```

import { Schedule, Day, Week, WorkWeek, Month, Agenda } from
 '@syncfusion/ej2-schedule';
let data: object [] = [{
    Id: 1,
    Subject: 'Rank 1',
    StartTime: new Date(2017, 9, 29, 10, 0),
    EndTime: new Date(2017, 9, 29, 11, 30),
    IsAllDay: false,
    RankId: '1'
}, {
    Id: 2,
    Subject: 'Rank 3',
    StartTime: new Date(2017, 9, 29, 10, 30),
    EndTime: new Date(2017, 9, 29, 12, 30),
    IsAllDay: false,
    RankId: '3'
}, {
    Id: 3,
    Subject: 'Rank 6',
    StartTime: new Date(2017, 9, 29, 7, 0),
    EndTime: new Date(2017, 9, 29, 14, 30),
    IsAllDay: false,
    RankId: '6'
}, {
    Id: 4,
    Subject: 'Rank 9',
    StartTime: new Date(2017, 9, 29, 11, 0),
    EndTime: new Date(2017, 9, 29, 15, 30),
    IsAllDay: false,
    RankId: '9'
}
];
let comparerFun: SortComparerFunction = (args: Record<string, any>) =>

```

```

args.sort((event1: Record<string, any>, event2: Record<string, any>) =>
    event1.RankId.localeCompare(event2.RankId, undefined, { numeric: true })
);
Schedule.Inject(Day, Week, WorkWeek, Month, Agenda );
let scheduleObj: Schedule = new Schedule({
    height: '550px',
    selectedDate: new Date(2017, 9, 29),
    eventSettings: {
        dataSource: data,
        sortComparer: comparerFun
    }
});
scheduleObj.appendTo('#Schedule');

```

INDEX.HTML

```

</head>
<body>

    <div id="container">
        <div id="Schedule"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";

```

```

}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Drag and drop appointments

Appointments can be rescheduled to any time by dragging and dropping them onto the desired location. To work with drag and drop functionality, it is necessary to inject the module **DragAndDrop** and make sure that **allowDragAndDrop** is set to true on Scheduler. In mobile mode, you can drag and drop the events by tap holding an event and dropping them on to the desired location.

By default, drag and drop action is applicable on all Scheduler views, except Agenda, Month-Agenda and Year view.

INDEX.TS

```

import { extend } from '@syncfusion/ej2-base';
import { Schedule, Day, Week, TimelineViews, TimelineMonth, Month, Agenda,
DragAndDrop } from '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Day, Week, TimelineViews, TimelineMonth, Month, Agenda,
DragAndDrop);
let data: Object[] = <Object[]>extend([], scheduleData, null, true);
let scheduleObj: Schedule = new Schedule({
    height: '550px',
    selectedDate: new Date(2018, 1, 15),
    views: ['TimelineDay', 'Day', 'Week', 'TimelineMonth', 'Month',
'Agenda'],
    eventSettings: { dataSource: data }
});
scheduleObj.appendTo('#Schedule');

```

INDEX.HTML

```

```

Drag and drop multiple appointments

We can drag and drop multiple appointments by enabling the `allowMultiDrag` property. We can select multiple appointments by holding the CTRL key. Once the events are selected, we can leave the CTRL key and start dragging the event.

We can also drag multiple events from one resource to another resource. In this case, if all the selected events are in the different resources, then all the events should be moved to the single resource that is related to the target event.

Note: Multiple events drag and drop is not supported on mobile devices.

INDEX.TS

```

import { extend } from '@syncfusion/ej2-base';
import { Schedule, Day, Week, WorkWeek, Month, Agenda, DragAndDrop } from
 '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Day, Week, WorkWeek, Month, Agenda, DragAndDrop);
let data: Object[] = <Object[]>extend([], scheduleData, null, true);
let scheduleObj: Schedule = new Schedule({
    height: '550px',
    allowMultiDrag: true,
    selectedDate: new Date(2018, 1, 15),
    eventSettings: { dataSource: data },
});
scheduleObj.appendTo('#Schedule');

```

```

Disable the drag action

By default, you can drag and drop the events within any of the applicable scheduler views, and to disable it, set `false` to the `allowDragAndDrop` property.

INDEX.TS

```

import { extend } from '@syncfusion/ej2-base';
import { Schedule, Day, Week, WorkWeek, Month, Agenda, DragAndDrop } from
 '@syncfusion/ej2-schedule';
import { scheduleData } from '../datasource.ts';
Schedule.Inject(Day, Week, WorkWeek, Month, Agenda, DragAndDrop);
let data: Object[] = <Object[]>extend([], scheduleData, null, true);
let scheduleObj: Schedule = new Schedule({

```

```

        height: '550px',
        allowDragAndDrop: false,
        selectedDate: new Date(2018, 1, 15),
        eventSettings: { dataSource: data },
    });
    scheduleObj.appendTo('#Schedule');

```

Preventing drag and drop on specific targets

It is possible to prevent the drag action on particular target, by passing the target to be excluded in the `excludeSelectors` option within `dragStart` event. In this example, we have prevented the drag action on all-day row.

INDEX.TS

```
import { extend } from '@syncfusion/ej2-base';
import { Schedule, Day, Week, WorkWeek, Month, Agenda, DragAndDrop,
DragEventArgs } from '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Day, Week, WorkWeek, Month, Agenda, DragAndDrop);
let data: Object[] = <Object[]>extend([], scheduleData, null, true);
let scheduleObj: Schedule = new Schedule({
    height: '550px',
    selectedDate: new Date(2018, 1, 15),
    eventSettings: { dataSource: data },
    dragStart: (args: DragEventArgs) => {
        args.excludeSelectors = 'e-header-cells,e-header-day,e-header-
date,e-all-day-cells';
    }
});
scheduleObj.appendTo('#Schedule');
```

INDEX.HTML

}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Disable scrolling on drag action

By default, while dragging an appointment to the edges, either top/bottom in the vertical Scheduler or left/right in the timeline Scheduler, scrolling action takes place automatically. To prevent this scrolling, set `false` to the `scroll` value within the `dragStart` event arguments.

INDEX.TS

```

import { extend } from '@syncfusion/ej2-base';
import { Schedule, Day, Week, WorkWeek, Month, Agenda, DragAndDrop,
DragEventArgs } from '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Day, Week, WorkWeek, Month, Agenda, DragAndDrop);
let data: Object[] = <Object[]>extend([], scheduleData, null, true);
let scheduleObj: Schedule = new Schedule({
    height: '550px',
    selectedDate: new Date(2018, 1, 15),
    eventSettings: { dataSource: data },
    dragStart: (args: DragEventArgs) => {
        args.scroll = { enable: false };
    }
});
scheduleObj.appendTo('#Schedule');

```

```

Auto navigation of date ranges on dragging an event

When an event is dragged either to the left or right extreme edges of the Scheduler and kept hold for few seconds without dropping, the auto navigation of date ranges will be enabled allowing the Scheduler to navigate from current date range to back and forth respectively. This action is set to **false** by default and to enable it, you need to set **navigation** to true within the **dragStart** event.

By default, the navigation delay is set to 2000ms. The navigation delay decides how long the user needs to drag and hold the appointments at the extremities. You can also set your own delay value for letting the users to navigate based on it, using the **timeDelay** within the **dragStart** event.

INDEX.TS

```
import { extend } from '@syncfusion/ej2-base';
import { Schedule, Day, Week, WorkWeek, Month, Agenda, DragAndDrop,
DragEventArgs } from '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Day, Week, WorkWeek, Month, Agenda, DragAndDrop);
let data: Object[] = <Object[]>extend([], scheduleData, null, true);
let scheduleObj: Schedule = new Schedule({
    height: '550px',
    selectedDate: new Date(2018, 1, 15),
    eventSettings: { dataSource: data },
    dragStart: (args: DragEventArgs) => {
        args.navigation = { enable: true, timeDelay: 4000 }
    }
});
scheduleObj.appendTo('#Schedule');
```

</body></html>

```

Drag and drop items from external source

It is possible to drag and drop the unplanned items from any of the external source into the scheduler, by manually saving those dropped item as a new appointment data through `addEvent` method of Scheduler.

In this example, we have used the tree view control as an external source and the child nodes from the tree view component are dragged and dropped onto the Scheduler. Therefore, it is necessary to make use of the `nodeDragStop` event of the TreeView component, where we can form an event object and save it using the `addEvent` method.

INDEX.TS

```

import { Schedule, Month, Resize, DragAndDrop, CellClickEventArgs } from
'@syncfusion/ej2-schedule';
import { ActionEventArgs } from '@syncfusion/ej2-schedule';
import { eventData, waitingList } from './datasource.ts';
import { DragAndDropEventArgs, TreeView } from '@syncfusion/ej2-
navigations';
import { closest, remove, addClass } from '@syncfusion/ej2-base';
Schedule.Inject(Month, Resize, DragAndDrop);
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '550px',

Opening the editor window on drag stop

There are scenarios where you want to open the editor filled with data on newly dropped location and may need to proceed to save it, only when **Save** button is clicked on the editor. On clicking the cancel button should revert these changes. This can be achieved using the **dragStop** event of Scheduler.

INDEX.TS

```

Inline Appointment

In Scheduler, another easier way for adding or editing the appointment's subject alone can be achieved by using the inline Add/Edit support. It allows the user to add and edit the appointments inline. To get familiar with the inline Add mode, single click on any of the Scheduler cells or press enter key on the selected cells.

When the inline adding mode is ON, a text box will get created within the clicked Scheduler cells with a blinking cursor in it, requiring the user to enter the subject of an appointment. Once the subject is entered, the appointment will be saved on pressing the enter key.

To enable the inline edit mode, single click on any of the existing appointment's subject, so that the user can edit the subject of that appointment. The edited subject of that appointment will be updated on pressing the enter key.

The inline option can be enabled/disabled on the Scheduler by using the `allowInline` API, whereas its default value is set to false.

While using the `allowInline` the `showQuickInfo` will be turned off. The `quickPopup` will not show on clicking the work cell or clicking the appointment when the `allowInline` property is set to true.

In work cells, select multiple cells using keyboard, and then press enter key. The appointment wrapper will be created, and focus will be on the subject field. Also, consider the overlapping scenarios when creating an inline event.

Normal Event

While editing appointments, single-click the appointment subject, the `editable` option will be enabled in UI and the cursor will focus at the end of the text. Inline editing will be considered for all possible views.

Recurrence Event

While editing the occurrence from the recurrence series, it is only possible to edit a `single occurrence`, not an entire series.

</body></html>

```

Appointment Resizing

Another way of rescheduling an appointment can be done by resizing it through either of its handlers. To work with resizing functionality, it is necessary to inject the module `Resize` and make sure that `allowResizing` property is set to true.

INDEX.TS

```
import { extend } from '@syncfusion/ej2-base';
import { Schedule, Day, Week, WorkWeek, Month, Agenda, Resize } from
 '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Day, Week, WorkWeek, Month, Agenda, Resize);
let data: Object[] = <Object[]>extend([], scheduleData, null, true);
let scheduleObj: Schedule = new Schedule({
    height: '550px',
    selectedDate: new Date(2018, 1, 15),
    eventSettings: { dataSource: data },
});
scheduleObj.appendTo('#Schedule');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
    <title>Schedule Typescript Component</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Disable the resize action

By default, resizing of events is allowed on all Scheduler views except Agenda and Month-Agenda view. To disable this event resizing action, set false to the `allowResizing` property.

INDEX.TS

```

import { extend } from '@syncfusion/ej2-base';
import { Schedule, Day, Week, WorkWeek, Month, Agenda, Resize } from
 '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Day, Week, WorkWeek, Month, Agenda, Resize);
let data: Object[] = <Object[]>extend([], scheduleData, null, true);
let scheduleObj: Schedule = new Schedule({
    height: '550px',
    allowResizing: false,
    selectedDate: new Date(2018, 1, 15),
    eventSettings: { dataSource: data },
});
scheduleObj.appendTo('#Schedule');

```

INDEX.HTML

```

    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Disable scrolling on resize action

By default, while resizing an appointment, when its handler reaches the extreme edges of the Scheduler, scrolling action will take place along with event resizing. To prevent this scrolling action, set false to `scroll` value within the `resizeStart` event.

INDEX.TS

```

import { extend } from '@syncfusion/ej2-base';
import { Schedule, Day, Week, WorkWeek, Month, Agenda, Resize,
ResizeEventArgs } from '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Day, Week, WorkWeek, Month, Agenda, Resize);
let data: Object[] = <Object[]>extend([], scheduleData, null, true);
let scheduleObj: Schedule = new Schedule({
    height: '550px',
    selectedDate: new Date(2018, 1, 15),
    eventSettings: { dataSource: data },
    resizeStart: (args: ResizeEventArgs) => {
        args.scroll = { enable: false };
    }
});
scheduleObj.appendTo('#Schedule');

```

    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Controlling scroll speed while resizing an event

The speed of the scrolling action while resizing an appointment to the Scheduler edges, can be controlled within the `resizeStart` event by setting the desired value to the `scrollBy` option.

INDEX.TS

```

import { extend } from '@syncfusion/ej2-base';
import { Schedule, Day, Week, WorkWeek, Month, Agenda, Resize,
ResizeEventArgs } from '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Day, Week, WorkWeek, Month, Agenda, Resize);
let data: Object[] = <Object[]>extend([], scheduleData, null, true);
let scheduleObj: Schedule = new Schedule({
    height: '550px',
    selectedDate: new Date(2018, 1, 15),
    eventSettings: { dataSource: data },
    resizeStart: (args: ResizeEventArgs) => {

```

```

        args.scroll = { enable: true, scrollBy: 15 };
    }
});
scheduleObj.appendTo('#Schedule');

```

INDEX.HTML

```

```

Setting resize time interval

By default, while resizing an appointment, it extends or shrinks at an interval of 30 minutes. To change this default resize interval, set appropriate values to `interval` option within the `resizeStart` event.

INDEX.TS

```
import { extend } from '@syncfusion/ej2-base';
import { Schedule, Day, Week, WorkWeek, Month, Agenda, Resize,
ResizeEventArgs } from '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Day, Week, WorkWeek, Month, Agenda, Resize);
let data: Object[] = <Object[]>extend([], scheduleData, null, true);
let scheduleObj: Schedule = new Schedule({
    height: '550px',
    selectedDate: new Date(2018, 1, 15),
    eventSettings: { dataSource: data },
    resizeStart: (args: ResizeEventArgs) => {
        args.interval = 10; //resize interval time is changed to 10 minutes
    }
});
scheduleObj.appendTo('#Schedule');
```

Appointment customization

The look and feel of the Scheduler events can be customized using any one of the following ways.

- [Using event templates](#)
- [Using eventRendered event](#)
- [Using custom CSS class](#)

Using template

Any kind of text, images and links can be added to customize the look of the events. The user can format and change the default appearance of the events by making use of the **template** option available within the **eventSettings** property. The following code example customizes the appointment's default color and time format.

INDEX.TS

```
import { Schedule, Day, Week, WorkWeek, Month, Agenda } from
 '@syncfusion/ej2-schedule';
import { webinarData } from './datasource.ts';
import { Internationalization } from '@syncfusion/ej2-base';
Schedule.Inject(Day, Week, WorkWeek, Month, Agenda);
let instance: Internationalization = new Internationalization();
(window as TemplateFunction).getTimeString = (value: Date) => {
  return instance.formatDate(value, { skeleton: 'hm' });
};
interface TemplateFunction extends Window {
  getTimeString?: Function;
}
let scheduleObj: Schedule = new Schedule({
  width: '100%',
  height: '500px',
  readonly: true,
  selectedDate: new Date(2018, 1, 15),
  eventSettings: {
    dataSource: webinarData,
    template: '#apptemplate'
  }
});
scheduleObj.appendTo('#Schedule');
```

INDEX.HTML

<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="Schedule"></div>
  </div>
<script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

All the built-in fields that are mapped to the appropriate field properties within the `eventSettings`, as well as custom mapped fields from the Scheduler `dataSource` can be accessed within the template code.

Using `eventRendered` event

The `eventRendered` event triggers before the appointment renders on the Scheduler. Therefore, this client-side event can be utilized to customize the look of events based on any specific criteria, before rendering them on the scheduler.

INDEX.TS

```

import { Schedule, Day, Week, WorkWeek, Month, Agenda View,
EventRenderedArgs } from '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Day, Week, WorkWeek, Month, Agenda);
let scheduleObj: Schedule = new Schedule({
  height: '550px',
  width: '100%',
  cssClass: 'custom-class',
  selectedDate: new Date(2018, 1, 15),
  eventSettings: { dataSource: scheduleData },
  eventRendered: (args: EventRenderedArgs) => applyCategoryColor(args,
scheduleObj.currentView)
});
scheduleObj.appendTo('#Schedule');
function applyCategoryColor(args: EventRenderedArgs, currentView: View):
void {
  let categoryColor: string = args.data.CategoryColor as string;
  if (!args.element || !categoryColor) {
    return;
  }
}

```

```

    }
    if (scheduleObj.currentView === 'Agenda') {
        (args.element.firstChild as HTMLElement).style.borderLeftColor =
categoryColor;
    } else {
        args.element.style.backgroundColor = categoryColor;
    }
}
}

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>Schedule Typescript Component</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript Schedule Control">
    <meta name="author" content="Syncfusion">
    <link href="index.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-

popups/styles/material.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
schedule/styles/material.css" rel="stylesheet">

    <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
    <script src="es5-datasource.js" type="text/javascript"></script>
    <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="Schedule"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Using custom CSS class

The customization of events can also be achieved using `cssClass` property of the Scheduler. In the following example, the background of appointments has been changed using the `cssClass`.

INDEX.TS

```
import { Schedule, Day, Week, WorkWeek, Month } from '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Day, Week, WorkWeek, Month);
let scheduleObj: Schedule = new Schedule({
    height: '550px',
    width: '100%',
    cssClass: 'custom-class',
    selectedDate: new Date(2018, 1, 15),
    views: ['Day', 'Week', 'WorkWeek', 'Month'],
    eventSettings: { dataSource: scheduleData }
});
scheduleObj.appendTo('#Schedule');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Schedule Typescript Component</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript Schedule Control">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-base/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-buttons/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-calendars/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-dropdowns/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-inputs/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-navigations/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-popups/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-schedule/styles/material.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
  <script src="es5-datasource.js" type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type="text/javascript"></script>
</head>
<body>

  <div id="container">
```

```

        <div id="Schedule"></div>
    </div>
</script>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Setting minimum height

It is possible to set minimal height for appointments on Scheduler using `eventRendered` event, when its start and end time duration is less than the default duration of a single slot.

INDEX.TS

```

import { Schedule, Day, Week, WorkWeek, Month, ActionEventArgs } from
'@syncfusion/ej2-schedule';
Schedule.Inject(Day, Week, WorkWeek, Month);
let data: object[] = [{
    Id: 13,
    Subject: 'Myths of Andromeda Galaxy',
    StartTime: new Date(2018, 1, 16, 10, 30),
    EndTime: new Date(2018, 1, 16, 10, 40)
}, {
    Id: 14,
    Subject: 'Aliens vs Humans',
    StartTime: new Date(2018, 1, 15, 10, 0),
    EndTime: new Date(2018, 1, 15, 10, 20)
}];
let scheduleObj: Schedule = new Schedule({
    height: '550px',
    width: '100%',
    selectedDate: new Date(2018, 1, 15),
    views: ['Day', 'Week', 'WorkWeek', 'Month'],
    eventSettings: { dataSource: data },
    eventRendered: (args: EventRenderedArgs) => {
        let cellHeight: number = (scheduleObj.element.querySelector('.e-
work-cells') as HTMLElement).offsetHeight;
        let appHeight: number = (args.data.EndTime.getTime() -
args.data.StartTime.getTime()) / (60 * 1000) * (cellHeight *
scheduleObj.timeScale.slotCount) / scheduleObj.timeScale.interval;
        args.element.style.height = appHeight + 'px';
    }
});
scheduleObj.appendTo('#Schedule');

```

INDEX.HTML

```

    <div id="container">
        <div id="Schedule"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Block Dates and Times

It is possible to block a set of dates or a particular time ranges on the Scheduler. To do so, define an appointment object within `eventSettings` along with the required time range to block and set the `isBlock` field to true. Usually, the event objects defined with `isBlock` field set to true will block the entire time cells lying within the appropriate time ranges specified through `startTime` and `endTime` fields.

INDEX.TS

```

import { Schedule, Day, Week, TimelineViews, Month, Agenda, Resize,
DragAndDrop } from '@syncfusion/ej2-schedule';
import { blockData } from './datasource.ts';
Schedule.Inject(Day, Week, TimelineViews, Month, Agenda, Resize,
DragAndDrop);
let scheduleObj: Schedule = new Schedule({
    height: '550px',

```

```

selectedDate: new Date(2018, 1, 15),
views: ['Day', 'Week', 'TimelineWeek', 'Month', 'Agenda'],
eventSettings: {
    dataSource: blockData
}
});
scheduleObj.appendTo('#Schedule');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>Schedule Typescript Component</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">

}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Readonly

An interaction with the appointments of Scheduler can be enabled/disabled using the **readonly** property. With this property enabled, you can simply navigate between the Scheduler dates, views and can be able to view the appointment details in the quick info window. Most importantly, the users are not allowed to perform any CRUD actions on Scheduler, when this property is set to true. By default, it is set as **false**.

INDEX.TS

```

import { Schedule, Day, Week, WorkWeek, Month, Agenda } from
'@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Day, Week, WorkWeek, Month, Agenda);
let scheduleObj: Schedule = new Schedule({
    height: '550px',
    readonly: true,
    selectedDate: new Date(2018, 1, 15),
    eventSettings: { dataSource: scheduleData }
});
scheduleObj.appendTo('#Schedule');

Make specific events readonly

There are scenarios where you need to restrict the CRUD action on specific appointments alone based on certain conditions. In the following example, the events that has occurred on the past hours from the current date of the Scheduler are made as read-only and the CRUD actions has been prevented only on those appointments. This can be achieved by setting `isReadOnly` field of read-only events to `true`.

INDEX.TS

```

import { Schedule, Day, Week, WorkWeek } from '@syncfusion/ej2-schedule';
import { readOnlyData } from './datasource.ts';
Schedule.Inject(Day, Week, WorkWeek);
let scheduleObj: Schedule = new Schedule({
    height: '550px',
    width: '100%',
    views: ['Day', 'Week', 'WorkWeek'],
    selectedDate: new Date(2018, 1, 15),
    eventSettings: { dataSource: readOnlyData }
});
scheduleObj.appendTo('#Schedule');

```

        EndTime: new Date(2018, 1, 15, 18, 0),
        IsReadOnly: false
    }
];

```

By default, the event editor is prevented to open on the read-only events when `isReadOnly` field is set to `true`.

Restricting event creation on specific time slots

You can restrict the users to create and update more than one appointment on specific time slots. Also, you can disable the CRUD action on those time slots if it is already occupied, which can be achieved using Scheduler's public method `isSlotAvailable`.

Note: The `isSlotAvailable` is centered around verifying appointments within the present view's date range. Yet, it does not encompass an evaluation of availability for recurrence occurrences that fall beyond this particular date range.

INDEX.TS

```
import { isNullOrUndefined } from '@syncfusion/ej2-base';
import { Schedule, Day, TimelineViews, WorkWeek, Month, ActionEventArgs }
from '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Day, TimelineViews, WorkWeek, Month);
let scheduleObj: Schedule = new Schedule({
    height: '550px',
    width: '100%',
    selectedDate: new Date(2018, 1, 15),
    views: ['Day', 'TimelineWeek', 'WorkWeek', 'Month'],
    currentView: 'TimelineWeek',
    eventSettings: { dataSource: scheduleData },
    actionBegin: (args: ActionEventArgs) => {
        if ((args.requestType === 'eventCreate' || args.requestType ===
        'eventChange') && (<Object[]>args.data).length > 0 ||
        !isNullOrUndefined(args.data)) {
            let eventData: any = args.data as any;
            let eventField: EventFieldsMapping = scheduleObj.eventFields;
            let startDate: Date = (((<Object[]>args.data).length > 0) ?
            eventData[0][eventField.startTime] : eventData[eventField.startTime]) as
            Date;
            let endDate: Date = (((<Object[]>args.data).length > 0) ?
            eventData[0][eventField.endTime] : eventData[eventField.endTime]) as Date;
            args.cancel = !scheduleObj.isSlotAvailable(startDate, endDate);
        }
    }
});
scheduleObj.appendTo('#Schedule');
```

```

Differentiate the past time events

To differentiate the appearance of the appointments based on specific criteria such as displaying the past hour appointments with different colors on Scheduler, `eventRendered` event can be used which triggers before the appointment renders on the Scheduler.

INDEX.TS

```

import { Schedule, Day, Week, WorkWeek, Month, ActionEventArgs } from
'@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Day, Week, WorkWeek, Month);

```

Appointments occupying entire cell

The Scheduler allows the event to occupies the full height of the cell without its header part by setting `true` for `enableMaxHeight` Property.

We can show more indicator if more than one appointment is available in a same cell by setting `true` to `enableIndicator` property whereas its default value is false.

INDEX.TS

```
import { Schedule, TimelineViews, TimelineMonth } from '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(TimelineViews, TimelineMonth);
let scheduleObj: Schedule = new Schedule({

How to limit maximum number of events to display

In the Scheduler, the default behavior is to display concurrent events based on cell height, with each new event represented as

+n more characters. However, you may want to improve the quality of the presentation by limiting the number of concurrent events. This can be accomplished by using the [maxEventsPerRow](#) property, which is defaulted to the [views](#) property.

The [maxEventsPerRow](#) property is specific to the month, timeline month, and timeline year views, allowing you to view events visually in these rows. Below is a code example that demonstrates how to use this constraint and the events displayed in a cell have been created:

INDEX.TS

```

import { Schedule, Month } from '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Month);
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '380px',
    selectedDate: new Date(2023, 11, 15),
    views: [{ option: 'Month', maxEventsPerRow: 3 }],
    eventSettings: { dataSource: scheduleData }
});
scheduleObj.appendTo('#Schedule');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>Schedule Typescript Component</title>
    <meta charset="utf-8">

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

The property [maxEventsPerRow](#) will be applicable only when [rowAutoHeight](#) feature is disabled in the Scheduler.

Display tooltip for appointments

The tooltip shows the Scheduler appointment's information in a formatted style by making use of the tooltip related options.

Show or hide built-in tooltip

The tooltip can be displayed for appointments by setting `true` to the `enableTooltip` option within the `eventSettings` property.

INDEX.TS

```

import { Schedule, TimelineViews, Week, WorkWeek, Month, Agenda } from
'@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(TimelineViews, Week, WorkWeek, Month, Agenda);
let scheduleObj: Schedule = new Schedule({

```

```

width: '100%',
height: '500px',
views: ['TimelineDay', 'Week', 'WorkWeek', 'Month', 'Agenda'],
selectedDate: new Date(2018, 1, 15),
eventSettings: {
    dataSource: scheduleData,
    enableTooltip: true
}
});
scheduleObj.appendTo('#Schedule');

```

```

Customizing event tooltip using template

After enabling the default tooltip, it is possible to customize the display of needed event information on tooltip by making use of the `tooltipTemplate` option within the `eventSettings`.

INDEX.TS

```
import { Schedule, Day, Week, WorkWeek, Month, Agenda } from
 '@syncfusion/ej2-schedule';
import { eventsData } from './datasource.ts';
Schedule.Inject(Day, Week, WorkWeek, Month, Agenda);
let template: string = '<div class="tooltip-wrap">' +
    '<div class="content-area"><div class="name">${Subject}</div>' +
    '${if(City !== null && City !== undefined)}<div
class="city">${City}</div>${if}' +
    '<div class="time">From : ${StartTime.toLocaleString()} </div>' +
    '<div class="time">To : ${EndTime.toLocaleString()}
</div></div></div>';
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '550px',
    selectedDate: new Date(2018, 1, 15),
    eventSettings: {
        dataSource: eventsData,
        enableTooltip: true,
        tooltipTemplate: template
    }
});
scheduleObj.appendTo('#Schedule');
```

INDEX.HTML

<script src="index.js" type="text/javascript"></script>
</body></html>

```

All the field names that are mapped from the Scheduler dataSource to the appropriate field properties such as subject, description, location, startTime and endTime within the `eventSettings` can be accessed within the template.

Appointment filtering

The appointments can be filtered by passing the predicate value to `query` option in `eventSettings`. The following code example shows how to filter and render the selected appointments alone in the Scheduler.

INDEX.TS

```

import { CheckBox } from '@syncfusion/ej2-buttons';
import { Query, Predicate } from '@syncfusion/ej2-data';
import { Schedule, Day, Week, WorkWeek, Month, Agenda, EventRenderedArgs }
from '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Day, Week, WorkWeek, Month, Agenda);
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '550px',
    selectedDate: new Date(2018, 1, 15),

```

```

eventSettings: { dataSource: scheduleData },
eventRendered: (args: EventRenderedArgs) => {
  switch (args.data.EventType) {
    case 'Requested':
      (args.element as HTMLElement).style.backgroundColor = '#F57F17';
      break;
    case 'Confirmed':
      (args.element as HTMLElement).style.backgroundColor = '#7fa900';
      break;
    case 'New':
      (args.element as HTMLElement).style.backgroundColor = '#8e24aa';
      break;
  }
};
scheduleObj.appendTo('#Schedule');
function onChange(): void {
  let predicate: Predicate;
  let checkBoxes: CheckBox[] = [confirm, request, fresh];
  checkBoxes.forEach((checkBoxObj: CheckBox) => {
    if (checkBoxObj.checked) {
      if (predicate) {
        predicate = predicate.or('EventType', 'equal',
checkBoxObj.label);
      } else {
        predicate = new Predicate('EventType', 'equal',
checkBoxObj.label);
      }
    }
  });
  scheduleObj.eventSettings.query = new Query().where(predicate);
}
let confirm: CheckBox = new CheckBox({ label: 'Confirmed', checked: true,
change: onChange }, '#confirmed');
let request: CheckBox = new CheckBox({ label: 'Requested', checked: true,
change: onChange }, '#requested');
let fresh: CheckBox = new CheckBox({ label: 'New', checked: true, change:
onChange }, '#new');

```

INDEX.HTML

```

    ele.style.visibility = "visible";
}
    </script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Appointment selection

Appointment selection can be done either through mouse or keyboard actions. The selected events in UI will have a box shadow effect around to differentiate it from other appointments.

| Action | Description |

|-----|-----|

| Mouse click or Single tap on appointments | Selects single appointment. |

| Ctrl + [Mouse click] or [Single tap] on appointments | Selects multiple appointments. |

Deleting multiple appointments

With the options available to select multiple appointments, it is also possible to delete the multiple selected appointments simply by pressing the **delete** key. In case of deleting multiple selected occurrences of an event series, only those occurrences will be deleted and not the entire series.

Retrieve event details from the UI of an event

It is possible to access the information about the event fields of an appointment element displayed on the Scheduler UI. This can be achieved by passing an appointment element as argument to the public method **getEventDetails**.

In the following example, the subject of the appointment clicked has been displayed.

INDEX.TS

```
import { Button } from '@syncfusion/ej2-buttons';
import { Schedule, Day, Week, WorkWeek, Month, Agenda, EventClickArgs } from '@syncfusion/ej2-schedule';
import { eventData } from './datasource.ts';
Schedule.Inject(Day, Week, WorkWeek, Month, Agenda);
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '550px',
    selectedDate: new Date(2018, 1, 15),
    eventSettings: { dataSource: eventData },
    eventClick: onEventClick
});
scheduleObj.appendTo('#Schedule');
let btn: Button = new Button();
btn.appendTo('#clear');
document.getElementById('clear').onclick = () => {
    document.getElementById('EventLog').innerHTML = '';
};
function onEventClick(args: EventClickArgs): void {
    let event: Object = scheduleObj.getEventDetails(args.element);
    appendElement(event.Subject + '<hr>');
}
function appendElement(html: string): void {
    let span: HTMLElement = document.createElement('span');
    span.innerHTML = html;
    let log: HTMLElement = document.getElementById('EventLog');
    log.insertBefore(span, log.firstChild);
}
```

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Get the current view appointments

To retrieve the appointments present in the current view of the Scheduler, you can make use of the `getCurrentViewEvents` public method. In the following example, the count of current view appointment collection rendered has been traced in `dataBound` event.

INDEX.TS

```

import { Button } from '@syncfusion/ej2-buttons';
import { Schedule, Day, Week, WorkWeek, Month, Agenda } from '@syncfusion/ej2-schedule';
import { eventData } from './datasource.ts';
Schedule.Inject(Day, Week, WorkWeek, Month, Agenda);
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '550px',
    selectedDate: new Date(2018, 1, 15),
    eventSettings: { dataSource: eventData },
    dataBound: onDataBound
});
scheduleObj.appendTo('#Schedule');
let btn: Button = new Button();
btn.appendTo('#clear');
document.getElementById('clear').onclick = () => {
    document.getElementById('EventLog').innerHTML = '';
};
function onDataBound(): void {
    let event: Object[] = scheduleObj.getCurrentViewEvents();
    if (event.length > 0) {
        appendElement('Events present on current view <b>' + event.length
+ '<b><hr>');
    } else {

Get the entire appointment collections

The entire collection of appointments rendered on the Scheduler can be accessed using the `getEvents` public method. In the following example, the count of entire appointment collection rendered on the Scheduler has been traced in `dataBound` event.

INDEX.TS

```

import { Button } from '@syncfusion/ej2-buttons';
import { Schedule, Day, Week, WorkWeek, Month, Agenda } from
 '@syncfusion/ej2-schedule';
import { eventData } from './datasource.ts';
Schedule.Inject(Day, Week, WorkWeek, Month, Agenda);
let scheduleObj: Schedule = new Schedule({
  width: '100%',
  height: '550px',
  selectedDate: new Date(2018, 1, 15),
  eventSettings: { dataSource: eventData },
  dataBound: onDataBound
});
scheduleObj.appendTo('#Schedule');
let btn: Button = new Button();
btn.appendTo('#clear');
document.getElementById('clear').onclick = () => {
  document.getElementById('EventLog').innerHTML = '';
};
function onDataBound(): void {
  let event: Object[] = scheduleObj.getEvents();
  appendElement('Events present on scheduler <b>' + event.length
+ '<b><hr>');
}
function appendElement(html: string): void {
  let span: HTMLElement = document.createElement('span');
  span.innerHTML = html;
  let log: HTMLElement = document.getElementById('EventLog');
  log.insertBefore(span, log.firstChild);
}

```

Refresh appointments

If your requirement is to simply refresh the appointments instead of refreshing the entire Scheduler elements from your application end, make use of the `refreshEvents` public method.

```
`ts
```

```
scheduleObj.refreshEvents();
```

You can refer to our [JavaScript Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [JavaScript Scheduler example](#) to know how to present and manipulate data.

Data binding in EJ2 JavaScript Schedule control

The Scheduler uses `DataManager`, which supports both RESTful data service binding and JavaScript object array binding. The `dataSource` property of Scheduler can be assigned either with the instance of `DataManager` or JavaScript object array collection, as it supports the following two kind of data binding methods:

- Local data
- Remote data

Binding local data

To bind local JSON data to the Scheduler, you can simply assign a JavaScript object array to the `dataSource` option of the scheduler within the `eventSettings` property. The JSON object `dataSource` can also be provided as an instance of `DataManager` and assigned to the Scheduler `dataSource` property.

INDEX.TS

```

import { Schedule, Day, Week, WorkWeek, Month, Agenda } from
 '@syncfusion/ej2-schedule';
Schedule.Inject(Day, Week, WorkWeek, Month, Agenda);
let scheduleData: object[] = [{
  Id: 1,
  Subject: 'Explosion of Betelgeuse Star',
  StartTime: new Date(2018, 1, 15, 9, 30),
  EndTime: new Date(2018, 1, 15, 11, 0)
}, {
  Id: 2,

```

```

    Subject: 'Thule Air Crash Report',
    StartTime: new Date(2018, 1, 12, 12, 0),
    EndTime: new Date(2018, 1, 12, 14, 0)
  }, {
    Id: 3,
    Subject: 'Blue Moon Eclipse',
    StartTime: new Date(2018, 1, 13, 9, 30),
    EndTime: new Date(2018, 1, 13, 11, 0)
  }, {
    Id: 4,
    Subject: 'Meteor Showers in 2018',
    StartTime: new Date(2018, 1, 14, 13, 0),
    EndTime: new Date(2018, 1, 14, 14, 30)
  }
];
let scheduleObj: Schedule = new Schedule({
  height: '550px',
  selectedDate: new Date(2018, 1, 15),
  eventSettings: { dataSource: scheduleData }
});
scheduleObj.appendTo('#Schedule');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

By default, **DataManager** uses **JsonAdaptor** for binding local data.

You can also bind different field names to the default event fields as well as include additional custom fields to the event object collection which can be referred [here](#).

Binding remote data

Any kind of remote data services can be bound to the Scheduler. To do so, create an instance of **DataManager** and provide the service URL to the **url** option of **DataManager** and then assign it to the **dataSource** property within **eventSettings**.

Using ODataV4Adaptor

ODataV4 is a standardized protocol for creating and consuming data. Refer to the following code example to retrieve the data from ODataV4 service using the **DataManager**. To connect with ODataV4 service end points, it is necessary to make use of **ODataV4Adaptor** within **DataManager**.

INDEX.TS

```

import { Schedule, Day, Week, WorkWeek, Month, Agenda } from
 '@syncfusion/ej2-schedule';
import { DataManager, ODataV4Adaptor, Query } from '@syncfusion/ej2-data';
Schedule.Inject(Day, Week, WorkWeek, Month, Agenda);
let dataManager: DataManager = new DataManager({
    url: 'https://services.odata.org/V4/Northwind/Northwind.svc/Orders/',
    adaptor: new ODataV4Adaptor,
    crossDomain: true
});
let scheduleObj: Schedule = new Schedule({
    height: '550px',
    selectedDate: new Date(1996, 6, 9),
    readonly: true,
    eventSettings: {
        dataSource: dataManager,
        fields: {
            id: 'Id',
            subject: { name: 'ShipName' },
            location: { name: 'ShipCountry' },
            description: { name: 'ShipAddress' },
            startTime: { name: 'OrderDate' },
            endTime: { name: 'RequiredDate' },
            recurrenceRule: { name: 'ShipRegion' }
        }
    }
});

```

```
scheduleObj.appendTo('#Schedule');
```

INDEX.HTML

</body></html>
```

Filter events using the in-built query

To enable server-side filtering operations based on predetermined conditions, the [includeFiltersInQuery](#) API can be set to true, this allows the filter query to be constructed using the start date, end date, and recurrence rule which in turn enables the request to be filtered accordingly.

This method greatly improves the component's performance by reducing the data that needs to be transferred to the client side. As a result, the component's efficiency and responsiveness are significantly enhanced, resulting in a better user experience. However, it is important to consider the possibility of longer query strings, which may cause issues with the maximum URL length or server limitations on query string length.

INDEX.TS

```
import { Schedule, Day, Week, WorkWeek, Month, Agenda } from
 '@syncfusion/ej2-schedule';
import { DataManager, ODataV4Adaptor, Query } from '@syncfusion/ej2-data';
Schedule.Inject(Day, Week, WorkWeek, Month, Agenda);
let dataManager: DataManager = new DataManager({
  url: 'https://services.odata.org/V4/Northwind/Northwind.svc/Orders/',
  adaptor: new ODataV4Adaptor,
  crossDomain: true
});
let scheduleObj: Schedule = new Schedule({
  height: '550px',
  selectedDate: new Date(1996, 6, 9),
  currentView: 'Month',
  readonly: true,
  eventSettings: {
    query: new Query(),
    includeFiltersInQuery: true, dataSource: dataManager,
    fields: {
      id: 'Id',
      subject: { name: 'ShipName' },
      location: { name: 'ShipCountry' },
      description: { name: 'ShipAddress' },

</body></html>

```

The following image represents how the parameters are passed using ODataV4 filter.

General

Request URL: https://services.odata.org/V4/Northwind/Northwind.svc/Orders/?\$filter=(((((OrderDate%20ge%201996-06-29T18:30:00.000Z)%20and%20(RequiredDate%20ge%201996-06-29T18:30:00.000Z))%20and%20(OrderDate%20lt%201996-08-03T18:30:00.000Z))%20or%20((OrderDate%20le%201996-06-29T18:30:00.000Z)%20and%20(RequiredDate%20gt%201996-06-29T18:30:00.000Z)))%20or%20((ShipRegion%20ne%20null)%20and%20(ShipRegion%20ne%20%27%27)))

Request Method: GET

Status Code: 200 OK

Remote Address: 137.117.17.70:443

Referrer Policy: strict-origin-when-cross-origin

Using custom adaptor

It is possible to create your own custom adaptor by extending the built-in available adaptors. The following example demonstrates the custom adaptor usage and how to add a custom field **EventID** for the appointments by overriding the built-in response processing using the **processResponse** method of the **ODataV4Adaptor**.

