            <div class="sidebar-content">
                <h2 class="sidebar-heading"> Responsive Sidebar With
TreeView</h2>
                <p class="paragraph-content">This is a graphical aid for
visualising and categorising the site, in the
                    style of an expandable and collapsable treeview
component. It auto-expands to display the node(s),
                        if any, corresponding to the currently viewed title,
highlighting that node(s) and its ancestors.
                            Load-on-demand when expanding nodes is available where
supported (most graphical browsers), falling
                                back to a full-page reload. MediaWiki-supported caching,
aside from squid, has been considered so
                                    that unnecessary re-downloads of content are avoided
where possible. The complete
                                        expanded/collapsed state of the treeview persists across
page views in most situations.</p>

Fixed sidebar in EJ2 JavaScript Sidebar control

The Sidebar does not require any specific style to make it as a fixed one. By default, the Sidebar position will be in fixed state. The following example demonstrates that the Sidebar is rendered with a fixed position. The position of the Sidebar will not change when scrolling the main content area.

INDEX.TS

```

import { Sidebar } from '@syncfusion/ej2-navigations';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
// Sidebar Initialization
let defaultSidebar: Sidebar = new Sidebar({
    width: '260px',
    created: onCreate
});

```

```

defaultSidebar.appendTo('#default-sidebar');
//end of Sidebar initialization
document.getElementById('hamburger').onclick = (): void => {
    defaultSidebar.toggle();
}
function onCreate(): void {
    this.element.style.visibility = '';
}

```

Sidebar with variation animation in EJ2 JavaScript Sidebar control

In the following example, the sidebar is rendered with custom animation effects. Click the buttons available in the main content area to check how the custom animations works with sidebar.

Sidebar will automatically adjust expanding animation to match any custom size specified in **CSS** styles.

INDEX.TS

```

import { Sidebar } from '@syncfusion/ej2-navigations';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
let sidebarElement: Sidebar = new Sidebar({
    showBackdrop: true,width: '280px', created: oncreate
});
sidebarElement.appendTo('#sidebar-element');
document.getElementById('zoom').onclick = (): void => {
    sidebarElement.show();
    sidebarElement.element.classList.add("w3-animate-zoom");
}
// Opendoor Effect
document.getElementById('open_door').onclick = (): void => {
    sidebarElement.show();
    let sidebar: Element =document.getElementsByClassName("e-sidebar-
overlay")[0];

```

```

        sidebar.classList.add("move");
    }
    //Bottom to Top
    document.getElementById('bottom_top').onclick = (): void => {
        sidebarElement.show();
        sidebarElement.element.classList.add("w3-animate-bottom");
    }
    //Rotate Sidebar
    document.getElementById('rotate').onclick = (): void => {
        sidebarElement.show();
        sidebarElement.element.classList.add("rotate");
    }
    //Sidebar with 3d Animation
    document.getElementById('rotate_3d').onclick = (): void => {
        sidebarElement.show();
        sidebarElement.element.classList.add("rotate_3d");
    }
    //Reverse Slide Out
    document.getElementById('reverse').onclick = (): void => {
        sidebarElement.show();
        sidebarElement.element.classList.add("reverse_slide_out");
    }
    // Close the Sidebar
    document.getElementById('close_btn').onclick = (): void => {
        sidebarElement.element.classList.remove("sidebar");
        sidebarElement.element.classList.remove("rotate");
        sidebarElement.element.classList.remove("w3-animate-zoom");
        sidebarElement.element.classList.remove("w3-animate-bottom");
        sidebarElement.element.classList.remove("rotate_3d");
        sidebarElement.element.classList.remove("reverse_slide_out");
        sidebarElement.hide();
    };
    //Remove the Flickering Effect
    function oncreate(): void {
        this.element.style.visibility = '';
    }

Signature

Customization in EJ2 JavaScript Signature control

The Signature control draws stroke/path using moveTo() and lineTo() methods to connect one or more points while drawing in canvas. The stroke width can be modified by using its color and width. And the background can be modified by using its background color and background image.

Stroke Width

The variable stroke width is based on the values of [maxStrokeWidth](#), [minStrokeWidth](#) and [velocity](#) for smoother and realistic signature. The default value of minimum stroke width is set as 0.5, maximum stroke width is set as 2.5 and velocity is set as 0.7.

In the following example, minimum stroke width is set as 0.5, maximum stroke width is set as 3 and velocity is set as 0.7.

INDEX.TS

```
import { Signature } from '@syncfusion/ej2-inputs';
let signature: Signature = new Signature({maxStrokeWidth:3, minStrokeWidth:
0.5, velocity: 0.7});
signature.appendTo('#signature');
```

INDEX.HTML

Open save in EJ2 JavaScript Signature control

The Signature control supports to open the signature by using hosted/online URL or base64. And it also supports various save options like image, base64, and blob.

Open Signature

The signature control opens a pre-drawn signature as either base64 or hosted/ online URL using the [load](#) method. It supports the PNG, JPEG, and SVG image's base64.

INDEX.TS

```
import { Signature } from '@syncfusion/ej2-inputs';
import { Button } from '@syncfusion/ej2-buttons';
let signature: Signature = new Signature({});
signature.appendTo('#signature');
let button: Button = new Button({cssClass: 'e-primary', '#open'});
button.element.onclick = function (e) {
    let sign: string = document.getElementById('text').value;
    signature.load(sign);
};
```

#text {
    height: 30px;
    width: 400px;
}

```

Save Signature

The Signature control saves the signature as base64, blob, and image like PNG, JPEG, and SVG.

Save as Base64

The `getSignature` method is used to get the signature as base64 with the PNG, JPEG, and SVG type. This can be loaded to signature using [load](#) method.