INDEX.TS

```
import { Schedule, Day, Week, WorkWeek, Month, Agenda } from
 '@syncfusion/ej2-schedule';
import { DataManager, ODataV4Adaptor, Query } from '@syncfusion/ej2-data';
Schedule.Inject(Day, Week, WorkWeek, Month, Agenda);
class CustomAdaptor extends ODataV4Adaptor {
  processResponse(): Object {
    let i: number = 0;
    // calling base class processResponse function
    let original: Object[] = super.processResponse.apply(this,
arguments);
    // adding employee id
    original.forEach((item: Object) => item['EventID'] = ++i);
    return original;
  }
}
let dataManager: DataManager = new DataManager({
  url: 'https://services.odata.org/V4/Northwind/Northwind.svc/Orders/',
  adaptor: new CustomAdaptor
});
let scheduleObj: Schedule = new Schedule({
  height: '550px',
  selectedDate: new Date(1996, 6, 9),
  readonly: true,
  eventSettings: {

```

Loading data via AJAX post

You can bind the event data through external ajax request and assign it to the `dataSource` property of Scheduler. In the following code example, we have retrieved the data from server with the help of ajax request and assigned the resultant data to the `dataSource` property of Scheduler within the `onSuccess` event of Ajax.

[src/app/app.ts]

```

`ts
import { Ajax } from '@syncfusion/ej2-base';
import { Schedule, Day, Week, WorkWeek, Month, Agenda } from '@syncfusion/ej2-schedule';
Schedule.Inject(Day, Week, WorkWeek, Month, Agenda);
let dataManager: object = [];
let ajax = new Ajax('Home/GetData', 'GET', false);

```

```

ajax.onSuccess = function (value) {
  dataManager = value;
};
ajax.send();
let scheduleObj: Schedule = new Schedule({
  height: '550px',
  selectedDate: new Date(2017, 5, 11),
  eventSettings: { dataSource: dataManager }
});
scheduleObj.appendTo('#Schedule');

```

Definition for the controller method `GetData` can be referred [here](#).

Passing additional parameters to the server

To send an additional custom parameter to the server-side post, you need to make use of the `addParams` method of `Query`. Now, assign this `Query` object with additional parameters to the `query` property of Scheduler.

INDEX.TS

```

import { Schedule, Day, Week, WorkWeek, Month, Agenda } from
 '@syncfusion/ej2-schedule';
import { DataManager, ODataV4Adaptor, Query } from '@syncfusion/ej2-data';
Schedule.Inject(Day, Week, WorkWeek, Month, Agenda);
let dataManager: DataManager = new DataManager({
  url: 'https://services.odata.org/V4/Northwind/Northwind.svc/Orders/',
  adaptor: new ODataV4Adaptor
});
let dataQuery: Query = new Query().addParams('readOnly', 'true');
let scheduleObj: Schedule = new Schedule({
  height: '550px',
  selectedDate: new Date(1996, 6, 9),
  readOnly: true,
  eventSettings: { dataSource: dataManager, query: dataQuery,
    fields: {
      id: 'Id',
      subject: { name: 'ShipName' },
      location: { name: 'ShipCountry' },
      description: { name: 'ShipAddress' },
      startTime: { name: 'OrderDate' },
      endTime: { name: 'RequiredDate' },
      recurrenceRule: { name: 'ShipRegion' }
    }
  }
});
scheduleObj.appendTo('#Schedule');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

The parameters added using the [query](#) property will be sent along with the data request sent to the server on every scheduler actions.

Handling failure actions

During the time of Scheduler interacting with server, there are chances that some server-side exceptions may occur. You can acquire those error messages or exception details in client-side using the [actionFailure](#) event of Scheduler.

The argument passed to the [actionFailure](#) event contains the error details returned from the server.

INDEX.TS

```
import { Schedule, Day, Week, WorkWeek, Month, Agenda } from
 '@syncfusion/ej2-schedule';
import { DataManager } from '@syncfusion/ej2-data';
Schedule.Inject(Day, Week, WorkWeek, Month, Agenda);
let dataManager: DataManager = new DataManager({
  url: 'http://some.com/invalidUrl'
});
let scheduleObj: Schedule = new Schedule({
  height: '550px',
  selectedDate: new Date(2017, 5, 11),
  eventSettings: { dataSource: dataManager },
  actionFailure: () => {
    let span: HTMLElement = document.createElement('span');
    scheduleObj.element.parentNode.insertBefore(span,
scheduleObj.element);
    span.style.color = '#FF0000'
    span.innerHTML = 'Server exception: 404 Not found';
  }
});
scheduleObj.appendTo('#Schedule');
```

INDEX.HTML

```

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

The [actionFailure](#) event will be triggered not only on server returning errors, but also when there is an exception while processing any of the Scheduler CRUD actions.

Scheduler CRUD actions

The CRUD (Create, Read, Update and Delete) actions can be performed easily on Scheduler appointments using the various adaptors available within the `DataManager`. Most preferably, we will be using `UrlAdaptor` for performing CRUD actions on scheduler appointments.

`ts

```

import { Schedule, Day, Week, WorkWeek, Month, Agenda } from '@syncfusion/ej2-schedule';
import { DataManager, UrlAdaptor } from '@syncfusion/ej2-data';

Schedule.Inject(Day, Week, WorkWeek, Month, Agenda);

let dataManager: DataManager = new DataManager({
    url: 'Home/GetData', // 'controller/actions'
    crudUrl: 'Home/UpdateData',
    adaptor: new UrlAdaptor
});

let scheduleObj: Schedule = new Schedule({
    height: '550px',
    selectedDate: new Date(2017, 5, 5),
    eventSettings: { dataSource: dataManager }
});

scheduleObj.appendTo('#Schedule');
`

```

The server-side controller code to handle the CRUD operations are as follows.

`c#

```

using System;
using System.Collections.Generic;
using System.Linq;

```

```
using System.Web;
using System.Web.Mvc;
using ScheduleSample.Models;
namespace ScheduleSample.Controllers
{
    public class HomeController : Controller
    {
        ScheduleDataDataContext db = new ScheduleDataDataContext();
        public ActionResult Index()
        {
            return View();
        }

        public JsonResult LoadData() // Here we get the Start and End Date and based on that can filter the data
        and return to Scheduler
        {
            var data = db.ScheduleEventDatas.ToList();
            return Json(data, JsonRequestBehavior.AllowGet);
        }

        [HttpPost]
        public JsonResult UpdateData(EditParams param)
        {
            if (param.action == "insert" || (param.action == "batch" && param.added != null)) // this block of code
            will execute while inserting the appointments
            {
                var value = (param.action == "insert") ? param.value : param.added[0];
                int intMax = db.ScheduleEventDatas.ToList().Count > 0 ? db.ScheduleEventDatas.ToList().Max(p => p.Id) :
                1;
                DateTime startTime = Convert.ToDateTime(value.StartTime);
                DateTime endTime = Convert.ToDateTime(value.EndTime);
                ScheduleEventData appointment = new ScheduleEventData()
                {
                    Id = intMax + 1,
                    StartTime = startTime.ToLocalTime(),
                    EndTime = endTime.ToLocalTime(),
                }
            }

if (param.action == "remove")
{
int key = Convert.ToInt32(param.key);
ScheduleEventData appointment = db.ScheduleEventDatas.Where(c => c.Id == key).FirstOrDefault();
if (appointment != null) db.ScheduleEventDatas.DeleteOnSubmit(appointment);
}
else
{
foreach (var apps in param.deleted)
{
ScheduleEventData appointment = db.ScheduleEventDatas.Where(c => c.Id == apps.Id).FirstOrDefault();
if (appointment != null) db.ScheduleEventDatas.DeleteOnSubmit(appointment);
}
}
db.SubmitChanges();
}
var data = db.ScheduleEventDatas.ToList();
return Json(data, JsonRequestBehavior.AllowGet);
}

public class EditParams
{
public string key { get; set; }
public string action { get; set; }
public List<ScheduleEventData> added { get; set; }
public List<ScheduleEventData> changed { get; set; }
public List<ScheduleEventData> deleted { get; set; }
public ScheduleEventData value { get; set; }
}
}
}
```

Configuring Scheduler with Google API service

We have assigned our custom created Google Calendar url to the DataManager and assigned the same to the Scheduler `dataSource`. Since the events data retrieved from the Google Calendar will be in its own object format, therefore it needs to be resolved manually within the Scheduler's `dataBinding` event. Within this event, the event fields needs to be mapped properly and then assigned to the result.

INDEX.TS

```
import { Schedule, Day, Week, WorkWeek, Month, Agenda } from
 '@syncfusion/ej2-schedule';
import { DataManager, WebApiAdaptor } from '@syncfusion/ej2-data';
Schedule.Inject(Day, Week, WorkWeek, Month, Agenda);
const CALENDAR_ID: string = 'en.usa%23holiday@group.v.calendar.google.com';
const PUBLIC_KEY: string = 'AIzaSyBgbX_tgmVanBP4yafDPPXxWr70sjbKAXM';
let dataManager: DataManager = new DataManager({
  url: 'https://www.googleapis.com/calendar/v3/calendars/' + CALENDAR_ID +
    '/events?key=' + PUBLIC_KEY,
  adaptor: new WebApiAdaptor,
  crossDomain: true
});
let scheduleObj: Schedule = new Schedule({
  height: '550px',
  eventSettings: { dataSource: dataManager },
  readonly: true,
  currentView: 'Month',
  timezone: 'UTC',
  dataBinding: (e: { [key: string]: Object }) => {
    let items: { [key: string]: Object }[] = (e.result as { [key:

[Salesforce Integration](#)

You can refer to our [JavaScript Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [JavaScript Scheduler example](#) to know how to present and manipulate data.

Crud actions in EJ2 JavaScript Schedule control

Events, a.k.a. Appointments, play an important role in Scheduler with which the users mostly interact. You can easily manipulate (add/edit/delete) the desired appointments as and when required either using the editor window or through the drag and resize action.

Add

Any kind of appointments such as normal, all-day, spanned or recurring events can be easily added on Scheduler using any one of the following ways.

- [Creation using editor window](#)
- [Creation using addEvent method](#)

Creation using editor window

The default editor window opens when you double click on the Scheduler cells. It provides you with event related options such as Subject, Location, Start and End time, All-day, Timezone, Description and other recurrence options. With these available fields, you can choose to provide detailed information to the events. Once the fields are filled with proper values, enter the **Save** button to add an event.

In case, if you want to simply provide the Subject alone for appointments, just single click on the required cells which will open the quick popup expecting you to enter subject alone and save it. You can also select multiple cells and press **Enter** key to open the quick popup for selected time range and save the appointment for that time range.

In case, if you need to add some other additional fields to the editor window, then you can opt for [custom editor window](#) which allows you to include fields as per your application needs. If you need to add just one or two [additional fields to the existing default editor window](#), you can do so by defining it manually and then appending it to the editor window.

Creation using addEvent method

The appointments can be created dynamically by using **addEvent** method. Either you can add a single or a collection of appointment objects using **addEvent** method. The following code example let you know how to use the **addEvent** method to create multiple appointments simultaneously.

INDEX.TS

```
import { Schedule, Day, Week, WorkWeek, Month } from '@syncfusion/ej2-schedule';
import { Button } from '@syncfusion/ej2-buttons';
Schedule.Inject(Day, Week, WorkWeek, Month);
let scheduleData: Object[] = [{
    Id: 1,
    Subject: 'Testing',
    StartTime: new Date(2018, 1, 11, 9, 0),
    EndTime: new Date(2018, 1, 11, 10, 0),
    IsAllDay: false
}, {
```

```

        Id: 2,
        Subject: 'Vacation',
        StartTime: new Date(2018, 1, 13, 9, 0),
        EndTime: new Date(2018, 1, 13, 10, 0),
        IsAllDay: false
    }];
let scheduleObj: Schedule = new Schedule({
    height: '550px',
    selectedDate: new Date(2018, 1, 15),
    views: ['Day', 'Week', 'WorkWeek', 'Month'],

```

Inserting events into database at server-side

While adding the normal or recurring events to the Scheduler, **insert** action takes place and the following code example describes how to add a new event into database at server side.

```
`ts
```

```

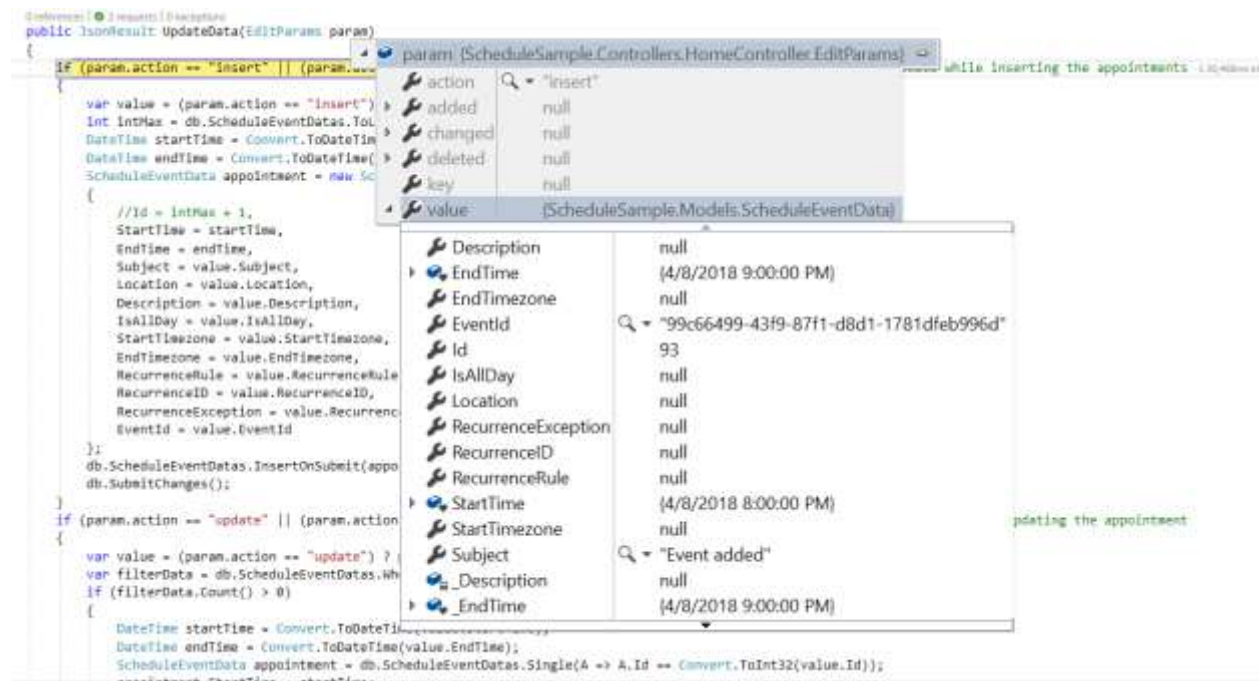

if (param.action == "insert" || (param.action == "batch" && param.added != null)) // this block of code
will execute while inserting the appointments
{
    var value = (param.action == "insert") ? param.value : param.added[0];
    int intMax = db.ScheduleEventDatas.ToList().Count > 0 ? db.ScheduleEventDatas.ToList().Max(p => p.Id) :
    1;
    DateTime startTime = Convert.ToDateTime(value.StartTime);
    DateTime endTime = Convert.ToDateTime(value.EndTime);
    ScheduleEventData appointment = new ScheduleEventData()
    {
        Id = intMax + 1,
        StartTime = startTime.ToLocalTime(),
        EndTime = endTime.ToLocalTime(),
        Subject = value.Subject,

```

```

IsAllDay = value.IsAllDay,
StartTimezone = value.StartTimezone,
EndTimezone = value.EndTimezone,
RecurrenceRule = value.RecurrenceRule,
RecurrenceID = value.RecurrenceID,
RecurrenceException = value.RecurrenceException
};
db.ScheduleEventDatas.InsertOnSubmit(appointment);
db.SubmitChanges();
}

```

Restricting add action based on specific criteria

In the following example, the specific fields of Scheduler editor window such as Subject and Location are made to undergo validation such that if it is left as blank, then the default **Required** validation message will be displayed, while clicking on a save button.

Additionally, the regex condition has been added to the Location field, so that if any special characters are typed into it, then the custom validation message will be displayed.

INDEX.TS

```

import { Schedule, Day, Week, WorkWeek, Month, Agenda } from
 '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Day, Week, WorkWeek, Month, Agenda);
let scheduleObj: Schedule = new Schedule({

```

```

width: '100%',
height: '550px',
selectedDate: new Date(2018, 1, 15),
eventSettings: {
  dataSource: scheduleData,
  fields: {
    subject: { name: 'Subject', validation: { required: true } },
    location: {
      name: 'Location', validation: {
        required: true,
        regex: ["^[a-zA-Z0-9- ]*$", 'Special character(s) not
allowed in this field']
      }
    }
  }
}
});
scheduleObj.appendTo('#Schedule');

```

INDEX.HTML

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

You can also dynamically prevent the creation of appointments on Scheduler. For example, say if you want to decline the creation of appointments on weekend days, you can check for its appropriate condition within the `actionBegin` event.

INDEX.TS

```

import { Schedule, Day, Week, WorkWeek, Month, Agenda, ActionEventArgs }
from '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Day, Week, WorkWeek, Month, Agenda);
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '550px',
    selectedDate: new Date(2018, 1, 15),
    eventSettings: { dataSource: scheduleData },
    actionBegin: (args: ActionEventArgs) => {
        let weekEnds: number[] = [0, 6];
        if (args.requestType == 'eventCreate' &&
            weekEnds.indexOf((args.data[0].StartTime).getDay()) >= 0) {
            args.cancel = true;
        }
    }
});
scheduleObj.appendTo('#Schedule');

```

```

Edit

The same way the appointments such as normal, all-day, spanned or recurring events are created, it can be easily edited using any of the following ways.

- [Update using editor window](#)
- [Update using saveEvent method](#)

Update using editor window

You can open the default editor window filled with appointment details by double clicking on the required events. It gets pre-filled with event options such as Subject, Location, Start and End time, All-day, timezone, description and other recurrence options, from which you can edit the desired field values and, then enter the **Save** button to update it.

You can also single click on appointments, which opens the quick info popup with edit and delete options. Clicking on the **edit** option will open the default editor filled with event details and **delete** option will prompt for delete confirmation.

Update using saveEvent method

The appointments can be edited and updated manually using the **saveEvent** method. The following code examples shows how to edit the normal and recurring events.

Normal event - Here, an event with ID **3** is edited and its subject is changed with a new text. When the modified data object is passed onto the **saveEvent** method, the changes gets reflected onto the original

event. The **Id** field is mandatory in this edit process, where the modified event object should hold the valid **Id** value that exists in the Scheduler data source.

INDEX.TS

```
import { Schedule, Day, Week, WorkWeek, Month } from '@syncfusion/ej2-schedule';
import { Button } from '@syncfusion/ej2-buttons';
Schedule.Inject(Day, Week, WorkWeek, Month);
let scheduleData: Object[] = [{
    Id: 3,
    Subject: 'Testing',
    StartTime: new Date(2018, 1, 11, 9, 0),
    EndTime: new Date(2018, 1, 11, 10, 0),
    IsAllDay: false
}, {

    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Recurring event - The following code example shows how to edit a single occurrence of a recurring event. In this case, the modified data should hold an additional field namely **RecurrenceID** mapping to its parent recurring event's Id value. Also, this modified occurrence will be considered as a new event in the Scheduler dataSource, where it is linked with its parent event through the **RecurrenceID** field value. The **saveEvent** method takes 2 arguments, first one accepting the modified event data object and second argument accepting either of the 2 text values - **EditOccurrence** or **EditSeries**.

When the second argument is passed as **EditOccurrence**, which means that the passed event data is a single modified occurrence - whereas if the second argument is passed as **EditSeries**, it means that the modified data needs to be edited as a whole series and therefore no new event object will be maintained in the Scheduler dataSource.

In case of modifying the single occurrence, it is also necessary to update the **RecurrenceException** field of parent event altogether with the occurrence editing. To know more about how to set **RecurrenceException** values, refer the [recurring events](#) topic.

INDEX.TS

```

import { DataManager, Query, Predicate } from '@syncfusion/ej2-data';
import { Schedule, Day, Week, WorkWeek, Month } from '@syncfusion/ej2-schedule';
import { Button } from '@syncfusion/ej2-buttons';

```

Updating events in database at server-side

While editing the normal events in the Scheduler, **update** action takes place and the following code example describes how to update event into database at server side.

```

`ts

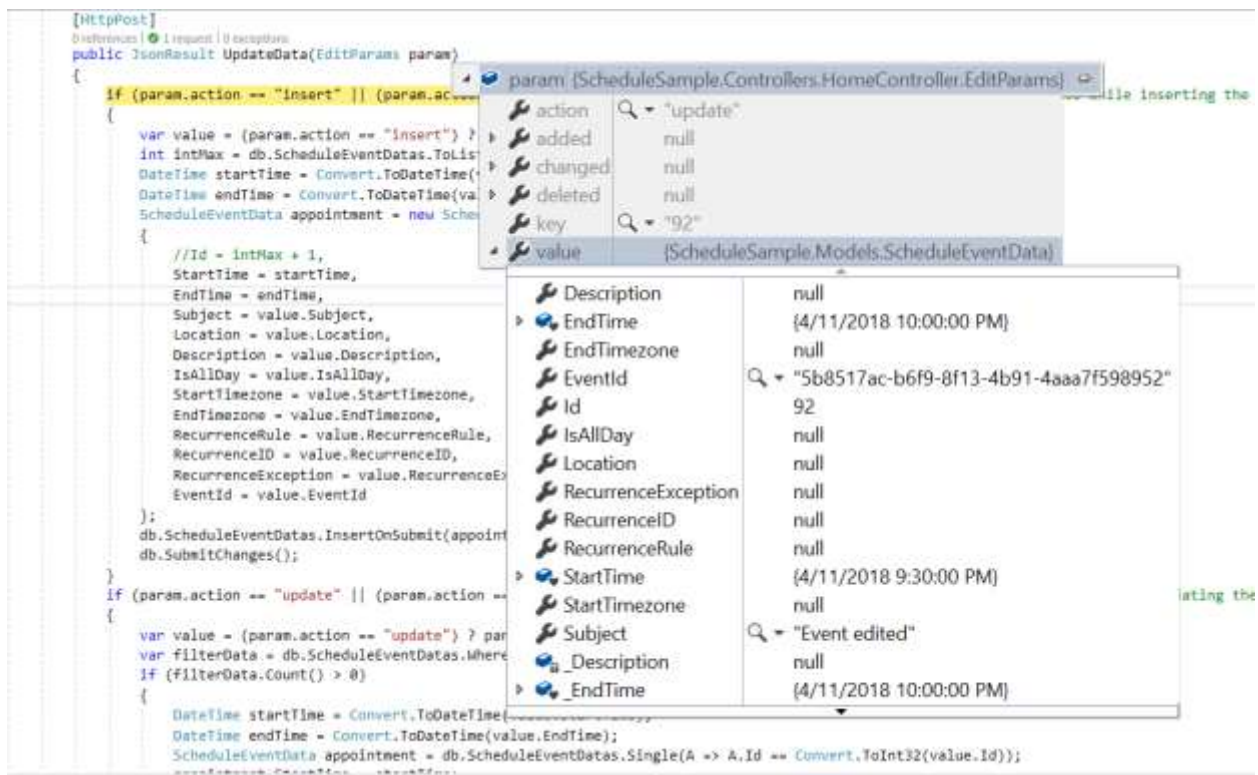

if (param.action == "update" || (param.action == "batch" && param.changed != null)) // this block of
code will execute while updating the appointment
{
    var value = (param.action == "update") ? param.value : param.changed[0];
    var filterData = db.ScheduleEventDatas.Where(c => c.Id == Convert.ToInt32(value.Id));
    if (filterData.Count() > 0)
    {
        DateTime startTime = Convert.ToDateTime(value.StartTime);
        DateTime endTime = Convert.ToDateTime(value.EndTime);
        ScheduleEventData appointment = db.ScheduleEventDatas.Single(A => A.Id ==
Convert.ToInt32(value.Id));

```

```

appointment.StartTime = startTime.ToLocalTime();
appointment.EndTime = endTime.ToLocalTime();
appointment.StartTimezone = value.StartTimezone;
appointment.EndTimezone = value.EndTimezone;
appointment.Subject = value.Subject;
appointment.IsAllDay = value.IsAllDay;
appointment.RecurrenceRule = value.RecurrenceRule;
appointment.RecurrenceID = value.RecurrenceID;
appointment.RecurrenceException = value.RecurrenceException;
}
db.SubmitChanges();
}

```

How to edit a single occurrence or entire series and update it in database at server-side

The recurring appointments can be edited in either of the following two ways.

- Single occurrence
- Entire series

Editing single occurrence - When you double click on a recurring event, a popup prompts you to choose either to edit the single event or entire series. From this, if you choose to select **EDIT EVENT** option, a single occurrence of the recurring appointment alone will be edited. The following process takes place while editing a single occurrence,

- A new event will be created from the parent event data and added to the Scheduler dataSource, with all its default field values overwritten with the newly modified data and additionally, the **recurrenceID** field will be added to it, that holds the **id** value of the parent recurring event. Also, a new **Id** will be generated for this event in the dataSource.
- The parent recurring event needs to be updated with appropriate **recurrenceException** field to hold the edited occurrence appointment's date collection.

Therefore, when a single occurrence is edited from a recurring event, the batch action takes place by allowing both the **Add** and **Edit** action requests to take place together.

In case, if you edit an existing edited occurrence of a recurring event, only those edited occurrence which present in the database as an individual event object will get updated. In this case, **update** action alone takes place on the edited occurrence object on the database.

```
`ts
```

```
if (param.action == "insert" || (param.action == "batch" && param.added != null)) // this block of code
will execute while inserting the appointments
{
var value = (param.action == "insert") ? param.value : param.added[0];
int intMax = db.ScheduleEventDatas.ToList().Count > 0 ? db.ScheduleEventDatas.ToList().Max(p => p.Id) :
1;
DateTime startTime = Convert.ToDateTime(value.StartTime);
DateTime endTime = Convert.ToDateTime(value.EndTime);
ScheduleEventData appointment = new ScheduleEventData()
{
Id = intMax + 1,
StartTime = startTime.ToLocalTime(),
EndTime = endTime.ToLocalTime(),
Subject = value.Subject,
IsAllDay = value.IsAllDay,
StartTimezone = value.StartTimezone,
EndTimezone = value.EndTimezone,
RecurrenceRule = value.RecurrenceRule,
RecurrenceID = value.RecurrenceID,
RecurrenceException = value.RecurrenceException
```

```

};
db.ScheduleEventDatas.InsertOnSubmit(appointment);
db.SubmitChanges();
}

if (param.action == "update" || (param.action == "batch" && param.changed != null)) // this block of
code will execute while updating the appointment
{
var value = (param.action == "update") ? param.value : param.changed[0];
var filterData = db.ScheduleEventDatas.Where(c => c.Id == Convert.ToInt32(value.Id));
if (filterData.Count() > 0)
{
DateTime startTime = Convert.ToDateTime(value.StartTime);
DateTime endTime = Convert.ToDateTime(value.EndTime);
ScheduleEventData appointment = db.ScheduleEventDatas.Single(A => A.Id ==
Convert.ToInt32(value.Id));
appointment.StartTime = startTime.ToLocalTime();
appointment.EndTime = endTime.ToLocalTime();
appointment.StartTimezone = value.StartTimezone;
appointment.EndTimezone = value.EndTimezone;
appointment.Subject = value.Subject;
appointment.IsAllDay = value.IsAllDay;
appointment.RecurrenceRule = value.RecurrenceRule;
appointment.RecurrenceID = value.RecurrenceID;
appointment.RecurrenceException = value.RecurrenceException;
}
db.SubmitChanges();
}
`ts

```

Editing entire series - When you select an option **EDIT SERIES** from the popup that opens on double clicking the recurring event, the whole recurring series will be updated with the newly provided value. When this option is chosen explicitly, if a parent event holds any edited occurrences - then all its child occurrences will be removed from the dataSource and simply the single parent data will be updated.

This action of editing entire series also leads to the batch process, as both the **Delete** and **Edit** action takes place together.

`ts

if (param.action == "update" || (param.action == "batch" && param.changed != null)) // this block of code will execute while updating the appointment

```
{
var value = (param.action == "update") ? param.value : param.changed[0];
var filterData = db.ScheduleEventDatas.Where(c => c.Id == Convert.ToInt32(value.Id));
if (filterData.Count() > 0)
{
DateTime startTime = Convert.ToDateTime(value.StartTime);
DateTime endTime = Convert.ToDateTime(value.EndTime);
ScheduleEventData appointment = db.ScheduleEventDatas.Single(A => A.Id ==
Convert.ToInt32(value.Id));
appointment.StartTime = startTime.ToLocalTime();
appointment.EndTime = endTime.ToLocalTime();
appointment.StartTimezone = value.StartTimezone;
appointment.EndTimezone = value.EndTimezone;
appointment.Subject = value.Subject;
appointment.IsAllDay = value.IsAllDay;
appointment.RecurrenceRule = value.RecurrenceRule;
appointment.RecurrenceID = value.RecurrenceID;
appointment.RecurrenceException = value.RecurrenceException;
}
db.SubmitChanges();
}
```

if (param.action == "remove" || (param.action == "batch" && param.deleted != null)) // this block of code will execute while removing the appointment

```
{
if (param.action == "remove")
{
int key = Convert.ToInt32(param.key);
ScheduleEventData appointment = db.ScheduleEventDatas.Where(c => c.Id == key).FirstOrDefault();
if (appointment != null) db.ScheduleEventDatas.DeleteOnSubmit(appointment);
}
else
{
```

```

foreach (var apps in param.deleted)
{
    ScheduleEventData appointment = db.ScheduleEventDatas.Where(c => c.Id == apps.Id).FirstOrDefault();
    if (appointment != null) db.ScheduleEventDatas.DeleteOnSubmit(appointment);
}
}
db.SubmitChanges();
}
,

```

To know more about handling recurrence exceptions, refer the [Adding exceptions](#) topic.

How to edit from the current and following events of a series

The recurring appointments can be edited from current and following events when enable the property `editFollowingEvents`.

Editing Following Events - When you double click on a recurring event, a popup prompts you to choose either to edit the single event or Edit Following Events or entire series. From this, if you choose to select **EDIT FOLLOWING EVENTS** option, a current and following events of the recurring appointment will be edited. The following process takes place while editing a following events,

- A new event will be created from the parent event data and added to the Scheduler dataSource, with all its default field values overwritten with the newly modified data and additionally, the `followingID` field will be added to it, that holds the `id` value of the immediate parent recurring event. Also, a new `Id` will be generated for this event in the dataSource.
- The parent recurring event needs to be updated with appropriate `recurrenceRule` field to hold the modified occurrence appointment's end date.

Therefore, when a following events are edited from a recurring event, the batch action takes place by allowing the `Add`, `Edit` and `Delete` action requests to take place together.

```
`ts
```

```

if (param.action == "insert" || (param.action == "batch" && param.added != null)) // this block of code
will execute while inserting the appointments
{
    var value = (param.action == "insert") ? param.value : param.added[0];
    int intMax = db.ScheduleEventDatas.ToList().Count > 0 ? db.ScheduleEventDatas.ToList().Max(p => p.Id) :
    1;
    DateTime startTime = Convert.ToDateTime(value.StartTime);
    DateTime endTime = Convert.ToDateTime(value.EndTime);
    ScheduleEventData appointment = new ScheduleEventData()
    {

```

```
Id = intMax + 1,
StartTime = startTime.ToLocalTime(),
EndTime = endTime.ToLocalTime(),
Subject = value.Subject,
IsAllDay = value.IsAllDay,
StartTimezone = value.StartTimezone,
EndTimezone = value.EndTimezone,
RecurrenceRule = value.RecurrenceRule,
FollowingID = value.FollowingID,
RecurrenceID = value.RecurrenceID,
RecurrenceException = value.RecurrenceException
};
db.ScheduleEventDatas.InsertOnSubmit(appointment);
db.SubmitChanges();
}

if (param.action == "update" || (param.action == "batch" && param.changed != null)) // this block of
code will execute while updating the appointment
{
var value = (param.action == "update") ? param.value : param.changed[0];
var filterData = db.ScheduleEventDatas.Where(c => c.Id == Convert.ToInt32(value.Id));
if (filterData.Count() > 0)
{
DateTime startTime = Convert.ToDateTime(value.StartTime);
DateTime endTime = Convert.ToDateTime(value.EndTime);
ScheduleEventData appointment = db.ScheduleEventDatas.Single(A => A.Id ==
Convert.ToInt32(value.Id));
appointment.StartTime = startTime.ToLocalTime();
appointment.EndTime = endTime.ToLocalTime();
appointment.StartTimezone = value.StartTimezone;
appointment.EndTimezone = value.EndTimezone;
appointment.Subject = value.Subject;
appointment.IsAllDay = value.IsAllDay;
appointment.RecurrenceRule = value.RecurrenceRule;
appointment.RecurrenceID = value.RecurrenceID;
```

```

appointment.FollowingID = value.FollowingID;
appointment.RecurrenceException = value.RecurrenceException;
}
db.SubmitChanges();
}
if (param.action == "remove" || (param.action == "batch" && param.deleted != null)) // this block of
code will execute while removing the appointment
{
if (param.action == "remove")
{
int key = Convert.ToInt32(param.key);
ScheduleEventData appointment = db.ScheduleEventDatas.Where(c => c.Id == key).FirstOrDefault();
if (appointment != null) db.ScheduleEventDatas.DeleteOnSubmit(appointment);
}
else
{
foreach (var apps in param.deleted)
{
ScheduleEventData appointment = db.ScheduleEventDatas.Where(c => c.Id == apps.Id).FirstOrDefault();
if (appointment != null) db.ScheduleEventDatas.DeleteOnSubmit(appointment);
}
}
db.SubmitChanges();
}
`

```

Restricting edit action based on specific criteria

You can also dynamically prevent the editing of appointments on Scheduler. For example, say if you want to decline the updating of appointments on non-working hours, you can check for its appropriate condition within the `actionBegin` event.

INDEX.TS

```

import { Schedule, Day, Week, WorkWeek, Month, Agenda, ActionEventArgs }
from '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Day, Week, WorkWeek, Month, Agenda);
let scheduleObj: Schedule = new Schedule({
  width: '100%',
  height: '550px',

```

```

selectedDate: new Date(2018, 1, 15),
eventSettings: { dataSource: scheduleData },
actionBegin: (args: ActionEventArgs) => {
    if (args.requestType == 'eventChange') {
        let weekEnds: number[] = [0, 6];
        let data: { [key: string]: Object } = args.data as { [key: string]:
Object };
        let weekDay: boolean = weekEnds.indexOf((data.StartTime as
Date).getDay()) >= 0;
        let workHours: boolean =
((parseInt(scheduleObj.workHours.start.toString().slice(0, 2), 10) <=
(data.StartTime as Date).getHours()) &&
(parseInt(scheduleObj.workHours.end.toString().slice(0, 2), 10)) >=
(data.StartTime as Date).getHours());
        if (weekDay || !workHours) {
            args.cancel = true;
        }
    }
}
});
scheduleObj.appendTo('#Schedule');

```

```

Delete

The appointments can be deleted in either of the following ways,

- Selecting an appointment and clicking the delete icon from the quick popup that opens.
- Selecting an appointment and pressing **Delete** key.
- Selecting multiple appointments by tap holding an event and then continuously single clicking on other consecutive events and then clicking the **Delete** key.
- Double clicking on an event which opens the default event editor pre-filled with event details, and then choosing **Delete** button in it.

While performing all these above mentioned actions, a pop-up with a delete confirmation message will be displayed prompting either to proceed with deleting an appointment.

Deletion using editor window

When you double click an event, the default editor window will be opened which includes a **Delete** button at the bottom left position to allow you to delete that particular appointment. When deleting an appointment through this editor window, the delete alert confirmation will not be asked and the event will be deleted immediately.

Deletion using deleteEvent method

The appointments can be removed manually using the **deleteEvent** method. The following code examples shows how to edit the normal and recurring events.

Normal event - You can delete the normal appointments of Scheduler by simply passing its **Id** value or the entire event object collection to the **deleteEvent** method.

Recurring Event - The recurring events can be removed as an entire series or simply removing single occurrence by using the deleteEvent method which takes in either the DeleteSeries or DeleteOccurrence parameters. The following code example shows how to delete entire series.

INDEX.TS

```

import { Schedule, Day, Week, WorkWeek, Month } from '@syncfusion/ej2-schedule';
import { Button } from '@syncfusion/ej2-buttons';
Schedule.Inject(Day, Week, WorkWeek, Month);
let scheduleData: Object[] = [{
  Id: 3,
  Subject: 'Testing',
  StartTime: new Date(2018, 1, 11, 9, 0),
  EndTime: new Date(2018, 1, 11, 10, 0),
  IsAllDay: false,
  RecurrenceRule: 'FREQ=DAILY;INTERVAL=1;COUNT=3'
}, {
  Id: 4,
  Subject: 'Vacation',
  StartTime: new Date(2018, 1, 12, 11, 0),
  EndTime: new Date(2018, 1, 12, 12, 0),
  IsAllDay: false,
  RecurrenceRule: 'FREQ=DAILY;INTERVAL=1;COUNT=2'
}];
let scheduleObj: Schedule = new Schedule({
  height: '550px',
  selectedDate: new Date(2018, 1, 15),
  views: ['Day', 'Week', 'WorkWeek', 'Month'],
  eventSettings: {
    dataSource: scheduleData
  }
});
scheduleObj.appendTo('#Schedule');
let remove: Button = new Button();
remove.appendTo('#delete');
remove.element.onclick = (): void => {
  let scheduleData: { [key: string]: Object }[] = [{
    Id: 4,
    Subject: 'Vacation',
    RecurrenceID: 4,
    StartTime: new Date(2018, 1, 12, 11, 0),
    EndTime: new Date(2018, 1, 12, 12, 0),

```

```

        IsAllDay: false,
        RecurrenceRule: 'FREQ=DAILY;INTERVAL=1;COUNT=2'
    }];
    scheduleObj.deleteEvent(scheduleData, 'DeleteSeries');
};

```

Removing events from database at server-side

While deleting the event from the Scheduler, **remove** action takes place and the following code example describes how to delete event from database at server side.

```
`ts
if (param.action == "remove" || (param.action == "batch" && param.deleted != null)) // this block of
code will execute while removing the appointment
{
if (param.action == "remove")
{
int key = Convert.ToInt32(param.key);
ScheduleEventData appointment = db.ScheduleEventDatas.Where(c => c.Id == key).FirstOrDefault();
if (appointment != null) db.ScheduleEventDatas.DeleteOnSubmit(appointment);
}
else
{
foreach (var apps in param.deleted)
{
ScheduleEventData appointment = db.ScheduleEventDatas.Where(c => c.Id == apps.Id).FirstOrDefault();
if (appointment != null) db.ScheduleEventDatas.DeleteOnSubmit(appointment);
}
}
db.SubmitChanges();
}
```

How to delete a single occurrence or entire series from Scheduler and update it in database at server-side

The recurring events can be deleted in either of the following two ways.

- Single occurrence
- Entire series

Single occurrence - When you attempt to delete the recurring events, a popup prompts you to choose either to delete the single event or entire series. From this, if you choose to select **DELETE EVENT** option, a single occurrence of the recurring appointment alone will be removed. The following process takes place while removing a single occurrence,

- The selected occurrence will be deleted from the Scheduler user interface.
- In code, the parent recurring event object will be updated with appropriate `recurrenceException` field, to hold the deleted occurrence appointment's date collection.

Therefore, when a single occurrence is deleted from a recurring event, the `update` action takes place on the parent recurring event as shown in the following code example.