INDEX.TS

```
import { Signature } from '@syncfusion/ej2-inputs';
import { Button } from '@syncfusion/ej2-buttons';
import { Dialog } from '@syncfusion/ej2-popups';
let signature: Signature = new Signature({});
signature.appendTo('#signature');
let dialogObj: Dialog = new Dialog({
    header: 'Base64 of the signature',
    height: 'auto',
    animationSettings: { effect: 'Zoom', duration: 400 },
    showCloseIcon: true,
    width: '80%',
    visible: false
});
dialogObj.appendTo('#defaultdialog');
let button: Button = new Button({cssClass: `e-primary`, content: 'Save As Base64'}, '#save');
document.getElementById('save').onclick = (): void => {
    dialogObj.content = signature.getSignature();
    dialogObj.show();

```

Save as Blob

The [saveAsBlob](#) method is used to save the signature as Blob. It is defined as the chunk of binary data stored as a single entity in a database system.

Save as Image

The [save](#) method is used to save the signature as an image. And it accepts file name and file type as parameter. The file type parameter supports PNG, JPEG, and SVG and the default file type is PNG.

INDEX.TS

```
import { Signature, SignatureFileType } from '@syncfusion/ej2-inputs';
```

```
import { SplitButton, ItemModel, MenuEventArgs } from '@syncfusion/ej2-splitbuttons';

```

Save with Background

The [saveWithBackground](#) property is used to save the signature with its background and its default value is true. So, by default the signature is saved with its background.

In the following sample, the background color is set as 'rgb(103 58 183)' and save with background as true.

INDEX.TS

```

import { Signature, SignatureFileType } from '@syncfusion/ej2-inputs';
import { SplitButton, ItemModel, MenuEventArgs } from '@syncfusion/ej2-splitbuttons';
let signature: Signature = new Signature({saveWithBackground: true,
backgroundColor:"rgb(103 58 183)"});
signature.appendTo('#signature');
let items: ItemModel[] = [
    {
        text: 'Png'
    },
    {
        text: 'Jpeg'
    },
    {
        text: 'Svg'
    }
];
let splitBtn: SplitButton = new SplitButton({iconCss: 'e-sign-icons e-save',
items: items, content: 'Save', select: onSelect }, '#save');
function onSelect(args: MenuEventArgs): void {
    signature.save(args.item.text as SignatureFileType, 'Signature');
}
document.getElementById('save').onclick = function () {
    signature.save();
}

Draw in EJ2 JavaScript Signature control

Draw

The [draw](#) method is used to draw a text as signature with different font families like Arial, Serif, with different font sizes. It accepts text, font family, font size as its parameters. The default font family is “Arial”, and the default font size is “30”.

INDEX.TS

```

import { Signature } from '@syncfusion/ej2-inputs';
import { DropDownList } from '@syncfusion/ej2-dropdowns';
import { Button } from '@syncfusion/ej2-buttons';
let signature: Signature = new Signature({});
signature.appendTo('#signature');
let ddlObj: DropDownList = new DropDownList(
    {
        value: 'Arial',
        popupHeight: '200px',
    });
ddlObj.appendTo('#ddl');
let ddlObj1: DropDownList = new DropDownList(
    {
        value: '20',
        popupHeight: '200px',
    });
ddlObj1.appendTo('#ddl1');
let button: Button = new Button({cssClass: 'e-primary'}, '#draw');
button.element.onclick = function (e) {
    let text: string = document.getElementById('text').value;
    let font: string = ddlObj.value;
    let size: number = ddlObj1.value;
    signature.draw(text, font, size);
};

```

User interaction in EJ2 JavaScript Signature control

The below interactions were available in Signature, and we can walk through one by one.

- Undo and Redo
- Clear
- Disabled
- ReadOnly

Undo and Redo

In the Signature, every action can be maintained as a snap for undo and redo operations. And maintained SnapIndex for indexing the snap collection.

The [undo](#) method reverts the last action of signature by decreasing SnapIndex value to index previous snap. Here, [canUndo](#) method is used to ensure whether undo can be performed or not.

The [redo](#) method reverts the last undo action of the signature by increasing the SnapIndex to get the next snap. Here, [canRedo](#) method is used to ensure whether redo can be performed or not.

Clear

The [clear](#) method is used to clear the signature and makes the canvas empty. This is also considered in Undo/ Redo. Here, [isEmpty](#) method is used to ensure whether the signature is empty or not.

Disabled

The [disabled](#) property is used to enable/disable the signature control. In the disabled state, the user is not allowed to draw signature. And it can't be focused until the user enables the signature.

ReadOnly

The [isReadOnly](#) property is used to enable/disable the ReadOnly Signature. It can be focused but it prevents drawing in Signature.

The following sample explains about user interactions available in signature.

INDEX.TS

```
import { Signature, SignatureChangeEventArgs } from '@syncfusion/ej2-inputs';
import { CheckBox, ChangeEventArgs, Button } from '@syncfusion/ej2-buttons';
let signature: Signature = new Signature({change: changeEvent});
signature.appendTo('#signature');
let undoButton: Button = new Button({cssClass: 'e-primary', disabled: true},
'#undo');
undoButton.element.onclick = function (e) {
    if (!signature.disabled && !signature.isReadOnly) {
        signature.undo();
    }
};
let redoButton: Button = new Button({cssClass: 'e-primary', disabled: true},
'#redo');
redoButton.element.onclick = function (e) {
    if (!signature.disabled && !signature.isReadOnly) {
        signature.redo();
    }
};
let clearButton: Button = new Button({cssClass: 'e-primary', disabled:
true}, '#clear');
clearButton.element.onclick = function (e) {
    if (!signature.disabled && !signature.isReadOnly) {
        signature.clear();
    }
};
let checkBox1: CheckBox = new CheckBox({ label: 'Disabled', change:
onChangeDisable}, '#disable');
function onChangeDisable(args: ChangeEventArgs): void {
    signature.disabled = args.checked;
}
let checkBox2: CheckBox = new CheckBox({ label: 'ReadOnly', change:
onChangeReadOnly}, '#readonly');
function onChangeReadOnly(args: ChangeEventArgs): void {
    signature.isReadOnly = args.checked;
}
function changeEvent(args: SignatureChangeEventArgs) {
    if (!signature.disabled && !signature.isReadOnly) {
        if (signature.canUndo()) {
            undoButton.disabled = false;
        } else {
```