In case, if you delete an existing edited occurrence of a recurring event, only those edited occurrence which present in the database as an individual event object will get removed. In this case, `delete` action takes place instead of `update` action and the parent recurring event object remains same with no changes.

```
`ts
```

```
if (param.action == "update" || (param.action == "batch" && param.changed != null)) // this block of code will execute while updating the appointment
```

```
{
```

```
var value = (param.action == "update") ? param.value : param.changed[0];
```

```
var filterData = db.ScheduleEventDatas.Where(c => c.Id == Convert.ToInt32(value.Id));
```

```
if (filterData.Count() > 0)
```

```
{
```

```
DateTime startTime = Convert.ToDateTime(value.StartTime);
```

```
DateTime endTime = Convert.ToDateTime(value.EndTime);
```

```
ScheduleEventData appointment = db.ScheduleEventDatas.Single(A => A.Id == Convert.ToInt32(value.Id));
```

```
appointment.StartTime = startTime.ToLocalTime();
```

```
appointment.EndTime = endTime.ToLocalTime();
```

```
appointment.StartTimezone = value.StartTimezone;
```

```
appointment.EndTimezone = value.EndTimezone;
```

```
appointment.Subject = value.Subject;
```

```
appointment.IsAllDay = value.IsAllDay;
```

```

appointment.RecurrenceRule = value.RecurrenceRule;
appointment.RecurrenceID = value.RecurrenceID;
appointment.RecurrenceException = value.RecurrenceException;
}
db.SubmitChanges();
}
`ts

```

Entire series - When you select an option **DELETE SERIES** from the popup, the whole recurring series will be deleted. When this option is chosen explicitly, if a parent event holds any edited occurrences - then all its child occurrences which are maintained as separate event objects will also be removed from the dataSource. This action of deleting entire series leads to **remove** action and removes one or more event objects at the same time.

```

`ts
if (param.action == "remove" || (param.action == "batch" && param.deleted != null)) // this block of
code will execute while removing the appointment
{
if (param.action == "remove")
{
int key = Convert.ToInt32(param.key);
ScheduleEventData appointment = db.ScheduleEventDatas.Where(c => c.Id == key).FirstOrDefault();
if (appointment != null) db.ScheduleEventDatas.DeleteOnSubmit(appointment);
}
else
{
foreach (var apps in param.deleted)
{
ScheduleEventData appointment = db.ScheduleEventDatas.Where(c => c.Id == apps.Id).FirstOrDefault();
if (appointment != null) db.ScheduleEventDatas.DeleteOnSubmit(appointment);
}
}
db.SubmitChanges();
}
`ts

```

How to delete only the current and following events of a series

The recurring events can be deleted from current and following events only when enable `editFollowingEvents` property.

Delete Following Events - When you attempt to delete the recurring events, a popup prompts you to choose either to delete the single event or Following Events or entire series. From this, if you choose to select **FOLLOWING EVENT** option, a current and following events of the recurring appointment alone will be removed. The following process takes place while removing a single occurrence,

- The selected occurrence and the following events in same series will be deleted from the Scheduler user interface.
- In code, the parent recurring event object will be updated with appropriate `recurrenceRule` field, to update the end date of the recurring events.

Therefore, when following events are deleted from a recurring event, the `remove` and `update` action takes place on the immediate parent recurring event as shown in the following code example.

```
`ts
if (param.action == "update" || (param.action == "batch" && param.changed != null)) // this block of
code will execute while updating the appointment
{
var value = (param.action == "update") ? param.value : param.changed[0];
var filterData = db.ScheduleEventDatas.Where(c => c.Id == Convert.ToInt32(value.Id));
if (filterData.Count() > 0)
{
DateTime startTime = Convert.ToDateTime(value.StartTime);
DateTime endTime = Convert.ToDateTime(value.EndTime);
ScheduleEventData appointment = db.ScheduleEventDatas.Single(A => A.Id ==
Convert.ToInt32(value.Id));
appointment.StartTime = startTime.ToLocalTime();
appointment.EndTime = endTime.ToLocalTime();
appointment.StartTimezone = value.StartTimezone;
appointment.EndTimezone = value.EndTimezone;
appointment.Subject = value.Subject;
appointment.IsAllDay = value.IsAllDay;
appointment.RecurrenceRule = value.RecurrenceRule;
appointment.RecurrenceID = value.RecurrenceID;
appointment.followingID = value.followingID;
appointment.RecurrenceException = value.RecurrenceException;
}
}
```

```

db.SubmitChanges();
}

if (param.action == "remove" || (param.action == "batch" && param.deleted != null)) // this block of
code will execute while removing the appointment
{
if (param.action == "remove")
{
int key = Convert.ToInt32(param.key);
ScheduleEventData appointment = db.ScheduleEventDatas.Where(c => c.Id == key).FirstOrDefault();
if (appointment != null) db.ScheduleEventDatas.DeleteOnSubmit(appointment);
}
else
{
foreach (var apps in param.deleted)
{
ScheduleEventData appointment = db.ScheduleEventDatas.Where(c => c.Id == apps.Id).FirstOrDefault();
if (appointment != null) db.ScheduleEventDatas.DeleteOnSubmit(appointment);
}
}
db.SubmitChanges();
}
`

```

Drag and drop

When you drag and drop a normal event on the Scheduler, the event editing action takes place. When a recurring event is drag and dropped on a desired time range, the batch action explained in [Editing a single occurrence](#) process will takes place - thus allowing both the [Add](#) and [Edit](#) action to take place together.

By default, when you drag a recurring instance, only the occurrence of the event gets edited and not a whole series.

INDEX.TS

```

import { extend } from '@syncfusion/ej2-base';
import { Schedule, Day, Week, WorkWeek, Month, Agenda, DragAndDrop } from
 '@syncfusion/ej2-schedule';
import { scheduleData } from '../datasource.ts';
Schedule.Inject(Day, Week, WorkWeek, Month, Agenda, DragAndDrop);
let data: Object[] = <Object[]>extend([], scheduleData, null, true);
let scheduleObj: Schedule = new Schedule({
    height: '550px',

```

```

        selectedDate: new Date(2018, 1, 15),
        eventSettings: { dataSource: data }
    });
    scheduleObj.appendTo('#Schedule');

```

Resize

When you resize a normal event on the Scheduler, the event editing action takes place. When a recurring event is resized to a new desired time, the batch action explained in [Editing a single occurrence](#) process will take place - thus allowing both the **Add** and **Edit** action to take place together.

By default, when you resize a recurring instance, only the occurrence of the event gets edited and not a whole series.

Virtual scrolling in EJ2 JavaScript Schedule control

To achieve better performance in the Scheduler when loading a large number of resources and events, we have added virtual scrolling support to load a large set of resources and events instantly as you scroll. You can dynamically load large number of resources and events in the Scheduler by setting `true` to the [allowVirtualScrolling](#) property within the view specific settings. The virtual loading of events is possible in Agenda view, by setting [allowVirtualScrolling](#) property to `true` within the agenda view specific settings.

```

Note: For now, the virtual loading of resources and events is not supported in **MonthAgenda**, **Year** and **TimelineYear** (Horizontal Orientation) views.

Enabling lazy loading for appointments

The lazy loading feature provides a convenient way to efficiently load resource appointments into the Scheduler using an on-demand approach. With this feature, you can seamlessly load a large volume of appointment data into the Scheduler without experiencing any performance degradation.

By default, the Scheduler fetches all the relevant appointments from the server with in the current date range. However, enabling this feature will trigger query requests to the server for appointment retrieval whenever new resources are rendered due to scroll actions. These queries contain the resource IDs of currently displayed resources along with current date range, which can be passed as a comma-separated string. In the server controller, these resource IDs are parsed to filter the necessary appointments to render in the scheduler.

When you enable this feature, the Scheduler becomes capable of fetching events from remote services only for the current view port alone to optimize the data retrieval. The remaining appointment data is fetched form the server on-demand based on currently rendered view port resources as you scroll's through the scheduler content.

To enable this feature, you have to set the [enableLazyLoading](#) property to **true** within the view specific settings.

```

Here's the server-side controller code that retrieves appointment data based on the resource IDs provided as query parameters:

```

`c#
using Microsoft.AspNetCore.Mvc;
using System.Collections.Generic;
using System;
using Microsoft.EntityFrameworkCore;
using System.Linq;
using System.ComponentModel.DataAnnotations;
using Microsoft.AspNetCore.OData.Query;
namespace LazyLoadingServices.Controllers
{
    public class VirtualEventDataController : Controller
    {
        private readonly EventsContext dbContext;

        [HttpGet]

```

```
[EnableQuery]
[Route("api/VirtualEventData")]
public IActionResult GetData([FromQuery] Params param)
{
    IQueryable<EventData> query = dbContext.Events;
    // Filter the appointment data based on the ResourceId query params.
    if (!string.IsNullOrEmpty(param.ResourceId))
    {
        string[] resourceId = param.ResourceId.Split(',');
        query = query.Where(data => resourceId.Contains(data.ResourceId.ToString()));
    }
    return Ok(query.ToList());
}
}
public class Params
{
    public DateTime? StartDate { get; set; }
    public DateTime? EndDate { get; set; }
    public string ResourceId { get; set; }
}
`
```

Note:

- The property will be effective, when large number of resources and appointments bound to the Scheduler.
- This property is applicable only when [resource grouping](#) is enabled in Scheduler.

You can refer to our [JavaScript Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [JavaScript Scheduler example](#) to know how to present and manipulate data.

Editor template in EJ2 JavaScript Schedule control

Scheduler makes use of popups and dialog to display the required notifications, as well as includes an editor window with event fields for making the appointment creation and editing process easier. You can also easily customize the editor window and the fields present in it, and can also apply validations on those fields.

Event editor

The editor window usually opens on the Scheduler, when a cell or event is double clicked. When a cell is double clicked, the detailed editor window opens in "Add new" mode, whereas when an event is double clicked, the same is opened in an "Edit" mode.

In mobile devices, you can open the detailed editor window in edit mode by clicking the edit icon on the popup, that opens on single tapping an event. You can also open it in add mode by single tapping a cell, which will display a + indication, clicking on it again will open the editor window.

You can also prevent the editor window from opening, by rendering Scheduler in a **readonly** mode or by doing code customization within the **popupOpen** event.

How to change the editor window header title and text of footer buttons

You can change the header title and the text of buttons displayed at the footer of the editor window by changing the appropriate localized word collection used in the Scheduler.

</body></html>

```

Field validation

It is possible to validate the required fields of the editor window from client-side before submitting it, by adding appropriate validation rules to each field. The appointment fields have been extended to accept both **string** and **object** type values. To perform validations, it is necessary to specify object values for the event fields.

INDEX.TS

```

import { Schedule, Day, Week, WorkWeek, Month, Agenda } from
'@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Day, Week, WorkWeek, Month, Agenda);
let minValidation: (args: { [key: string]: string }) => boolean = (args: {
[key: string]: string }) => {
    return args['value'].length >= 5;
};
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '500px',
    selectedDate: new Date(2018, 1, 15),
    eventSettings: {
        dataSource: scheduleData,
        fields: {
            id: 'Id',
            subject: { name: 'Subject', validation: { required: true } },
            location: { name: 'Location', validation: { required: true } },
            description: {
                name: 'Description', validation: {
                    required: true, minLength: [minValidation, 'Need atleast
5 letters to be entered']
                }
            },
            startTime: { name: 'StartTime', validation: { required: true } },
            endTime: { name: 'EndTime', validation: { required: true } }
        }
    }
});

```

```
});
scheduleObj.appendTo('#Schedule');
```

INDEX.HTML

  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Applicable validation rules can be referred from [form validation](#) documentation.

Add additional fields to the default editor

The additional fields can be added to the default event editor by making use of the `popupOpen` event which gets triggered before the event editor opens on the Scheduler. The `popupOpen` is a client-side event that triggers before any of the generic popups opens on the Scheduler. The additional field (any of the form elements) should be added with a common class name `e-field`, so as to handle and process those additional data along with the default event object. In the following example, an additional field `Event Type` has been added to the default event editor and its value is processed accordingly.

INDEX.TS

```
import { DropDownList } from '@syncfusion/ej2-dropdowns';
import { createElement } from '@syncfusion/ej2-base';
import { Schedule, Day, Week, WorkWeek, Month, PopupOpenEventArgs } from '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Day, Week, WorkWeek);
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '550px',
    selectedDate: new Date(2018, 1, 15),
    views: ['Day', 'Week', 'WorkWeek', 'Month'],
    popupOpen: (args: PopupOpenEventArgs) => {
        if (args.type === 'Editor') {
            // Create required custom elements in initial time
            if (!args.element.querySelector('.custom-field-row')) {
                let row: HTMLElement = createElement('div', { className: 'custom-field-row' });
                let formElement: HTMLElement = args.element.querySelector('.e-schedule-form');
                formElement.firstChild.insertBefore(row, args.element.querySelector('.e-title-location-row'));
                let container: HTMLElement = createElement('div', { className: 'custom-field-container' });
                let inputEle: HTMLInputElement = createElement('input', {
                    className: 'e-field',
                    attrs: { name: 'EventType' }
                }) as HTMLInputElement;
                container.appendChild(inputEle);
                row.appendChild(container);
                let dropDownList: DropDownList = new DropDownList({
                    dataSource: [
                        { text: 'Public Event', value: 'public-event' },
                        { text: 'Maintenance', value: 'maintenance' },
                        { text: 'Commercial Event', value: 'commercial-event' },
                        { text: 'Family Event', value: 'family-event' }
                    ],
                    fields: { text: 'text', value: 'value' },
                    value: (<{ [key: string]: Object }>(args.data)).EventType as string,
                    floatLabelType: 'Always',
                    placeholder: 'Event Type'
                });
                dropDownList.appendTo(inputEle);
                inputEle.setAttribute('name', 'EventType');
```

```

    }
  },

```

Customizing the default time duration in editor window

In default event editor window, start and end time duration are processed based on the **interval** value set within the **timeScale** property. By default, **interval** value is set to 30, and therefore the start/end time duration within the event editor will be in a 30 minutes time difference. You can change this duration value by changing the **duration** option within the **popupOpen** event as shown in the following code example.

INDEX.TS

```

import { Schedule, Day, Week, WorkWeek, Month, PopupOpenEventArgs } from
 '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Day, Week, WorkWeek);

How to prevent the display of editor and quick popups

It is possible to prevent the display of editor and quick popup windows by passing the value `true` to `cancel` option within the `popupOpen` event.

INDEX.TS

```

import { Schedule, Day, Week, WorkWeek, Month, PopupOpenEventArgs } from
'@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Day, Week, WorkWeek);
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '550px',
    selectedDate: new Date(2018, 1, 15),
    views: ['Day', 'Week', 'WorkWeek', 'Month'],
    popupOpen: (args: PopupOpenEventArgs) => {
        args.cancel = true;
    },
    eventSettings: { dataSource: scheduleData }
});
scheduleObj.appendTo('#Schedule');

```

INDEX.HTML

```

</body></html>

```

In case, if you need to prevent only specific popups on Scheduler, then you can check the condition based on the popup type. The types of the popup that can be checked within the `popupOpen` event are as follows.

Type	Description
----- -----	
Editor	For Detailed editor window.
QuickInfo	For Quick popup which opens on cell click.
EditEventInfo	For Quick popup which opens on event click.
ViewEventInfo	For Quick popup which opens on responsive mode.
EventContainer	For more event indicator popup.
RecurrenceAlert	For edit recurrence event alert popup.
DeleteAlert	For delete confirmation popup.
ValidationAlert	For validation alert popup.
RecurrenceValidationAlert	For recurrence validation alert popup.

Customizing timezone collection in the editor window

By default, the timezone collections in the editor window have been loaded with built-in timezone collections. Now we can be able to customize the timezone collections using the `timezoneDataSource` property with the collection of `TimezoneFields` data.

INDEX.TS

```
import { Schedule, Day, Week, WorkWeek, Month, Agenda } from
 '@syncfusion/ej2-schedule';
let data: object[] = [{
  Id: 1,
  Subject: 'Explosion of Betelgeuse Star',
  StartTime: new Date(2020, 1, 15, 10, 0),
  EndTime: new Date(2018, 1, 15, 12, 30),
  IsAllDay: false
}, {
  Id: 2,
  Subject: 'Blue Moon Eclipse',
  StartTime: new Date(2020, 1, 16, 12, 0),
  EndTime: new Date(2018, 1, 16, 13, 0),
  IsAllDay: false
}];
Schedule.Inject(Day, Week, WorkWeek, Month, Agenda);
let scheduleObj: Schedule = new Schedule({
  height: '550px',
  selectedDate: new Date(2018, 1, 15),
  eventSettings: { dataSource: data },
  timezoneDataSource: [
    { Value: 'Pacific/Niue', Text: 'Niue' },
    { Value: 'Pacific/Pago_Pago', Text: 'Pago Pago' },
    { Value: 'Pacific/Honolulu', Text: 'Hawaii Time' },
    { Value: 'Pacific/Rarotonga', Text: 'Rarotonga' },
    { Value: 'Pacific/Tahiti', Text: 'Tahiti' },
  ],
});
scheduleObj.appendTo('#Schedule');
```

INDEX.HTML

</body></html>

```

Customizing event editor using template

The event editor window can be customized by making use of the `editorTemplate` option. Here, the custom window design is built with the required fields using the script template and its type should be of `text/x-template`.

Each field defined within template should contain the **e-field** class, so as to allow the processing of those field values internally. The ID of this customized script template section is assigned to the `editorTemplate` option, so that these customized fields will be replaced onto the default editor window.

Note: **e-field** class only applicable for **DropDownList**, **DateTimePicker**, **MultiSelect**, **DatePicker**, **CheckBox** and **TextBox** components. Since we have processed the field values internally for the above mentioned components.

As we are using our Syncfusion sub-components within our editor using template in the following example, the custom defined form elements needs to be configured as required Syncfusion components such as **DropDownList** and **DateTimePicker** within the `popupOpen` event. This particular step can be skipped, if the user needs to simply use the usual form elements.

INDEX.TS

```
import { DateTimePicker } from '@syncfusion/ej2-calendars';
import { DropDownList } from '@syncfusion/ej2-dropdowns';
import { Schedule, Day, Week, WorkWeek, Month, Agenda, PopupOpenEventArgs }

How to customize header and footer using template

The editor window's header and footer can be enhanced with custom designs using the [editorHeaderTemplate](#) and [editorFooterTemplate](#) options. To achieve this, create a script template that includes the necessary fields. Ensure that the template type is set to **text/x-template**.

In this demo, we tailor the editor's header according to the appointment's subject field using the [editorHeaderTemplate](#). Furthermore, we make use of the [editorFooterTemplate](#) to handle the functionality of validating specific fields before proceeding with the save action or canceling it if validation requirements are not met.

INDEX.TS

```
import { Schedule, Day, Week, WorkWeek, Month, Agenda, PopupOpenEventArgs }

How to add recurrence options within editor template

The following code example shows how to add recurrence options within the editor template by importing `RecurrenceEditor`.

INDEX.TS

```

import { DateTimePicker } from '@syncfusion/ej2-calendars';
import { Schedule, Day, Week, WorkWeek, Month, RecurrenceEditor,
PopupOpenEventArgs } from '@syncfusion/ej2-schedule';
import { eventData } from './datasource.ts';
Schedule.Inject(Day, Week, WorkWeek);
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '550px',
    selectedDate: new Date(2018, 1, 15),
    views: ['Day', 'Week', 'WorkWeek', 'Month'],
    editorTemplate: '#EventEditorTemplate',
    popupOpen: (args: PopupOpenEventArgs) => {
        if (args.type === 'Editor') {
            let startElement: HTMLInputElement =
args.element.querySelector('#StartTime') as HTMLInputElement;
            if (!startElement.classList.contains('e-datetimepicker')) {
                new DateTimePicker({ value: new Date(startElement.value) ||
new Date() }, startElement);
            }
            let endElement: HTMLInputElement =
args.element.querySelector('#EndTime') as HTMLInputElement;
            if (!endElement.classList.contains('e-datetimepicker')) {
                new DateTimePicker({ value: new Date(endElement.value) ||
new Date() }, endElement);
            }
            let recurElement: HTMLElement =
args.element.querySelector('#RecurrenceEditor');
            if (!recurElement.classList.contains('e-recurrenceeditor')) {
                let recurrObject: RecurrenceEditor = new RecurrenceEditor({
                });
                recurrObject.appendTo(recurElement);
                (scheduleObj.eventWindow as any).recurrenceEditor =
recurrObject;
            }
            document.getElementById('RecurrenceEditor').style.display =
(scheduleObj.currentAction === "EditOccurrence") ? 'none' : 'block';
        }
    },
    eventSettings: { dataSource: eventData }
}

```

```
});
scheduleObj.appendTo('#Schedule');
```

Apply validations on editor template fields

In the following code example, validation has been added to the status field.

INDEX.TS

```

import { DateTimePicker } from '@syncfusion/ej2-calendars';
import { DropDownList } from '@syncfusion/ej2-dropdowns';
import { FormValidator } from '@syncfusion/ej2-inputs';
import { isNullOrUndefined } from '@syncfusion/ej2-base';
import { Schedule, Day, Week, WorkWeek, Month, PopupOpenEventArgs,
EJ2Instance } from '@syncfusion/ej2-schedule';
import { eventData } from '../datasource.ts';
Schedule.Inject(Day, Week, WorkWeek, Month);

```

```

let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '550px',
    selectedDate: new Date(2018, 1, 15),
    views: ['Day', 'Week', 'WorkWeek', 'Month'],
    showQuickInfo: false,
    editorTemplate: '#EventEditorTemplate',
    popupOpen: (args: PopupOpenEventArgs) => {
        if (args.type === 'Editor') {
            if
(!isNullOrUndefined(document.getElementById("EventType_Error"))) {
                document.getElementById("EventType_Error").style.display =
"none";
                document.getElementById("EventType_Error").style.left =
"351px";
            }
            let formElement: HTMLElement =
<HTMLElement>args.element.querySelector('.e-schedule-form');
            let statusElement: HTMLInputElement =
args.element.querySelector('#EventType') as HTMLInputElement;
            if (!statusElement.classList.contains('e-dropdownlist')) {
                let dropDownListObject: DropDownList = new DropDownList({
                    placeholder: 'Choose status', value:
statusElement.value,
                    dataSource: ['New', 'Requested', 'Confirmed'],
                    select: function(args) {
                        if
(!isNullOrUndefined(document.getElementById("EventType_Error"))) {
                            document.getElementById("EventType_Error").style.display = "none";
                        }
                    }
                });
                dropDownListObject.appendTo(statusElement);
            }
            let validator: FormValidator = ((formElement as
EJ2Instance).ej2_instances[0] as FormValidator);
            validator.addRules('EventType', { required: true });
            let startElement: HTMLInputElement =
args.element.querySelector('#StartTime') as HTMLInputElement;
            if (!startElement.classList.contains('e-datetimepicker')) {
                new DateTimePicker({ value: new Date(startElement.value) ||

How to save the customized event editor using template

The **e-field** class is not added to each field defined within the template, so you should allow to set those field values externally by using the **popupClose** event.

Note: You can allow to retrieve the data only on the **save** and **delete** option. Data cannot be retrieved on the **close** and **cancel** options in the editor window.

The following code example shows how to save the customized event editor using a template by the **popupClose** event.

INDEX.TS

```
import { DateTimePicker } from '@syncfusion/ej2-calendars';
```

```

import { DropDownList } from '@syncfusion/ej2-dropdowns';
import { isNullOrUndefined } from '@syncfusion/ej2-base';
import { Schedule, Day, Week, WorkWeek, Month, Agenda, PopupOpenEventArgs,
PopupCloseEventArgs } from '@syncfusion/ej2-schedule';
import { eventData } from './datasource.ts';
Schedule.Inject(Day, Week, WorkWeek, Month, Agenda);
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '550px',
    selectedDate: new Date(2018, 1, 15),
    showQuickInfo: false,
    editorTemplate: '#EventEditorTemplate',

```

In case, if you need to prevent only specific popups on Scheduler, then you can check the condition based on the popup type. The types of the popup that can be checked within the `popupClose` event are as follows.

Type	Description
Editor	For Detailed editor window.
QuickInfo	For Quick popup which opens on cell click.
EditEventInfo	For Quick popup which opens on event click.
ViewEventInfo	For Quick popup which opens on responsive mode.
EventContainer	For more event indicator popup.
RecurrenceAlert	For edit recurrence event alert popup.
DeleteAlert	For delete confirmation popup.
ValidationAlert	For validation alert popup.
RecurrenceValidationAlert	For recurrence validation alert popup.

Quick popups

The quick info popups are the ones that gets opened, when a cell or appointment is single clicked on the desktop mode. On single clicking a cell, you can simply provide a subject and save it. Also, while single clicking on an event, a popup will be displayed where you can get the overview of the event information. You can also edit or delete those events through the options available in it.

By default, these popups are displayed over cells and appointments of Scheduler and to disable this action, set `false` to `showQuickInfo` property.

The quick popup that opens while single clicking on the cells are not applicable on mobile devices.

INDEX.TS

```
import { Schedule, Day, Week, TimelineViews, Month, Agenda } from
 '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Day, Week, TimelineViews, Month, Agenda);
let scheduleObj: Schedule = new Schedule({

How to change the watermark text of quick popup subject

By default, Add Title text is displayed on the subject field of quick popup. To change the default watermark text, change the value of the appropriate localized word collection used in the Scheduler.

```
`ts
```

```
L10n.load({
```

```
'en-US': {
```

```
'schedule': {
  'addTitle' : 'New Title'
}
}
});
`
```

Customizing quick popups

The look and feel of the built-in quick popup window, which opens when single clicked on the cells or appointments can be customized by making use of the `quickInfoTemplates` property of the Scheduler. There are 3 sub-options available to customize them easily,

- header - Accepts the template design that customizes the header part of the quick popup.
- content - Accepts the template design that customizes the content part of the quick popup.
- footer - Accepts the template design that customizes the footer part of the quick popup.

```

The quick popup in adaptive mode can also be customized using `quickInfoTemplates` using `e-device` class.

More events indicator and popup

When the number of appointments count that lies on a particular time range * default appointment height exceeds the default height of a cell in month view and all other timeline views, a + more text indicator will be displayed at the bottom of those cells. This indicator denotes that the cell contains few

more appointments in it and clicking on that will display a popup displaying all the appointments present on that day.

To disable this option of showing popup with all hidden appointments, while clicking on the text indicator, you can do code customization within the `popupOpen` event.

The same indicator is displayed on all-day row in calendar views such as day, week and work week views alone, when the number of appointment count present in a cell exceeds three. Clicking on the text indicator here will not open a popup, but will allow the expand/collapse option for viewing the remaining appointments present in the all-day row.

The following code example shows how to disable the display of such popups while clicking on the more text indicator.

How to prevent the display of popup when clicking on the more text indicator

It is possible to prevent the display of popup window by passing the value `true` to `cancel` option within the `MoreEventsClick` event.

INDEX.TS

```

import { Schedule, Day, Week, WorkWeek, Month, MoreEventsClickArgs } from
'@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Day, Week, WorkWeek, Month);
let scheduleObj: Schedule = new Schedule({

```

```

width: '100%',
height: '550px',
selectedDate: new Date(2018, 1, 15),
currentView: 'Month',
views: ['Day', 'Week', 'WorkWeek', 'Month'],
moreEventsClick: (args: MoreEventsClickArgs) => {
    args.cancel = true;
},
eventSettings: { dataSource: scheduleData }
});
scheduleObj.appendTo('#Schedule');

```

You can refer to our [JavaScript Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [JavaScript Scheduler example](#) to know how to present and manipulate data.

Timezone in EJ2 JavaScript Schedule control

The Scheduler makes use of the current system time zone by default. If it needs to follow some other user-specific time zone, then the `timezone` property needs to be used. Apart from the default action of applying specific timezone to the Scheduler, it is also possible to set different time zone values for each appointments through the properties `startTimezone` and `endTimezone` which can be defined as separate fields within the event fields collection.

Note: `timezone` property only applicable for the appointment processing and current time indication.

Understanding date manipulation in JavaScript

The `new Date()` in JavaScript returns the exact current date object with complete time and timezone information. For example, it may return value such as `Wed Dec 12 2018 05:23:27 GMT+0530 (India Standard Time)` which indicates that the current date is December 12, 2018 and the current time is 5.23 AM on browsers following the IST timezone.

Scheduler with no timezone

When no specific time zone is set to Scheduler, appointments will be displayed based on the client system's timezone which is the default behavior. Here, the same appointment when viewed from different timezone will have different start and end times.

The following code example displays an appointment from 9.00 AM to 10.00 AM when you open the Scheduler from any of the timezone. This is because, we are providing the start and end time enclosing with `new Date()` which works based on the client browser's timezone.

INDEX.TS

```
import { Schedule, Day, Week, TimelineViews, Month, Agenda } from
 '@syncfusion/ej2-schedule';
let data: object [] = [{
    Subject: 'Paris',
    StartTime: new Date(2018, 1, 15, 9, 0),
    EndTime: new Date(2018, 1, 15, 10, 0)
}];
Schedule.Inject(Day, Week, TimelineViews, Month, Agenda);
let scheduleObj: Schedule = new Schedule({
    height: '550px',
    selectedDate: new Date(2018, 1, 15),
    views: ['Day', 'Week', 'TimelineWeek', 'Month', 'Agenda'],
    eventSettings: {
        dataSource: data
    }
});
scheduleObj.appendTo('#Schedule');
```

    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Scheduler set to specific timezone

When a time zone is set to Scheduler through `timezone` property, the appointments will be displayed exactly based on the Scheduler timezone regardless of its client timezone. In the following code example, appointments will be displayed based on Eastern Time (UTC -05:00).

INDEX.TS

```

import { Schedule, Day, Week, Month, Timezone } from '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Day, Week, Month);
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '550px',
    views: ['Day', 'Week', 'Month'],
    selectedDate: new Date(2018, 1, 17),
    timezone: 'America/New_York',
    eventSettings: { dataSource: scheduleData }
});
scheduleObj.appendTo('#Schedule');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>Schedule Typescript Component</title>
    <meta charset="utf-8">

```

Display events on same time everywhere with no time difference

Setting **timezone** to UTC for Scheduler will display the appointments on same time as in the database for all the users in different time zone.

INDEX.TS

```

import { Schedule, Day, Week, Month, Timezone } from '@syncfusion/ej2-
schedule';
import { fifaEventsData } from './datasource.ts';
import { extend } from '@syncfusion/ej2-base';
Schedule.Inject(Day, Week, Month);
let fifaEvents: Object[] = <Object[]>extend([], fifaEventsData, null, true);
let timezone: Timezone = new Timezone();
for (let fifaEvent of fifaEvents) {
    let event: { [key: string]: Object } = fifaEvent as { [key: string]:
Object };
    event.StartTime = timezone.removeLocalOffset(<Date>event.StartTime);
    event.EndTime = timezone.removeLocalOffset(<Date>event.EndTime);
}
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '550px',
    selectedDate: new Date(2018, 5, 17),
    views: ['Day', 'Week', 'Month'],
    timezone: 'UTC',
    eventSettings: { dataSource: fifaEvents }
});
scheduleObj.appendTo('#Schedule');

```

  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Set specific timezone for events

It is possible to set different timezone for Scheduler events by setting `startTimezone` and `endTimezone` properties within the `eventSettings` option. It allows each appointment to maintain different timezone and displays on Scheduler with appropriate time differences.

INDEX.TS

```
import { Schedule, Day, Week, TimelineViews, Month, Agenda } from
 '@syncfusion/ej2-schedule';
let data: object [] = [{
    Subject: 'Paris',
    StartTime: new Date(2018, 1, 15, 10, 0),
    EndTime: new Date(2018, 1, 15, 12, 30),
    StartTimezone: 'Europe/Moscow',
    EndTimezone: 'Europe/Moscow'
}];
Schedule.Inject(Day, Week, TimelineViews, Month, Agenda);
let scheduleObj: Schedule = new Schedule({
    height: '550px',
    selectedDate: new Date(2018, 1, 15),
    views: ['Day', 'Week', 'TimelineWeek', 'Month', 'Agenda'],
    eventSettings: {
        dataSource: data
    }
});
scheduleObj.appendTo('#Schedule');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>

```

Add or remove timezone names to/from the timezone collection

Instead of displaying all the timezone names within the timezone collection (more than 200 are displayed on the editor window timezone fields by default), you can customize the timezone collection at application end as shown in the following example.

INDEX.TS

```

import { Schedule, Day, Week, Month, timezoneData } from '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
let customTimezoneData: { [key: string]: Object }[] = [
    { Value: 'America/New_York', Text: '(UTC-05:00) Eastern Time' },
    { Value: 'UTC', Text: 'UTC' },
    { Value: 'Asia/Kolkata', Text: '(UTC+05:30) India Standard Time' }
];
timezoneData.splice(0, timezoneData.length, ...customTimezoneData);
Schedule.Inject(Day, Week, Month);
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '550px',
    selectedDate: new Date(2018, 1, 11),
    views: ['Day', 'Week', 'Month'],
    eventSettings: { dataSource: scheduleData }
});
scheduleObj.appendTo('#Schedule');

```

INDEX.HTML

Timezone methods

offset

This method is used to calculate the difference between passed UTC date and timezone.

| Parameters | Type | Description |

|-----|-----|-----|

| Date | Date | UTC time as date object. |

| Timezone | String | Timezone. |

Returns **number**

```
`ts
```

```
// Assume your local timezone as IST/UTC+05:30
```

```
let timezone: Timezone = new Timezone();
```

```
let date: Date = new Date(2018,11,5,15,25,11);
```

```
let timeZoneOffset: number = timezone.offset(date,"Europe/Paris");
```

```
console.log(timeZoneOffset); //-60
```

```
,
```

convert

This method is used to convert the passed date from one timezone to another timezone.

Parameters	Type	Description
----- ----- -----		
Date	Date	UTC time as date object.
fromOffset	number/string	Timezone from which date need to be converted.
toOffset	number/string	Timezone to which date need to be converted.

Returns **Date**

```
`ts
// Assume your local timezone as IST/UTC+05:30
let timezone: Timezone = new Timezone();
let date: Date = new Date(2018,11,5,15,25,11);
let convertedDate: Date = timezone.convert(date, "Europe/Paris", "Asia/Tokya");
let convertedDate1: Date = timezone.convert(date, 60, -360);
console.log(convertedDate); //2018-12-05T08:55:11.000Z
console.log(convertedDate1); //2018-12-05T16:55:11.000Z
`
```

add

This method is used to add the time difference between passed UTC date and timezone.

Parameters	Type	Description
----- ----- -----		
Date	Date	UTC time as date object.
Timezone	String	Timezone.

Returns **Date**

```
`ts
// Assume your local timezone as IST/UTC+05:30
let timezone: Timezone = new Timezone();
let date: Date = new Date(2018,11,5,15,25,11);
let convertedDate: Date = timezone.add(date, "Europe/Paris");
console.log(convertedDate); //2018-12-05T05:25:11.000Z
`
```

remove

This method is used to remove the time difference between passed UTC date and timezone.

Parameters	Type	Description
------------	------	-------------

----- ----- -----	----- ----- -----	----- ----- -----
Date	Date	UTC as date object.
Timezone	String	Timezone.

Returns **Date**

```
`ts
// Assume your local timezone as IST/UTC+05:30
let timezone: Timezone = new Timezone();
let date: Date = new Date(2018,11,5,15,25,11);
let convertedDate: Date = timezone.remove(date, "Europe/Paris");
console.log(convertedDate); //2018-12-05T14:25:11.000Z
`
```

removeLocalOffset

This method is used to remove the local offset time from the date passed.

----- ----- -----	----- ----- -----	----- ----- -----
Date	Date	UTC as date object.

Returns **Date**

```
`ts
// Assume your local timezone as IST/UTC+05:30
let timezone: Timezone = new Timezone();
let date: Date = new Date(2018,11,5,15,25,11);
let convertedDate: Date = timezone.removeLocalOffset(date);
console.log(convertedDate); //2018-12-05T15:25:11.000Z
`
```

You can refer to our [JavaScript Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [JavaScript Scheduler example](#) to know how to present and manipulate data.

Views in EJ2 JavaScript Schedule control

The Scheduler includes wide variety of view modes with unique configuration options for each view. The available view modes are Day, Week, Work Week, Month, Agenda, Month Agenda, Timeline Day, Timeline Week, Timeline Work Week and Timeline Month, out of which the **Week** view is set as active.

To navigate between different views and dates, the navigation options are available at the Scheduler header bar. The active view option is usually highlighted by default. The date range of the active view will also be displayed at the left corner of the header bar, clicking on which will open a calendar popup for the ease of desired date selection.

By default, Scheduler displays the calendar views such as day, week, work week, month and agenda.

Setting specific view on scheduler

As the Scheduler displays **week** view by default, therefore to change the active view, set **currentView** property with the desired view name. The applicable view names that the Scheduler accepts are as follows,

- Day
- Week
- WorkWeek
- Month
- Year
- Agenda
- MonthAgenda
- TimelineDay
- TimelineWeek
- TimelineWorkWeek
- TimelineMonth
- TimelineYear

It is necessary to import and inject the appropriate view modules into the application to make use of these view modes on the Scheduler. Also, it is possible to display only the desired views on the Scheduler. To define and configure specific views, use the [views](#) property.

In the following example, the Scheduler displays 4 views namely, Week, Month, TimelineWeek and TimelineMonth. The appropriate view modules are imported and injected properly to display those views on the Scheduler.

INDEX.TS

```
import { Schedule, Week, Month, TimelineViews, TimelineMonth } from
'@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject( Week, Month, TimelineViews, TimelineMonth );
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '550px',
    selectedDate: new Date(2018, 1, 15),
    views: ['Week', 'TimelineWeek', 'Month', 'TimelineMonth'],
    eventSettings: { dataSource: scheduleData }
});
scheduleObj.appendTo('#Schedule');
```

<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="es5-datasource.js" type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="Schedule"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

To configure Scheduler with simply 2 views, but with different configurations on each view, refer the following code example. Here, the Week view displays the dates in **dd-MM-yyyy** format whereas the Month view hides the weekend days and also displays it in readonly mode.

INDEX.TS

```

import { Schedule, Week, Month } from '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject( Week, Month );
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '550px',
    selectedDate: new Date(2018, 1, 15),
    views: [{ option: 'Week', dateFormat: 'dd-MMM-yyyy' }, { option:
'Month', showWeekend: false, readonly: true }],
    eventSettings: { dataSource: scheduleData }
});
scheduleObj.appendTo('#Schedule');

```

INDEX.HTML

```

</body></html>

```

View specific configuration

There are scenarios where each view may need to have different configurations. For such cases, you can define the applicable scheduler properties within the **views** Property for each view option as depicted in the following examples. The fields available to be used within each view options are as follows.

Property	Type	Description	Applicable views
-----	-----	-----	-----

- | **option** | View | It accepts the Scheduler view name, based on which we can define its related properties. The view names can be **Day**, **Week** and so on. | All views. |
- | **isSelected** | Boolean | It acts similar to the **currentView** property and defines the active view of the Scheduler. | All views. |
- | **dateFormat** | Date | By default, Scheduler follows the date format as per the default culture assigned to it. When it is defined under specific view, only those assigned views follows this date format. | All views. |
- | **readonly** | Boolean | When set to **true**, prevents the CRUD actions on the respective view under where it is defined. | All views. |
- | **resourceHeaderTemplate** | String | The template option which is used to customize the resource header cells on the Scheduler. It gets applied only on the views, wherever it is defined. | All views. |
- | **dateHeaderTemplate** | String | The template option which is used to customize the date header cells and is applied only on the views, wherever it is defined. | All views. |
- | **eventTemplate** | String | The template option to customize the events background. It will get applied to the events of the view to which it is currently being defined. | All views. |
- | **showWeekend** | Boolean | When set to **false**, it hides the weekend days of a week from the views on which it is defined. | All views. |
- | **group** | [GroupModel](#) | Allows to set different resource grouping options on all available Scheduler view modes. | All views. |
- | **cellTemplate** | String | The template option to customize the work cells of the Scheduler and is applied only on the views, on which it is defined. | Applicable on all views except Agenda view. |
- | **workDays** | Number[] | It is used to set the working days on the Scheduler views. | Applicable on all views except Agenda view. |
- | **displayName** | String | When a particular view is customized to display with different intervals, this property allows the user to set different display name for each of the views. | Applicable on all views except Agenda and Month Agenda. |
- | **interval** | Number | It allows to customize the default Scheduler views with different set of days, weeks, work weeks or months on the applicable view type. | Applicable on all views except Agenda and Month Agenda. |
- | **startHour** | String | It is used to specify the start hour, from which the Scheduler should be displayed. It accepts the time string in a short skeleton format and also, hides the time beyond the specified start time. | Applicable on Day, Week, Work Week, Timeline Day, Timeline Week and Timeline Work Week views. |
- | **endHour** | String | It is used to specify the end hour, at which the Scheduler ends. It accepts the time string in a short skeleton format. | Applicable on Day, Week, Work Week, Timeline Day, Timeline Week, and Timeline Work Week views. |
- | **timeScale** | [TimeScaleModel](#) | Allows to set different timescale configuration on each applicable view modes. | Applicable on Day, Week, Work Week, Timeline Day, Timeline Week, and Timeline Work Week views. |

| **showWeekNumber** | Boolean | When set to **true**, shows the week number on the respective weeks. | Applicable on Day, Week, Work Week, and Month views. |

| **allowVirtualScrolling** | Boolean | It is used to enable or disable the virtual scrolling functionality. | Applicable on Agenda and Timeline views. |

| **headerRows** | [HeaderRowsModel](#) | Allows defining the custom header rows on timeline views of the Scheduler to display the year, month, week, date and hour label as an individual row. | Applicable only on all timeline views. |

Day view

Usually a day view displays a single day with all its related appointments. It is possible to customize the day view to display more number of days by extending the **views** property with **interval** option. You can also define any of the above defined properties within the **views** object definition as depicted in the following code example.