```

        undoButton.disabled = true;
    }
    if (signature.canRedo()) {
        redoButton.disabled = false;
    } else {
        redoButton.disabled = true;
    }
    if (!signature.isEmpty()) {
        clearButton.disabled = false;
    } else {
        clearButton.disabled = true;
    }
}
}

```

Accessibility in EJ2 JavaScript Signature control

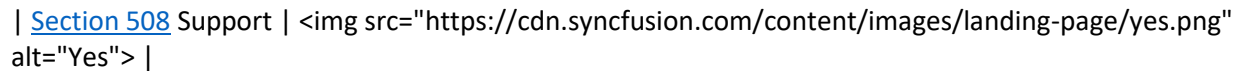

The Signature component followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

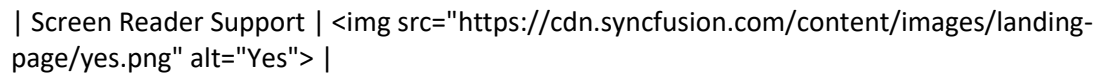

The accessibility compliance for the Signature component is outlined below.

| Accessibility Criteria | Compatibility |

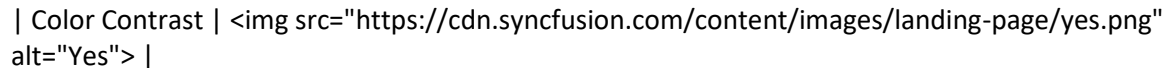

| -- | -- |

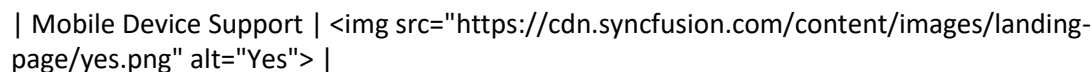

| [WCAG 2.2](#) Support |  |

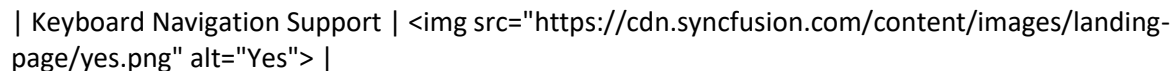

| [Section 508](#) Support |  |

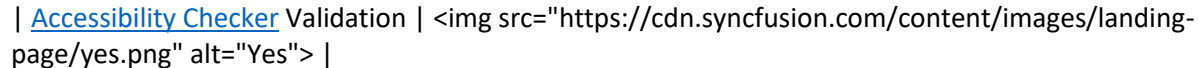

| Screen Reader Support |  |

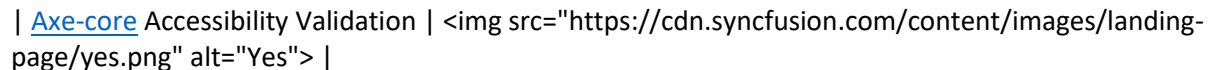

| Right-To-Left Support | Not Applicable |

| Color Contrast |  |

| Mobile Device Support |  |

| Keyboard Navigation Support |  |

| [Accessibility Checker](#) Validation |  |

| [Axe-core](#) Accessibility Validation |  |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<div> - All features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

Keyboard interaction

The Signature component followed the [keyboard interaction] guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Signature component.

| **Press** | **To do this** |

| --- | --- |

| **Ctrl + Z** | **Undo the last action.** |

| **Ctrl + Y** | **Redo the last action.** |

| **Ctrl + S** | **To save the signature.** |

| **delete** | **Erases all the signature strokes signed by user.** |

Ensuring accessibility

The Signature component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Signature component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Signature component with accessibility tools.

How To

Toolbar integration in EJ2 JavaScript Signature control

The Signature control integrates with the toolbar and the interaction performed using the `change` event of the toolbar. In that, [canUndo](#), [canRedo](#) and [isEmpty](#) methods were used to enable/disable undo, redo, and clear buttons.

INDEX.TS

```
import { Toolbar, ClickEventArgs } from '@syncfusion/ej2-navigations';
import { CheckBox, ChangeEventArgs } from '@syncfusion/ej2-buttons';

Skeleton

Shapes in EJ2 JavaScript Skeleton control

The Skeleton control support various built-in shape variants to design layout of the page. You can use the [shape](#) property to create a preview of any layout.

The Skeleton component supports the following shapes,

Circle skeleton shape

```
`js
// Initialize Skeleton control for circle shape
var circle = new ej.notifications.Skeleton({
  shape: 'Circle',
  width: "48px"
});
// Render initialized Skeleton.
circle.appendTo('#circleSkeleton');
`
```

Square skeleton shape

```
`js
// Initialize Skeleton control for square shape
var square = new ej.notifications.Skeleton({
  shape: 'Square',
  width: "48px"
});
// Render initialized Skeleton.
square.appendTo('#squareSkeleton');
`
```

Rectangle skeleton shape

```
`js
// Initialize Skeleton control for rectangle shape
var rect = new ej.notifications.Skeleton({
  shape: "Rectangle",
  height: '50px'
});
// Render initialized Skeleton.
rect.appendTo('#rectSkeleton');
```

Text skeleton shape

`js

// Initialize Skeleton control for text shape

```
var text = new ej.notifications.Skeleton({
  shape: "Text",
  height: "15px"
})
```

// Render initialized Skeleton.

text.appendTo('#textSkeleton');

Below example demonstrates the above functionalities of a Skeleton control.