INDEX.TS

```
import { Schedule, Day } from '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Day);
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '550px',
    currentView: 'Day',
    selectedDate: new Date(2018, 1, 15),
    views: [{ option: 'Day', startHour: '09:30', endHour: '18:00',
timeScale: { enable: true, slotCount: 5 } }],
    eventSettings: { dataSource: scheduleData }
});
scheduleObj.appendTo('#Schedule');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
    <title>Schedule Typescript Component</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0,
user-scalable=no">
    <meta name="description" content="Typescript Schedule Control">
    <meta name="author" content="Syncfusion">
    <link href="index.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-

type="text/javascript"></script>
<script src="es5-datasource.js" type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="Schedule"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

All the above defined properties can be accessed within Day view except `allowVirtualScrolling` and `headerRows`.

Week view

The Week view displays a count of 7 days (from Sunday to Saturday) with all its related appointments. The first day of the week can be changed using the `firstDayOfWeek` which accepts the integer (Sunday=0, Monday=1, Tuesday=2 and so on) value. You can navigate to a particular date in day view from the week view by clicking on the appropriate dates on the date header bar.

INDEX.TS

```

import { Schedule, Day, Week } from '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Day, Week);
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '550px',
    selectedDate: new Date(2018, 1, 15),
    views: [
        { option: 'Day', interval: 2, displayName: '2 Days', startHour:
'09:30', endHour: '18:00', timeScale: {enable: true, slotCount: 5}},
        { option: 'Week', displayName: '2 Weeks', interval: 2, showWeekend:
false, isSelected: true }
    ],
    eventSettings: { dataSource: scheduleData }
});
scheduleObj.appendTo('#Schedule');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>Schedule Typescript Component</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0,
user-scalable=no">
  <meta name="description" content="Typescript Schedule Control">

if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

All the above defined properties in the table can be accessed within Week and Work week views except `allowVirtualScrolling` and `headerRows`.

Work Week view

The Work week view displays only the working days of a week (count of 5 days) and its associated appointments. It is possible to customize the working days on the work week view by using the `workDays` property which accepts an array of integer values (such as Sunday=0, Monday=1, Tuesday=2

and so on). By default, it displays from Monday to Friday (5 days). You can also navigate to a particular date in the day view from the work week view by clicking on the appropriate dates in the date header bar.

The following code example depicts how to change the working days only on the **Work Week** view of the Scheduler.

INDEX.TS

```
import { Schedule, WorkWeek } from '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(WorkWeek);
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '550px',
    selectedDate: new Date(2018, 1, 15),
    views: [{ option: 'WorkWeek', workDays: [2, 3, 5] }],
    eventSettings: { dataSource: scheduleData }
});
scheduleObj.appendTo('#Schedule');
```

INDEX.HTML

<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

The Week, Work week and Day views can display the all-day row appointments in a separate all-day row with an expand/collapse option to view it.

Month view

A Month view displays the entire days of a particular month and all its related appointments. You can navigate to a particular date in the day view by clicking on the appropriate date text on the month cells.

By default, when you try to create an appointment through Month view, it is considered as created for an entire day. You can explicitly change this behavior by unchecking the **All-day** option from editor window, so that it defaults to the start time duration as 9.00 AM and end time as 9.30 AM.

You can also have the **+ more** text indicator on each day cell of a Month view, clicking on which will allow you to view the hidden appointments of a day.

INDEX.TS

```

import { Schedule, Month } from '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Month);
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '550px',
    selectedDate: new Date(2018, 1, 15),
    views: [{ option: 'Month', showWeekNumber: true, readonly: true }],
    eventSettings: { dataSource: scheduleData }
});
scheduleObj.appendTo('#Schedule');

```

</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Year view

A Year view displays all the days of a particular year with months and all its related appointments. You can navigate to a particular date in the day view by clicking on the appropriate date text on the year cells.

Year view is available in both the **Horizontal** and **Vertical** orientations. You can manage the orientation of year view through **views** property.

INDEX.TS

```

import { Schedule, Year } from '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Year);
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '550px',
    selectedDate: new Date(2018, 1, 15),
    views: ['Year'],
    eventSettings: { dataSource: scheduleData }
});
scheduleObj.appendTo('#Schedule');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="Schedule"></div>
  </div>
<script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

The year view also has module support. In that, you can get all the months of a particular year in a calendar view format. In that calendar view, appointment contained dates are highlighted with dots placed under the individual date. When you click on the date, the event popup will be displayed and the events will be listed.

Agenda view

The Agenda view lists out the appointments in a grid-like view for the next 7 days by default from the current date. The count of the days can be changed using the API `agendaDaysCount`. It allows virtual scrolling of dates by enabling the `allowVirtualScrolling` property. Also, you can enable or disable the display of days on Scheduler that has no appointments by setting true or false to the `hideEmptyAgendaDays` property.

The following code example depicts how to customize the display of events within Agenda view alone.

INDEX.TS

```
import { Internationalization } from '@syncfusion/ej2-base';
import { Schedule, Agenda } from '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Agenda);
let instance: Internationalization = new Internationalization();
(window as TemplateFunction).getTimeString = (value: Date) => {
    return instance.formatDate(value, { skeleton: 'hm' });
};
interface TemplateFunction extends Window {
    getTimeString?: Function;
}
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '350px',
    selectedDate: new Date(2018, 1, 15),
    views: [{
        option: 'Agenda',
        eventTemplate: '<div class="template-wrap"><div
class="subject">${Subject}</div><div
class="time">${getTimeString(data.StartTime)} -
${getTimeString(data.EndTime)}</div></div>',
        allowVirtualScrolling: true
    }],
    eventSettings: { dataSource: scheduleData }
});
scheduleObj.appendTo('#Schedule');
```

    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Schedule Height is mandatory to set in pixels for Agenda view alone.

Month Agenda view

A Month-Agenda view shows a month calendar, where clicking on a particular day will display the appointments present on that date below the calendar. The day with appointments are differentiated with a circular dot below the date of the calendar.

The following code example shows how to hide the weekend days on **MonthAgenda** view as well as the working days list is modified on Month Agenda view alone.

INDEX.TS

```

import { Schedule, MonthAgenda } from '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(MonthAgenda);
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '550px',
    selectedDate: new Date(2018, 1, 14),
    views: [{ option: 'MonthAgenda', showWeekend: false, workDays: [1, 2, 3]
    }],
    eventSettings: { dataSource: scheduleData }
});
scheduleObj.appendTo('#Schedule');

```

</body></html>

```

Timeline views – Day, Week, Work Week

Similar to the day view, timeline day view shows a single day with all its appointments where the time slots are displayed horizontally. By default, the cell height adjusts as per the height set to Scheduler.

When the number of appointments exceeds the visible area of the cells, the **+ more** text indicator will be displayed at the bottom to denote the presence of few more appointments in that time range.

To make use of the timeline views (Timeline Day, Timeline Week and Timeline Work Week) on Scheduler, import and inject the module `TimelineViews` from the `ej2-schedule` package.

INDEX.TS

```
import { Schedule, TimelineViews } from '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(TimelineViews);
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '550px',
    selectedDate: new Date(2018, 1, 15),
    views: [{ option: 'TimelineDay', startHour: '10:00', endHour: '15:30'
}],
    eventSettings: { dataSource: scheduleData }
});
scheduleObj.appendTo('#Schedule');
```

INDEX.HTML

```

</script>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Similar to the Week view, the timeline week view shows 7 days with its associated appointments with the time slots displayed horizontally.

INDEX.TS

```

import { Schedule, TimelineViews } from '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(TimelineViews);
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '550px',
    selectedDate: new Date(2018, 1, 15),
    views: [{ option: 'TimelineWeek', timeScale: { enable: false } }],
    eventSettings: { dataSource: scheduleData }
});
scheduleObj.appendTo('#Schedule');

```

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Clicking on the dates in the date header bar of Timeline day, Timeline week and Timeline work week will allow you to navigate to the Agenda view.

Timeline Month view

A Timeline Month view displays the current month days along with its appointments. To make use of the timeline Month view on Scheduler, import and inject `TimelineMonth` module from the `ej2-schedule` package.

INDEX.TS

```

import { Schedule, TimelineMonth } from '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(TimelineMonth);
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '550px',
    selectedDate: new Date(2018, 1, 15),
    views: [{ option: 'TimelineMonth', showWeekend: false }],
    eventSettings: { dataSource: scheduleData }
});
scheduleObj.appendTo('#Schedule');

```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
```

```

<title>Schedule Typescript Component</title>
<meta charset="utf-8">
<meta name="viewport" content="width=device-width, initial-scale=1.0,
user-scalable=no">
<meta name="description" content="Typescript Schedule Control">

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Clicking on the dates in the date header bar of Timeline month will allow you to navigate to the Timeline day view.

Timeline Year view

In Timeline Year view, each row depicts a single resource. Whereas in the vertical view, each resource is grouped parallelly as columns. Here, the resource grouping follows the tree-view like hierarchical grouping structure and can contain any level of child resources.

To make use of the timeline Year view on Scheduler, import and inject `TimelineYear` module from the `ej2-schedule` package.

INDEX.TS

```
import { Schedule, TimelineYear } from '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(TimelineYear);
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '550px',
    selectedDate: new Date(2018, 1, 15),
    views: [{ option: 'TimelineYear', displayName: 'Horizontal Timeline
Year', isSelected: true }],
    eventSettings: { dataSource: scheduleData }
});
scheduleObj.appendTo('#Schedule');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
    <title>Schedule Typescript Component</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0,
user-scalable=no">
    <meta name="description" content="Typescript Schedule Control">
    <meta name="author" content="Syncfusion">
    <link href="index.css" rel="stylesheet">

```

```

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Timeline Year view is available in both the **Horizontal** and **Vertical** orientations. You can manage the orientation of Timeline Year view through **views** property.

Resource grouping

The following code example depicts how to group the multiple resources on Timeline Year view and its relevant events are displayed accordingly under those resources.

INDEX.TS

```

import { Schedule, TimelineYear } from '@syncfusion/ej2-schedule';
import { resourceData } from './datasource.ts';
Schedule.Inject(TimelineYear);
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '550px',
    views: [{ option: 'TimelineYear', displayName: 'Horizontal Timeline Year', isSelected: true },
        { option: 'TimelineYear', displayName: 'Vertical Timeline Year',
orientation: 'Vertical' }],
    selectedDate: new Date(2018, 3, 4),
    group: {
        resources: ['Rooms', 'Owners']
    },
    resources: [{
        field: 'RoomId', title: 'Room',
        name: 'Rooms', allowMultiple: false,
        dataSource: [
            { RoomText: 'ROOM 1', Id: 1, RoomColor: '#cb6bb2' },
            { RoomText: 'ROOM 2', Id: 2, RoomColor: '#56ca85' }
        ],
        textField: 'RoomText', idField: 'Id', colorField: 'RoomColor'
    }, {
        field: 'OwnerId', title: 'Owner',
        name: 'Owners', allowMultiple: true,
        dataSource: [
            { OwnerText: 'Nancy', Id: 1, OwnerGroupId: 1, OwnerColor: '#ffaa00' },
            { OwnerText: 'Steven', Id: 2, OwnerGroupId: 2, OwnerColor: '#f8a398' },
            { OwnerText: 'Michael', Id: 3, OwnerGroupId: 1, OwnerColor: '#7499e1' }
        ],
        textField: 'OwnerText', idField: 'Id', groupIDField: 'OwnerGroupId',
        colorField: 'OwnerColor'
    }],
    eventSettings: { dataSource: resourceData }
});
scheduleObj.appendTo('#Schedule');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>Schedule Typescript Component</title>
  <meta charset="utf-8">

if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Auto row height

Timeline Year view supports Auto row height. When the feature `rowAutoHeight` is enabled, the row height gets auto-adjusted based on the number of overlapping events occupied in the same time range. If you disable the Auto row height, you have the + more text indicator on each day cell of a Timeline Year view, clicking on which will allow you to view the hidden appointments of a day.

INDEX.TS

```
import { Schedule, TimelineYear } from '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(TimelineYear);
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '550px',
    rowAutoHeight: true,
    selectedDate: new Date(2018, 1, 15),
    views: [{ option: 'TimelineYear', displayName: 'Horizontal Timeline Year', isSelected: true },
        { option: 'TimelineYear', displayName: 'Vertical Timeline Year',
            orientation: 'Vertical' }],
    eventSettings: { dataSource: scheduleData }
});
scheduleObj.appendTo('#Schedule');
```

<body>

    <div id="container">
        <div id="Schedule"></div>
    </div>
</body>
</html>
```

```

var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Extending view intervals

It is possible to customize the display of default number of days on different Scheduler view modes. For example, a day view can be extended to display 3 days by setting the `interval` option as 3 for the `Day` option within the `views` property as depicted in the following code example. In the same way, you can also display 2 weeks by setting interval 2 for the `Week` option.

You can provide the alternative display name for such customized views on the Scheduler header bar, by setting the appropriate `displayName` property.

INDEX.TS

```

import { Schedule, Day, Week } from '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Day, Week);
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '550px',
    currentView: 'Day',
    selectedDate: new Date(2018, 1, 15),
    views: [{ option: 'Day', interval: 3, displayName: '3 Days' },
            { option: 'Week', interval: 2, displayName: '2 Weeks' }],
    eventSettings: { dataSource: scheduleData }
});
scheduleObj.appendTo('#Schedule');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

The view intervals can be extended on all the Scheduler view modes except Agenda and Month-Agenda views.

We can also use `isSelected` property to set the current view of the scheduler. The below code sample demonstrates that how to use `isSelected` property.

INDEX.TS

```

import { Schedule, Day, Week } from '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Day, Week);
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '550px',
    selectedDate: new Date(2018, 1, 15),
    views: [
        {
            option: 'Day',
            interval: 3,
            displayName: '3 Days',
        },
        {
            option: 'Week',
            displayName: '2 Weeks',
            interval: 2,
            isSelected: true,
        },
    ],
    eventSettings: { dataSource: scheduleData }
});

```

```
scheduleObj.appendTo('#Schedule');
```

Calendar mode in EJ2 JavaScript Schedule control

The Scheduler supports the following two types of calendar mode.

- Gregorian Calendar
- Islamic Calendar

Gregorian Calendar

The Scheduler by default displays the gregorian calendar dates which is the most widely used calendar in the world. The Gregorian calendar is a solar calendar which has 12 months with 28 to 31 days each. A year which is divisible by four is said to be a leap year in this calendar mode. A leap year usually has 366 days whereas the regular year has 365 days.

Islamic Calendar

The Islamic Calendar, also known as the Hijri or Muslim calendar, is a lunar calendar which has 12 months in a year with 354 or 355 days. Each month of this calendar denotes the birth of the new lunar cycle and therefore, each month can have 29 or 30 days depending on the visibility of the moon. Here, the odd-numbered months have 30 days and the even months have 29 days.

The current Islamic year is 1440 AH. Usually the Gregorian calendar runs from approximately 11 September 2018 to 30 August 2019 for this 1440 AH year.

The Scheduler has a property `calendarMode` which is used to switch between the gregorian and islamic calendar modes. By default, it is set to `Gregorian` and to use it with Islamic calendar dates, define the `calendarMode` of Scheduler to `Islamic`. The following example depicts, how to display the Islamic calendar dates on Scheduler.

To make use of Islamic calendar in Scheduler, import the `Calendar` and `Islamic` module from `ej2-calendars` package and also inject it using the `Calendar.Inject` method. Apart from this, it requires the following CLDR data to be loaded using `loadCldr` function.

- `numberingSystems.json`
- `ca-gregorian.json`
- `numbers.json`
- `timeZoneNames.json`
- `ca-islamic.json`

To know more information on, how to install the CLDR data, refer the [Internationalization](#) topic.

```

You can refer to our [JavaScript Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [JavaScript Scheduler example](#) to know how to present and manipulate data.

Resources in EJ2 JavaScript Schedule control

Resources and grouping support allows the Scheduler to be shared by multiple resources. Also, the appointments of each resource are displayed under relevant resources. Each resource in the Scheduler is arranged in a column/row wise order, with individual spacing to display all its respective appointments on a single page. It also supports the multiple levels of grouping of resources, thus enabling the categorization of resources in a hierarchical structure and shows it either in expandable groups (Timeline views) or else vertical hierarchy one after the other (Calendar views).

It is also possible to assign one or more resources to the same appointment, by allowing multiple selection of resource options available in the event editor window.

The HTML5 JavaScript Scheduler groups the resources based on different criteria. It includes grouping appointments based on resources, grouping resources based on dates, and timeline scheduling. Also, the data for resources bind with Scheduler either as a local JSON collection or URL, retrieving data from remote data services.

Resource fields

The default options available within the `resources` collection are as follows,

Field name	Type	Description
------------	------	-------------

|-----|-----| ----- |

| **field** | String | A value that binds to the resource field of event object. |

| **title** | String | It holds the title of the resource field to be displayed on the event editor window. |

| **name** | String | A unique resource name used for differentiating various resource objects while grouping. |

| **allowMultiple** | Boolean | When set to **true**, allows multiple selection of resource names, thus creating multiple instances of same appointment for the selected resources. |

| **dataSource** | Object | Assigns the resource **dataSource**, where data can be passed either as an array of JavaScript objects, or else can create an instance of [DataManager](#) in case of processing remote data and can be assigned to the **dataSource** property. With the remote data assigned to **dataSource**, check the available [adaptors](#) to customize the data processing. |

| **query** | Query | Defines the external [query](#) that will be executed along with the data processing. |

| **idField** | String | Binds the resource ID field name from the resources **dataSource**. |

| **expandedField** | String | Binds the **expandedField** name from the resources **dataSource**. It usually holds boolean value which decide whether the resource of timeline views is in collapse or expand state on initial load. |

| **textField** | String | Binds the text field name from the resources **dataSource**. It usually holds the resource names. |

| **groupIDField** | String | Binds the group ID field name from the resource **dataSource**. It usually holds the value of resource IDs of parent level resources. |

| **colorField** | String | Binds the color field name from the resource **dataSource**. The color value mapped in this field will be applied to the events of resources. |

| **startHourField** | String | Binds the start hour field name from the resource **dataSource**. It allows to provide different work start hour for the resources. |

| **endHourField** | String | Binds the end hour field name from the resource **dataSource**. It allows to provide different work end hour for the resources. |

| **workDaysField** | String | Binds the work days field name from the resources **dataSource**. It allows to provide different working days collection for the resources. |

| **cssClassField** | String | Binds the custom CSS class field name from the resources **dataSource**. It maps the CSS class written for the specific resources and applies it to the events of those resources. |

Resource data binding

The data for resources can bind with Scheduler either as a local JSON collection or a service URL, retrieving resource data from remote data services.

Using local JSON data

The following code example depicts how to bind the local JSON data to the **dataSource** of **resources** collection.

```
`ts
```

```

import { Schedule, Week, Month, Agenda, TimelineViews, TimelineMonth } from '@syncfusion/ej2-schedule';
import { resourceData } from './datasource.ts';
Schedule.Inject( Week, Month, TimelineViews, TimelineMonth, Agenda);
let scheduleObj: Schedule = new Schedule({
width: '100%',
height: '550px',
currentView: 'Week',
views: ['Week', 'Month', 'TimelineWeek', 'TimelineMonth', 'Agenda'],
selectedDate: new Date(2018, 3, 1),
resources: [{
field: 'OwnerId', title: 'Owner',
name: 'Owners', allowMultiple: true,
dataSource: [
{ OwnerText: 'Nancy', Id: 1, OwnerColor: '#ffaa00' },
{ OwnerText: 'Steven', Id: 2, OwnerColor: '#f8a398' },
{ OwnerText: 'Michael', Id: 3, OwnerColor: '#7499e1' }
],
textField: 'OwnerText', idField: 'Id', colorField: 'OwnerColor'
}],
eventSettings: { dataSource: resourceData }
});
scheduleObj.appendTo('#Schedule');

```

Using remote service URL

The following code example depicts how to bind the remote data for resources `dataSource`.

```

`ts
import { DataManager, UrlAdaptor } from '@syncfusion/ej2-data';
import { Schedule, Week, Month, Agenda, TimelineViews, TimelineMonth } from '@syncfusion/ej2-schedule';
import { resourceData } from './datasource.ts';
let resource: DataManager = new DataManager({
url: 'Home/GetResourceData',
adaptor: new UrlAdaptor,

```

```

crossDomain: true
});
Schedule.Inject( Week, Month, TimelineViews, TimelineMonth, Agenda);
let scheduleObj: Schedule = new Schedule({
width: '100%',
height: '550px',
currentView: 'Week',
views: ['Week', 'Month', 'TimelineWeek', 'TimelineMonth', 'Agenda'],
selectedDate: new Date(2018, 3, 1),
resources: [{
field: 'OwnerId', title: 'Owner',
name: 'Owners', allowMultiple: true,
dataSource: resource,
textField: 'OwnerText', idField: 'Id', colorField: 'OwnerColor'
}],
eventSettings: { dataSource: resourceData }
});
scheduleObj.appendTo('#Schedule');

```

Scheduler with multiple resources

It is possible to display the Scheduler in default mode without visually showcasing all the resources in it, but allowing to assign the required resources to the appointments through the event editor resource options.

The appointments belonging to the different resources will be displayed altogether on the default Scheduler, which will be differentiated based on the resource color assigned in the **resources** (depicting to which resource that particular appointment belongs) collection.

Example: To display default Scheduler with multiple resource options in the event editor, ignore the group option and simply define the **resources** property with all its internal options.

INDEX.TS

```

import { Schedule, Week, Month, Agenda, TimelineViews, TimelineMonth } from
'@syncfusion/ej2-schedule';
import { resourceData } from './datasource.ts';
Schedule.Inject( Week, Month, TimelineViews, TimelineMonth, Agenda);
let scheduleObj: Schedule = new Schedule({
width: '100%',
height: '550px',
currentView: 'Week',
views: ['Week', 'Month', 'TimelineWeek', 'TimelineMonth', 'Agenda'],
selectedDate: new Date(2018, 3, 1),

```

```

resources: [{
    field: 'OwnerId', title: 'Owner',
    name: 'Owners', allowMultiple: true,
    dataSource: [
        { OwnerText: 'Nancy', Id: 1, OwnerColor: '#ffaa00' },
        { OwnerText: 'Steven', Id: 2, OwnerColor: '#f8a398' },
        { OwnerText: 'Michael', Id: 3, OwnerColor: '#7499e1' }
    ],
    textField: 'OwnerText', idField: 'Id', colorField: 'OwnerColor'
}],
eventSettings: { dataSource: resourceData }
});
scheduleObj.appendTo('#Schedule');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>Schedule Typescript Component</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript Schedule Control">
    <meta name="author" content="Syncfusion">
    <link href="index.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-

    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
dropdowns/styles/material.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
inputs/styles/material.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
navigations/styles/material.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
popups/styles/material.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
schedule/styles/material.css" rel="stylesheet">

    <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
    <script src="es5-datasource.js" type="text/javascript"></script>
    <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="Schedule"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";

```

```

}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Setting `allowMultiple` to `true` in the above code example allows you to select multiple resources from the event editor and also creates multiple copies of the same appointment in the Scheduler for each resources while rendering.

Resource grouping

Resource grouping support allows the Scheduler to group the resources in a hierarchical structure both as an expandable groups (Timeline views) and as vertical hierarchy displaying resources one after the other (Resources view).

Scheduler supports both single and multiple levels of resource grouping that can be customized both in timeline and vertical Scheduler views.

Vertical resource view

The following code example displays how the multiple resources are grouped and its events are portrayed in the default calendar views.

INDEX.TS

```

import { Schedule, Week, Month, Agenda } from '@syncfusion/ej2-schedule';
import { resourceConferenceData } from './datasource.ts';
Schedule.Inject( Week, Month, Agenda );
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '550px',
    currentView: 'Week',
    views: ['Week', 'Month', 'Agenda'],
    selectedDate: new Date(2018, 3, 4),
    group: {
        byGroupID: false,
        resources: ['Projects', 'Categories']
    },
    resources: [
        {
            field: 'ProjectId', title: 'Choose Project', name: 'Projects',
            dataSource: [
                { text: 'PROJECT 1', id: 1, color: '#cb6bb2' },
                { text: 'PROJECT 2', id: 2, color: '#56ca85' },
                { text: 'PROJECT 3', id: 3, color: '#df5286' }
            ],
            textField: 'text', idField: 'id', colorField: 'color'
        }, {
            field: 'TaskId', title: 'Category',
            name: 'Categories', allowMultiple: true,
            dataSource: [
                { text: 'Development', id: 1, color: '#df5286' },
                { text: 'Testing', id: 2, color: '#7fa900' }
            ],
            textField: 'text', idField: 'id', colorField: 'color'
        }
    ],
},

```

```
eventSettings: { dataSource: resourceConferenceData }
});
scheduleObj.appendTo('#Schedule');
```

INDEX.HTML

[Timeline resource view](#)

The following code example depicts how to group the multiple resources on Timeline Scheduler views and its relevant events are displayed accordingly under those resources.

INDEX.TS

```
import { Schedule, TimelineViews, TimelineMonth, Agenda } from
 '@syncfusion/ej2-schedule';
import { resourceData } from './datasource.ts';
Schedule.Inject(TimelineViews, TimelineMonth, Agenda );
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '550px',
    currentView: 'TimelineWeek',
    views: ['TimelineWeek', 'TimelineMonth', 'Agenda'],
    selectedDate: new Date(2018, 3, 4),
    group: {
        resources: ['Rooms', 'Owners']
    },
    resources: [{
        field: 'RoomId', title: 'Room',
        name: 'Rooms', allowMultiple: false,
        dataSource: [
            { RoomText: 'ROOM 1', Id: 1, RoomColor: '#cb6bb2' },
            { RoomText: 'ROOM 2', Id: 2, RoomColor: '#56ca85' }
        ],
        textField: 'RoomText', idField: 'Id', colorField: 'RoomColor'
    }, {
        field: 'OwnerId', title: 'Owner',
        name: 'Owners', allowMultiple: true,
        dataSource: [
            { OwnerText: 'Nancy', Id: 1, OwnerGroupId: 1, OwnerColor:
 '#ffaa00' },
            { OwnerText: 'Steven', Id: 2, OwnerGroupId: 2, OwnerColor:
 '#f8a398' },
            { OwnerText: 'Michael', Id: 3, OwnerGroupId: 1, OwnerColor:
 '#7499e1' }
        ],
        textField: 'OwnerText', idField: 'Id', groupIDField: 'OwnerGroupId',
        colorField: 'OwnerColor'
    }],
    eventSettings: { dataSource: resourceData }
});
scheduleObj.appendTo('#Schedule');
```

```

Grouping single-level resources

This kind of grouping allows the Scheduler to display all the resources at a single level simultaneously. The appointments mapped under resources will be displayed with the colors as per the `colorField` defined on the resources collection.

Example: To display the Scheduler with single level resource grouping,

INDEX.TS

```

import { Schedule, Week, Month, Agenda, TimelineViews, TimelineMonth } from
'@syncfusion/ej2-schedule';
import { resourceData } from './datasource.ts';
Schedule.Inject(Month, Week, Agenda, TimelineViews, TimelineMonth);
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '550px',
    views: ['Week', 'Month', 'TimelineWeek', 'TimelineMonth', 'Agenda'],
    selectedDate: new Date(2018, 3, 1),
    group: {
        resources: ['Owners']
    },
    resources: [{
        field: 'OwnerId', title: 'Owner',
        name: 'Owners', allowMultiple: true,

```

```

        dataSource: [
            { OwnerText: 'Nancy', Id: 1, OwnerColor: '#ffaa00' },
            { OwnerText: 'Steven', Id: 2, OwnerColor: '#f8a398' },
            { OwnerText: 'Michael', Id: 3, OwnerColor: '#7499e1' }
        ],
        textField: 'OwnerText', idField: 'Id', colorField: 'OwnerColor'
    }],
    eventSettings: { dataSource: resourceData }
});
scheduleObj.appendTo('#Schedule');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>Schedule Typescript Component</title>

    <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="Schedule"></div>
    </div>

    <script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
    </script>
<script src="index.js" type="text/javascript"></script>

```

```
</body></html>
```

The **name** field defined in the **resources** collection namely **Owners** will be mapped within the **group** property, in order to enable the grouping option with those resource levels on the Scheduler.

Grouping multi-level resources

It is possible to group the resources of Scheduler in multiple levels, by mapping the child resources to each parent resource. In the following example, there are 2 levels of resources, on which the second level resources are defined with **groupID** mapping to the first level resource's ID so as to establish the parent-child relationship between them.

Example: To display the Scheduler with multiple level resource grouping options,

INDEX.TS

```
import { Schedule, Week, Month, Agenda, TimelineViews, TimelineMonth } from
 '@syncfusion/ej2-schedule';
import { resourceData } from './datasource.ts';
Schedule.Inject(Month, Week, Agenda, TimelineViews, TimelineMonth);
let scheduleObj: Schedule = new Schedule({
  width: '100%',
  height: '550px',
  views: ['Week', 'Month', 'TimelineWeek', 'TimelineMonth', 'Agenda'],
  selectedDate: new Date(2018, 3, 1),
  group: {
    resources: ['Rooms', 'Owners']
  },
  resources: [{
    field: 'RoomId', title: 'Room',
    name: 'Rooms', allowMultiple: false,
    dataSource: [
      { RoomText: 'ROOM 1', Id: 1, RoomColor: '#cb6bb2' },
      { RoomText: 'ROOM 2', Id: 2, RoomColor: '#56ca85' }
    ],
    textField: 'RoomText', idField: 'Id', colorField: 'RoomColor'
  }, {
    field: 'OwnerId', title: 'Owner',
    name: 'Owners', allowMultiple: true,
    dataSource: [
      { OwnerText: 'Nancy', Id: 1, OwnerGroupId: 1, OwnerColor:
        '#ffaa00' },
      { OwnerText: 'Steven', Id: 2, OwnerGroupId: 2, OwnerColor:
        '#f8a398' },
      { OwnerText: 'Michael', Id: 3, OwnerGroupId: 1, OwnerColor:
        '#7499e1' }
    ],
    textField: 'OwnerText', idField: 'Id', groupIDField: 'OwnerGroupId',
    colorField: 'OwnerColor'
  }],
  eventSettings: { dataSource: resourceData }
});
scheduleObj.appendTo('#Schedule');
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

One-to-One grouping

In multi-level grouping, Scheduler usually groups the resources on the child level based on the **GroupID** that maps with the **Id** field of parent level resources (as **byGroupID** set to true by default). There are also option which allows you to group all the child resource(s) against each of its parent resource(s). To enable this kind of grouping, set **false** to the **byGroupID** option within the **group** property. In the following code example, there are two levels of resources, on which all the 3 resources at the child level is mapped one to one with each resource on the first level.

INDEX.TS

```

import { Schedule, Week, Month, TimelineViews, TimelineMonth, Agenda } from
 '@syncfusion/ej2-schedule';
import { resourceData } from './datasource.ts';
Schedule.Inject(Week, Month, TimelineViews, TimelineMonth, Agenda );
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '550px',
    currentView: 'Week',
    views: ['Week', 'Month', 'TimelineWeek', 'TimelineMonth', 'Agenda'],
    selectedDate: new Date(2018, 3, 1),
    group: {
        byGroupID: false,
        resources: ['Rooms', 'Owners']
    },
    resources: [{
        field: 'RoomId', title: 'Room',
        name: 'Rooms', allowMultiple: false,
        dataSource: [
            { RoomText: 'ROOM 1', Id: 1, RoomColor: '#cb6bb2' },
            { RoomText: 'ROOM 2', Id: 2, RoomColor: '#56ca85' }
        ],
        textField: 'RoomText', idField: 'Id', colorField: 'RoomColor'
    }, {
        field: 'OwnerId', title: 'Owner',
        name: 'Owners', allowMultiple: true,
        dataSource: [
            { OwnerText: 'Nancy', Id: 1, OwnerColor: '#ffaa00' },
            { OwnerText: 'Steven', Id: 2, OwnerColor: '#f8a398' },
            { OwnerText: 'Michael', Id: 3, OwnerColor: '#7499e1' }
        ],
        textField: 'OwnerText', idField: 'Id', colorField: 'OwnerColor'
    }
    ],
    eventSettings: { dataSource: resourceData }
});
scheduleObj.appendTo('#Schedule');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Grouping resources by date

It groups the number of resources under each date and is applicable only on the calendar views such as Day, Week, Work Week, Month, Agenda and Month-Agenda. To enable such grouping, set **byDate** option to **true** within the **group** property.

Example: To display the Scheduler with resources grouped by date,

INDEX.TS

```

import { Schedule, Week, Month, Agenda } from '@syncfusion/ej2-schedule';
import { resourceData } from './datasource.ts';
Schedule.Inject(Month, Week, Agenda);
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '550px',
    views: ['Week', 'Month', 'Agenda'],
    selectedDate: new Date(2018, 3, 1),
    group: {
        byDate: true,
        resources: ['Owners']
    },
    resources: [{
        field: 'OwnerId', title: 'Owner',
        name: 'Owners', allowMultiple: true,
        dataSource: [
            { text: 'Alice', id: 1, color: '#1aaa55' },
            { text: 'Smith', id: 2, color: '#7fa900' }
        ]
    }],

```

```

        textField: 'text', idField: 'id', colorField: 'color'
    }],
    eventSettings: { dataSource: resourceData }
});
scheduleObj.appendTo('#Schedule');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>Schedule Typescript Component</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript Schedule Control">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-

  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
popups/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
schedule/styles/material.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="es5-datasource.js" type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="Schedule"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

This kind of grouping by date is not applicable on any of the timeline views.

Customizing parent resource cells

In timeline view work cells of parent resource can be customized by checking the `elementType` as `resourceGroupCells` in the event `renderCell`. In the following code example, background color of the work hours has been changed.

INDEX.TS

```
import { Schedule, TimelineViews, TimelineMonth, RenderCellEventArgs } from
'@syncfusion/ej2-schedule';
import { resourceData } from './datasource.ts';
Schedule.Inject(TimelineViews, TimelineMonth);
let scheduleObj: Schedule = new Schedule({
  width: '100%',
  height: '550px',
  currentView: 'TimelineWeek',
  views: ['TimelineDay', 'TimelineWeek', 'TimelineMonth'],
  selectedDate: new Date(2018, 3, 4),
  group: {
    resources: ['Rooms', 'Owners']
  },
  resources: [{
    field: 'RoomId', title: 'Room',
    name: 'Rooms', allowMultiple: false,
    dataSource: [
      { RoomText: 'ROOM 1', Id: 1, RoomColor: '#cb6bb2' },
      { RoomText: 'ROOM 2', Id: 2, RoomColor: '#56ca85' }
    ],
    textField: 'RoomText', idField: 'Id', colorField: 'RoomColor'
  }, {
    field: 'OwnerId', title: 'Owner',
    name: 'Owners', allowMultiple: true,
    dataSource: [
      { OwnerText: 'Nancy', Id: 1, OwnerGroupId: 1, OwnerColor:
'#ffaa00' },
      { OwnerText: 'Steven', Id: 2, OwnerGroupId: 2, OwnerColor:
'#f8a398' },
      { OwnerText: 'Michael', Id: 3, OwnerGroupId: 1, OwnerColor:
'#7499e1' }
    ],
    textField: 'OwnerText', idField: 'Id', groupIDField: 'OwnerGroupId',
colorField: 'OwnerColor'
  }],
  eventSettings: { dataSource: resourceData },
  renderCell: (args: RenderCellEventArgs) {
    if (args.elementType == 'resourceGroupCells' &&
args.element.className.indexOf('e-work-hours') > 0) {
      args.element.style.background = "#FAFAE3";
    }
  }
});
scheduleObj.appendTo('#Schedule');
```

INDEX.HTML

```

```

Working with shared events

Multiple resources can share the same events, thus allowing the CRUD action made on it to reflect on all other shared instances simultaneously. To enable such option, set `allowGroupEdit` option to `true` within the `group` property. With this property enabled, a single appointment object will be maintained within the appointment collection, even if it is shared by more than one resource – whereas the resource fields of such appointment object will be in array which hold the IDs of the multiple resources.

Any actions such as create, edit or delete held on any one of the shared event instances, will be reflected on all other related instances visible on the UI.

Example: To edit all the resource events simultaneously,

INDEX.TS

```

import { Schedule, Week, Month, Agenda, TimelineViews, TimelineMonth, Resize } from '@syncfusion/ej2-schedule';
Schedule.Inject(Month, Week, Agenda, TimelineViews, TimelineMonth, Resize);
let resourceConferenceData: Object[] = [
    {
        Id: 1,
        Subject: 'Burning Man',
        StartTime: new Date(2018, 5, 1, 15, 0),
        EndTime: new Date(2018, 5, 1, 17, 0),
        ConferenceId: [1, 2, 3]
    }, {

Simple resource header customization

It is possible to customize the resource header cells using built-in template option and change the look and appearance of it in both the vertical and timeline view modes. All the resource related fields and other information can be accessed within the resource header template option.

Example: To customize the resource header and display it along with designation field, refer the below code example.

INDEX.TS

```
import {
    Schedule, Week, Month, TimelineViews, TimelineMonth, Agenda
} from '@syncfusion/ej2-schedule';
import { doctorData } from './datasource.ts';
Schedule.Inject(Week, Month, TimelineViews, TimelineMonth, Agenda);
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '550px',
    selectedDate: new Date(2018, 3, 1),
    resourceHeaderTemplate: '#resourceTemplate',
    views: ['Week', 'Month', 'TimelineWeek', 'TimelineMonth', 'Agenda'],
    group: {
        resources: ['Doctors']
    },
    resources: [{
        field: 'DoctorId', title: 'Doctor Name', name: 'Doctors',
        dataSource: [
            { text: 'Will Smith', id: 1, color: '#ea7a57', designation:
'Cardiologist' },
            { text: 'Alice', id: 2, color: '#7fa900', designation:
'Neurologist' },
            { text: 'Robson', id: 3, color: '#7fa900', designation:
'Orthopedic Surgeon' }
        ],
        textField: 'text', idField: 'id', colorField: 'color',
        designationField: 'designation'
    }],
    eventSettings: { dataSource: doctorData }
});
scheduleObj.appendTo('#Schedule');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
    <title>Schedule Typescript Component</title>

popups/styles/material.css" rel="stylesheet">
<link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
schedule/styles/material.css" rel="stylesheet">

<style>
.e-schedule .e-vertical-view .e-resource-cells {
    height: 62px;
}
.e-schedule .template-wrap {
    display: flex;
    text-align: left;
}
.e-schedule .template-wrap .resource-details {
    padding-left: 10px;
}
.e-schedule .template-wrap .resource-details .resource-name {
    font-size: 16px;
    font-weight: 500;
    margin-top: 5px;
}
.e-schedule.e-device .template-wrap .resource-details .resource-name {
    font-size: inherit;
    font-weight: inherit;
}
.e-schedule.e-device .e-resource-tree-popup .e-fullrow {
    height: 50px;
}
.e-schedule.e-device .template-wrap .resource-details .resource-
designation {
    display: none;
}
</style>
<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="es5-datasource.js" type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head><body>
    <script id="resourceTemplate" type="text/x-template">
        <div class='template-wrap'>
            <div class="resource-details">
                <div class="resource-name">${resourceData.text}</div>
                <div class="resource-
designation">${resourceData.designation}</div>
            </div>
        </div>
    </script>

    <div id="container">
        <div id="Schedule"></div>
    </div>

</script>

```

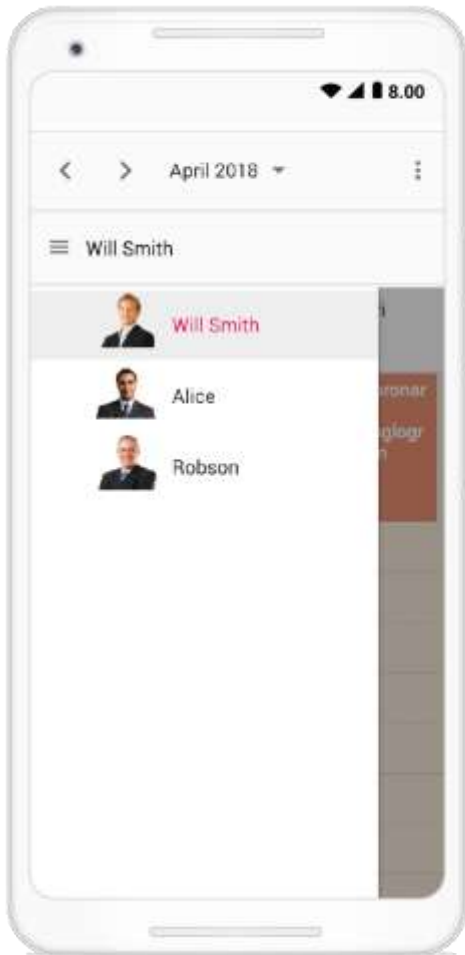

```

var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

To customize the resource header in compact mode properly make use of the class `e-device` as in the code example.

Customizing resource header with multiple columns

It is possible to customize the resource headers to display with multiple columns such as Room, Type and Capacity. The following code example depicts the way to achieve it and is applicable only on timeline views.

INDEX.TS

```

import {
    Schedule, RenderCellEventArgs, TimelineViews, TimelineMonth
} from '@syncfusion/ej2-schedule';
import { roomData } from './datasource.ts';
Schedule.Inject(TimelineViews, TimelineMonth);

```

```

let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '550px',
    selectedDate: new Date(2018, 7, 1),
    resourceHeaderTemplate: '#resourceTemplate',
    views: ['TimelineWeek', 'TimelineMonth'],
    group: {
        resources: ['MeetingRoom']
    },
    resources: [{
        field: 'RoomId', title: 'Room Type',
        name: 'MeetingRoom', allowMultiple: true,
        dataSource: [
            { text: 'Jammy', id: 1, color: '#ea7a57', capacity: 20, type:
'Conference' },
            { text: 'Tweety', id: 2, color: '#7fa900', capacity: 7, type:
'Cabin' },
            { text: 'Nestle', id: 3, color: '#5978ee', capacity: 5, type:
'Cabin' },
            { text: 'Phoenix', id: 4, color: '#fec200', capacity: 15, type:
'Conference' },
            { text: 'Mission', id: 5, color: '#df5286', capacity: 25, type:
'Conference' },
            { text: 'Hangout', id: 6, color: '#00bdae', capacity: 10, type:
'Cabin' },
            { text: 'Rick Roll', id: 7, color: '#865fcf', capacity: 20,
type: 'Conference' },
            { text: 'Rainbow', id: 8, color: '#1aaa55', capacity: 8, type:
'Cabin' },
            { text: 'Swarm', id: 9, color: '#df5286', capacity: 30, type:
'Conference' },
            { text: 'Photogenic', id: 10, color: '#710193', capacity: 25,
type: 'Conference' }
        ],
        textField: 'text', idField: 'id', colorField: 'color'
    }
    ],
    renderCell: (args: RenderCellEventArgs) => {
        if (args.elementType === 'emptyCells' &&
args.element.classList.contains('e-resource-left-td')) {
            let target: HTMLElement = args.element.querySelector('.e-
resource-text') as HTMLElement;
            target.innerHTML = '<div class="name">Rooms</div><div
class="type">Type</div><div class="capacity">Capacity</div>';
        }
    },
    eventSettings: { dataSource: roomData }
});
scheduleObj.appendTo('#Schedule');

```

INDEX.HTML

```

Collapse/Expand child resources in timeline views

It is possible to expand and collapse the resources which have child resource in timeline views dynamically. By default, resources are in expanded state with their child resource. We can collapse and expand the child resources in UI by setting `expandedField` option as `false` whereas its default value is `true`.

INDEX.TS

```

import { Schedule, TimelineViews, TimelineMonth, Agenda } from
'@syncfusion/ej2-schedule';
import { resourceData } from './datasource.ts';
Schedule.Inject(TimelineViews, TimelineMonth, Agenda);
let scheduleObj: Schedule = new Schedule({
  width: "100%",
  height: "550px",
  currentView: "TimelineWeek",
  views: ["TimelineWeek", "TimelineMonth", "Agenda"],
  selectedDate: new Date(2018, 3, 4),
  group: {
    resources: ["Rooms", "Owners"]
  },
  resources: [
    {
      field: "RoomId", title: "Room",
      name: "Rooms", allowMultiple: false,
      dataSource: [
        { RoomText: "ROOM 1", Id: 1, RoomColor: "#cb6bb2", IsExpand: false
      },
        { RoomText: "ROOM 2", Id: 2, RoomColor: "#56ca85" }
      ],
      textField: "RoomText", idField: "Id", colorField: "RoomColor",
      expandedField: "IsExpand"
    },
  ],

```

```

{
    field: "OwnerId", title: "Owner",
    name: "Owners", allowMultiple: true,
    dataSource: [
        { OwnerText: "Nancy", Id: 1, OwnerGroupId: 1, OwnerColor: "#ffaa00"
    },
        { OwnerText: "Steven", Id: 2, OwnerGroupId: 2, OwnerColor: "#f8a398"
    },
        { OwnerText: "Michael", Id: 3, OwnerGroupId: 1, OwnerColor:

Displaying tooltip for resource headers

It is possible to display tooltips over the resource headers showing the resource information. By default, there won't be any tooltips displayed on the resource headers, and to enable it, you need to assign the customized template design to the `headerTooltipTemplate` option within the `group` property.

INDEX.TS

```

import {
    Schedule, Week, Month, TimelineViews, TimelineMonth
} from '@syncfusion/ej2-schedule';
import { resourceData } from './datasource.ts';
Schedule.Inject(Week, Month, TimelineViews, TimelineMonth);
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '550px',
    selectedDate: new Date(2018, 3, 1),
    views: ['Week', 'Month', 'TimelineWeek', 'TimelineMonth'],
    group: {
        resources: ['Rooms', 'Owners'],
        headerTooltipTemplate: '#tooltipTemplate'
    },
    resources: [
        {
            field: 'OwnerId', title: 'Owner',
            name: 'Owners', allowMultiple: true,
            dataSource: [
                { OwnerText: 'Nancy', Id: 1, OwnerGroupId: 1, OwnerColor:
                    '#ffaa00' },
                { OwnerText: 'Steven', Id: 2, OwnerGroupId: 2, OwnerColor:
                    '#f8a398' },
                { OwnerText: 'Michael', Id: 3, OwnerGroupId: 1, OwnerColor:
                    '#7499e1' }
            ],
            textField: 'OwnerText', idField: 'Id', groupIDField:
                'OwnerGroupId', colorField: 'OwnerColor'
        }
    ],
    eventSettings: { dataSource: resourceData }
});
scheduleObj.appendTo('#Schedule');

```

Choosing among resource colors for appointments

By default, the colors defined on the top level resources collection will be applied for the events. In case, if you want to apply specific resource color to events irrespective of its top-level parent resource color, it can be achieved by defining **resourceColorField** option within the **eventSettings** property.

In the following example, the colors mentioned in the second level will get applied over the events.

INDEX.TS

```
import { RadioButton, ChangeArgs } from '@syncfusion/ej2-buttons';
import { Schedule, Week, Month, Agenda, TimelineViews, TimelineMonth } from '@syncfusion/ej2-schedule';
import { resourceData } from './datasource.ts';
Schedule.Inject(Month, Week, Agenda, TimelineViews, TimelineMonth);
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '550px',
    views: ['Week', 'Month', 'TimelineWeek', 'TimelineMonth', 'Agenda'],
    selectedDate: new Date(2018, 3, 1),
    group: {
        resources: ['Rooms', 'Owners']
    },
    resources: [{
        field: 'RoomId', title: 'Room',
        name: 'Rooms', allowMultiple: false,

</body></html>

```

The value of the `resourceColorField` field should be mapped with the `name` value given within the `resources` property.

Setting different style to each resource appointments

By default, the appearance of events is the same for all resource events. In case, if you want to apply the different styles to each resource event, you can do this by defining the `cssClassField` option within the `resource` property that maps the different `cssClass` fields from the resource `dataSource` as depicted in the following example.

INDEX.TS

```

import { Schedule, Week, Month, Agenda, TimelineViews, TimelineMonth } from
'@syncfusion/ej2-schedule';
import { resourceData } from './datasource.ts';
Schedule.Inject(Month, Week, Agenda, TimelineViews, TimelineMonth);
let scheduleObj: Schedule = new Schedule({
  width: '100%',
  height: '550px',
  views: ['Week', 'Month', 'TimelineWeek', 'TimelineMonth', 'Agenda'],
  selectedDate: new Date(2018, 3, 1),
  group: {
    resources: ['Owners']
  },
  resources: [
    {
      field: 'OwnerId', title: 'Owner',
      name: 'Owners', allowMultiple: true,
      dataSource: [
        { OwnerText: 'Nancy', Id: 1, OwnerGroupId: 1, OwnerColor:
'#ffaa00', ResourceCssClass: "NancyResource" },
        { OwnerText: 'Steven', Id: 2, OwnerGroupId: 2, OwnerColor:
'#f8a398', ResourceCssClass: "StevenResource" },
        { OwnerText: 'Michael', Id: 3, OwnerGroupId: 1, OwnerColor:
'#7499e1', ResourceCssClass: "MichaelResource" }
      ]
    }
  ]
});

```

```

    ],
    textField: 'OwnerText', idField: 'Id', groupIDField: 'OwnerGroupId',
    colorField: 'OwnerColor', cssClassField: "ResourceCssClass"
  }],
  eventSettings: { dataSource: resourceData, resourceColorField: 'Rooms' }
});
scheduleObj.appendTo('#Schedule');

```

```

Dynamically add and remove resources

It is possible to add or remove the resources dynamically to and from the Scheduler respectively. In the following example, when the checkboxes are checked and unchecked, the respective resources gets added up or removed from the Scheduler layout. To add new resource dynamically, **addResource** method is used which accepts the arguments such as resource object, resource name (within which level, the resource object to be added) and index (position where the resource needs to be added).

To remove the resources dynamically, **removeResource** method is used which accepts the index (position from where the resource to be removed) and resource name (within which level, the resource object presents) as parameters.

Setting different working days and hours for resources

Each resource in the Scheduler can have different working hours as well as different working days set to it. There are default options available within the `resources` collection, to customize the default working hours and days of the Scheduler.

Set different work days

Different working days can be set for the resources of Scheduler using the `workDaysField` property which maps the working days field from the resource dataSource. This field accepts the collection of day indexes (from 0 to 6) of a week. By default, it is set to [1, 2, 3, 4, 5] and in the following example, each resource has been set with different values and therefore each of them will render only those working days. This option is applicable only on the calendar views and is not applicable on timeline views.

INDEX.TS

```
import { Schedule, Week, WorkWeek, Month } from '@syncfusion/ej2-schedule';
import { doctorData } from './datasource.ts';
Schedule.Inject(Month, Week, WorkWeek);
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '550px',
    selectedDate: new Date(2018, 3, 1),
    views: ['Week', 'WorkWeek', 'Month'],
    currentView: 'WorkWeek',
    group: {
        resources: ['Doctors']
    },
    resources: [{
        field: 'DoctorId', title: 'Choose Doctor',

Set different work hours

Working hours indicates the work hour duration of a day, which is highlighted visually with active color over the work cells. Each resource on the Scheduler can be defined with its own set of working hours as depicted in the following example.

- **startHourField** - Denotes the start time of the working/business hour in a day.
- **endHourField** - Denotes the end time limit of the working/business hour in a day.

INDEX.TS

```

import { Schedule, Week, Month, TimelineViews, TimelineMonth } from
'@syncfusion/ej2-schedule';
import { doctorData } from './datasource.ts';
Schedule.Inject(Week, Month, TimelineViews, TimelineMonth);
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '550px',
    selectedDate: new Date(2018, 3, 1),

```

```

views: ['Week', 'Month', 'TimelineWeek', 'TimelineMonth'],

    <div id="container">
      <div id="Schedule"></div>
    </div>
</script>
<script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

In this example, a resource named **Will Smith** is depicted with working hours ranging from 8.00 AM to 3.00 PM and is visually illustrated with active colors, whereas the other two resources have different working hours set.

Hide non-working days when grouped by date

In Scheduler, you can set custom work days for each resource and group the Scheduler by date to display these work days. By default, the Scheduler will show all days when it is grouped by date, even if they are not included in the custom work days for the resources. However, you can use the [hideNonWorkingDays](#) property to only display the custom work days in the Scheduler.

To use the [hideNonWorkingDays](#) property, you need to include it in the configuration options for your Scheduler component. Set the value of [hideNonWorkingDays](#) to **true** to enable this feature.

Example: To display the Scheduler with resources grouped by date for custom working days,

INDEX.TS

```

import { Schedule, ScheduleModel, Day, Week, Month, Agenda } from
'@syncfusion/ej2-schedule';
import * as dataSource from './datasource.json';
/**
 * schedule resources group sample
 */
Schedule.Inject(Day, Week, Month, Agenda);
let scheduleOptions: ScheduleModel = {
  width: '100%',
  height: '650px',
  group: {
    byDate: true,
    hideNonWorkingDays: true,
    resources: ['Owners']
  },
  resources: [{
    field: 'TaskId', title: 'Assignee',
    name: 'Owners', allowMultiple: true,
    dataSource: [
      { text: 'Alice', id: 1, color: '#df5286', workDays: [1, 2,
3, 4] },
      { text: 'Smith', id: 2, color: '#7fa900', workDays: [2, 3,
5] }
    ],
    textField: 'text', idField: 'id', colorField: 'color',
    workDaysField: 'workDays'
  }
]
}

```

```

    }],
  };
  let scheduleObj: Schedule = new Schedule(scheduleOptions);
  scheduleObj.appendTo(document.getElementById('Schedule'));

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>Schedule Typescript Component</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

The [hideNonWorkingDays](#) property only applies when the Scheduler is grouped [byDate](#).

Scroll to specific resource

You can manually scroll to a specific resource on Scheduler by making use of the `scrollToResource` method as depicted in the following code example.

INDEX.TS

```
import { Schedule, Week, Month, Agenda, TimelineViews, TimelineMonth } from
 '@syncfusion/ej2-schedule';
import { Button } from '@syncfusion/ej2-buttons';
import { resourceData } from './datasource.ts';
Schedule.Inject(Month, Week, Agenda, TimelineViews, TimelineMonth);
let scheduleObj: Schedule = new Schedule({
  width: '100%',
  height: '550px',
  views: ['Week', 'Month', 'TimelineWeek', 'TimelineMonth', 'Agenda'],
  selectedDate: new Date(2018, 3, 1),
  group: {
    resources: ['Owners']
  },
  resources: [
    {
      field: 'OwnerId', title: 'Owner',
      name: 'Owners', allowMultiple: true,
      dataSource: [
        { OwnerText: 'Jammy', Id: 1, OwnerColor: '#ffaa00' },
        { OwnerText: 'Steven', Id: 2, OwnerColor: '#f8a398' },
        { OwnerText: 'Tweety', Id: 3, OwnerColor: '#7499e1' },
        { OwnerText: 'Jammy', Id: 4, OwnerColor: '#ffaa00' },
        { OwnerText: 'Nestle', Id: 5, OwnerGroupId: 2, OwnerColor:

```

Compact view in mobile

Although the Scheduler views are designed keeping in mind the responsiveness of the control in mobile devices, however when using Scheduler with multiple resources - it is difficult to view all the resources and its relevant events at once on the mobile. Therefore, we have introduced a new compact mode specially for displaying multiple resources of Scheduler on mobile devices. By default, this mode is enabled while using Scheduler with multiple resources on mobile devices. If in case, you need to disable this compact mode, set `false` to the `enableCompactView` option within the `group` property. Disabling this option will display the exact desktop mode of Scheduler view on mobile devices.

With this compact view enabled on mobile, you can view only single resource at a time and to switch to other resources, there is a treeview at the left listing out all other available resources - clicking on which will display that particular resource and its related appointments.

Clicking on the menu icon before the resource text will show the resources available in the Scheduler as following.

Adaptive UI in desktop

By default, the Scheduler layout adapts automatically in the desktop and mobile devices with appropriate UI changes. In case, if the user wants to display the Adaptive scheduler in desktop mode with adaptive enhancements, then the property `enableAdaptiveUI` can be set to true. Enabling this option will display the exact mobile mode of Scheduler view on desktop devices.

Some of the default changes made for compact Scheduler to render in desktop devices are as follows,

- View options displayed in the Navigation drawer.
- Plus icon is added to the header for new event creation.
- Today icon is added to the header instead of the Today button.
- With Multiple resources – only one resource has been shown to enhance the view experience of resource events details clearly. To switch to other resources, there is a TreeView on the left that lists all other available resources, clicking on which will display that particular resource and its related events.

INDEX.TS

```
import { Schedule, Day, Week, Month, Resize, DragAndDrop } from
'@syncfusion/ej2-schedule';
import { extend } from '@syncfusion/ej2-base';

You can refer to our [JavaScript Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [JavaScript Scheduler example](#) to know how to present and manipulate data.

Header rows in EJ2 JavaScript Schedule control

The Timeline views can have additional header rows other than its default date and time header rows. It is possible to show individual header rows for displaying year, month and week separately using the `headerRows` property. This property is applicable only on the timeline views. The possible rows which can be added using `headerRows` property are as follows.

- Year
- Month
- Week
- Date
- Hour

The `Hour` row is not applicable for Timeline month view.

The following example shows the Scheduler displaying all the available header rows on timeline views.

INDEX.TS

```
import { Schedule, TimelineViews } from '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(TimelineViews);
let scheduleObj: Schedule = new Schedule({
    width: '100%', height: '550px',
    selectedDate: new Date(2018, 11, 31),
    startHour: '09:00',
    endHour: '13:00',
    headerRows: [
        { option: 'Year' },
        { option: 'Month' },
        { option: 'Week' },
        { option: 'Date' },
        { option: 'Hour' }
    ],
    views: ['TimelineWeek'],
    eventSettings: { dataSource: scheduleData }
});
scheduleObj.appendTo('#Schedule');
```

```

Display year and month rows in timeline views

To display the timeline Scheduler simply with year and month names alone, define the option **Year** and **Month** within the **headerRows** property.

INDEX.TS

```

import { Schedule, TimelineMonth } from '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(TimelineMonth);
let scheduleObj: Schedule = new Schedule({
    width: '100%', height: '550px',
    selectedDate: new Date(2018, 11, 31),
    headerRows: [{ option: 'Year' }, { option: 'Month' }],
    currentView: 'TimelineMonth',
    views: [{ option: 'TimelineMonth', interval: 24 }],
    eventSettings: { dataSource: scheduleData }
});
scheduleObj.appendTo('#Schedule');

```

INDEX.HTML

```

</body></html>

```

You can refer to our [JavaScript Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [JavaScript Scheduler example](#) to know how to present and manipulate data.

Row auto height in EJ2 JavaScript Schedule control

By default, the height of the Scheduler rows in Timeline views are static and therefore, when the same time range holds multiple overlapping appointments, a **+n more** text indicator will be displayed. With this feature enabled, you can now view all the overlapping appointments present in those specific time range by auto-adjusting the row height based on the presence of the appointments count, instead of displaying the **+n more** text indicators.

To enable auto row height adjustments on Scheduler Timeline views and Month view, set **true** to the **rowAutoHeight** property whose default value is **false**.

This auto row height adjustment is applicable only on all the Timeline views as well as on the calendar Month view.

Now, let's see how it works on those applicable views with examples.

Calendar month view

By default, the rows of the calendar Month view can hold only the limited appointments count based on its row height, and the rest of the overlapping appointments are indicated with a **+n more** text indicator. The following example shows how the month view row auto-adjusts based on the number of appointments count, when this **rowAutoHeight** feature is enabled.

INDEX.TS

```

import { Schedule, Month } from '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Month);
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '450px',
    selectedDate: new Date(2018, 1, 15),
    currentView: 'Month',
    rowAutoHeight: true,
    views: ['Month'],
    eventSettings: { dataSource: scheduleData }
});
scheduleObj.appendTo('#Schedule');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>Schedule Typescript Component</title>

if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Timeline views

When the feature **rowAutoHeight** is enabled in Timeline views, the row height gets auto-adjusted based on the number of overlapping events occupied on the same time range, which is demonstrated in the following example.

INDEX.TS

```
import { Schedule, TimelineViews, TimelineMonth, Agenda, Resize, DragAndDrop
} from '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(TimelineViews, TimelineMonth, Agenda, Resize, DragAndDrop);
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '450px',
    rowAutoHeight: true,
    selectedDate: new Date(2018, 1, 15),
    currentView: 'TimelineWeek',
    views: [
        { option: 'TimelineDay' },
        { option: 'TimelineWeek' },
        { option: 'TimelineWorkWeek' },
        { option: 'TimelineMonth' },
        { option: 'Agenda' }
    ],
    eventSettings: { dataSource: scheduleData }
});
scheduleObj.appendTo('#Schedule');
```

Timeline views with multiple resources

The following example shows how the auto row adjustment feature works on timeline views with multiple resources.

INDEX.TS

```

import { Schedule, TimelineViews, Resize, DragAndDrop } from
 '@syncfusion/ej2-schedule';
import { CheckBox, ChangeEventArgs } from '@syncfusion/ej2-buttons';
import { roomData } from './datasource.ts';
Schedule.Inject(TimelineViews, Resize, DragAndDrop);
let scheduleObj: Schedule = new Schedule({
  width: '100%',
  height: '550px',
  selectedDate: new Date(2018, 7, 1),
  currentView: 'TimelineWeek',
  rowAutoHeight: true,
  views: ['TimelineDay', 'TimelineWeek'],
  group: {
    enableCompactView: false,
    resources: ['MeetingRoom']
  },
  resources: [{
    field: 'RoomId', title: 'Room Type',
    name: 'MeetingRoom', allowMultiple: true,
    dataSource: [
      { text: 'Room A', id: 1, color: '#98AFC7' },
      { text: 'Room B', id: 2, color: '#99c68e' },
      { text: 'Room C', id: 3, color: '#C2B280' },
      { text: 'Room D', id: 4, color: '#3090C7' },
      { text: 'Room E', id: 5, color: '#95b9' },
      { text: 'Room F', id: 6, color: '#95b9c7' },

```

Appointments occupying entire cell

By default, with the feature `rowAutoHeight`, there will be a space in the bottom of the cell when appointment is rendered. To avoid this space, we can set true to the property `ignoreWhitespace` with in `eventSettings` whereas its default property value is false. In the following code example, the whitespace below the appointments has been ignored.

INDEX.TS

```
import { Schedule, TimelineViews, TimelineMonth } from '@syncfusion/ej2-schedule';
import { resourceData } from './datasource.ts';
Schedule.Inject(TimelineViews, TimelineMonth);
let scheduleObj: Schedule = new Schedule({
  width: '100%',
  height: '550px',
  currentView: 'TimelineWeek',
  rowAutoHeight: true,
  views: ['TimelineWeek', 'TimelineMonth'],
  selectedDate: new Date(2021, 7, 4),
  group: {
    resources: ['Rooms', 'Owners']
  },
  resources: [{
    field: 'RoomId', title: 'Room',
    name: 'Rooms', allowMultiple: false,
    dataSource: [
      { RoomText: 'ROOM 1', Id: 1, RoomColor: '#cb6bb2' },
      { RoomText: 'ROOM 2', Id: 2, RoomColor: '#56ca85' }
    ],
    textField: 'RoomText', idField: 'Id', colorField: 'RoomColor'
  }, {
    field: 'OwnerId', title: 'Owner',
    name: 'Owners', allowMultiple: true,
    dataSource: [
      { OwnerText: 'Nancy', Id: 1, OwnerGroupId: 1, OwnerColor: '#ffaa00' },
      { OwnerText: 'Steven', Id: 2, OwnerGroupId: 2, OwnerColor: '#f8a398' },
      { OwnerText: 'Michael', Id: 3, OwnerGroupId: 1, OwnerColor: '#7499e1' }
    ],
    textField: 'OwnerText', idField: 'Id', groupIDField: 'OwnerGroupId',
    colorField: 'OwnerColor'
  }],
  eventSettings: { dataSource: resourceData, ignoreWhitespace: true }
});
scheduleObj.appendTo('#Schedule');
```

</body></html>

```

Note: The property `ignoreWhitespace` will be applicable only when `rowAutoHeight` feature is enabled in the Scheduler.

You can refer to our [JavaScript Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [JavaScript Scheduler example](#) to know how to present and manipulate data.

Header bar in EJ2 JavaScript Schedule control

The header part of Scheduler can be customized easily with the built-in options available.

Show or Hide header bar

By default, the header bar holds the date and view navigation options, through which the user can switch between the dates and various views. This header bar can be hidden from the UI by setting `false` to the `showHeaderBar` property. Its default value is `true`.

INDEX.TS

```
import { Schedule, Day, Week, WorkWeek } from '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Day, Week, WorkWeek);
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '550px',
    selectedDate: new Date(2018, 1, 15),
    views: ['Day', 'Week', 'WorkWeek'],
    showHeaderBar: false,
    eventSettings: { dataSource: scheduleData }
});
scheduleObj.appendTo('#Schedule');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
    <title>Schedule Typescript Component</title>

if(ele) {
```

```

    ele.style.visibility = "visible";
  }
  </script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Customizing header bar using template

Apart from the default date navigation and view options available on the header bar, you can add custom items into the Scheduler header bar by making use of the [toolbarItems](#) property. To display the default items, it's essential to assign a [name](#) field to each item. The names of the default items are **Previous**, **Next**, **Today**, **DateRangeText**, **NewEvent**, and **Views**. For custom items you can give the name as **Custom** to the [name](#) field. Here, the default items such as previous, next, date range text, and today have been used along with external icon as custom items.

INDEX.TS

```

import { Schedule, Month } from '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
import { ChangeEventArgs, DropDownList } from '@syncfusion/ej2-dropdowns';
import { Predicate, Query } from '@syncfusion/ej2-data';
Schedule.Inject(Month);
let ownerCollections: Record<string, any>[] = [
  { OwnerText: 'Margaret', OwnerId: 1, Color: '#ea7a57' },
  { OwnerText: 'Robert', OwnerId: 2, Color: '#df5286' },
  { OwnerText: 'Laura', OwnerId: 3, Color: '#865fcf' }
];
let scheduleObj: Schedule = new Schedule({
  width: '100%',
  height: '550px',
  selectedDate: new Date(2023, 10, 15),
  views: ['Month'],
  currentView: 'Month',
  resources: [{
    field: 'OwnerId', title: 'Owners',
    name: 'Owners', allowMultiple: true,
    dataSource: ownerCollections,

How to display the view options within the header bar popup

By default, the header bar holds the view navigation options, through which the user can switch between various views. You can move this view options to the header bar popup by setting `true` to the `enableAdaptiveUI` property.

INDEX.TS

```

import { Schedule, Day, Week, WorkWeek, Month, Agenda } from

```

Refer [here](#) to know more about adaptive UI in resources scheduler.

Date header customization

The Scheduler UI that displays the date text on all views are considered as the date header cells. You can customize the date header cells of Scheduler either using `dateHeaderTemplate` or `renderCell` event.

Using date header template

The `dateHeaderTemplate` option is used to customize the date header cells of day, week and work-week views.

INDEX.TS

```

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Using renderCell event

In month view, the date header template is not applicable and therefore the same customization can be added beside the date text in month cells by making use of the `renderCell` event.

INDEX.TS

```

import { Schedule, Month, RenderCellEventArgs } from '@syncfusion/ej2-
schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Month);
let getWeather: Function = (value: Date) => {
    switch (value.getDay()) {
        case 0:
            return '<div class="weather-text">25°C</div>';
        case 1:
            return '<div class="weather-text">18°C</div>';
        case 2:
            return '<div class="weather-text">10°C</div>';
        case 3:
            return '<div class="weather-text">16°C</div>';
        case 4:
            return '<div class="weather-text">8°C</div>';
        case 5:
            return '<div class="weather-text">27°C</div>';
        case 6:
            return '<div class="weather-text">17°C</div>';
        default:
            return null;
    }
};
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '550px',
    selectedDate: new Date(2018, 1, 15),
    views: ['Month'],
    renderCell: (args: RenderCellEventArgs) => {
        if (args.elementType === 'monthCells') {
            let ele: Element = document.createElement('div');
            ele.innerHTML = getWeather(args.date);

```

```

        (args.element).appendChild(ele.firstChild);
    },
    eventSettings: { dataSource: scheduleData }
});
scheduleObj.appendTo('#Schedule');

```

```

Customizing the date range text

The [dateRangeTemplate](#) option allows you to customize the text content of the date range displayed in the scheduler. By default, the date range text is determined by the scheduler view being used. However, you can use the [dateRangeTemplate](#) option to override the default text and specify your own custom text to be displayed.

The [dateRangeTemplate](#) property includes `startDate`, `endDate` and `currentView` options, you can customize the date range text using these available options.

INDEX.TS

```
import { Schedule, Day, Week, Agenda, TimelineViews, TimelineMonth } from
 '@syncfusion/ej2-schedule';
Schedule.Inject(Day, Week, Agenda, TimelineViews, TimelineMonth);
(window as any TemplateFunction).getDateRange = (value: Date) =>
 value.toLocaleString('en-us', { month: 'long' }) + ' ' + value.getFullYear();
interface TemplateFunction extends Window {
    getDateRange?: Function;
}
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '550px',
    dateRangeTemplate: '<div class="date-
text">${getDateRange(data.startDate)}-${getDateRange(data.endDate)}</div>'
});
scheduleObj.appendTo('#Schedule');
```

```

Customizing header indent cells

It is possible to customize the header indent cells using the `headerIndentTemplate` option and change the look and appearance in both the vertical and timeline views. In vertical views, You can customize the header indent cells at the hierarchy level and you can customize the resource header left indent cell in timeline views using the template option.

Example: To customize the header left indent cell to display resources text, refer to the below code example.

INDEX.TS

```

import { Schedule, Day, Week, WorkWeek, TimelineViews, TimelineMonth } from
'@syncfusion/ej2-schedule';
import { resourceData } from './datasource.ts';
Schedule.Inject( Day, Week, WorkWeek, TimelineViews, TimelineMonth );
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '550px',
    selectedDate: new Date(2018, 3, 1),
    headerIndentTemplate: '#indentTemplate',
    views: [
        { option: 'Day' },
        { option: 'Week' },
        { option: 'WorkWeek' },
        { option: 'TimelineWeek' },
        { option: 'TimelineMonth' }
    ],
    group: {
        resources: ['Owners']
    },
    resources: [
        {
            field: 'OwnerId', title: 'Owner',
            name: 'Owners', allowMultiple: true,
            dataSource: [

```

```

        { OwnerText: 'Nancy', Id: 1, OwnerGroupId: 1, OwnerColor:

```

You can refer to our [JavaScript Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [JavaScript Scheduler example](#) to know how to present and manipulate data.

Timescale in EJ2 JavaScript Schedule control

The time slots are usually the time cells that are displayed on the Day, Week and Work Week views of both the calendar (to the left most position) and timeline views (at the top position). The **timeScale** property allows you to control and set the required time slot duration for the work cells displayed on Scheduler. It includes the following sub-options such as,

- **enable** - When set to **true**, allows the Scheduler to display the appointments accurately against the exact time duration. If set to **false**, all the appointments of a day will be displayed one below the other with no grid lines displayed. Its default value is **true**.
- **interval** – Defines the time duration on which the time axis to be displayed either in 1 hour or 30 minutes interval and so on. It accepts the values in minutes and defaults to 60.
- **slotCount** – Decides the number of slot count to be split for the specified time interval duration. It defaults to 2, thus displaying two slots to represent an hour(each slot depicting 30 minutes duration).

Note: The upper limit for rendering slots within a single day, utilizing the **interval** and **slotCount** properties of the **timeScale**, stands at 1000. This constraint aligns with the maximum **colspan** value permissible for the **table** element, also capped at 1000. This particular restriction is relevant exclusively to the **TimelineDay**, **TimelineWeek** and **TimelineWorkWeek** views.

Setting different time slot duration

The **interval** and **slotCount** properties can be used together on the Scheduler to set different time slot duration which is depicted in the following code example. Here, six time slots together represents an hour.

INDEX.TS

```
import { Schedule, Day, Week, WorkWeek } from '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Day, Week, WorkWeek);
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '550px',
    selectedDate: new Date(2018, 1, 15),
    views: ['Day', 'Week', 'WorkWeek'],
    timeScale: {
        enable: true,
        interval: 60,
        slotCount: 6
    },
    eventSettings: { dataSource: scheduleData }
});
scheduleObj.appendTo('#Schedule');
```

}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Customizing time cells using template

The `timeScale` property also provides template option to allow customization of time slots which are as follows,

- **majorSlotTemplate** - The template option to be applied for major time slots. Here, the template accepts either the string or HTML element as template design and then the parsed design is displayed onto the time cells. The time details can be accessed within this template.
- **minorSlotTemplate** - The template option to be applied for minor time slots. Here, the template accepts either the string or HTML element as template design and then the parsed design is displayed onto the time cells. The time details can be accessed within this template.

INDEX.TS

```
import { Schedule, Day, Week, WorkWeek } from '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
import { Internationalization } from '@syncfusion/ej2-base';
Schedule.Inject(Day, Week, WorkWeek);
let instance: Internationalization = new Internationalization();
(window as TemplateFunction).majorSlotTemplate = (date: Date) => {
    return instance.formatDate(date, { skeleton: 'hm' });
};
(window as TemplateFunction).minorSlotTemplate = (date: Date) => {
    return instance.formatDate(date, { skeleton: 'ms' }).replace(':00', '');
};
interface TemplateFunction extends Window {
    majorSlotTemplate?: Function;
    minorSlotTemplate?: Function;
}
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '550px',
    selectedDate: new Date(2018, 1, 15),
    views: ['Day', 'Week', 'WorkWeek'],
    timeScale: {
        enable: true,
        interval: 60,
        slotCount: 6,
        majorSlotTemplate: '#majorSlotTemplate',
        minorSlotTemplate: '#minorSlotTemplate'
    },
    eventSettings: { dataSource: scheduleData }
});
scheduleObj.appendTo('#Schedule');
```

```

Highlighting current date and time

By default, Scheduler indicates current date with a highlighted date header on all views, as well as marks accurately the system's current time on specific views such as Day, Week, Work Week, Timeline Day, Timeline Week and Timeline Work Week views. To stop highlighting the current time indicator on Scheduler views, set `false` to the `showTimeIndicator` property which defaults to `true`.

INDEX.TS

```
import { Schedule, Day, Week, WorkWeek, TimelineViews } from
 '@syncfusion/ej2-schedule';
Schedule.Inject(Day, Week, WorkWeek, TimelineViews);
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '550px',
    views: ['Day', 'Week', 'WorkWeek', 'TimelineDay'],
    showTimeIndicator: true
});
scheduleObj.appendTo('#Schedule');
```

You can refer to our [JavaScript Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [JavaScript Scheduler example](#) to know how to present and manipulate data.

Working days in EJ2 JavaScript Schedule control

The Scheduler can be customized on various aspects as well as it inherits almost all the calendar-specific features such as options,

- To set custom time range display on Scheduler
- To set different working hours
- To set different working days
- To set different first day of week
- To show/hide weekend days
- To show the week number

Set working days

By default, Scheduler considers the week days from Monday to Friday as **Working days** and therefore defaults to [1,2,3,4,5] - where 1 represents Monday, 2 represents Tuesday and so on. The days which are not defined in this working days collection are considered as non-working days. Therefore, when the weekend days are set to hide from Scheduler, all those non-working days too gets hidden from the layout.

The Work week and Timeline Work week views displays exactly the defined working days on Scheduler layout, whereas other views displays all the days and simply differentiates the non-working days on UI with inactive cell color.

The working or business hours depiction on Scheduler are usually valid only on these specified working days.

The following example code depicts how to set the Scheduler to display Monday, Wednesday and Friday as working days of a week.

INDEX.TS

```
import { Schedule, Week, WorkWeek, Month, TimelineViews } from
'@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Week, WorkWeek, Month, TimelineViews);
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '550px',
    selectedDate: new Date(2018, 1, 15),
    currentView: 'WorkWeek',
    views: ['Week', 'WorkWeek', 'Month', 'TimelineWeek',
'TimelineWorkWeek'],
    workDays: [1, 3, 5],
    eventSettings: { dataSource: scheduleData }
});
scheduleObj.appendTo('#Schedule');
```

INDEX.HTML

    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Hiding weekend days

The `showWeekend` property is used to either show or hide the weekend days of a week and it is not applicable on Work week view (as non-working days are usually not displayed on work week view). By default, it is set to `true`. The days which are not a part of the working days collection of a Scheduler are usually considered as non-working or weekend days.

Here, the working days are defined as [1, 3, 4, 5] on Scheduler and therefore the remaining days (0, 2, 6 – Sunday, Tuesday and Saturday) are considered as non-working or weekend days and will be hidden from all the views when `showWeekend` property is set to `false`.

INDEX.TS

```

import { Schedule, Day, Week, TimelineMonth } from '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Day, Week, TimelineMonth);
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '550px',
    selectedDate: new Date(2018, 1, 15),
    views: ['Day', 'Week', 'TimelineMonth'],
    showWeekend: false,
    workDays: [1, 3, 4, 5],
    eventSettings: { dataSource: scheduleData }
});
scheduleObj.appendTo('#Schedule');

```

</body></html>

```

Show week numbers

It is possible to show the week number count of a week in the header bar of the Scheduler by setting true to `showWeekNumber` property. By default, its default value is `false`. In Month view, the week numbers are displayed as a first column.

The `showWeekNumber` property is not applicable on Timeline views, as it has the equivalent `headerRows` property to handle such requirement with additional customizations.

INDEX.TS

```

import { Schedule, Day, Week, Month } from '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Day, Week, Month);

```

Different options in showing week numbers

By default, week numbers are shown in the Scheduler based on the first day of the year. However, the week numbers can be determined based on the following criteria.

FirstDay – The first week of the year is calculated based on the first day of the year.

FirstFourDayWeek – The first week of the year begins from the first week with four or more days.

FirstFullWeek – The first week of the year begins when meeting the first day of the week (firstDayOfWeek) and the first day of the year.

For more details refer to [this link](#)

INDEX.TS

```
import { Schedule, Day, Week, Month } from '@syncfusion/ej2-schedule';
Schedule.Inject(Day, Week, Month);

</body></html>

```

Note: Enable the `showWeekNumber` property to configure the `weekRule` property. Also, the `weekRule` property depends on the value of the `firstDayOfWeek` property.

Set working hours

Working hours indicates the work hour limit within the Scheduler, which is visually highlighted with an active color on work cells. The working hours can be set on Scheduler using the `workHours` property which is of object type and includes the following sub-options,

- `highlight` – enables/disables the highlighting of work hours.
- `start` - sets the start time of the working/business hour of a day.
- `end` - sets the end time limit of the working/business hour of a day.

Scheduler displaying custom hours

It is possible to display the event Scheduler layout with specific time durations by hiding the unwanted hours. To do so, set the start and end hour for the Scheduler using the `startHour` and `endHour` properties respectively.

The following code example displays the Scheduler starting from the time range 7.00 AM to 6.00 PM and the remaining hours are hidden on the UI.

INDEX.TS

```

import { Schedule, Day, Week, WorkWeek } from '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Day, Week, WorkWeek);
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '550px',
    selectedDate: new Date(2018, 1, 15),
    views: ['Day', 'Week', 'WorkWeek'],
    startHour: '07:00',
    endHour: '18:00',
    eventSettings: { dataSource: scheduleData }
});
scheduleObj.appendTo('#Schedule');

```

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Setting start day of the week

By default, Scheduler defaults to **Sunday** as its first day of a week. To change the Scheduler's start day of a week with different day, set the **firstDayOfWeek** property with the values ranging from 0 to 6.

Here, Sunday is always denoted as 0, Monday as 1 and so on.

INDEX.TS

```

import { Schedule, Week, Month } from '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Week, Month);
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '550px',
    selectedDate: new Date(2018, 1, 15),
    views: ['Week', 'Month'],
    firstDayOfWeek : 3,
    eventSettings: { dataSource: scheduleData }
});
scheduleObj.appendTo('#Schedule');

```

Scroll to specific time and date

You can manually scroll to a specific time on Scheduler by making use of the `scrollTo` method as depicted in the following code example.

INDEX.TS

```

import { Schedule, Day, Week, WorkWeek } from '@syncfusion/ej2-schedule';
import { TimePicker, ChangeEventArgs } from '@syncfusion/ej2-calendars';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Day, Week, WorkWeek);
let scheduleObj: Schedule = new Schedule({
    height: '550px',
    width: '100%',
    views: ['Day', 'Week', 'WorkWeek'],
    selectedDate: new Date(2018, 1, 15),
    eventSettings: { dataSource: scheduleData }
});
scheduleObj.appendTo('#Schedule');
let scrollToHour: TimePicker = new TimePicker({
    width: 100,

```

```

    value: new Date(2000, 0, 1, 9),
    format: 'HH:mm',
    change: (args: ChangeEventArgs) => {
        scheduleObj.scrollTo(args.text);
    }
});
scrollToHour.appendTo('#ScrollToHour');

```

INDEX.HTML

</body></html>

```

How to scroll to current time on initial load

There are scenarios where you may need to load the Scheduler displaying the system's current time on the currently visible view port area. In such cases, the Scheduler needs to be scrolled to a specific time based on the system's current time which is depicted in the following code example.