INDEX.JS

```
ej.base.enableRipple(true);
// Initialize Skeleton control for circle shape
var cardProfile = new ej.notifications.Skeleton({shape: 'Circle', width:
'60px', height: '60px'});
// Render initialized Skeleton.
cardProfile.appendTo('#cardProfile');
var text1 = new ej.notifications.Skeleton({width: '30%', height: '15px'});
text1.appendTo('#text1');
var text2 = new ej.notifications.Skeleton({width: '15%', height: '15px'});
text2.appendTo('#text2');
var cardImage = new ej.notifications.Skeleton({shape: 'Rectangle', width:
'100%', height: '150px'});
cardImage.appendTo('#cardImage');
var rightOption = new ej.notifications.Skeleton({shape: 'Rectangle', width:
'20%', height: '32px'});
rightOption.appendTo('#rightOption');
var leftOption = new ej.notifications.Skeleton({shape: 'Rectangle', width:
'20%', height: '32px'});
leftOption.appendTo('#leftOption');
```

INDEX.HTML

            </div>
        </div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Shimmer effect in EJ2 JavaScript Skeleton control

You can use the [shimmerEffect](#) property to change animation effect in the skeleton control. Skeleton supports **Wave**, **Pulse** and **Fade** effects and by default, the **shimmerEffect** is set to **Wave** effect.

```

`js
// Initialize Skeleton control with pulse effect
var pulse = ej.notifications.Skeleton({
    shape: 'Circle',
    width: "60px",
    shimmerEffect: 'Pulse'
});
// Render initialized Skeleton.
pulse.appendTo('#pulseSkeleton');
`

```

Below example demonstrates a list with pulse effect skeleton.

INDEX.JS

```
ej.base.enableRipple(true);
// Initialize Skeleton control
var listProfile = new ej.notifications.Skeleton({
  shape: 'Circle',
  width: '40px',
  height: '40px',
  shimmerEffect: 'Pulse'
});
// Render initialized Skeleton.
listProfile.appendTo('#listProfile');
var listProfile1 = new ej.notifications.Skeleton({
  shape: 'Circle',
  width: '40px',
  height: '40px',
  shimmerEffect: 'Pulse'
});
listProfile1.appendTo('#listProfile1');
var listCtn = new ej.notifications.Skeleton({
  width: '60%',
  height: '15px',
  shimmerEffect: 'Pulse'
});
listCtn.appendTo('#listCtn');
var listCtn1 = new ej.notifications.Skeleton({
  width: '60%',
  height: '15px',
  shimmerEffect: 'Pulse'
});
listCtn1.appendTo('#listCtn1');
var distCtn = new ej.notifications.Skeleton({
  width: '40%',
  height: '15px',
  shimmerEffect: 'Pulse'
});
distCtn.appendTo('#distCtn');
var distCtn1 = new ej.notifications.Skeleton({
  width: '40%',
  height: '15px',
  shimmerEffect: 'Pulse'
});
distCtn1.appendTo('#distCtn1');
```

```

Styles in EJ2 JavaScript Skeleton control

You can customize skeleton control in the below ways.

cssClass

You can customize the style of a Skeleton control by using [cssClass](#). The appearance of JavaScript Skeleton can be customized by changing the wave color, background color, width, and height. For detailed information, refer `styles.css` file below.

INDEX.JS

```

ej.base.enableRipple(true);
// Initialize Skeleton control
var circle = new ej.notifications.Skeleton({
    shape: 'Circle',
    width: "60px",
    cssClass: 'e-customize'

```

```
});
// Render initialized Skeleton.
circle.appendTo('#circleSkeleton');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Skeleton</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
notifications/styles/material.css" rel="stylesheet">
  <link href="styles.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div style="position:relative;min-height:310px;border:1px solid;
padding:20px;">
      <div id="circleSkeleton"></div>
    </div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Visible

You can use the [visible](#) property which defines the visible state of Skeleton.

```
`js
```

```
// Initialize Skeleton control in hidden state
```

```
var circle: Skeleton = new ej.notifications.Skeleton({
shape: 'Circle',
width: "60px",
visible: false
});
```

```
// Render initialized Skeleton
circle.appendTo('#circleSkeleton');
`
```

Accessibility in EJ2 JavaScript Skeleton control

Accessibility is achieved in the Skeleton control through WAI-ARIA standard. The Skeleton control can be effectively accessed through assistive technologies such as screen readers.

ARIA attributes

The Skeleton control characterized with complete ARIA accessibility support that helps to be accessible by on-screen readers and other assistive technology devices. The following ARIA attributes are applicable for Skeleton control.

Properties	Functionality
role	This attribute is added to the input element to describe the actual role.
aria-label	Attribute provides the text label with some default description for the Skeleton.
aria-live	The aria-live attribute indicates the priority of updates to a live region.
aria-busy	This attribute is set to true when component is shown.

Smithchart

Getting started in EJ2 JavaScript Smithchart control

This section explains you the steps required to create a Smith Chart and demonstrate the basic usage of the Smith Chart control.

Dependencies

Below is the list of minimum dependencies required to use the Smith Chart.

```
`javascript
|-- @syncfusion/ej2-charts
|-- @syncfusion/ej2-base
|-- @syncfusion/ej2-data
|-- @syncfusion/ej2-svg-base
|-- @syncfusion/ej2-pdf-export
|-- @syncfusion/ej2-compression
|-- @syncfusion/ej2-file-utils
`
```

Installation and Configuration

- To get you started with Smith Chart component, you can clone the

[Essential JS 2 quickstart](#) project

and install necessary packages by using the following commands.