INDEX.TS

```

import { Internationalization } from '@syncfusion/ej2-base';
import { Schedule, Day, Week, TimelineViews } from '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Day, Week, TimelineViews);
let intl: Internationalization = new Internationalization();
let scheduleObj: Schedule = new Schedule({
  height: '550px',
  width: '100%',
  views: ['Day', 'Week', 'TimelineWorkWeek'],
  selectedDate: new Date(2018, 1, 15),
  eventSettings: { dataSource: scheduleData },
  created: ():void => {
    scheduleObj.scrollTo(intl.formatDate(new Date(), { skeleton: 'Hm'
  }));
});
scheduleObj.appendTo('#Schedule');

```

INDEX.HTML

Cell customization in EJ2 JavaScript Schedule control

The cells of the Scheduler can be easily customized either using the cell template or `renderCell` event.

Setting cell dimensions in all views

The height and width of the Scheduler cells can be customized either to increase or reduce its size through the `cssClass` property, which overrides the default CSS applied on cells.

INDEX.TS

```
import { Schedule, Day, Week, WorkWeek, Month, ActionEventArgs } from
 '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Day, Week, WorkWeek, Month);
let scheduleObj: Schedule = new Schedule({
    height: '550px',
    width: '100%',
    views: ['Day', 'Week', 'WorkWeek', 'Month'],
    cssClass: 'schedule-cell-dimension',
    selectedDate: new Date(2018, 1, 15),
    eventSettings: { dataSource: scheduleData }
});
scheduleObj.appendTo('#Schedule');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Schedule Typescript Component</title>

if(ele) {
  ele.style.visibility = "visible";
```

```

}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Check for cell availability

You can check whether the given time range slots are available for event creation or already occupied by other events using the `isSlotAvailable` method. In the following code example, if a specific time slot already contains an appointment, then no more appointments can be added to that cell.

Note: The `isSlotAvailable` is centered around verifying appointments within the present view's date range. Yet, it does not encompass an evaluation of availability for recurrence occurrences that fall beyond this particular date range.

INDEX.TS

```

import { Schedule, Day, Week, WorkWeek, Month, ActionEventArgs,
EventFieldsMapping } from '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Day, Week, WorkWeek, Month);
let scheduleObj: Schedule = new Schedule({
    height: '550px',
    selectedDate: new Date(2018, 1, 15),
    views: ['Day', 'Week', 'WorkWeek', 'Month'],
    actionBegin: (args: ActionEventArgs) => {
        if (args.requestType === 'eventCreate' &&
(<Object[]>args.data).length > 0) {
            let eventData: { [key: string]: Object } = args.data[0] as {
[key: string]: Object };
            let eventField: EventFieldsMapping = scheduleObj.eventFields;
            let startDate: Date = eventData[eventField.startTime] as Date;
            let endDate: Date = eventData[eventField.endTime] as Date;
            args.cancel = !scheduleObj.isSlotAvailable(startDate, endDate);
        }
    },
    eventSettings: { dataSource: scheduleData }
});
scheduleObj.appendTo('#Schedule');

```

</body></html>

```

Customizing cells in all the views

It is possible to customize the appearance of the cells using both template options and `renderCell` event on all the views.

Using template

The `cellTemplate` option accepts the template string and is used to customize the cell background with specific images or appropriate text on the given date values.

INDEX.TS

```

import { Schedule, Day, Week, Month, TimelineViews } from '@syncfusion/ej2-
schedule';
Schedule.Inject(Day, Week, Month, TimelineViews);
(window as Window).TemplateFunction.getMonthCellText = (date: Date) => {
    if (date.getMonth() === 10 && date.getDate() === 23) {
        return '<img src=
"https://ej2.syncfusion.com/demos/src/schedule/images/birthday.svg" />';
    } else if (date.getMonth() === 11 && date.getDate() === 9) {
        return '<img src=
"https://ej2.syncfusion.com/demos/src/schedule/images/get-together.svg" />';
    } else if (date.getMonth() === 11 && date.getDate() === 13) {
        return '<img src=
"https://ej2.syncfusion.com/demos/src/schedule/images/birthday.svg" />';
    } else if (date.getMonth() === 11 && date.getDate() === 22) {

```

```

        return '<img src=
"https://ej2.syncfusion.com/demos/src/schedule/images/thanksgiving-day.svg"
/>';
    } else if (date.getMonth() === 11 && date.getDate() === 24) {
        return '';
    } else if (date.getMonth() === 11 && date.getDate() === 25) {
        return '<img src=
"https://ej2.syncfusion.com/demos/src/schedule/images/christmas.svg" />';
    } else if (date.getMonth() === 0 && date.getDate() === 1) {
        return '<img src=
"https://ej2.syncfusion.com/demos/src/schedule/images/newyear.svg" />';
    } else if (date.getMonth() === 0 && date.getDate() === 14) {
        return '<img src=
"https://ej2.syncfusion.com/demos/src/schedule/images/birthday.svg" />';
    }
    return '';
};
(window as TemplateFunction).getWorkCellText = (date: Date) => {
    let weekEnds: number[] = [0, 6];
    if (weekEnds.indexOf(date.getDay()) >= 0) {
        return '';
    }
    return '';
};
interface TemplateFunction extends Window {
    getWorkCellText?: Function;
    getMonthCellText?: Function;
}
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '550px',
    views: ['Day', 'Week', 'TimelineWeek', 'Month'],
    cssClass: 'schedule-cell-template',
    cellTemplate: '${if(type === "workCells")}<div
class="templatewrap">${getWorkCellText(data.date)}</div>${if}${if(type ===

<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="Schedule"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Using renderCell event

An alternative to `cellTemplate` is the `renderCell` event, which can also be used to customize the cells with appropriate images or formatted text values.

INDEX.TS

```

import { createElement } from '@syncfusion/ej2-base';
import { Schedule, Day, Week, Month, RenderCellEventArgs } from
 '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Day, Week, Month);
let scheduleObj: Schedule = new Schedule({
    height: '550px',
    selectedDate: new Date(2018, 1, 14),
    currentView: 'Month',
    views: ['Day', 'Week', 'Month'],
    renderCell: (args: RenderCellEventArgs) => {
        if (args.elementType == 'workCells' || args.elementType ==
 'monthCells') {
            let weekEnds: number[] = [0, 6];

```

```

        if (weekEnds.indexOf((args.date).getDay()) >= 0) {
            let ele: HTMLElement = createElement('div', {
                innerHTML: "<img
src='https://ej2.syncfusion.com/demos/src/schedule/images/newyear.svg' />",
                className: 'templatewrap'
            });
            (args.element).appendChild(ele);
        }
    },
    eventSettings: { dataSource: scheduleData }
});
scheduleObj.appendTo('#Schedule');

```

</body></html>

```

You can customize cells such as work cells, month cells, all-day cells, header cells, resource header cells using `renderCell` event by checking the `elementType` option within the event. You can check `elementType` with any of the following.

Element type	Description
----- -----	
dateHeader	triggers on header cell rendering.
monthDay	triggers on header cell in month view rendering.
resourceHeader	triggers on resource header cell rendering.
alldayCells	triggers on all day cell rendering.
emptyCells	triggers on empty cell rendering on header bar.
resourceGroupCells	triggers on rendering of work cells for parent resource.
workCells	triggers on work cell rendering.
monthCells	triggers on month cell rendering.
majorSlot	triggers on major time slot cell rendering.
minorSlot	triggers on minor time slot cell rendering.
weekNumberCell	triggers on cell displaying week number.

Customizing cell header in month view

The month header of each date cell in the month view can be customized using the `cellHeaderTemplate` option which accepts the string or `HTMLElement`. The corresponding date can be accessed with the template.

INDEX.TS

```

import { Internationalization } from "@syncfusion/ej2-base";
import { Schedule, Month } from '@syncfusion/ej2-schedule';
Schedule.Inject(Month);
let instance: Internationalization = new Internationalization();
(window as TemplateFunction).getDate = (date: Date) => {
    return instance.formatDate(date, { skeleton: "Ed" });
};
interface TemplateFunction extends Window {
    getDate?: Function;
}
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '550px',
    views: ['Month'],
    cssClass: 'schedule-cell-header-template',
    cellHeaderTemplate: '<div class="cell-header-wrap">${getDate(data.date)}</div>'

```

```
});
scheduleObj.appendTo('#Schedule');
```

INDEX.HTML

  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Customizing the minimum and maximum date values

Providing the `minDate` and `maxDate` property with some date values, allows the Scheduler to set the minimum and maximum date range. The Scheduler date that lies beyond this minimum and maximum

date range will be in a disabled state so that the date navigation will be blocked beyond the specified date range.

INDEX.TS

```
import { Schedule, Day, Week, WorkWeek, Month, Agenda, Year } from
 '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Day, Week, WorkWeek, Month, Agenda, Year);
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '550px',
    views: ['Day', 'Week', 'Month', 'Agenda', 'Year'],
    selectedDate: new Date(2018, 1, 17),
    minDate: new Date(2017, 4, 17),
    maxDate: new Date(2018, 5, 17)
    eventSettings: { dataSource: scheduleData }
});
scheduleObj.appendTo('#Schedule');
```

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

By default, the `minDate` property value is set to `new Date(1900, 0, 1)` and `maxDate` property value is set to `new Date(2099, 11, 31)`. The user can also set the customized `minDate` and `maxDate` property values.

How to disable multiple cell and row selection in Schedule

By default, the `allowMultiCellSelection` and `allowMultiRowSelection` properties of the Schedule are set to `true`. So, the Schedule allows user to select multiple cells and rows. If the user want to disable this multiple cell and row selection. The user can disable this feature by setting up `false` to these properties.

You can refer to our [JavaScript Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [JavaScript Scheduler example](#) to know how to present and manipulate data.

State persistence in EJ2 JavaScript Schedule control

State persistence allowed Scheduler to retain the `currentView`, `selectedDate` and Scroll position values in the `localStorage` for state maintenance even if the browser is refreshed or if you move to the next page within the browser. This action is handled through the `enablePersistence` property which is set to `false` by default. When it is set to `true`, `currentView`, `selectedDate` and Scroll position values of the scheduler component will be retained even after refreshing the page.

Note: Scheduler `id` is essential to set state persistence.

The following sample demonstrates how to set state persistence of the Scheduler component.

INDEX.TS

```

import { Schedule, Day, Week, WorkWeek, Month } from '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Day, Week, WorkWeek, Month);
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '450px',
    selectedDate: new Date(2018, 1, 15),
    currentView: 'Month',
    enablePersistence: true,
    views: [ "Day", "Week", "WorkWeek", "Month"],
    eventSettings: { dataSource: scheduleData }
});
scheduleObj.appendTo('#Schedule');

```

You can refer to our [JavaScript Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [JavaScript Scheduler example](#) to know how to present and manipulate data.

Exporting in EJ2 JavaScript Schedule control

The Scheduler supports exporting all its appointments both to an Excel or ICS extension file at client-side. It offers different client-side methods to export its appointments in an Excel or iCal format file. Let's look onto the ways on how to implement the exporting functionality in Scheduler.

Excel Exporting

The Scheduler allows you to export all its events into an Excel format file by using the [exportToExcel] client-side method. By default, it exports all the default fields of Scheduler mapped through eventSettings property.

Before you start with excel exporting functionality, you need to import and inject the ExcelExport module from the '@syncfusion/ej2-schedule' package using the Inject method of Scheduler.

INDEX.TS

```
import { Schedule, Week, ExcelExport, ActionEventArgs, ToolbarActionArgs }
  from '@syncfusion/ej2-schedule';
import { ItemModel } from '@syncfusion/ej2-navigations';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Week, ExcelExport);
let scheduleObj: Schedule = new Schedule({
  width: '100%',
  height: '550px',
  selectedDate: new Date(2019, 0, 10),
  views: ['Week'],
  eventSettings: { dataSource: scheduleData },
  actionBegin: (args: ActionEventArgs & ToolbarActionArgs) => {
    if (args.requestType === 'toolbarItemRendering') {
      let exportItem: ItemModel = {
        align: 'Right', showTextOn: 'Both', prefixIcon: 'e-icon-
schedule-excel-export',
        text: 'Excel Export', cssClass: 'e-excel-export', click:
onExportClick
      };
      args.items.push(exportItem);
    }
  }
});
scheduleObj.appendTo('#Schedule');
function onExportClick(): void {
  scheduleObj.exportToExcel();
}
```

    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Exporting with custom fields

By default, Scheduler exports all the default event fields that are mapped to it through the `eventSettings` property. To limit the number of fields on the exported excel file, it provides an option to export only the custom fields of the event data. To export such custom fields alone, define the required fields through the `ExportOptions` interface and pass it as argument to the `exportToExcel` method as shown in the following example. For example: `['Id', 'Subject', 'StartTime', 'EndTime', 'Location']`.

INDEX.TS

```

import { Schedule, Week, ExcelExport, ExportOptions, ActionEventArgs,
ToolbarActionArgs } from '@syncfusion/ej2-schedule';
import { ItemModel } from '@syncfusion/ej2-navigations';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Week, ExcelExport);
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '550px',
    selectedDate: new Date(2019, 0, 10),
    views: ['Week'],
    eventSettings: { dataSource: scheduleData },
    actionBegin: (args: ActionEventArgs & ToolbarActionArgs) => {
        if (args.requestType === 'toolbarItemRendering') {
            let exportItem: ItemModel = {
                align: 'Right', showTextOn: 'Both', prefixIcon: 'e-icon-
schedule-excel-export',

```

```

                text: 'Excel Export', cssClass: 'e-excel-export', click:
onExportClick
            };
            args.items.push(exportItem);
        }
    }
});
scheduleObj.appendTo('#Schedule');
function onExportClick(): void {
    let exportValues: ExportOptions = { fields: ['Id', 'Subject',
'StartTime', 'EndTime', 'Location'] };
    scheduleObj.exportToExcel(exportValues);
}

```

INDEX.HTML

```

if(ele) {

```

```

    ele.style.visibility = "visible";
  }
  </script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Exporting individual occurrences of a recurring series

By default, the Scheduler exports recurring events as a single data by exporting only its parent record into the excel file. If you want to export each individual occurrences of a recurring series appointment as separate records in an Excel file, define the `includeOccurrences` option as `true` through the `ExportOptions` interface and pass it as argument to the `exportToExcel` method. By default, the `includeOccurrences` option is set to `false`.

INDEX.TS

```

import { Schedule, Week, ExcelExport, ExportOptions, ActionEventArgs,
ToolbarActionArgs } from '@syncfusion/ej2-schedule';
import { ItemModel } from '@syncfusion/ej2-navigations';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Week, ExcelExport);
let scheduleObj: Schedule = new Schedule({
  width: '100%',
  height: '550px',
  selectedDate: new Date(2019, 0, 10),
  views: ['Week'],
  eventSettings: { dataSource: scheduleData },
  actionBegin: (args: ActionEventArgs & ToolbarActionArgs) => {
    if (args.requestType === 'toolbarItemRendering') {
      let exportItem: ItemModel = {
        align: 'Right', showTextOn: 'Both', prefixIcon: 'e-icon-
schedule-excel-export',
        text: 'Excel Export', cssClass: 'e-excel-export', click:
onExportClick
      };
      args.items.push(exportItem);
    }
  }
});
scheduleObj.appendTo('#Schedule');
function onExportClick(): void {
  let exportValues: ExportOptions = { includeOccurrences: true };
  scheduleObj.exportToExcel(exportValues);
}

```

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Exporting custom event data

By default, the whole event collection bound to the Scheduler gets exported as an excel file. To export only specific events of Scheduler or some custom event collection, you need to pass those custom data collection as a parameter to the `exportToExcel` method as shown in this following example, through the `customData` option of `ExportOptions` interface.

By default, the event data are taken from Scheduler `dataSource`.

INDEX.TS

```

import { Schedule, Week, ExcelExport, ExportOptions, ActionEventArgs,
ToolbarActionArgs } from '@syncfusion/ej2-schedule';
import { ItemModel } from '@syncfusion/ej2-navigations';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Week, ExcelExport);
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '550px',

```

```

        selectedDate: new Date(2019, 0, 10),
        views: ['Week'],
        eventSettings: { dataSource: scheduleData },
        actionBegin: (args: ActionEventArgs & ToolbarActionArgs) => {
            if (args.requestType === 'toolbarItemRendering') {
                let exportItem: ItemModel = {
                    align: 'Right', showTextOn: 'Both', prefixIcon: 'e-icon-
schedule-excel-export',
                    text: 'Excel Export', cssClass: 'e-excel-export', click:
onExportClick
                };
                args.items.push(exportItem);

Customizing column header with custom fields exporting

Using fields property, we can only export the defined fields into excel without customizing the header. Now we can provide the alternate support to customize the header of custom fields exporting using the fieldsInfo option through the ExportFieldInfo interface and pass it as an argument to the exportToExcel method as shown in the following example.

INDEX.TS

```

import {
    Schedule, ScheduleModel, Week, ExcelExport, ExportOptions,
    ExportFieldInfo, ActionEventArgs
} from '@syncfusion/ej2-schedule';
import { ItemModel } from '@syncfusion/ej2-navigations';
Schedule.Inject(Week, ExcelExport);
const data: Record<string, any>[] = [
    {
        Id: 1,
        Subject: 'Explosion of Betelgeuse Star',
        StartTime: new Date(2018, 1, 16, 9, 30),
        EndTime: new Date(2018, 1, 16, 11, 0),
        Location: 'Chennai',
        OwnerId: 1
    }, {
        Id: 2,
        Subject: 'Thule Air Crash Report',

```

```

        StartTime: new Date(2018, 1, 12, 12, 0),
        EndTime: new Date(2018, 1, 12, 14, 0),
        Location: 'Mumbai',
        OwnerId: 2
    }, {
        Id: 3,
        Subject: 'Blue Moon Eclipse',
        StartTime: new Date(2018, 1, 13, 9, 30),
        EndTime: new Date(2018, 1, 13, 11, 0),
        Location: 'Mumbai',
        OwnerId: 3
    }, {
        Id: 4,
        Subject: 'Meteor Showers in 2018',
        StartTime: new Date(2018, 1, 14, 13, 0),
        EndTime: new Date(2018, 1, 14, 14, 30),
        Location: 'Bangalore',
        OwnerId: 1
    }, {
        Id: 5,
        Subject: 'Milky Way as Melting pot',
        StartTime: new Date(2018, 1, 15, 12, 0),
        EndTime: new Date(2018, 1, 15, 14, 0),
        Location: 'Chennai',
        OwnerId: 2
    }
];
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: 500,
    selectedDate: new Date(2018, 1, 15),
    views: [
        { option: 'Week' }
    ],
    resources: [

Export with custom file name

By default, the Scheduler allows you to download the exported Excel file with a name `Schedule.xlsx`. It also provides an option to export the excel file with a custom file name, by defining the desired `fileName` through the `ExportOptions` interface and passing it as an argument to the `exportToExcel` method.

INDEX.TS

```

import { Schedule, Week, ExcelExport, ExportOptions, ActionEventArgs,
ToolbarActionArgs } from '@syncfusion/ej2-schedule';
import { ItemModel } from '@syncfusion/ej2-navigations';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Week, ExcelExport);
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '550px',
    selectedDate: new Date(2019, 0, 10),
    views: ['Week'],
    eventSettings: { dataSource: scheduleData },
    actionBegin: (args: ActionEventArgs & ToolbarActionArgs) => {
        if (args.requestType === 'toolbarItemRendering') {
            let exportItem: ItemModel = {

```

Excel file formats

By default, the Scheduler exports event data to an excel file in the .xlsx format. You can also export the Scheduler data in either of the file type such as .xlsx or csv formats, by defining the exportType option as either csv or xlsx through the ExportOptions interface. By default, the exportType is set to xlsx.

INDEX.TS

```

import { Schedule, Week, ExcelExport, ExportOptions, ActionEventArgs,
ToolbarActionArgs } from '@syncfusion/ej2-schedule';
import { ItemModel } from '@syncfusion/ej2-navigations';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Week, ExcelExport);
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '550px',
    selectedDate: new Date(2019, 0, 10),
    views: ['Week'],
    eventSettings: { dataSource: scheduleData },

```

```

    actionBegin: (args: ActionEventArgs & ToolbarActionArgs) => {
        if (args.requestType === 'toolbarItemRendering') {
            let exportItem: ItemModel = {
                align: 'Right', showTextOn: 'Both', prefixIcon: 'e-icon-
schedule-excel-export',
                text: 'Excel Export', cssClass: 'e-excel-export', click:
onExportClick
            };
            args.items.push(exportItem);
        }
    }
});
scheduleObj.appendTo('#Schedule');

Exporting calendar events as ICS file

You can export the Scheduler events to a calendar (.ics) file format, and open it on any of the other default calendars such as Google or Outlook. To export the events of Scheduler to an ICS file, you need to first import the `ICalendarExport` module from `@syncfusion/ej2-schedule` package and then inject it using the `Schedule.Inject(ICalendarExport)` method.

The following code example shows how the Scheduler events are exported to a calendar (.ics) file by making use of the `exportToCalendar` public method.

INDEX.TS

```

import { Button } from '@syncfusion/ej2-buttons';
import { Schedule, Day, Week, WorkWeek, Month, Agenda, ICalendarExport } from '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Day, Week, WorkWeek, Month, Agenda, ICalendarExport);
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '520px',
    selectedDate: new Date(2018, 1, 15),
    views: ['Day', 'Week', 'WorkWeek', 'Month', 'Agenda'],
    eventSettings: { dataSource: scheduleData }
});
scheduleObj.appendTo('#Schedule');
let buttonObj: Button = new Button();
buttonObj.appendTo('#ics-export');
buttonObj.element.onclick = () => scheduleObj.exportToICalendar();

```

INDEX.HTML

Exporting calendar with custom file name

By default, the calendar is exported with a file name **Calendar.ics**. To change this file name on export, pass the custom string value as **fileName** to the method argument so as to get the file downloaded with this provided name.

The following example downloads the iCal file with a name **ScheduleEvents.ics**.

INDEX.TS

```

import { Button } from '@syncfusion/ej2-buttons';
import { Schedule, Day, Week, WorkWeek, Month, Agenda, ICalendarExport } from
 '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Day, Week, WorkWeek, Month, Agenda, ICalendarExport);
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '520px',
    selectedDate: new Date(2018, 1, 15),
    views: ['Day', 'Week', 'WorkWeek', 'Month', 'Agenda'],
    eventSettings: { dataSource: scheduleData }
});
scheduleObj.appendTo('#Schedule');
let buttonObj: Button = new Button();
buttonObj.appendTo('#ics-export');
buttonObj.element.onclick = () =>
    scheduleObj.exportToICalendar('ScheduleEvents');

```

```

Import events from other calendars

The events from external calendars (ICS files) can be imported into Scheduler by using the `importICalendar` method. This method accepts the `blob object` of an .ics file to be imported, as a mandatory argument.

To import an ICS file containing events into Scheduler, you need to first import the `ICalendarImport` module from `@syncfusion/ej2-schedule` package and then inject it using the `Schedule.Inject(ICalendarImport)` method.

The following example shows how to import an ICS file into Scheduler, using the `importICalendar` method.

INDEX.TS

```
import { Uploader, SelectedEventArgs } from '@syncfusion/ej2-inputs';
import { Schedule, Day, Week, WorkWeek, Month, Agenda, ICalendarImport } from '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Day, Week, WorkWeek, Month, Agenda, ICalendarImport);
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '520px',
    selectedDate: new Date(2018, 1, 15),
    views: ['Day', 'Week', 'WorkWeek', 'Month', 'Agenda'],
    eventSettings: { dataSource: scheduleData }
});
scheduleObj.appendTo('#Schedule');
// Initialize Uploader component for import
let uploadObj: Uploader = new Uploader({
    allowedExtensions: '.ics',
    cssClass: 'calendar-import',
    buttons: { browse: 'Choose file' },
    multiple: false,
    showFileList: false,
    selected: (args: SelectedEventArgs) =>
scheduleObj.importICalendar((<HTMLInputElement>args.event.target).files[0])
});
uploadObj.appendTo('#ics-import');
```

How to print the Scheduler element

The Scheduler allows you to print the Scheduler element by using the `print` client-side method. The `print` method works in two ways. You can find it below.

- Using print method without options.
- Using a print method with options.

To print the Schedule, you need to import the `Print` module from the `@syncfusion/ej2-schedule` package and then inject it using the `Schedule.Inject(Print)` method.

Using print method without options

You can print the Schedule element with the current view by using the `print` method without passing the options. The following example shows how to print the Scheduler using the `print` method without passing options.

INDEX.TS

```

import { extend } from '@syncfusion/ej2-base';
import { ItemModel } from '@syncfusion/ej2-navigations';
import { Schedule, Day, Week, WorkWeek, Month, Agenda, ActionEventArgs,
ToolbarActionArgs, Print } from '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Day, Week, WorkWeek, Month, Agenda, Print);
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '520px',
    selectedDate: new Date(2018, 1, 15),
    eventSettings: { dataSource: scheduleData },
    actionBegin: (args: ActionEventArgs & ToolbarActionArgs) => {
        if (args.requestType === 'toolbarItemRendering') {
            let printItem: ItemModel = {

```

```

        align: 'Right', showTextOn: 'Both', prefixIcon: 'e-icon-
schedule-print',
        text: 'Print', cssClass: 'e-schedule-print', click:
onPrintIconClick
    };
    args.items.push(printItem);
}
}
});
scheduleObj.appendTo('#Schedule');
function onPrintIconClick(): void {
    scheduleObj.print();
}

```

```

You can refer to our [JavaScript Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [JavaScript Scheduler example](#) to know how to present and manipulate data.

Context menu in EJ2 JavaScript Schedule control

You can display context menu on work cells and appointments of Scheduler by making use of the **ContextMenu** control manually from the application end. In the following code example, context menu control is being added from sample end and set its target as **Scheduler**.

On Scheduler cells, you can display the menu items such as **New Event**, **New Recurring Event** and **Today** option. For appointments, you can display its related options such as **Edit Event** and **Delete Event**. The default event window can be opened for appointment creation and editing using the **openEditor** method of Scheduler.

The deletion of appointments can be done by using the **deleteEvent** public method. Also, the **selectedDate** property can be used to navigate between different dates.

You can also display custom menu options on Scheduler cells and appointments. Context menu will open on tap-hold in responsive mode.

Dimensions in EJ2 JavaScript Schedule control

The Scheduler dimensions refers to both height and width of the entire layout and it accepts 3 types of values.

- auto
- pixel
- percentage

Auto Height and Width

When height and width of the Scheduler are set to **auto**, it will try as hard as possible to keep an element the same width as its parent container. In other words, the parent container that holds Scheduler, its width/height will be the sum of its children. By default, Scheduler is assigned with **auto** values for both height and width properties.

INDEX.TS

```

import { Schedule, Day, Week, WorkWeek, Month, Agenda } from
 '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Day, Week, WorkWeek, Month, Agenda);
let scheduleObj: Schedule = new Schedule({
    width: 'auto', height: 'auto',
    selectedDate: new Date(2018, 1, 15),
    eventSettings: { dataSource: scheduleData }
});
scheduleObj.appendTo('#Schedule');

```

Recurrence editor in EJ2 JavaScript Schedule control

The Recurrence editor is integrated into Scheduler editor window by default, to process the recurrence rule generation for events. Apart from this, it can also be used as an individual component referring from the Scheduler repository to work with the recurrence related processes.

All the valid recurrence rule string mentioned in the [iCalendar](#) specifications are applicable to use with the recurrence editor.

Customizing the repeat type option in editor

By default, there are 5 types of repeat options available in recurrence editor such as,

- Never
- Daily
- Weekly
- Monthly
- Yearly

It is possible to customize the recurrence editor to display only the specific repeat options such as **Daily** and **Weekly** options alone by setting the appropriate **frequencies** option.

INDEX.TS

```
import { Schedule, Day, Week, WorkWeek, Month, Agenda, RecurrenceEditor,
  PopupOpenEventArgs } from '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Day, Week, WorkWeek, Month, Agenda);
let scheduleObj: Schedule = new Schedule({
  width: '100%', height: '550px',
  selectedDate: new Date(2018, 1, 15),
  eventSettings: { dataSource: scheduleData },
  popupOpen: (args: PopupOpenEventArgs): void => {
    if (args.type == 'Editor') {
      scheduleObj.eventWindow.recurrenceEditor.frequencies = ['none',
        'daily', 'weekly'];
    }
  }
});
scheduleObj.appendTo('#Schedule');
```

```

The other properties available in recurrence editor are tabulated below,

Properties	Type	Description
----- ----- -----		
firstDayOfWeek	number	Sets the first day of the week on recurrence editor.
startDate	Date	Sets the start date from which date the recurrence event starts.
dateFormat	string	Sets the specific date format on recurrence editor.
locale	string	Sets the locale to be applied on recurrence editor.
cssClass	string	Allows styling to be applied on recurrence editor with custom class names.
enableRtl	boolean	Allows recurrence editor to render in RTL mode.

- | minDate | Date | Sets the minimum date on recurrence editor. |
- | maxDate | Date | Sets the maximum date on recurrence editor. |
- | value | string | Sets the recurrence rule value on recurrence editor. |
- | selectedType | number | Sets the specific repeat type on the recurrence editor. |

Customizing the End Type Option in Editor

By default, there are 3 types of end options available in the recurrence editor such as:

- Never
- Until
- Count

It is possible to customize the recurrence editor to display only the specific end options, such as the **Until** and **Count** options alone, by setting the appropriate [endTypes](#) option.

INDEX.TS

```
import { RecurrenceEditor } from '@syncfusion/ej2-schedule';
let recObject: RecurrenceEditor = new RecurrenceEditor({
    frequencies: ['daily', 'weekly'],
    endTypes: ['until', 'count']
});
recObject.appendTo('#RecurrenceEditor');
```

Accessing the recurrence rule string

The recurrence rule is usually generated based on the options selected from the recurrence editor and also it follows the [iCalendar](#) specifications. The generated recurrence rule string is a valid one to be used with the Scheduler event's recurrence rule field.

There is a `change` event available in recurrence editor, that triggers on every time the fields of recurrence editor tends to change. Within this event argument, you can access the generated recurrence value through the `value` option as shown in the following code example.

INDEX.TS

```

import { RecurrenceEditor, RecurrenceEditorChangeEventArgs } from
'@syncfusion/ej2-schedule';
let outputElement: HTMLElement = <HTMLElement>document.querySelector('#rule-
output');
let recObject: RecurrenceEditor = new RecurrenceEditor({
  change: (args: RecurrenceEditorChangeEventArgs) => {
    if(args.value == "") {
      outputElement.innerText = 'Select Rule';
    } else {
      outputElement.innerText = args.value;
    }
  }
});
recObject.appendTo('#RecurrenceEditor');
outputElement.innerText = 'Select Rule';

```

Set specific value on recurrence editor

It is possible to display the recurrence editor with specific options loaded initially, based on the rule string that we provide. The fields of recurrence editor will change its values accordingly, when we provide a particular rule through the `setRecurrenceRule` method.

INDEX.TS

```
import { RecurrenceEditor, RecurrenceEditorChangeEventArgs } from
 '@syncfusion/ej2-schedule';
let outputElement: HTMLElement = <HTMLElement>document.querySelector('#rule-
output');
let recObject: RecurrenceEditor = new RecurrenceEditor({
  change: (args: RecurrenceEditorChangeEventArgs) => {
    outputElement.innerText = args.value;
  }
});
recObject.appendTo('#RecurrenceEditor');
recObject.setRecurrenceRule('FREQ=DAILY;INTERVAL=2;COUNT=8');
outputElement.innerText = recObject.value as string;
```

```

Recurrence date generation

You can parse the `recurrenceRule` of an event to generate the date instances on which that particular event is going to occur, using the `getRecurrenceDates` method. It generates the dates based on the `recurrenceRule` that we provide. The parameters to be provided for `getRecurrenceDates` method are as follows.

Field name	Type	Description
----- ----- -----		
<code>startDate</code>	Date	Appointment start date.
<code>rule</code>	String	Recurrence rule present in an event object.
<code>excludeDate</code>	String	Date collection (in ISO format) to be excluded. It is optional .
<code>maximumCount</code>	Number	Number of date count to be generated. It is optional .
<code>viewDate</code>	Date	Current view range's first date. It is optional .

INDEX.TS

```

import { createElement } from '@syncfusion/ej2-base';
import { RecurrenceEditor, RecurrenceEditorChangeEventArgs } from
 '@syncfusion/ej2-schedule';
let outputElement: HTMLElement = <HTMLElement>document.querySelector('#rule-
output');
let labelElement: HTMLElement = <HTMLElement>document.querySelector('#rule-
label');
let recObject: RecurrenceEditor = new RecurrenceEditor({
    change: OnRecurrenceChange,
});
recObject.appendTo('#RecurrenceEditor');
let ruleString: string = 'FREQ=DAILY;INTERVAL=1';
recObject.setRecurrenceRule(ruleString);
labelElement.innerText = 'Date Collections';
outputElement.innerHTML = '';
let ruleStringDates: number[] = recObject.getRecurrenceDates(
    new Date(),
    ruleString
);
for (let index: number = 0; index < ruleStringDates.length; index++) {
    outputElement.appendChild(
        createElement('div', {
            innerHTML: new Date(ruleStringDates[index]).toString(),
        })
    );
}
function OnRecurrenceChange(args: RecurrenceEditorChangeEventArgs): void {
    if (args.value == '') {
        outputElement.innerText = 'Select Rule';
    } else {
        outputElement.innerHTML = '';
        let dates: number[] = recObject.getRecurrenceDates(new Date(),
args.value);
        for (let index: number = 0; index < dates.length; index++) {
            outputElement.appendChild(
                createElement('div', { innerHTML: new Date(dates[index]).toString()
            })
        );
    }
}
}

        </div>
        <div id="RecurrenceEditor"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Above example will generate two dates January 7, 2018 & January 9 2018 by excluding the in between dates January 8 2018 & January 10 2018, since those dates were given in the exclusion list. Generated dates can then be utilised to create appointments.

Recurrence date generation in server-side

It is also possible to generate recurrence date instances from server-side by manually referring the **RecurrenceHelper** class, which is specifically written and referred from application end to handle this date generation process.

Refer [here](#) for the step by step procedure to achieve date generation in server-side.

Restrict date generation with specific count

In case, if the rule is given in "NEVER ENDS" category, then you can mention the maximum count when you actually want to stop the date generation starting from the provided start date. To do so, provide the appropriate **maximumCount** value within the **getRecurrenceDates** method as shown in the following code example.

INDEX.TS

```
import { createElement } from '@syncfusion/ej2-base';
import { RecurrenceEditor } from '@syncfusion/ej2-schedule';
import { NumericTextBox, ChangeEventArgs } from '@syncfusion/ej2-inputs';
let numericValue: number = 10;
let numeric: NumericTextBox = new NumericTextBox({
    value: numericValue,
    change: numericFocus,
});
numeric.appendTo('#numeric');
let outputElement: HTMLElement = <HTMLElement>document.querySelector('#rule-output');
let labelElement: HTMLElement = <HTMLElement>document.querySelector('#rule-label');
let ruleString: string = 'FREQ=DAILY;INTERVAL=1; COUNT=30';
let recObject: RecurrenceEditor = new RecurrenceEditor();
let dates: number[] =
recObject.getRecurrenceDates(new Date(2018, 0, 7, 10, 0), ruleString,
'20180108T114224Z,20180110T114224Z', numericValue, new Date(2018, 0, 7));
labelElement.innerText = 'Date Collections';
outputElement.innerHTML = '';
for (let index: number = 0; index < dates.length; index++) {
    outputElement.appendChild(createElement('div', { innerHTML: new
Date(dates[index]).toString() }));
}
function numericFocus(args: ChangeEventArgs): void {
    outputElement.innerHTML = '';
    let dates: number[] = recObject.getRecurrenceDates(
        new Date(2018, 0, 7, 10, 0),
        ruleString,
        '20180108T114224Z,20180110T114224Z',
        args.value,
        new Date(2018, 0, 7)
    );
    for (let index: number = 0; index < dates.length; index++) {
        outputElement.appendChild(
```

```

        createElement('div', { innerHTML: new Date(dates[index]).toString() })
    );
}
}

```

```

You can refer to our [JavaScript Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [JavaScript Scheduler example](#) to know how to present and manipulate data.

Localization in EJ2 JavaScript Schedule control

The Scheduler integrates different date-time formats and cultures, which allows it to function globally, thus meeting the diverse needs of different regions.

You can adapt the Scheduler to various languages by parsing and formatting the date or number ([Internationalization](#)), adding culture specific customization and translation to the text ([Localization](#)).

Globalization

The Internationalization library provides support for formatting and parsing the number, date, and time by using the official [Unicode CLDR](#) JSON data and also provides the `loadCldr` method to load the culture specific CLDR JSON data.

By default, Scheduler is set to follow the English culture ('en-US'). If you want to go with different culture other than English, follow the below steps.

- Install the `CLDR-Data` package by using the below command (it installs the CLDR JSON data). For more information about CLDR-Data, refer to this [link](#).

```
npm install cldr-data --save
```

Once the package is installed, you can find the culture specific JSON data under the location `/node_modules/cldr-data`.

- Now import the installed CLDR JSON data into the `app.ts` file. To import JSON data, you need to install the JSON plugin loader. Here, we have used the SystemJS JSON plugin loader.

```
npm install systemjs-plugin-json --save-dev
```

- Once installed, configure the `system.config.js` configuration settings as shown in the following code to map the `systemjs-plugin-json` loader.

```
`ts
System.config({
  paths: {
    'syncfusion:': 'npm:@syncfusion/'
  },
  map: {
    app: 'app',
    //Syncfusion packages mapping
    "@syncfusion/ej2-base": "syncfusion:ej2-base/dist/ej2-base.umd.min.js",
    "@syncfusion/ej2-data": "syncfusion:ej2-data/dist/ej2-data.umd.min.js",
    "@syncfusion/ej2-inputs": "syncfusion:ej2-inputs/dist/ej2-inputs.umd.min.js",
    "@syncfusion/ej2-buttons": "syncfusion:ej2-buttons/dist/ej2-buttons.umd.min.js",
    "@syncfusion/ej2-dropdowns": "syncfusion:ej2-dropdowns/dist/ej2-dropdowns.umd.min.js",
    "@syncfusion/ej2-compression": "syncfusion:ej2-compression/dist/ej2-compression.umd.min.js",
    "@syncfusion/ej2-file-utils": "syncfusion:ej2-file-utils/dist/ej2-file-utils.umd.min.js",
    "@syncfusion/ej2-splitbuttons": "syncfusion:ej2-splitbuttons/dist/ej2-splitbuttons.umd.min.js",
    "@syncfusion/ej2-lists": "syncfusion:ej2-lists/dist/ej2-lists.umd.min.js",
    "@syncfusion/ej2-navigations": "syncfusion:ej2-navigations/dist/ej2-navigations.umd.min.js",
    "@syncfusion/ej2-popups": "syncfusion:ej2-popups/dist/ej2-popups.umd.min.js",
    "@syncfusion/ej2-calendars": "syncfusion:ej2-calendars/dist/ej2-calendars.umd.min.js",
    "@syncfusion/ej2-excel-export": "syncfusion:ej2-excel-export/dist/ej2-excel-export.umd.min.js",
    "@syncfusion/ej2-schedule": "syncfusion:ej2-schedule/dist/ej2-schedule.umd.min.js",
    "cldr-data": 'npm:cldr-data',
    "plugin-json": "npm:systemjs-plugin-json/json.js"
  },
  meta: {
    '*.json': { loader: 'plugin-json' }
  },
}
```

```
packages: {
  'app': { main: 'app', defaultExtension: 'js' },
  'cldr-data': { main: 'index.js', defaultExtension: 'js' }
}
});
System.import('app');
`
```

- Now import the required cultures from the installed location to `app.ts` file as given in the following code example.

```
`ts
//import the loadCldr from ej2-base
import { loadCldr } from '@syncfusion/ej2-base';
loadCldr(
  require('cldr-data/supplemental/numberingSystems.json'),
  require('cldr-data/main/fr-CH/ca-gregorian.json'),
  require('cldr-data/main/fr-CH/numbers.json'),
  require('cldr-data/main/fr-CH/timeZoneNames.json')
);
`
```

- Set the culture to Scheduler by using the `locale` property.