`

```
git clone https://github.com/syncfusion/ej2-quickstart.git quickstart
```

```
cd quickstart
```

```
npm install
```

`

- **Smith Chart packages** need to be mapped in **system.config.js** configuration file.

```
`javascript
```

```
System.config({
```

```
paths: {
```

```
'syncfusion:': './node_modules/@syncfusion/',
```

```
},
```

```
map: {
```

```
app: 'app',
```

```
//Syncfusion packages mapping
```

```
"@syncfusion/ej2-base": "syncfusion:ej2-base/dist/ej2-base.umd.min.js",
```

```
"@syncfusion/ej2-data": "syncfusion:ej2-data/dist/ej2-data.umd.min.js",
```

```
"@syncfusion/ej2-svg-base": "syncfusion:ej2-svg-base/dist/ej2-svg-base.umd.min.js",
```

```
"@syncfusion/ej2-pdf-export": "syncfusion:ej2-pdf-export/dist/ej2-pdf-export.umd.min.js",
```

```
"@syncfusion/ej2-compression": "syncfusion:ej2-compression/dist/ej2-compression.umd.min.js",
```

```
"@syncfusion/ej2-file-utils": "syncfusion:ej2-file-utils/dist/ej2-file-utils.umd.min.js",
```

```
"@syncfusion/ej2-popups": "syncfusion:ej2-popups/dist/ej2-popups.umd.min.js",
```

```
"@syncfusion/ej2-buttons": "syncfusion:ej2-buttons/dist/ej2-buttons.umd.min.js",
```

```
"@syncfusion/ej2-charts": "syncfusion:ej2-charts/dist/ej2-charts.umd.min.js",
```

```
},
```

```
packages: {
```

```
'app': { main: 'app', defaultExtension: 'js' }
```

```
}
```

```
});
```

```
`
```

The [project](#) is preconfigured with common settings (**src/styles/styles.css**, **system.config.js**) to start with all Essential JS 2 components.

Add Smith Chart to the Project

Add the HTML div element for Smith Chart into your `index.html`. [src/index.html]

```
`html
<!DOCTYPE html>
<html lang="en">
<head>
<title>EJ2 Animation</title>
<meta charset="utf-8" />
<meta name="viewport" content="width=device-width, initial-scale=1.0" />
<meta name="description" content="Typescript UI Controls" />
<meta name="author" content="Syncfusion" />
<link href="index.css" rel="stylesheet" />
<script src="https://cdnjs.cloudflare.com/ajax/libs/systemjs/0.19.38/system.js"></script>
<script src="systemjs.config.js"></script>
</head>
<body>
<!--container which is going to render the Smith Chart-->
<div id='container'>
</div>
</body>
</html>
`
```

Now import the Smithchart component into your `index.ts` to instantiate a smithchart and append the smithchart instance to the `#container`

```
`javascript
import { Smithchart } from '@syncfusion/ej2-charts';
// initialize Smithchart component
let smithchart: Smithchart = new Smithchart();
// render initialized Smithchart
smithchart.appendTo('#container');
`
```

Now use the `npm run start` command to run the application in the browser.

npm run start

The below example shows a basic Smithchart.

INDEX.TS

```
import { Smithchart } from '@syncfusion/ej2-charts';
let smithchart: Smithchart = new Smithchart();
smithchart.appendTo('#container');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>

  <title>Essential JS 2 for Smith chart </title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Essential JS 2 for Smithchart UI
Control">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <link href="//cdn.syncfusion.com/ej2/21.2.3/ej2-
charts/styles/material.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Module Injection

Smithchart component are segregated into individual feature-wise modules. In order to use a particular feature, you need to inject its feature module using `Smithchart.Inject()` method. In the current application, we are going to modify the above basic smithchart to visualize transmission lines.

For this application we are going to use tooltip and legend feature of the smithchart. Please find relevant feature module name and description as follows.

- SmithchartLegend - Inject this provider to use legend feature.

- TooltipRender - Inject this provider to use tooltip feature.

Now import the above mentioned modules from smithchart package and inject it into the Smithchart component using `Smithchart.Inject` method.

```
`javascript
```

```
import { Smithchart, SmithchartLegend, TooltipRender } from '@syncfusion/ej2-charts';
```

```
Smithchart.Inject(SmithchartLegend, TooltipRender);
```

```
,
```

Add Series to Smithchart

Smithchart had two type of specification for adding series.

- dataSource - Using this, Data object can bind directly by specifying the resistance and reactance values, series add to smithchart.
- points - Using this, collection of resistance and reactance values can bind directly to render series.

Below sample demonstrate adding two series to smithchart both ways.

- First series Transmission1 shows dataSource bound series.
- Second series Transmission2 shows points bound series.

INDEX.TS

```
import { Smithchart } from '@syncfusion/ej2-charts';
let smithchart: Smithchart = new Smithchart({
  series: [
    {
      dataSource: [
        { resistance: 0, reactance: 0.05 }, { resistance: 0,
reactance: 0.05 },
        { resistance: 0, reactance: 0.05 }, { resistance: 0,
reactance: 0.05 },
        { resistance: 0, reactance: 0.05 }, { resistance: 0,
reactance: 0.05 },
        { resistance: 0, reactance: 0.05 }, { resistance: 0,
reactance: 0.05 },
        { resistance: 0.3, reactance: 0.1 }, { resistance: 0.5,
reactance: 0.2 },
        { resistance: 1.5, reactance: 0.5 }, { resistance: 2.0,
reactance: 0.5 },
        { resistance: 2.5, reactance: 0.4 }, { resistance: 3.5,
reactance: 0.0 },
        { resistance: 2.5, reactance: 0.4 }, { resistance: 3.5,
reactance: 0.0 },
        { resistance: 2.5, reactance: 0.4 }, { resistance: 3.5,
reactance: 0.0 },
        { resistance: 4.5, reactance: -0.5 }, { resistance: 5.0,
reactance: -1.0 }
      ]
    }
  ]
});
```