INDEX.TS

```
import { Schedule, Day, Week, WorkWeek, Month } from '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
import { loadCldr } from '@syncfusion/ej2-base';
import * as numberingSystems from './numberingSystems.json';
import * as gregorian from './ca-gregorian.json';
import * as numbers from './numbers.json';
import * as detimeZoneNames from './timeZoneNames.json';
Schedule.Inject(Day, Week, WorkWeek, Month);
loadCldr(numberingSystems, gregorian, numbers, detimeZoneNames);
let scheduleObj: Schedule = new Schedule({
  height: '550px',
  locale: 'fr-CH',
  selectedDate: new Date(2018, 1, 15),
  views: ['Day', 'Week', 'WorkWeek', 'Month'],
  eventSettings: { dataSource: scheduleData }
});
scheduleObj.appendTo('#Schedule');
```

```

Localizing the static Scheduler text

[Localization](#) library allows to display all the static text, date content, and time mode of the Scheduler following the localized language. To achieve this, set the **locale** property of Scheduler, as well as define the translation text of static words of Scheduler through the **load** method.

For example, the following code example lets you to define the French translation words for all the static words used in Scheduler.

INDEX.TS

```
import { Schedule, Day, Week, WorkWeek, Month } from '@syncfusion/ej2-schedule';
import { L10n, loadCldr } from '@syncfusion/ej2-base';
import { scheduleData } from './datasource.ts';
import * as numberingSystems from './numberingSystems.json';
import * as gregorian from './ca-gregorian.json';
import * as numbers from './numbers.json';
import * as timeZoneNames from './timeZoneNames.json';
import * as localeTexts from './locale.json';
Schedule.Inject(Day, Week, WorkWeek, Month);
loadCldr(numberingSystems, gregorian, numbers, timeZoneNames);
L10n.load(localeTexts);
let scheduleObj: Schedule = new Schedule({
    height: '550px',
    locale: 'fr-CH',
    selectedDate: new Date(2018, 1, 15),
    views: ['Day', 'Week', 'WorkWeek', 'Month'],
    eventSettings: { dataSource: scheduleData }
});
scheduleObj.appendTo('#Schedule');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
    <title>Schedule Typescript Component</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript Schedule Control">
    <meta name="author" content="Syncfusion">

}
});
`

```

Setting date format

Scheduler can be used with all valid date formats and by default it follows the universal date format "MM/dd/yyyy". If the `dateFormat` property is not specified particularly, then it will work based on the locale that is assigned to the Scheduler. As the default locale applied on Scheduler is "en-US", this makes it to follow the "MM/dd/yyyy" pattern.

INDEX.TS

```

import { Schedule, Day, Week, WorkWeek, Month } from '@syncfusion/ej2-schedule';
import { scheduleData } from '../datasource.ts';
Schedule.Inject(Day, Week, WorkWeek, Month);
let scheduleObj: Schedule = new Schedule({
    height: '550px',
    dateFormat: "yyyy/MM/dd",

```

```

views: ['Day', 'Week', 'WorkWeek', 'Month'],
selectedDate: new Date(2018, 1, 15),
eventSettings: { dataSource: scheduleData }
});
scheduleObj.appendTo('#Schedule');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>Schedule Typescript Component</title>

if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Setting the time format

Time formats is a way of representing the time value in different string formats in the Scheduler. By default, the time mode of the Scheduler can be either 12 or 24 hours format which is completely based on the **locale** set to the Scheduler. Since the default **locale** value of the Scheduler is en-US, the time mode will be set to 12 hours format automatically. You can also customize the format by using the **timeFormat** property. To know more about the time format standards, refer to the [Date and Time Format](#) section.

The following example demonstrates the Scheduler component in 24 hours format.

INDEX.TS

```
import { Schedule, Day, Week, WorkWeek, Month } from '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Day, Week, WorkWeek, Month);
let scheduleObj: Schedule = new Schedule({
    height: '550px',
    timeFormat: 'HH:mm',
    views: ['Day', 'Week', 'WorkWeek', 'Month'],
    selectedDate: new Date(2018, 1, 15),
    eventSettings: { dataSource: scheduleData }
});
scheduleObj.appendTo('#Schedule');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
    <title>Schedule Typescript Component</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Note: **timeFormat** property only accepts the valid time format's.

Displaying Scheduler in RTL mode

The Scheduler layout and its behavior can be changed as per the common RTL (Right to Left) conventions by setting **enableRtl** to **true**. By doing so, the Scheduler will display its usual layout from right to left. It's default value is **false**.

INDEX.TS

```

import { Schedule, Day, Week, WorkWeek } from '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Day, Week, WorkWeek);
let scheduleObj: Schedule = new Schedule({
    height: '550px',
    enableRtl: true,
    selectedDate: new Date(2018, 1, 15),
    views: ['Day', 'Week', 'WorkWeek'],
    eventSettings: { dataSource: scheduleData }
});
scheduleObj.appendTo('#Schedule');

```

Accessibility in EJ2 JavaScript Schedule control

The Scheduler has been designed based on the WAI-ARIA specifications, thus applying the appropriate ARIA roles, states and properties for the Scheduler elements. It is also available with a built-in keyboard navigation support, making it easier for the people who use assistive technologies or who completely rely on the Keyboard support. As per the accessibility standard, the navigated dates, views and other interactive actions performed on the Scheduler will be read out to the target users who use assistive technologies such as screen readers.

The Scheduler makes use of the most required ARIA attributes such as `aria-label` and `role` to support the accessibility in it. To be more accurate, it must be used with an ARIA compliant browser along with the screen reader running from backend.

The accessibility compliance for the Schedule control is outlined below.

| Accessibility Criteria | Compatibility |

```

| -- | -- |
| WCAG 2.2 Support |  |
| Section 508 Support |  |
| Screen Reader Support |  |
| Right-To-Left Support |  |
| Color Contrast |  |
| Mobile Device Support |  |
| Keyboard Navigation Support |  |
| Accessibility Checker Validation |  |
| Axe-core Accessibility Validation |  |
<style>
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
</style>
<div> - All
features of the control meet the requirement.</div>
<div> - Some features of the control do not meet the requirement.</div>
<div> - The
control does not meet the requirement.</div>

```

ARIA attributes

The Scheduler parent element is assigned with a role of `main`, to denote it as the main content of a control as well as a unique element of the entire document.

The following ARIA attributes are used in the Scheduler.

Attributes	Description
------------	-------------

-----	-----
-------	-------

| role="main" | Attribute added to the Scheduler element describes the actual role of the element and denote it as a main and unique content. |

| role="button" | Attribute is assigned to the appointments of Scheduler, to denote it as a clickable element. |

| aria-label | Attribute is set to the Scheduler parent element and its default value is Scheduler's current date. On every time, the date is navigated, this attribute is updated with appropriate current date values. It is also assigned to other scheduler UI elements such as previous and next date navigation buttons depicting its purpose, div element displaying date range in the header bar and appointment elements. |

| aria-labelledby | It indicates editor dialog title to the user through assistive technologies. |

| aria-describedby | It indicates editor dialog content description to the user through assistive technologies. |

| aria-disabled | Attribute is set to the appointment element to indicates the disabled state of the Scheduler.

Keyboard interaction

All the Scheduler actions can be controlled via keyboard keys by using the `allowKeyboardInteraction` property which is set to `true` by default. The following are the standard keys that work on Scheduler.

Keys	Description
----- -----	
Alt + j	Focuses the Scheduler element [provided from application end].
Tab	Focuses the first or active item on the Scheduler header bar and then move the focus to the next available event elements. If no events present, then focus moves out of the control.
Shift + Tab	Reverse focusing of the <code>Tab</code> key functionality. Inverse focusing of event elements from the last one and then move onto the first or active item on Scheduler header bar and then moves out of the control.
Enter	Opens the quick info popup on the selected cells or events.
Escape	Closes any of the popup that are in open state.
Arrow	To move onto the next available cells in either of the needed directions. (left, right, top and right)
Shift + Arrow	For multiple cell selection on either direction.
Delete	Deletes one or more selected events.
Ctrl + Click on events	To select multiple events.
Alt + Number (from 1 to 6)	To switch between the views of Scheduler.
Ctrl + Left Arrow	To navigate to the previous date period.
Ctrl + Right Arrow	To navigate to the next date period.

| Left or Right Arrow | On pressing any of these keys, when focus is currently on the Schedule header bar, moves the focus to the previous or next items in the header bar. |

| Space or Enter | It activates any of the focused items. |

| Page Up & Page Down | To scroll through the work cells area. |

| Home | To move the selection to the first cell of Scheduler. |

You can refer to our [JavaScript Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [JavaScript Scheduler example](#) to know how to present and manipulate data.

Ensuring accessibility

The Scheduler control accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Scheduler control is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Scheduler control with accessibility tools.

Scheduler styling in EJ2 JavaScript Schedule control

To modify the Scheduler appearance, you need to override the default CSS of Scheduler. Also, you have an option to create your own custom theme using our [Theme Studio](#). Please find the list of CSS classes in Scheduler.

| Css class | Purpose |

|-----|-----|

| .e-schedule .e-vertical-view .e-work-cells | Work cells in vertical views of scheduler |

| .e-schedule .e-month-view .e-work-cells | Work cells in month view of scheduler |

| .e-schedule .e-month-view .e-other-month | Work cells of other month in month view of scheduler |

| .e-schedule .e-timeline-view .e-work-cells | Work cells in timeline views of scheduler |

| .e-schedule .e-timeline-month-view .e-work-cells | Work cells in timeline month view of scheduler |

| .e-schedule .e-timeline-year-view .e-work-cells | Work cells in timeline year view of scheduler |

| .e-schedule .e-timeline-year-view .e-work-cells.e-other-month | Work cells of other month in timeline year view of scheduler |

| .e-schedule .e-month-agenda-view .e-work-cells | Work cells in month agenda view of scheduler |

| .e-schedule .e-month-agenda-view .e-other-month | Work cells of other month in month agenda view of scheduler |

| .e-schedule .e-year-view .e-calendar-wrapper .e-month-calendar.e-calendar .e-other-month | Work cells of other month in year view of scheduler |

| .e-schedule .e-vertical-view .e-all-day-cells | All day cells in vertical views of scheduler |

| .e-schedule .e-vertical-view .e-work-hours | Work hour cells in vertical views of scheduler |

| .e-schedule .e-month-view .e-work-days | Work day cells in month view of scheduler |

| .e-schedule .e-month-agenda-view .e-work-days | Work day cells in month agenda view of scheduler |

| .e-schedule .e-timeline-view .e-work-hours | Work hour cells in timeline views of scheduler |

| .e-schedule .e-timeline-month-view .e-work-days | Work day cells in timeline month view of scheduler |

| .e-schedule .e-timeline-year-view .e-work-cells.e-work-days | Work day cells in timeline year view of scheduler |

| .e-schedule .e-vertical-view .e-day-wrapper .e-appointment | Appointment in vertical views of scheduler |

| .e-schedule .e-vertical-view .e-all-day-appointment-wrapper .e-appointment | All day Appointment in vertical views of scheduler |

| .e-schedule .e-month-view .e-appointment | Appointment in month view of scheduler |

| .e-schedule .e-timeline-view .e-appointment | Appointment in timeline views of scheduler |

| .e-schedule .e-timeline-month-view .e-appointment | Appointment in timeline month view of scheduler |

| .e-schedule .e-timeline-year-view .e-event-table .e-appointment | Appointment in timeline year view of scheduler |

| .e-schedule .e-year-view .e-calendar-wrapper .e-month-calendar.e-calendar .e-appointment | Appointment in year view of scheduler |

| .e-schedule .e-agenda-view .e-appointment | Appointment in agenda view of scheduler |

| .e-schedule .e-month-agenda-view .e-appointment-indicator | Appointment in month agenda view of scheduler |

| .e-schedule .e-block-appointment | Block appointment in scheduler |

| .e-schedule .e-read-only | Read only appointment in scheduler. |

| e-appointment-border | Appointment which are currently selected, use the appointment class hierarchical based on your views. |

| e-selected-cells | work cells which are currently selected, use the work cell class hierarchical based on your views. |

| e-header-cells | Header cells of scheduler, use the work cells hierarchical based on your views. |

| .e-schedule .e-vertical-view .e-resource-cells| Resource cells in vertical views of scheduler. |

| .e-schedule .e-month-view .e-resource-cells| Resource cells in month view of scheduler. |

| .e-schedule .e-timeline-view .e-resource-cells | Resource cells in timeline views of scheduler. |

| .e-schedule .e-timeline-month-view .e-resource-cells| Resource cells in timeline month view of scheduler. |

| e-parent-node | Parent resource cells in timeline views of scheduler. |

| e-child-node | Child resource cells in timeline views of scheduler. |

You can refer to our [JavaScript Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [JavaScript Scheduler example](#) to know how to present and manipulate data.

Frequently asked questions in EJ2 JavaScript Schedule control

In this article, you can find some frequently asked questions and corresponding solutions while getting hands-on experience with scheduler control.

Grouping with empty resources

Grouping without providing any resource data will throw the following problems.

- Normal(vertical) views are rendered, but you are not able to perform CRUD operations
- Timeline views not at all render and shows empty scheduler table

So, we suggest to avoid grouping with empty resources in the scheduler.

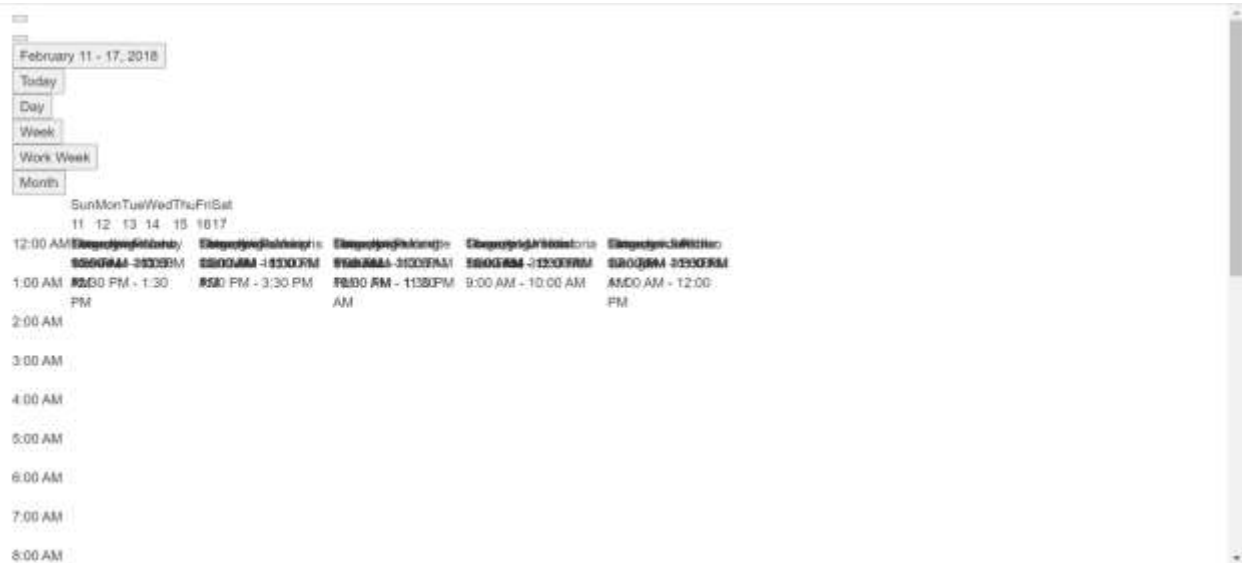

Not providing e-field in editor template

Error: While using editor template, value of `e-field` is missing in editor window.

Solution: `e-field` value is mandatory, we need to add it. Please refer [here](#) for more info.

Missing CSS reference

Error Image:

Solution:

The above problem occurs when missing CSS references for the scheduler in a project. You can resolve this issue by providing proper CSS for the scheduler.

,

```
<html>
```

```
<head>
```

```
<title>Syncfusion Javascript Sample</title>
```

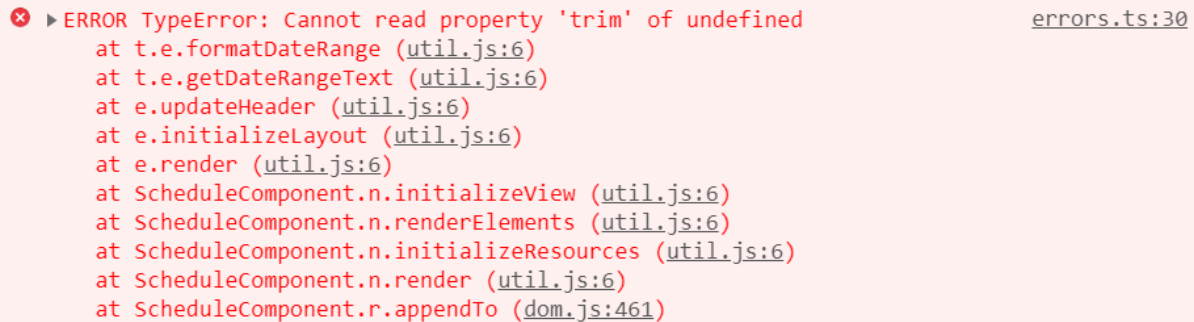

```
<meta charset="utf-8" />
<meta name="viewport" content="width=device-width, initial-scale=1.0, user-scalable=no" />
<meta http-equiv="x-ua-compatible" content="ie=edge">
<meta name="author" content="Syncfusion" />
<! — scheduler CSS is referred from this link —>
<link href="https://cdn.syncfusion.com/ej2/material.css" rel="stylesheet">
</head>
<body class="material">
<div id='sample'>
</body>
</html>
`
```

[QuickInfoTemplate at bottom](#)

When using the `quickInfoTemplate` in scheduler, sometimes quickinfo popup not shown fully at the bottom area of scheduler. You can resolve this by using `cellClick` and `eventClick` events and below code snippet.

```
`javascript
var eventAdded = false;
var scheduleObj = new ej.schedule.Schedule({
.
.
cellClick: onClick,
eventClick: onClick
});
scheduleObj.appendTo('#Schedule');
function onClick(args) {
if (!this.eventAdded) {
let popupInstance = document.querySelector('.e-quick-popup-wrapper').ej2_instances[0];
popupInstance.open = () => {
popupInstance.refreshPosition();
};
this.eventAdded = true;
}
}
```

Not processing culture files while using localization

Error Image:

```

✖ ERROR TypeError: Cannot read property 'trim' of undefined
    at t.e.formatDateRange (util.js:6)
    at t.e.getDateRangeText (util.js:6)
    at e.updateHeader (util.js:6)
    at e.initializeLayout (util.js:6)
    at e.render (util.js:6)
    at ScheduleComponent.n.initializeView (util.js:6)
    at ScheduleComponent.n.renderElements (util.js:6)
    at ScheduleComponent.n.initializeResources (util.js:6)
    at ScheduleComponent.n.render (util.js:6)
    at ScheduleComponent.r.appendTo (dom.js:461)
errors.ts:30

```

While using [locale](#) in scheduler, not processing the `loadCultureFiles` properly throws the problem.

Solution: Properly add the culture files(numberingSystems, timeZoneNames, loadCldr, L10n etc.,) and `loadCultureFiles` method in your project will resolve the problem.

```

`javascript
loadCultureFiles();

var localeTexts;

var localeAjax = new ej.base.Ajax('./locale.json', 'GET', false);

localeAjax.onSuccess = function (value) {
    localeTexts = value;
};

localeAjax.send();

ej.base.L10n.load(JSON.parse(localeTexts));

function loadCultureFiles() {
    // Processing culture files

    var files = ['ca-gregorian.json', 'numbers.json', 'numberingSystems.json', 'timeZoneNames.json'];
    var loader = ej.base.loadCldr;
    var loadCulture = function (prop) {
        var val, ajax;

        ajax = new ej.base.Ajax('./' + files[prop], 'GET', false);
        ajax.onSuccess = function (value) {
            val = value;
        };
        ajax.send();
        loader(JSON.parse(val));
    };
}

```

```

};
for (var prop = 0; prop < files.length; prop++) {
  loadCulture(prop);
}
}
var scheduleObj = new ej.schedule.Schedule({
  width: '100%',
  height: '550px',
  locale: 'fr-CH',
});
scheduleObj.appendTo('#Schedule');
`

```

Getting instance of the Scheduler component

User can access the component instance from the component element through the variable where you are initializing the Schedule component(scheduleObj) or by using the ej2_instances property as shown below.

```

`javascript
var scheduleObj = new ej.schedule.Schedule({
  .
  .
  cellClick: onClick,
});
scheduleObj.appendTo('#Schedule');
function onClick(args) {
  let scheduleInstance = document.querySelector('.e-schedule').ej2_instances[0];
}
`

```

Ej1 api migration in EJ2 JavaScript Schedule control

This topic shows the API equivalent of JS2 Scheduler component to be used, while migrating your project that uses JS1 Scheduler.

Scheduler

Properties

Behavior	API in Essential JS 1	API in Essential JS 2

| To change the display of days count in agenda view | **Property:** *daysInAgenda*

 \$("#Schedule").ejSchedule({
 currentView: "Agenda",
daysInAgenda: 7
}); | **Property:** *agendaDaysCount*

 var scheduleObj = new ej.schedule.Schedule({
currentView: 'Agenda',
agendaDaysCount: 7
});
scheduleObj.appendTo('#Schedule'); |

| Preventing deletion of appointment | **Property:** *allowDelete*

 \$("#Schedule").ejSchedule({
allowDelete: false
}); | Not applicable |

| Allows dragging and dropping of appointments | **Property:** *allowDragAndDrop*

\$("#Schedule").ejSchedule({
 allowDragAndDrop: false
}); | **Property:** *allowDragAndDrop*

 var scheduleObj = new ej.schedule.Schedule({
allowDragAndDrop: false
});
scheduleObj.appendTo('#Schedule'); |

| Enabling inline editing of appointments | **Property:** *allowInline*

\$("#Schedule").ejSchedule({
 allowInline: true
}); | Not applicable |

| Allow keyboard interactions | **Property:** *allowKeyboardNavigation*

 \$("#Schedule").ejSchedule({
allowKeyboardNavigation: false
}); | **Property:** *allowKeyboardInteraction*

 var scheduleObj = new ej.schedule.Schedule({
allowKeyboardInteraction: false
});
scheduleObj.appendTo('#Schedule'); |

| Enable resizing of appointments | **Property:** *enableAppointmentResize*

 \$("#Schedule").ejSchedule({
enableAppointmentResize: true
}); | **Property:** *allowResizing*

 var scheduleObj = new ej.schedule.Schedule({
allowResizing: true
});
scheduleObj.appendTo('#Schedule'); |

| Blocking time intervals | **Property:** *blockoutSettings*

 \$("#Schedule").ejSchedule({
currentDate: new Date(2014, 4, 5),
blockoutSettings: {
enable: true,
dataSource: [{
BlockId: 101,
BlockStartTime: new Date(2014, 4, 5, 10, 00),
BlockEndTime: new Date(2014, 4, 5, 11, 00),
BlockSubject: "Service",
IsBlockAppointment: true
}],
id: "BlockId",
startTime: "BlockStartTime",
endTime: "BlockEndTime",
subject: "BlockSubject",
isBlockAppointment: "IsBlockAppointment"
}); | **Property:** *isBlock*

 var data = [{ Id: 1, Subject: 'Explosion of Betelgeuse Star', StartTime: new Date(2018, 1, 15, 9, 30), EndTime: new Date(2018, 1, 15, 11, 0), IsBlock: true }
var scheduleObj = new ej.schedule.Schedule({
eventSettings: { *dataSource*: data }
});

Methods

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| To add appointments manually | **Method:** saveAppointment()

\$('#Schedule').ejSchedule();
 var data = {
 Id: 1,
Subject: "Testing",
StartTime: new Date(2014, 4, 5, 10, 00),
EndTime: new Date(2014, 4, 5, 12, 00)};
 var scheduleobj = \$("#Schedule").data("ejSchedule");
scheduleobj.saveAppointment(data);
 | **Method:** addEvent()

 var scheduleobj= document.getElementById('schedule').ej2_instances[0];
scheduleObj.addEvent({
Id: 1,
Subject: "New Event",
StartTime: new Date(2014, 4, 5, 10, 00),
EndTime: new Date(2014, 4, 5, 12, 00)}
});
 |

| To add resources dynamically | **Method:** addResource()

\$("#Schedule").ejSchedule();
 var data = { text: "Paul", id: 1, groupId: 3, color: "#cc99ff" };
 var index = 0;
 var scheduleobj = \$("#Schedule").data("ejSchedule");
 scheduleobj.addResource(data, "Owners", index); | **Method:** addResource()

 var data = { text: "Paul", id: 1, groupId: 3, color: "#cc99ff" };
 var index = 0;
 var scheduleobj= document.getElementById('schedule').ej2_instances[0];
 scheduleobj.addResource(data, "Owners", index); |

| databind | Not applicable | **Method:** dataBind()

 var scheduleobj= document.getElementById('schedule').ej2_instances[0];
 scheduleobj.currentView = 'Month';
 scheduleobj.dataBind();
 |

| Delete appointment manually | **Method:** deleteAppointment()

\$("#Schedule").ejSchedule();
 var data = {
 Id: 1,
Subject: "Testing",
StartTime: new Date(2014, 4, 5, 10, 00),
EndTime: new Date(2014, 4, 5, 12, 00)};
 var scheduleobj = \$("#Schedule").data("ejSchedule");
schObj.deleteAppointment(data); | **Method:** deleteEvent()

 var data = {
Id: 1,
Subject: "Testing",
StartTime: new Date(2014, 4, 5, 10, 00),
EndTime: new Date(2014, 4, 5, 12, 00)};
var scheduleobj= document.getElementById('schedule').ej2_instances[0];
 scheduleobj.deleteEvent(data); |

| destroy scheduler | **Method:** *destroy()*

\$(("#Schedule").ejSchedule());
 var
scheduleobj = \$(("#Schedule").data("ejSchedule"));
schObj.destroy(); | **Method:** *destroy()*

 var scheduleobj= document.getElementById('schedule').ej2_instances[0];

scheduleObj.destroy(); |

| Get cell details | **Method:** *getSlotByElement()*

 \$(("#Schedule").ejSchedule());
 var
scheduleobj = \$(("#Schedule").data("ejSchedule"));
 var \$td = \$(".e-draggableworkarea table
tr td").first();
var slotDetails = obj.getSlotByElement(\$td); | **Method:** *getCellDetails()*

 var scheduleobj= document.getElementById('schedule').ej2_instances[0];
 var td
= document.querySelector(".e-work-cells");
var cellDetail =
scheduleobj.getCellDetails(td);
 |

| Get current view appointments | **Method:** *getCurrentViewAppointments()*

\$(("#Schedule").ejSchedule());
 var scheduleobj =
\$(("#Schedule").data("ejSchedule"));
 var currApp=
scheduleobj.getCurrentViewAppointments(); | **Method:** *getCurrentViewEvents()*

 var
scheduleobj= document.getElementById('schedule').ej2_instances[0];
 var currApp =
scheduleobj.getCurrentViewEvents(); |

| Get entire appointment collection | **Method:** *getAppointments()*

\$(("#Schedule").ejSchedule());
var scheduleobj = \$(("#Schedule").data("ejSchedule"));
 var
AppDetails = scheduleobj.getAppointments();
 | **Method:** *getEvents()*

 var
scheduleobj= document.getElementById('schedule').ej2_instances[0];
 var AppDetails =
scheduleobj.getEvents(); |

| Get current view dates | Not applicable | **Method:** *getCurrentViewDates()*

 var
scheduleobj= document.getElementById('schedule').ej2_instances[0];
 var AppDetails =
scheduleobj.getCurrentViewDates(); |

| Get event details | Not applicable | **Method:** *getEventDetails()*

 var scheduleobj=
document.getElementById('schedule').ej2_instances[0];
 var AppDetails =
scheduleobj.getEventDetails(appElement);
 |

| Get occurrences using event ID | Not applicable | **Method:** *getOccurrencesById()*

 var
scheduleobj= document.getElementById('schedule').ej2_instances[0];
 var recCollection =
scheduleobj.getOccurrencesById(1);
 |

| Get occurrences in the provided date range | Not applicable | **Method:** *getOccurrencesByRange()*

 var scheduleobj= document.getElementById('schedule').ej2_instances[0];
 var
sDate = new Date(2018, 1, 12);
 var eDate = new Date(2018, 1, 17);
 var resCollection =
scheduleobj.getOccurrencesByRange(sDate, eDate); |

| Get resource details using index | Not applicable | **Method:** *getResourceByIndex()*

 var
scheduleobj= document.getElementById('schedule').ej2_instances[0];
 var resCollection =
scheduleobj.getResourceByIndex(2); |

| Show spinner | Not applicable | **Method:** *showSpinner()*

 var scheduleobj=
document.getElementById('schedule').ej2_instances[0];
 scheduleobj.showSpinner(); |

| Hide spinner | Not applicable | **Method:** *hideSpinner()*

 var scheduleobj= document.getElementById('schedule').ej2_instances[0];
 scheduleobj.hideSpinner(); |

| Check whether the time slot is available | Not applicable | **Method:** *isSlotAvailable()*

 var scheduleobj= document.getElementById('schedule').ej2_instances[0];
 var sTime = new Date(2018, 1, 14, 09, 30);
 var eTime = new Date(2018, 1, 14, 10, 30);
 var resCollection = scheduleobj.isSlotAvailable(sTime, eTime); |

| Open the event window manually | Not applicable | **Method:** *openEditor()*

 var scheduleobj= document.getElementById('schedule').ej2_instances[0];
var \$td = document.querySelector(".e-content-table tbody tr td");
var cellDetail = scheduleobj.getCellDetails(\$td);
 scheduleobj.openEditor(cellDetail); |

| Refresh the scheduler | **Method:** *refresh()*

 \$("#Schedule").ejSchedule();
var scheduleobj = \$("#Schedule").data("ejSchedule");
 scheduleobj.refresh(); | **Method:** *refresh()*

 var scheduleobj= document.getElementById('schedule').ej2_instances[0];
scheduleobj.refresh(); |

| Refresh the events | **Method:** *refreshAppointments()*

 \$("#Schedule").ejSchedule();
var scheduleobj = \$("#Schedule").data("ejSchedule");
 scheduleobj.refreshAppointments(); | **Method:** *refreshEvents()*

 var scheduleobj= document.getElementById('schedule').ej2_instances[0];
 scheduleobj.refreshEvents(); |

| Refresh the scroller | **Method:** *refreshScroller()*

 \$("#Schedule").ejSchedule();
var scheduleobj = \$("#Schedule").data("ejSchedule");
 scheduleobj.refreshScroller(); | Not Applicable |

| To remove resources dynamically | **Method:** *removeResource()*

\$("#Schedule").ejSchedule();
 var resID = 1;
var scheduleobj = \$("#Schedule").data("ejSchedule");
scheduleobj.removeResource(resID, "Owners"); | **Method:** *removeResource()*

 var data = { text: "Paul", id: 3, groupId: 1, color: "#cc99ff" };
var index = 0;
var scheduleobj= document.getElementById('schedule').ej2_instances[0];
 scheduleobj.removeResource(index, "Owners",); |

| Export scheduler as PDF | **Method:** *exportSchedule()*

\$("#Schedule").ejSchedule();
 var scheduleobj = \$("#Schedule").data("ejSchedule");
 scheduleobj.exportSchedule("ActionName","null", null);
 | Not Applicable |

| Export scheduler events to ICS | **Method:** *exportSchedule()*

 \$("#Schedule").ejSchedule();
var scheduleobj = \$("#Schedule").data("ejSchedule");
 scheduleobj.exportSchedule("ActionName", "ExportToICS", null);
 | **Method:** *exportToCalendar()*
 var scheduleobj= document.getElementById('schedule').ej2_instances[0];
 scheduleObj.exportToCalendar(); |

| Import scheduler events from ICS | Not Applicable | **Method:** *importCalendar()*
 var scheduleobj= document.getElementById('schedule').ej2_instances[0];
 scheduleObj.importCalendar(); |

| Export scheduler appointments in Excel file | **Method** *exportToExcel()*

 var scheduleobj= \$(“#schedule”).ejSchedule(instance);
 scheduleobj.exportToExcel(“ActionName”, null, true); | **Method:** *exportToExcel()*
 var scheduleobj= document.getElementById(‘schedule’).ej2_instances[0];
 scheduleObj.exportToExcel(); |

| Print the scheduler | **Method:** *print()*

 \$(“#Schedule”).ejSchedule();
 var scheduleobj = \$(“#Schedule”).data(“ejSchedule”);
 scheduleobj.print();
 | Not Applicable |

| Filter appointments | **Method:** *filterAppointments()*

 \$(“#Schedule”).ejSchedule();
 var scheduleobj = \$(“#Schedule”).data(“ejSchedule”);
 var filter = [{ field: “Subject”, operator: “contains”, value: “with”, predicate: “or” }];
 var filteredApp = scheduleobj.filterAppointments(filter); | Not Applicable |

| Search appointments | **Method:** *searchAppointments()*

 \$(“#Schedule”).ejSchedule();
 var scheduleobj = \$(“#Schedule”).data(“ejSchedule”);
 var searchApp = scheduleobj.searchAppointments(“with”); | Not Applicable |

| To edit appointments manually | Not applicable | **Method:** *saveEvent()*

 var scheduleobj= document.getElementById(‘schedule’).ej2_instances[0];
 scheduleobj.saveEvent({
 Id: 1,
 Subject: ‘Event edited’,
 StartTime: new Date(2018, 7, 31, 10, 30),
 EndTime: new Date(2018, 7, 31, 12, 0)}); |

| Setting work hours | Not applicable | **Method:** *setWorkHours()*

 var scheduleobj= document.getElementById(‘schedule’).ej2_instances[0];
 scheduleobj.setWorkHours([new Date(2017, 9, 5)], ‘04:00’, ‘08:00’); |

| Scrolling to specific time | Not applicable | **Method:** *scrollTo()*

 var scheduleobj= document.getElementById(‘schedule’).ej2_instances[0];
 scheduleobj.scrollTo(‘12:00’); |

Events

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Fires on the beginning of each scheduler action | **Event:** *actionBegin*

 \$(“#Schedule”).ejSchedule({
 actionBegin: function OnActionBegin (args){}
 }); | **Event:** *actionBegin*

 var schObj = new ej.schedule.Schedule({
 actionBegin: function onActionBegin(args) {}
 }); |

| Fires on the completion of each scheduler action | **Event:** *actionComplete*

 \$(“#Schedule”).ejSchedule({
 actionComplete: function onActionComplete (args){}
 });
 | **Event:** *actionComplete*

 var schObj = new ej.schedule.Schedule({
 actionComplete: function onActionComplete (args) {}
 }); |

| Fires when the scheduler action gets failed | Not applicable | **Event:** *actionFailure*

 var schObj = new ej.schedule.Schedule({
 actionFailure: function onActionFailure(args) {}
 }); |

| Fires on appointment hover | **Event:** *appointmentHover*

 \$(“#Schedule”).ejSchedule({
 appointmentHover: function onAppointmentHover (args) {}
 }); | Not applicable |

| Fires before an appointment gets created | **Event:** *beforeAppointmentCreate*

 \$("#Schedule").ejSchedule({
 beforeAppointmentCreate: function
 OnBeforeAppointmentCreate (args){}
 }); | **Event:** *actionBegin*

 var schedule = new
 ej.schedule.Schedule({
 actionBegin: function onActionBegin(args) { if(args.requestType ==
 'eventCreate') {} }
 }); |

| Fires before an appointment gets edited | **Event:** *beforeAppointmentChange*

 \$("#Schedule").ejSchedule({
 beforeAppointmentChange: function
 OnBeforeAppointmentChange (args){}
 }); | **Event:** *actionBegin*

 var schedule = new
 ej.schedule.Schedule({
 actionBegin: function onActionBegin(args) { if(args.requestType ==
 'eventChange') {} }
 }); |

| Fires before an appointment gets deleted | **Event:** *beforeAppointmentRemove*

 \$("#Schedule").ejSchedule({
 beforeAppointmentRemove: function
 OnBeforeAppointmentRemove (args){}
 }); | **Event:** *actionBegin*

 var schedule =
 new ej.schedule.Schedule({
 actionBegin: function onActionBegin(args) {
 if(args.requestType == 'eventRemove') {} }
 }); |

| Fires before the context menu opens on scheduler | **Event:** *beforeContextMenuOpen*

 \$("#Schedule").ejSchedule({
 beforeContextMenuOpen: function
 OnBeforeContextMenuOpen (args){}
 }); | Not applicable |

| Fires on cell click | **Event:** *cellClick*

 \$("#Schedule").ejSchedule({
 cellClick: function
 onCellClick (args){}
 }); | **Event:** *cellClick*

 var schObj = new ej.schedule.Schedule({

 cellClick: function onCellClick (args) {}
 }); |

| Fires on cell double click | **Event:** *cellDoubleClick*

 \$("#Schedule").ejSchedule({

 cellDoubleClick: function oncellDoubleClick (args){}
 }); | **Event:** *cellDoubleClick*

 var schObj = new ej.schedule.Schedule({
 cellDoubleClick: function oncellDoubleClick (args)
 {}
 }); |

| Fires on cell hover | **Event:** *CellHover*

 \$("#Schedule").ejSchedule({
 CellHover:
 function onCellHover (args){}
 }); |

| Fires once the scheduler is created | **Event:** *create*

 \$("#Schedule").ejSchedule({

 Create: function onCreate (args){}
 }); | **Event:** *created*

 var schObj = new
 ej.schedule.Schedule({
 created: function oncreated (args) {}
 }); |

| Fires on data binding action | Not applicable | **Event:** *dataBinding*

 var schObj = new
 ej.schedule.Schedule({
 dataBinding: function onDataBinding (args) {}
 }); |

| Fires after the data is bound to the control | Not applicable | **Event:** *dataBound*

 var
 schObj = new ej.schedule.Schedule({
 dataBinding: function onDataBound (args) {}
 }); |

| Fires once the scheduler is destroyed | **Event:** *destroy*

 \$("#Schedule").ejSchedule({

 destroy: function onDestroy (args){}
 }); | **Event:** *destroyed*

 var schObj = new
 ej.schedule.Schedule({
 destroyed: function onDestroyed (args) {}
 }); |

| Fires on event click | **Event:** *appointmentClick*

 \$("#Schedule").ejSchedule({

 appointmentClick: function onAppointmentClick (args) {}
 }); | **Event:** *eventClick*

```
</></> var schObj = new ej.schedule.Schedule({ <br> eventClick: function  
onAppointmentClick(args) {} <br> }); |
```

| Fires on event double click | **Event:** *appointmentDoubleClick*

\$("#Schedule").ejSchedule({
 appointmentDoubleClick: function onappointmentDoubleClick
(args) {}
}); | Not applicable |

| Fires for keyboard actions | **Event:** *keyDown*

 \$("#Schedule").ejSchedule({

keyDown: function onKeyDown (args) {}
}); | Not applicable |

| Fires on context menu item click | **Event:** *menutemClick*

 \$("#Schedule").ejSchedule({

 menutemClick: function onMenuitemClick (args) {}
}); | Not applicable |

| Fires on navigation | **Event:** *navigation*

 \$("#Schedule").ejSchedule({
 navigation:
function onNavigation (args) {}
}); | **Event:** *navigating*

 var schObj = new
ej.schedule.Schedule({
 navigating: function onNavigating(args) {}
 }); |

| Fires on popup open | **Event:** *appointmentWindowOpen*

 \$("#Schedule").ejSchedule({

 appointmentWindowOpen: function onAppointmentWindowOpen (args) {}
}); | **Event:**
popupOpen

 var schObj = new ej.schedule.Schedule({
 popupOpen: function
onPopupOpen(args) {}
 }); |

| Fires on dragging event | **Event:** *drag*

 \$("#Schedule").ejSchedule({
 drag: function
onDrag(args) {}
 }); | **Event:** *drag*

 var schObj = new ej.schedule.Schedule({

drag: function onDrag(args) {}
 }); |

| Fires on drag start | **Event:** *dragStart*

 \$("#Schedule").ejSchedule({
 dragStart:
function onDragStart(args) {}
 }); | **Event:** *dragStart*

 var schObj = new
ej.schedule.Schedule({
 dragStart: function onDragStart(args) {}
 }); |

| Fires on drag stop | **Event:** *dragStop*

 \$("#Schedule").ejSchedule({
 dragStop:
function onDragStop(args) {}
 }); | **Event:** *dragStop*

 var schObj = new
ej.schedule.Schedule({
 dragStop: function onDragStop(args) {}
 }); |

| Fires on overflow button click | **Event:** *overflowButtonClick*

 \$("#Schedule").ejSchedule({

 overflowButtonClick: function onOverflowButtonClick(args) {}
 }); | **Event:** *popupOpen*

 var schedule = new ej.schedule.Schedule({
 popupOpen: function
onPopupOpen(args) { if(args.requestType == 'EventContainer') {} }
 }); |

| Fires on overflow button hover | **Event:** *overflowButtonHover*

\$("#Schedule").ejSchedule({
 overflowButtonHover: function onOverflowButtonHover(args)
{ }
 }); | Not applicable |

| Fires when the reminder action takes place | **Event:** *reminder*

\$("#Schedule").ejSchedule({
 reminder: function onReminder(args) {}
 }); | Not applicable
|

| Fires on resizing event | **Event:** *resize*

 \$("#Schedule").ejSchedule({
 resize: function
onResize(args) {}
 }); | **Event:** *resize*

 var schObj = new ej.schedule.Schedule({

resize: function onResize(args) {}
 }); |

| Fires on resize start | **Event:** *resizeStart*

 `$("#Schedule").ejSchedule({
resizeStart: function onResizeStart(args) {}
 });` | **Event:** *resizeStart*

 `var schObj = new ej.schedule.Schedule({
resizeStart: function onResizeStart (args) {}
 });` |

| Fires on resize stop | **Event:** *resizeStop*

 `$("#Schedule").ejSchedule({
resizeStop: function onResizeStop(args) {}
 });` | **Event:** *resizeStop*

 `var schObj = new ej.schedule.Schedule({
resizeStop: function onResizeStop (args) {}
 });` |

| Fires on rendering of every scheduler elements | **Event:** *queryCellInfo*

 `$("#Schedule").ejSchedule({
queryCellInfo: function onQueryCellInfo (args) {}
 | Event: renderCell

 var schObj = new ej.schedule.Schedule({
renderCell: function onRenderCell (args) {}
 });` |

| Fires before the event rendering on UI | Not applicable | **Event:** *eventRendered*

 `var schObj = new ej.schedule.Schedule({
eventRendered: function onEventRendered (args) {}
 });` |

You can refer to our [JavaScript Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [JavaScript Scheduler example](#) to know how to present and manipulate data.

How To

Add edit and remove events in EJ2 JavaScript Schedule control

CRUD actions can be manually performed on appointments using `addEvent`, `saveEvent` and `deleteEvent` methods as shown below.

Normal event

INDEX.TS

```
import { Schedule, Day, Week, WorkWeek, Month } from '@syncfusion/ej2-schedule';
import { Button } from '@syncfusion/ej2-buttons';
Schedule.Inject(Day, Week, WorkWeek, Month);
let scheduleData: Object[] = [{
  Id: 3,
  Subject: 'Testing',
  StartTime: new Date(2018, 1, 11, 9, 0),
  EndTime: new Date(2018, 1, 11, 10, 0),
  IsAllDay: false
}, {
  Id: 4,
  Subject: 'Vacation',
  StartTime: new Date(2018, 1, 13, 9, 0),
  EndTime: new Date(2018, 1, 13, 10, 0),
  IsAllDay: false
}];
let scheduleObj: Schedule = new Schedule({
  height: '550px',
  selectedDate: new Date(2018, 1, 15),
  views: ['Day', 'Week', 'WorkWeek', 'Month'],
  eventSettings: {
    dataSource: scheduleData
  }
});
```

```

scheduleObj.appendTo('#Schedule');
let button: Button = new Button();
button.appendTo('#btn1');
button.element.onclick = (): void => {
let Data: Object[] = [{
    Id: 1,
    Subject: 'Conference',
    StartTime: new Date(2018, 1, 12, 9, 0),
    EndTime: new Date(2018, 1, 12, 10, 0),
    IsAllDay: false
}],{
    Id: 2,
    Subject: 'Meeting',
    StartTime: new Date(2018, 1, 15, 10, 0),
    EndTime: new Date(2018, 1, 15, 11, 30),
    IsAllDay: false
}
});
scheduleObj.addEvent(Data);
};
let button2: Button = new Button();
button2.appendTo('#btn2');
button2.element.onclick = (): void => {
let Data: Object = {
    Id: 3,
    Subject: 'Testing-edited',
    StartTime: new Date(2018, 1, 11, 10, 0),
    EndTime: new Date(2018, 1, 11, 11, 0),
    IsAllDay: false
};
scheduleObj.saveEvent(Data);
};
let button3: Button = new Button();
button3.appendTo('#btn3');
button3.element.onclick = (): void => {
scheduleObj.deleteEvent(4);
};
};

```

Open event editor manually in EJ2 JavaScript Schedule control

Open Editor Window externally

Scheduler allows the user to manually open the event editor on specific time or on certain events using **openEditor** method. To open the editor on specific range of time, user need to pass the cell details as first argument and **Add** as second argument whereas to open it on event pass that event detail and **Save** as arguments. In the following code example, on clicking the respective button will open the respective editor window manually.

INDEX.TS

```
import { Schedule, Day, Week, WorkWeek, Month } from '@syncfusion/ej2-schedule';
import { Button } from '@syncfusion/ej2-buttons';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Day, Week, WorkWeek, Month);
let scheduleObj: Schedule = new Schedule({
    height: '550px',
    selectedDate: new Date(2018, 1, 15),
    views: ['Day', 'Week', 'WorkWeek', 'Month'],
    eventSettings: { dataSource: scheduleData }
});
scheduleObj.appendTo('#Schedule');
let button1: Button = new Button();
button1.appendTo('#btn1');
let button2: Button = new Button();
button2.appendTo('#btn2');
button1.element.onclick = (): void => {
    let cellData: Object = {
        startTime: new Date(2018, 1, 15, 10, 0),
        endTime: new Date(2018, 1, 15, 11, 0),
    };
    scheduleObj.openEditor(cellData, 'Add');
};
button2.element.onclick = (): void => {
    let eventData: Object = {
        Id: 4,
        Subject: 'Meteor Showers in 2018',
        StartTime: new Date(2018, 1, 14, 13, 0),
        EndTime: new Date(2018, 1, 14, 14, 30)
    };
    scheduleObj.openEditor(eventData, 'Save');
};
```

```

Open editor window on single click

By default, Scheduler Editor window will open when double clicking the cells or appointments. You can also open the editor window with single click by using `openEditor` method in `eventClick` and `cellClick` events of scheduler and setting `false` to `showQuickInfo`. The following example shows how to open editor window on single click of cells and appointments.