```

    ],
    name: 'Transmission1',
    reactance: 'reactance', resistance: 'resistance'
  },
  {
    points: [{ resistance: 0, reactance: 0.15 }, { resistance: 0,
reactance: 0.15 },
    { resistance: 0, reactance: 0.15 }, { resistance: 0.3,
reactance: 0.2 },
    { resistance: 0.3, reactance: 0.2 }, { resistance: 0.3,
reactance: 0.2 },
    { resistance: 0.3, reactance: 0.2 }, { resistance: 0.3,
reactance: 0.2 },
    { resistance: 0.5, reactance: 0.4 }, { resistance: 1.0,
reactance: 0.8 },
    { resistance: 2.5, reactance: 1.3 }, { resistance: 3.5,
reactance: 1.6 },
    { resistance: 3.5, reactance: 1.6 }, { resistance: 3.5,
reactance: 1.6 },
    { resistance: 4.5, reactance: 2.0 }, { resistance: 6.0,
reactance: 4.5 },
    { resistance: 8, reactance: 6 }, { resistance: 10, reactance: 25
}],
    name: 'Transmission2'
  }
]
});
smithchart.appendTo('#container');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

  <title>Essential JS 2 for Smith chart </title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

}

</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Add title to SmithChart

smithchart **title** API used to add title for smithchart. In that **text** API used to set text of the title.

API **visible** used to toggle the title.

INDEX.TS

```

import { Smithchart } from '@syncfusion/ej2-charts';
let smithchart: Smithchart = new Smithchart({
    title: { text: 'Transmission lines applied for both impedance and admittance' },
    series: [
        {
            dataSource: [
                { resistance: 0, reactance: 0.05 }, { resistance: 0, reactance: 0.05 },
                { resistance: 0, reactance: 0.05 }, { resistance: 0, reactance: 0.05 },
                { resistance: 0, reactance: 0.05 }, { resistance: 0, reactance: 0.05 },
                { resistance: 0, reactance: 0.05 }, { resistance: 0, reactance: 0.05 },
                { resistance: 0, reactance: 0.05 }, { resistance: 0, reactance: 0.05 },

Enable Marker to Smithchart

To use series marker and its customization in smithchart, use series **marker**. To display marker for particular series, need to specify **marker visible** as true. Below sample marker enabled for first series only.

INDEX.TS

```

import { Smithchart } from '@syncfusion/ej2-charts';
let smithchart: Smithchart = new Smithchart({
  title: { text: 'Transmission lines applied for both impedance and admittance' },
  series: [
    {
      dataSource: [
        { resistance: 0, reactance: 0.05 }, { resistance: 0, reactance: 0.05 },
        { resistance: 0, reactance: 0.05 }, { resistance: 0, reactance: 0.05 },
        { resistance: 0, reactance: 0.05 }, { resistance: 0, reactance: 0.05 },
        { resistance: 0, reactance: 0.05 }, { resistance: 0, reactance: 0.05 },
        { resistance: 0.3, reactance: 0.1 }, { resistance: 0.5, reactance: 0.2 },
        { resistance: 1.5, reactance: 0.5 }, { resistance: 2.0, reactance: 0.5 },
        { resistance: 2.5, reactance: 0.4 }, { resistance: 3.5, reactance: 0.0 },
        { resistance: 2.5, reactance: 0.4 }, { resistance: 3.5, reactance: 0.0 },
        { resistance: 2.5, reactance: 0.4 }, { resistance: 3.5, reactance: 0.0 },
        { resistance: 4.5, reactance: -0.5 }, { resistance: 5.0, reactance: -1.0 }
      ],
      name: 'Transmission1',
      reactance: 'reactance', resistance: 'resistance',
      marker: {
        visible: true
      }
    },
    {
      points: [{ resistance: 0, reactance: 0.15 }, { resistance: 0, reactance: 0.15 },
        { resistance: 0, reactance: 0.15 }, { resistance: 0.3, reactance: 0.2 },
        { resistance: 0.3, reactance: 0.2 }, { resistance: 0.3, reactance: 0.2 },
        { resistance: 0.3, reactance: 0.2 }, { resistance: 0.3, reactance: 0.2 },
        { resistance: 0.5, reactance: 0.4 }, { resistance: 1.0, reactance: 0.8 },
        { resistance: 2.5, reactance: 1.3 }, { resistance: 3.5, reactance: 1.6 },
        { resistance: 3.5, reactance: 1.6 }, { resistance: 3.5, reactance: 1.6 },
        { resistance: 4.5, reactance: 2.0 }, { resistance: 6.0, reactance: 4.5 },
        { resistance: 8, reactance: 6 }, { resistance: 10, reactance: 25 }
      ],
    }
  ]
});

```

```

        name: 'Transmission2'
    }
    ]
});
smithchart.appendTo('#container');
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

```

Enable DataLabel to Smithchart Marker

To use marker dataLabel and its customization in smithchart, use marker dataLabel. To display dataLabel for particular series marker, need to specify dataLabel visible as true in that series marker. Below sample dataLabel enabled for first series.

INDEX.TS

```

import { Smithchart } from '@syncfusion/ej2-charts';
let smithchart: Smithchart = new Smithchart({
    title: { text: 'Transmission lines applied for both impedance and
admittance'},
    series: [
        {
            dataSource: [
```

```

    { resistance: 0, reactance: 0.05 }, { resistance: 0,
reactance: 0.05 },
    { resistance: 0, reactance: 0.05 }, { resistance: 0,
reactance: 0.05 },
    { resistance: 0, reactance: 0.05 }, { resistance: 0,
reactance: 0.05 },
    { resistance: 0, reactance: 0.05 }, { resistance: 0,
reactance: 0.05 },
    { resistance: 0.3, reactance: 0.1 }, { resistance: 0.5,
reactance: 0.2 },
    { resistance: 1.5, reactance: 0.5 }, { resistance: 2.0,
reactance: 0.5 },
    { resistance: 2.5, reactance: 0.4 }, { resistance: 3.5,
reactance: 0.0 },
    { resistance: 2.5, reactance: 0.4 }, { resistance: 3.5,
reactance: 0.0 },
    { resistance: 2.5, reactance: 0.4 }, { resistance: 3.5,
reactance: 0.0 },
    { resistance: 4.5, reactance: -0.5 }, { resistance: 5.0,
reactance: -1.0 }
    ],
    name: 'Transmission1',
    reactance: 'reactance', resistance: 'resistance',
    marker: {
        visible: true,
        dataLabel: {
            visible: true
        }
    }
},
{
    points: [{ resistance: 0, reactance: 0.15 }, { resistance: 0,
reactance: 0.15 },
    { resistance: 0, reactance: 0.15 }, { resistance: 0.3,
reactance: 0.2 },
    { resistance: 0.3, reactance: 0.2 }, { resistance: 0.3,
reactance: 0.2 },
    { resistance: 0.3, reactance: 0.2 }, { resistance: 0.3,
reactance: 0.2 },
    { resistance: 0.5, reactance: 0.4 }, { resistance: 1.0,
reactance: 0.8 },
    { resistance: 2.5, reactance: 1.3 }, { resistance: 3.5,
reactance: 1.6 },
    { resistance: 3.5, reactance: 1.6 }, { resistance: 3.5,
reactance: 1.6 },
    { resistance: 4.5, reactance: 2.0 }, { resistance: 6.0,
reactance: 4.5 },
    { resistance: 8, reactance: 6 }, { resistance: 10, reactance: 25
}],
    name: 'Transmission2'
}
]
});
smithchart.appendTo('#container');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

  <title>Essential JS 2 for Smith chart </title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Enable Legend for Smithchart

Smithchart had a legend feature, which is used to denote the correspond series. To enable the legend, need to inject `SmithchartLegend` module using `Smithchart.Inject(SmithchartLegend)` method and smithchart `legendSettings` visible as true. Following example sample shows enabling legend for smithchart. Series name can customize using series `name`.

INDEX.TS

```

import { Smithchart, SmithchartLegend } from '@syncfusion/ej2-charts';
Smithchart.Inject(SmithchartLegend);
let smithchart: Smithchart = new Smithchart({
  title: { text: 'Transmission lines applied for both impedance and
admittance' },
  legendSettings: {
    visible: true
  },
  series: [
    {
      dataSource: [

```

```

        { resistance: 0, reactance: 0.05 }, { resistance: 0,
reactance: 0.05 },
        { resistance: 0, reactance: 0.05 }, { resistance: 0,
reactance: 0.05 },
        { resistance: 0, reactance: 0.05 }, { resistance: 0,
reactance: 0.05 },
        { resistance: 0, reactance: 0.05 }, { resistance: 0,
reactance: 0.05 },
        { resistance: 0.3, reactance: 0.1 }, { resistance: 0.5,
reactance: 0.2 },
        { resistance: 1.5, reactance: 0.5 }, { resistance: 2.0,
reactance: 0.5 },
        { resistance: 2.5, reactance: 0.4 }, { resistance: 3.5,
reactance: 0.0 },
        { resistance: 2.5, reactance: 0.4 }, { resistance: 3.5,

Enable Tooltip for Smithchart Series

Smithchart had a tooltip feature, which is used to show the current point's values. To enable the tooltip, need to inject **TooltipRender** module using **Smithchart.Inject(TooltipRender)** method and smithchart series **tooltip visible** as true. Following example sample shows enabling tooltip for smithchart series collection.

INDEX.TS

```

import { Smithchart, SmithchartLegend, TooltipRender} from '@syncfusion/ej2-
charts';
Smithchart.Inject(SmithchartLegend, TooltipRender);
let smithchart: Smithchart = new Smithchart({
  title: { text: 'Transmission lines applied for both impedance and
admittance'},
  legendSettings: {
    visible: true
  },
  series: [
    {
      dataSource: [

```

```

    { resistance: 0, reactance: 0.05 }, { resistance: 0,
reactance: 0.05 },
    { resistance: 0, reactance: 0.05 }, { resistance: 0,
reactance: 0.05 },
    { resistance: 0, reactance: 0.05 }, { resistance: 0,
reactance: 0.05 },

Working with data in EJ2 JavaScript Smithchart control

Smithchart can visualise the data bound from local data. The data you bind for the smithchart, should be an array of object and that should contain the field resistance and reactance. This should be bind to points or datasource in the smithchart.

Data Binding

You can bind simple JSON data to smithchart using point property in series. JSON data should contain [resistance] and [reactance] fields. This JSON data should be bind to points or datasource in the smithchart. You can any number of JSON for points or datasource as per your requirement.

INDEX.TS

```

import { Smithchart } from '@syncfusion/ej2-charts';
let smithchart: Smithchart = new Smithchart({
  series: [
```

```

    {
        points: [
            { resistance: 10, reactance: 25 }, { resistance: 8,
reactance: 6 },
            { resistance: 6, reactance: 4.5 }, { resistance: 4.5,
reactance: 2 },
            { resistance: 3.5, reactance: 1.6 }, { resistance: 2.5,
reactance: 1.3 },
            { resistance: 2, reactance: 1.2 }, { resistance: 1.5,
reactance: 1 },
            { resistance: 1, reactance: 0.8 }, { resistance: 0.5,
reactance: 0.4 },
            { resistance: 0.3, reactance: 0.2 }, { resistance: 0,
reactance: 0.15 },
        ],
    }, {
        points: [
            { resistance: 20, reactance: -50 }, { resistance: 10,
reactance: -10 },
            { resistance: 9, reactance: -4.5 }, { resistance: 8,
reactance: -3.5 },
            { resistance: 7, reactance: -2.5 }, { resistance: 6,
reactance: -1.5 },
            { resistance: 5, reactance: -1 }, { resistance: 4.5,
reactance: -0.5 },
            { resistance: 3.5, reactance: 0 }, { resistance: 2.5,
reactance: 0.4 },
            { resistance: 2, reactance: 0.5 }, { resistance: 1.5,
reactance: 0.5 },
            { resistance: 1, reactance: 0.4 }, { resistance: 0.5,
reactance: 0.2 },
            { resistance: 0.3, reactance: 0.1 }, { resistance: 0,
reactance: 0.05 },
        ],
    },
],
});
smithchart.appendTo('#container');

```

Smith chart dimensions in EJ2 JavaScript Smithchart control

You can render the smithchart either corresponding to its container size or you can set the size of the smithchart as per your requirement. To render the smithchart corresponding to its container size, you need to set the size for the smithchart container. Else to set the size for the smithchart as per your requirement, you can use the width and height properties in the smithchart.