INDEX.TS

```

import { Schedule, Day, Week, WorkWeek, Month, CellClickEventArgs,
EventClickArgs } from '@syncfusion/ej2-schedule';
import { Button } from '@syncfusion/ej2-buttons';
import { schedulerData } from './datasource.ts';
Schedule.Inject(Day, Week, WorkWeek, Month);
let scheduleObj: Schedule = new Schedule({
    height: '550px',

```

```

selectedDate: new Date(2021, 7, 15),
views: ['Day', 'Week', 'WorkWeek', 'Month'],
eventSettings: { dataSource: schedulerData },
showQuickInfo: false,
cellClick: (args: CellClickEventArgs) => {
    scheduleObj.openEditor(args, 'Add');
},
eventClick: (args: EventClickArgs) => {
    if (!args.event as any).RecurrenceRule {
        scheduleObj.openEditor(args.event, 'Save');
    }
    else {
        scheduleObj.quickPopup.openRecurrenceAlert();
    }
}
});
scheduleObj.appendTo('#Schedule');

```

Prevent date navigation in EJ2 JavaScript Schedule control

We can prevent navigation while clicking on the date header by simply removing `e-navigate` class from header cells which can be achieved in the `renderCell` event as shown in the following code example.

INDEX.TS

```

import { removeClass } from '@syncfusion/ej2-base';
import { Schedule, Day, Week, WorkWeek, Month, Agenda, RenderCellEventArgs }
from '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Day, Week, WorkWeek, Month, Agenda);
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '500px',
    selectedDate: new Date(2018, 1, 15),
    currentView: 'WorkWeek',
    renderCell: (args: RenderCellEventArgs) => {
        if(args.elementType === "dateHeader" || args.elementType ===
"monthCells") {
            removeClass(args.element.childNodes, "e-navigate");
        }
    },
    eventSettings: {
        dataSource: scheduleData
    }
});
scheduleObj.appendTo('#Schedule');

```

INDEX.HTML

Half yearly view in EJ2 JavaScript Schedule control

The year view of our scheduler displays all the 365 days and their related appointments of a particular year. You can customize the year view by using the following properties.

- [firstMonthOfYear](#)
- [monthsCount](#)
- [monthHeaderTemplate](#)

In the following code example, you can see how to render only the last six months of a year in the scheduler. To start with the month of June, `firstMonthYear` is set to 6 and `monthsCount` is set to 6 to render only 6 months.

INDEX.TS

```

import { Schedule, Year, TimelineYear, DragAndDrop, Resize } from
'@syncfusion/ej2-schedule';
import { Internationalization } from '@syncfusion/ej2-base';
import { resourceData } from './datasource.ts';
Schedule.Inject(Year, TimelineYear, DragAndDrop, Resize);
interface TemplateFunction extends Window {
    getMonthHeaderText?: Function;
}
(window as TemplateFunction).getMonthHeaderText = (date: Date) => { return
date.toLocaleString("en-us", { month: "long" }) + " " + date.getFullYear();
};
let scheduleObj: Schedule = new Schedule({
    width: '100%',
    height: '555px',
    selectedDate: new Date(2021, 7, 4),
    firstMonthOfYear: 6,
    monthsCount: 6,
    monthHeaderTemplate: '<div class="date-
text">${getMonthHeaderText(data.date)}</div>',
    resourceHeaderTemplate: '#resourceTemplate',

```

```

Set different work hours in EJ2 JavaScript Schedule control

By default, the work hours of the Scheduler is highlighted based on the start and end values provided within the `workHours` property which remains same for all days. To highlight different work hours range for different days, `setWorkHours` method. You can pass date object/ multiple date objects collection as first argument and start and end time need to be added as work hours should be passed as second and third arguments respectively. In the following code example, on button click 11:00 AM to 08:00 PM of 15th and 17th February has been added in work hours.

INDEX.TS

```

import { Schedule, Day, Week, WorkWeek, Month } from '@syncfusion/ej2-schedule';
import { Button } from '@syncfusion/ej2-buttons';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Day, Week, WorkWeek, Month);
let scheduleObj: Schedule = new Schedule({
    height: '550px',
    selectedDate: new Date(2018, 1, 15),
    workHours: {
        highlight: true,
        start: '09:00',
        end: '11:00'
    },
    views: ['Day', 'Week', 'WorkWeek', 'Month'],
    eventSettings: { dataSource: scheduleData }
});
scheduleObj.appendTo('#Schedule');
let button: Button = new Button();
button.appendTo('#btn1');
let btnElement: HTMLElement =
<HTMLElement>document.querySelector('#btn1');
let btnElement2: HTMLElement =
<HTMLElement>document.querySelector('#btn2');
btnElement.innerText = 'Change the work hours';
btnElement2.style.display='none';
button.element.onclick = (): void => {
    let dates: Date[] = [new Date(2018, 1, 15), new Date(2018, 1, 17)];
    scheduleObj.setWorkHours(dates, '11:00', '20:00');
};

Zoom in and zoom out the schedule in EJ2 JavaScript Schedule control

By default Scheduler component doesn't have the Zoom in/out support. Using the `timeScale` and `headerRows` properties of our scheduler, we can achieve this.

Refer to the following code example.

INDEX.TS

```

import { Schedule, Week, Month, Agenda, TimelineViews, TimelineMonth,
NavigatingEventArgs } from '@syncfusion/ej2-schedule';
import { scheduleData } from './datasource.ts';
Schedule.Inject(Month, Week, Agenda, TimelineViews, TimelineMonth);
let scheduleObj: Schedule = new Schedule({
    height: "600px",
    width: "100%",
    selectedDate: new Date(2020, 2, 12),
    currentView: "TimelineWeek",
    views: ["TimelineDay", "TimelineWeek", "TimelineMonth"],
    timeScale: {
        enable: true,
        interval: 60,
        slotCount: 2
    },
    navigating: (args: NavigatingEventArgs) => {
        if (args.currentView !== "TimelineMonth") {
            scheduleObj.headerRows = [];
        }
    },
    eventSettings: { dataSource: scheduleData }
});
scheduleObj.appendTo('#Schedule');
window.addEventListener("wheel", event => {
    const delta = Math.sign(event.deltaY);
    if (scheduleObj.currentView === "TimelineMonth") {
        var len = scheduleObj.headerRows.length;
        if (delta < 0) {
            if (len == 0) {
                scheduleObj.setProperties({
                    headerRows: [{ option: "Date" }]
                });
            } else if (len == 1) {
                scheduleObj.setProperties({
                    headerRows: [{ option: "Week" }, { option: "Date" }]
                });
            } else if (len == 2) {
                scheduleObj.setProperties({
                    headerRows: [
                        { option: "Month" },
                        { option: "Week" },
                        { option: "Date" }
                    ]
                });
            } else if (len == 3) {
                scheduleObj.setProperties({
                    headerRows: [
                        { option: "Year" },
                        { option: "Month" },
                        { option: "Week" },

Show entire time in responsive mode in EJ2 JavaScript Schedule control

9 AM is visible since it has enough space in responsive mode, but if you set 08:45 AM as start hour of scheduler then the time slots will not show full time in the time slot of responsive scheduler, for which we can use `majorSlotTemplate` to set proper time slots in scheduler.

INDEX.TS

```

import { Schedule, Day, Week, WorkWeek } from "@syncfusion/ej2-schedule";
import { Internationalization } from "@syncfusion/ej2-base";
import { scheduleData } from './datasource.ts';
Schedule.Inject(Day, Week, WorkWeek);
let instance: Internationalization = new Internationalization();
(window as TemplateFunction).majorSlotTemplate = (date: Date) => {
    return instance.formatDate(date, { skeleton: "hm" });
};
interface TemplateFunction extends Window {
    majorSlotTemplate?: Function;
}
let scheduleObj: Schedule = new Schedule({
    width: "100%",
    height: "550px",

Enable scroll option on all day section in EJ2 JavaScript Schedule control

When you have larger number of appointments in all-day row, it is difficult to view all the appointments properly. In that case you can enable scroller option for all-day row by setting true to `enableAllDayScroll` whereas its default value is false. When setting this property to true, individual scroller for all-day row is enabled when it reaches its maximum height on expanding.

Note: This property is not applicable for Scheduler with height `auto`.

INDEX.TS

```

import { Schedule, Day, Week, WorkWeek, Month, Agenda } from
'@syncfusion/ej2-schedule';
import { generateObject } from './datasource.ts';
Schedule.Inject(Day, Week, WorkWeek, Month, Agenda);
let data: Object[] = generateObject();
let scheduleObj: Schedule = new Schedule({
    height: '550px',
    selectedDate: new Date(2021, 3, 28),
    enableAllDayScroll: true,
    eventSettings: { dataSource: data }
});
scheduleObj.appendTo('#Schedule');

```

Manual refresh in EJ2 JavaScript Schedule control

In Scheduler, we can able to refresh the layout manually without re-render the DOM element by using the [refreshLayout](#) public method. The following example code explains to know how to use the refreshLayout method.

INDEX.TS

```

import { Schedule, Day, Week, WorkWeek, Month } from '@syncfusion/ej2-
schedule';
import { Button } from '@syncfusion/ej2-buttons';
Schedule.Inject(Day, Week, WorkWeek, Month);

```

```

let scheduleData: Object[] = [
    {
        Id: 1,
        Subject: 'Testing',
        StartTime: new Date(2021, 10, 16, 10, 0),
        EndTime: new Date(2021, 10, 16, 12, 0),
        IsAllDay: false
    }, {
        Id: 2,
        Subject: 'Vacation',
        StartTime: new Date(2021, 10, 18, 10, 0),
        EndTime: new Date(2021, 10, 18, 12, 0),
        IsAllDay: false
    }
];
let scheduleObj: Schedule = new Schedule({
    height: '550px',
    selectedDate: new Date(2021, 10, 15),
    views: ['Day', 'Week', 'WorkWeek', 'Month'],
    eventSettings: {
        dataSource: scheduleData
    }
});
scheduleObj.appendTo('#Schedule');
let button: Button = new Button({
    cssClass: 'e-info'
});
button.appendTo('#btn1');
button.element.onclick = (): void => {
    scheduleObj.refreshLayout();
};

```

```

Sidebar

Getting started in EJ2 JavaScript Sidebar control

The Essential JS 2 for JavaScript (global script) is an ES5 formatted pure JavaScript framework which can be directly used in latest web browsers.

Component Initialization

Create an app folder **myapp** in local machine to initialize Essential JS 2 JavaScript components.

Using either of the following way to refer the required script and styles.

- Using local script and style references in a HTML page.
- Using CDN link for script and style reference.

Using local script and style references in a HTML page

Step 1: Create an app folder **myapp** for Essential JS 2 JavaScript components.

Step 2: You can get the global scripts and styles from the [Essential Studio JavaScript \(Essential JS 2\)](#) build installed location.

Syntax:

Script: **(installed location)\Syncfusion\Essential Studio\JavaScript - EJ2\{RELEASEVERSION}\Web (Essential JS 2)\JavaScript\{PACKAGENAME}\dist\global\{PACKAGE_NAME}.min.js**

Styles: **(installed location)\Syncfusion\Essential Studio\JavaScript - EJ2\{RELEASEVERSION}\Web (Essential JS 2)\JavaScript\{PACKAGENAME}\styles\material.css**

Example:

Script: C:\Program Files (x86)\Syncfusion\Essential Studio\JavaScript - EJ2\16.3.0.17\Web (Essential JS 2)\JavaScript\ej2-navigations\dist\global\ej2-navigations.min.js

Styles: C:\Program Files (x86)\Syncfusion\Essential Studio\JavaScript - EJ2\16.3.0.17\Web (Essential JS 2)\JavaScript\ej2-navigations\styles\material.css

The below located script and style file contains all Syncfusion JavaScript (ES5) UI control resources in a single file.

Scripts: **(installed location)**\Syncfusion\Essential Studio\JavaScript - EJ2\{RELEASE_VERSION}\Web (Essential JS 2)\JavaScript\ej2\dist\ej2.min.js

Styles: **(installed location)**\Syncfusion\Essential Studio\JavaScript - EJ2\{RELEASE_VERSION}\Web (Essential JS 2)\JavaScript\ej2\material.css

Step 3: Create a folder `myapp/resources` and copy/paste the above mentioned packages from the above installed location to `myapp/resources` location.

Step 4: Create a HTML page (`index.html`) in `myapp` location and add the Essentials JS 2 script and style references.

```
`html
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<title>Essential JS 2</title>
<!-- Essential JS 2 material theme -->
<link href="resources/material.css" rel="stylesheet" type="text/css"/>
<!-- Essential JS 2 Sidebar's global and dependent script -->
<script src="resources/ej2-base.min.js" type="text/javascript"></script>
<script src="resources/ej2-navigations.min.js" type="text/javascript"></script>
</head>
<body>
</body>
</html>
`
```

Step 5: Now, add the `div` element and initiate the `Essential JS 2 Sidebar` component in the `index.html` by using following code

```
`html
```

```
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<title>Essential JS 2</title>
<!-- Essential JS 2 material theme -->
<link href="resources/material.css" rel="stylesheet" type="text/css"/>
<!-- Essential JS 2 Sidebar's global and dependent script -->
<script src="resources/ej2-base.min.js" type="text/javascript"></script>
<script src="resources/ej2-navigations.min.js" type="text/javascript"></script>
</head>
<body>
<!-- Add the HTML <div> element -->
<div id='container'>
<aside id="default">
<div class="title"> Sidebar </div>
</aside>
<!-- end of sidebar element -->
<!-- main content declaration -->
<div>
<div class="title">Main content</div>
<div class="sub-title"> Content goes here</div>
</div>
</div>
<script>
// initialize Sidebar component
var defaultSidebar = new ej.navigations.Sidebar();
// Render initialized sidebar.
defaultSidebar.appendTo('#default')
</script>
</body>
</html>
,
```

Step 6: Now, run the `index.html` in web browser, it will render the **Essential JS 2 Sidebar** component.

Using CDN link for script and style reference

Step 1: The Essential JS 2 components scripts and styles are already hosted in the below CDN link formats.

Syntax:

Script: `http://cdn.syncfusion.com/ej2/{PACKAGENAME}/dist/global/{PACKAGENAME}.min.js`

Style: `http://cdn.syncfusion.com/ej2/{PACKAGE_NAME}/styles/material.css`

Example:

Script: <http://cdn.syncfusion.com/ej2/ej2-navigations/dist/global/ej2-navigations.min.js>

Styles: <http://cdn.syncfusion.com/ej2/ej2-navigations/styles/material.css>

Step 2: Have to add CDN global script and style for Sidebar and its dependent packages in `myapp/index.html` like below.

```
`html
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<title>Essential JS 2 Sidebar Component</title>
<!-- Sidebar and its dependent theme -->
<link href="http://cdn.syncfusion.com/ej2/ej2-base/styles/material.css" rel="stylesheet"
type="text/css" />

<!-- Essential JS 2 Sidebar's global script -->
<script src="http://cdn.syncfusion.com/ej2/ej2-navigations/dist/global/ej2-navigations.min.js"
type="text/javascript"></script>
</head>
<body>
<!-- Add the HTML <div> element -->
<div id='container'>
<aside id="default">
<div class="title"> Sidebar </div>
</aside>
<!-- end of sidebar element -->
```

```

<!-- main content declaration -->
<div>
<div class="title">Main content</div>
<div class="sub-title"> Content goes here</div>
</div>
</div>
<script>
// initialize Sidebar component
var defaultSidebar = new ej.navigations.Sidebar();
// Render initialized sidebar.
defaultSidebar.appendTo('#default')
</script>
</body>
</html>
`

```

When referencing CDN links in application, always ensure the network connection will be in enabled state.

Enable backdrop

Enabling the `showBackdrop` in the Sidebar component will prevent the main content from user interactions, when it is in expanded state.

Here, the DOM elements will not get changed. It only closes the main content by covering with a black backdrop overlay and focuses the Sidebar in the screen. Sidebar can be rendered with specific width by setting `width` property.

Note: To achieve a proper **backdrop**, we suggest that you create a wrapper parent container for the div block in which you intend to enable the backdrop. Set the class name of this parent container as the **target** for the Sidebar. Alternatively, you can place an empty div container after the target container.

INDEX.JS

```

ej.base.enableRipple(true);
//sidebar initialization
var defaultSidebar = new ej.navigations.Sidebar({
  showBackdrop: true,
  type: "Push",
  width: '280px'
});
defaultSidebar.appendTo('#default-sidebar');
//end of sidebar initialization
// Toggle(Open/Close) the sidebar
document.getElementById('toggle').onclick = function() {
  defaultSidebar.toggle();
};
// Close the sidebar

```

```
document.getElementById('close').onclick = function() {
    defaultSidebar.hide();
};
//end of sidebar initialization
// Toggle(Open/Close) the sidebar
```

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Position

Positioning the Sidebar to the right or left of the main content can be achieved by using the `position` property. If the position is not set, the Sidebar will expand from the left to the body element. `enablePersistence` will persist the component's state between page reloads. `change` event will be triggered when the state(expand/collapse) of the component is changed.

INDEX.JS

```

ej.base.enableRipple(true);
//sidebar initialization
var defaultSidebar = new ej.navigations.Sidebar({
    showBackdrop: true,
    enablePersistence: true,
    type: "Push",
    width: '280px'
});
defaultSidebar.appendTo('#default-sidebar');
//end of Sidebar initialization
//toggle button initialization
var togglebtn = new ej.buttons.Button({iconCss: 'e-icons burg-icon',
isToggle: true, content: 'Open'}, '#toggle');
//Click Event for toggle button to trigger show/hide methods of Sidebar
document.getElementById('toggle').onclick = function(){
    if (document.getElementById('toggle').classList.contains('e-active')) {
        togglebtn.content = 'Close';
        defaultSidebar.show();
    } else {
        togglebtn.content = 'Open';
        defaultSidebar.hide();
    }
};
// Close the sidebar
document.getElementById('close').onclick = function() {
    defaultSidebar.hide();
    document.getElementById('toggle').classList.remove('e-active');
    togglebtn.content = 'Open'
};

```

Animate

Animation transitions can be set while expanding or collapsing the Sidebar using the `animate` property. By default, `animate` property is set to true. `enableRTL` will display the sidebar in the right-to-left direction.

INDEX.JS

```

ej.base.enableRipple(true);

var defaultSidebar = new ej.navigations.Sidebar({
    type: "Push",
    width: '280px',
    animate: false,
    enableRtl: true
});
defaultSidebar.appendTo('#default-sidebar');
//end of Sidebar initialization
// Toggle(Open/Close) the sidebar
document.getElementById('toggle').onclick = function() {
    defaultSidebar.toggle();
};
// Close the sidebar
document.getElementById('close').onclick = function() {
    defaultSidebar.hide();
};
//end of sidebar initialization
// Toggle(Open/Close) the sidebar

```

</body></html>

```

Close on document click

Sidebar can be closed on document click by setting `closeOnDocumentClick` to true. If this property is not set, the Sidebar will not close on document click since its default value is false. Sidebar can be kept opened during rendering using `isOpen` property.

INDEX.JS

```
ej.base.enableRipple(true);

var defaultSidebar = new ej.navigations.Sidebar({
  type: "Push",
  width: '280px',
  closeOnDocumentClick: true,
  isOpen: true
});
defaultSidebar.appendTo('#default-sidebar');
//end of Sidebar initialization
// Toggle(Open/Close) the sidebar
document.getElementById('toggle').onclick = function() {
  defaultSidebar.show();
};
//end of sidebar initialization
// Toggle(Open/Close) the sidebar
```

Custom context in EJ2 JavaScript Sidebar control

Sidebar has a flexible option to make it initialize, target to any HTML element alongside of the main content of a web page.

By default, Sidebar initializes target to the body element. Using the [target](#) property, set target element to initialize the Sidebar inside any HTML element apart from the body element.

If required, `zIndex` can be set when sidebar act as overlay type.

In the following sample, sidebar is rendered context to a div container element which has the CSS class `e-main-content`.

INDEX.TS

```
import { Sidebar } from '@syncfusion/ej2-navigations';
import { Button } from '@syncfusion/ej2-buttons';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
let defaultSidebar: Sidebar = new Sidebar({
    width: "280px",
    type: "Push",
    target: '.maincontent'
});
defaultSidebar.appendTo('#default-sidebar');
//end of Sidebar initialization
//toggle button initialization
let togglebtn: Button = new Button({iconCss: 'e-icons burg-icon', isToggle:
true, content:'Open'}, '#toggle');
// Close the Sidebar
document.getElementById('close').onclick = (): void => {
    defaultSidebar.hide();
    document.getElementById('toggle').classList.remove('e-active');
    togglebtn.content = 'Open'
};
//Click Event.
document.getElementById('toggle').onclick = (): void => {
    if (document.getElementById('toggle').classList.contains('e-
active')) {
        togglebtn.content = 'Close';
        defaultSidebar.show();
    } else {
        togglebtn.content = 'Open';
        defaultSidebar.hide();
    }
};
```

</body></html>

```

Variations in EJ2 JavaScript Sidebar control

The Sidebar component's expand behaviour can be modified based on the purpose of use.

Expanding types of Sidebar

The Sidebar can be set to initialize based on four different types that are consistent with the main component as explained below. When `dataBind` is invoked, this applies the pending property changes immediately to the component.

Item	Description
Over	Sidebar floats over the main content area.
Push	Sidebar pushes the main content area to appear side-by-side, and shrinks the main content within the screen width.
Slide	Sidebar translates the x and y positions of main content area based on the Sidebar width. The main content area will not be adjusted within the screen width.
Auto	Sidebar with Over type in mobile resolution, and Push type in other higher resolutions.

Auto is the default expand mode. Sidebar with type **Auto** will always expand on initial rendering, irrespective of [enableDock](#) and [isOpen](#) properties.

In the following sample, the types of Sidebar are demonstrated.

INDEX.TS

```
import { Sidebar } from '@syncfusion/ej2-navigations';
import { Button, RadioButton, ChangeArgs } from '@syncfusion/ej2-buttons';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
let defaultSidebar: Sidebar = new Sidebar({
    type: "Push",
    target: <HTMLElement>document.querySelector('.maincontent'),
});
defaultSidebar.appendTo('#default-sidebar');
//end of Sidebar initialization
//toggle button initialization
let togglebtn: Button = new Button({iconCss: 'e-icons burg-icon', isToggle:
true, content:'Open'}, '#toggle');
//Click Event.
document.getElementById('toggle').onclick = (): void => {
    if (document.getElementById('toggle').classList.contains('e-
active')) {
        togglebtn.content = 'Close';
        defaultSidebar.show();
    } else {
        togglebtn.content = 'Open';
        defaultSidebar.hide();
    }
};
// Close the Sidebar
document.getElementById('close').onclick = (): void => {
    defaultSidebar.hide();
    document.getElementById('toggle').classList.remove('e-active');
    togglebtn.content = 'Open'
};
let typeOver: RadioButton = new RadioButton({ label: 'Over', name: 'state',
change: Change });

Auto close in EJ2 JavaScript Sidebar control

The Sidebar often behaves differently on mobile display and differently on desktop display. It has an effective feature that offers to set it in opened or closed state depending on the specified resolution. This is achieved through [mediaQuery](#) property that allows you to set the Sidebar in an expanded state or collapsed state only in user-defined resolution.

In the following sample, `mediaQuery` has been used to close and open the Sidebar based on a specific resolution.

INDEX.TS

```

import { Sidebar } from '@syncfusion/ej2-navigations';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
let defaultSidebar: Sidebar = new Sidebar({
  mediaQuery: window.matchMedia('(min-width: 600px)'), width: "280px",
});
defaultSidebar.appendTo('#default');
//end of Sidebar initialization
}

```

Docking sidebar in EJ2 JavaScript Sidebar control

[Dock](#) state of the Sidebar reserves some space on the page that always remains in a visible state when the Sidebar is collapsed. It is used to show the short term of a content like icons alone instead of lengthy text. To achieve this, set `enableDock` as true along with required `dockSize`.

In the following sample, the list item has icon with text representation. On dock state, only icons in list will be visible to represent the hint of the hidden text content.

INDEX.TS

```

import { Sidebar } from '@syncfusion/ej2-navigations';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(false);
//Sidebar initialization
let dockBar: Sidebar = new Sidebar({
  width: '220px',
  dockSize: '72px',

```

```

    enableDock: true
  });
dockBar.appendTo('#dockSidebar');
//end of Sidebar initialization
document.getElementById('toggle').onclick = (): void => {
  dockBar.toggle();
};

```

Style in EJ2 JavaScript Sidebar control

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user's preference.

Customizing the sidebar

Use the below CSS to customize the sidebar root element.

```

.e-sidebar {
background: #898b2b
}

```

Customizing the sidebar based on the positions

Use the below CSS to customize the left positioned sidebar.

```

.e-sidebar.e-left {
border-right: 2px solid red;
}

```

```
}  
,
```

Use the below CSS to customize the right positioned sidebar.

```
,
```

```
.e-sidebar.e-right {  
border-left: 2px solid red;  
}
```

```
,
```

Customizing the sidebar based on the active state

Use the below CSS to customize the open state of the left positioned sidebar.

```
,
```

```
.e-sidebar.e-left.e-open {  
transition: transform 2.5s ease;  
}
```

```
,
```

Use the below CSS to customize the open state of the right positioned sidebar.

```
,
```

```
.e-sidebar.e-right.e-open {  
transition: transform 2.5s ease;  
}
```

```
,
```

Use the below CSS to customize the closed state of the left positioned sidebar.

```
,
```

```
.e-sidebar.e-left.e-transition.e-close {  
transition: transform 2.5s ease, visibility 1200ms;  
}
```

```
,
```

Use the below CSS to customize the closed state of the right positioned sidebar.

```
,
```

```
.e-sidebar.e-right.e-transition.e-close {  
transition: transform 2.5s ease, visibility 1200ms;  
}
```

```
,
```

Customizing the sidebar with dock state

When you enable the Dock support, the "e-dock" class will be added to the root element. Based on that class, you can also customize all the above stated customization. Use the following CSS to customize the sidebar element with a dock state.

```
、  
  
.e-sidebar.e-dock {  
background: #2d323e;  
}  
、
```

Customizing the different types of sidebar

Use the below CSS to customize the auto type sidebar.

```
、  
  
.e-sidebar.e-left.e-auto {  
background-color: pink;  
}  
、
```

Use the below CSS to customize the push type sidebar.

```
、  
  
.e-sidebar.e-left.e-push {  
background-color: beige;  
}  
、
```

Use the below CSS to customize the over type sidebar.

```
、  
  
.e-sidebar.e-left.e-over {  
background-color: aqua;  
}  
、
```

Use the below CSS to customize the slide type sidebar.

```
、  
  
.e-sidebar.e-left.e-slide {  
background-color: green;  
}  
、
```

Customizing the backdrop of the sidebar

Use the below CSS to customize the backdrop of the sidebar.

,

```
.e-sidebar-overlay {
background-color: aqua;
}
```

,

Customizing the sidebar in the RTL direction

When you enable the RTL (right to left direction) support, the "e-rtl" class will be added to the root element. Based on that class, you can also customize all the above stated customization. Use the following CSS to customize the sidebar element in the RTL (right to left direction) mode.

,

```
.e-sidebar.e-left.e-rtl {
background-color: antiquewhite;
}
```

,

Prevent the animation transition for the Sidebar component

Use the below CSS to prevent the animation transition for the Sidebar component.

,

```
.e-sidebar-context .e-content-animation {
transition: none !important;
transform: none !important;
}
```

,

Accessibility in EJ2 JavaScript Sidebar component

The Sidebar component followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Sidebar component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support | |

| [Section 508](#) Support | |

| Screen Reader Support | |

| Right-To-Left Support | |

| Color Contrast | |

| Mobile Device Support | |

| Keyboard Navigation Support | |

| [Accessibility Checker](#) Validation | |

| [Axe-core](#) Accessibility Validation | |

<style>

```
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
```

</style>

<div> - All features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

WAI-ARIA attributes

The Sidebar component followed the [WAI-ARIA](#) patterns to meet accessibility standards. By default, the Sidebar utilizes the [complementary](#) role, with the option to modify the ARIA role based on provided attributes to the root element, depending on the specific use case.

If there are multiple complementary landmark roles or aside elements in a document, it is important to provide a label for each landmark using the `aria-label` attribute. Alternatively, if the aside has a descriptive title, it can be referenced using the `aria-labelledby` attribute. This label will help assistive technology users quickly understand the purpose of each landmark.

For optimal accessibility, it is recommended to incorporate a trigger component that is navigable via a keyboard, such as a button. If this is not feasible, inclusion of the `tabIndex` attribute becomes necessary. Furthermore, explicit handling of the `aria-expanded` attribute is required for the trigger element.

Keyboard interaction

The Sidebar component does not have any inbuilt keyboard interaction support. However, you can utilize the keyboard interactions of focusable elements within the Sidebar component.

Ensuring accessibility

The Sidebar component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Sidebar component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Sidebar component with accessibility tools.

How To

Sidebar with list view in EJ2 JavaScript Sidebar control

Any HTML element can be placed in the Sidebar content area. Sidebar supports all types of HTML structures like `TreeView`, `ListView`, etc.

In the following example, the Sidebar is rendered with `ListView` component in its content area.

INDEX.TS

```
import { Sidebar } from '@syncfusion/ej2-navigations';
import { ListView } from '@syncfusion/ej2-lists';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
// Initialize ListView component
let data: { [key: string]: Object }[] = [
    { text: 'Home', id: 'list-02' },
    { text: 'Offers', id: 'list-03' },
    { text: 'Support', id: 'list-04' },
    { text: 'Logout', id: 'list-06' }
];
let listInstance: ListView = new ListView({
    //Set defined data to dataSource property
    dataSource: data
});
//Render initialized ListView component
listInstance.appendTo('#list');
let defaultSidebar: Sidebar = new Sidebar({
    type: "Over", width: '100%'
});
defaultSidebar.appendTo('#default-sidebar');
//end of Sidebar initialization
// Toggle(Open/Close) the Sidebar
document.getElementById('toggle').onclick = (): void => {
    defaultSidebar.toggle();
};
// Close the Sidebar
document.getElementById('close').onclick = (): void => {
    defaultSidebar.hide();
};
```

if(ele) {
    ele.style.visibility = "visible";

```

```

}
    </script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Open and close the sidebar in EJ2 JavaScript Sidebar control

Opening and closing the Sidebar can be achieved with built-in public methods.

- [show\(\)](#): Method to open the Sidebar.
- [hide\(\)](#): Method to close the Sidebar.
- [toggle\(\)](#): Method to toggle between open and close states of the Sidebar.

In the following sample, toggle method has been used to show or hide the Sidebar on button click.

INDEX.TS

```

import { Sidebar } from '@syncfusion/ej2-navigations';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
//Sidebar initialization
let defaultSidebar: Sidebar = new Sidebar({
    showBackdrop: false,
    open: function(e)
    {
        console.log("Sidebar is opened");
    },
    close: function(e)
    {
        console.log("Sidebar is closed");
    }
});
defaultSidebar.appendTo('#default');
//end of Sidebar initialization
// Open the Sidebar
document.getElementById('open').onclick = (): void => {
    defaultSidebar.show();
};
// Toggle(Open/Close) the Sidebar
document.getElementById('toggle').onclick = (): void => {
    defaultSidebar.toggle();
};
// Close the Sidebar
document.getElementById('close').onclick = (): void => {
    defaultSidebar.hide();
};

```

Top and bottom sidebar in EJ2 JavaScript Sidebar control

You can initialize Sidebar at the left and right positions by using the [position](#) property. It will automatically adjust the width of the main content.

You can also initialize Sidebar at the top and bottom positions in application level. For initializing Sidebar, you need to manually adjust the height of the main content.

In the following sample, the [toggle](#) method has been used to show or hide the top and bottom sidebar on button click.

INDEX.TS

```
import { Sidebar } from '@syncfusion/ej2-navigations';
import { Button } from '@syncfusion/ej2-buttons';
// Top sidebar initialization
let topSidebar: Sidebar = new Sidebar({ type: "Push", open:
top_sidebar_open, close: top_sidebar_close });
topSidebar.appendTo('#top-sidebar');
// Bottom sidebar initialization
let bottomSidebar: Sidebar = new Sidebar({ type: "Push", open:
bottom_sidebar_open, close: bottom_sidebar_close });
bottomSidebar.appendTo('#bottom-sidebar');
// Top sidebar toggle button initialization
let topBtn: Button = new Button({ cssClass: 'e-info' });
topBtn.appendTo('#top-btn');
// Bottom sidebar toggle button initialization
let bottomBtn: Button = new Button({ cssClass: 'e-info' });
bottomBtn.appendTo('#bottom-btn');
topBtn.element.onclick = ()=>{
    topSidebar.toggle();
}
bottomBtn.element.onclick = ()=>{
    bottomSidebar.toggle();
}

Multiple sidebar in EJ2 JavaScript Sidebar control

Two Sidebars can be initialized in a web page with same main content.

Sidebar can be initialized on right side or left side of the main content using `position` property.

The HTML element with class name `e-main-content` will be considered as the main content and both the Sidebars will behave as side content to this main content area of a web page.

INDEX.TS

```
import { Sidebar } from '@syncfusion/ej2-navigations';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
let leftSidebar: Sidebar = new Sidebar({
    width: "200px",
    type: 'Push'
});
leftSidebar.appendTo('#default');
//end of leftSidebar initialization
let rightSidebar: Sidebar = new Sidebar({
    width: "200px",
    position: 'Right',
    type: 'Push'
});
rightSidebar.appendTo('#default1');
//end of rightSidebar initialization
// Toggle (Open/Close) the Sidebar1
document.getElementById('toggle-btn').onclick = function () {
```

```

    leftSidebar.toggle();
};
// Toggle(Open/Close) the Sidebar2
document.getElementById('toggle-btn2').onclick = function () {
    rightSidebar.toggle();
};

```

Multiple sidebar in same position in EJ2 JavaScript Sidebar control

You can initialize Sidebar at the left positions by using the [position](#) property. It will automatically adjust the width of the main content.

You can also initialize the another sidebar on the same position by adjusting the width of the first sidebar.

The following example demonstrate how to align the multiple sidebar on the same position.

INDEX.TS

```

import { Sidebar } from '@syncfusion/ej2-navigations';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
//Dock Sidebar initialization
let dockBar: Sidebar = new Sidebar({
    width: '220px',
    dockSize: '72px',
    enableDock: true,
    type: 'Push',
    target: 'e-main-content',
    zIndex: 3000
});
dockBar.appendTo('#dockSidebar');
//end of DockSidebar initialization
let defaultSidebar: Sidebar = new Sidebar({
    target: 'e-main-content',
    type: "Push",
});
defaultSidebar.appendTo('#default-sidebar');
//end of DefaultSidebar initialization
//switch the expand and collapse state
document.getElementById('buttonClick').onclick = function () {
    defaultSidebar.toggle();
};

```