Size for Container

You can render smithchart to it's container size. To achieve this, you need to specify the width and height of the smithchart's container via inline or CSS as demonstrated below.

```

`javascript
<div id='container'>
<div id='element' style="width:650px; height:350px;"></div>
</div>
`

```

INDEX.TS

```

import { Smithchart } from '@syncfusion/ej2-charts';
let smithchart: Smithchart = new Smithchart({
    series: [
        {
            points: [
                { resistance: 10, reactance: 25 }, { resistance: 8,
reactance: 6 },

```

```

    { resistance: 6, reactance: 4.5 }, { resistance: 4.5,
reactance: 2 },
    { resistance: 3.5, reactance: 1.6 }, { resistance: 2.5,
reactance: 1.3 },
    { resistance: 2, reactance: 1.2 }, { resistance: 1.5,
reactance: 1 },
    { resistance: 1, reactance: 0.8 }, { resistance: 0.5,
reactance: 0.4 },
    { resistance: 0.3, reactance: 0.2 }, { resistance: 0,
reactance: 0.15 },
    ],
    },
  ],
});
smithchart.appendTo('#container');
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

</head>
<body>

  <div id="container">
  </div>
  <script src="app.js"></script>
  <script>
    let loader = document.getElementById('loader');
    let container = document.getElementById('container');
    if (loader) {
      loader.style.display = "none";
    }
    if (container) {
      container.style.visibility = "visible";
    }
  </script>
  <script>
  var ele = document.getElementById('container');
  if(ele) {
    ele.style.visibility = "visible";
  }
  </script>
```

```
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Size for Smithchart

You can also set size for smithchart directly through `[width]` and `[height]` properties. Using this properties, you can directly mention the width and height of the smithchart in pixels or you can set the width and height in percentage.

In Pixel

In smithchart's width and height property, you can directly give values in pixels like below demonstration. This will render smithchart in same size as you mentioned in you code.

INDEX.TS

```
import { Smithchart } from '@syncfusion/ej2-charts';
let smithchart: Smithchart = new Smithchart({
  width: '650px',
  height: '300px',
  series: [
    {
      points: [
        { resistance: 10, reactance: 25 }, { resistance: 8,
reactance: 6 },
        { resistance: 6, reactance: 4.5 }, { resistance: 4.5,
reactance: 2 },
        { resistance: 3.5, reactance: 1.6 }, { resistance: 2.5,
reactance: 1.3 },
        { resistance: 2, reactance: 1.2 }, { resistance: 1.5,
reactance: 1 },
        { resistance: 1, reactance: 0.8 }, { resistance: 0.5,
reactance: 0.4 },
        { resistance: 0.3, reactance: 0.2 }, { resistance: 0,
reactance: 0.15 },
      ],
    }
  ],
});
smithchart.appendTo('#container');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 for Smith chart </title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Essential JS 2 for Smithchart UI
Control">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
charts/styles/material.css" rel="stylesheet">
```

```

<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
    </div>
    <script src="app.js"></script>
    <script>
        let loader = document.getElementById('loader');
        let container = document.getElementById('container');
        if (loader) {
            loader.style.display = "none";
        }
        if (container) {
            container.style.visibility = "visible";
        }
    </script>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

In percentage

You can also specify the width and height of the smithchart in percentage. If you mention the width and height in percentage, then smithchart will be render as per the percentage of it's container size. You can set the values in percentage like below demonstration.

INDEX.TS

```

import { Smithchart } from '@syncfusion/ej2-charts';
let smithchart: Smithchart = new Smithchart({
    width: '90%',
    height: '85%',
    series: [
        {
            points: [
                { resistance: 10, reactance: 25 }, { resistance: 8,
reactance: 6 },
                { resistance: 6, reactance: 4.5 }, { resistance: 4.5,
reactance: 2 },
                { resistance: 3.5, reactance: 1.6 }, { resistance: 2.5,
reactance: 1.3 },
                { resistance: 2, reactance: 1.2 }, { resistance: 1.5,
reactance: 1 },
                { resistance: 1, reactance: 0.8 }, { resistance: 0.5,
reactance: 0.4 },
                { resistance: 0.3, reactance: 0.2 }, { resistance: 0,
reactance: 0.15 },
            ]
        }
    ]
});

```

```

    ],
  },
  ],
});
smithchart.appendTo('#container');

```

INDEX.HTML

Title subtitle in EJ2 JavaScript Smithchart control

Enable title

Title and subtitle is used to depicts the information about the data plotted in the smithchart. You can set the title and subtitle of the smithchart using the `[text]` property in title and subtitle. By default visibility

of the title as well as subtitle is enabled. You need to set simply text for title and subtitle in your sample as like below.

INDEX.TS

```
import { Smithchart } from '@syncfusion/ej2-charts';
let smithchart: Smithchart = new Smithchart({
  title : {
    text: 'Impedance Transmission',
    subtitle: {
      text: 'Transmission'
    }
  },
  series: [
    {
      points: [
        { resistance: 10, reactance: 25 }, { resistance: 8,
reactance: 6 },
        { resistance: 6, reactance: 4.5 }, { resistance: 4.5,
reactance: 2 },
        { resistance: 3.5, reactance: 1.6 }, { resistance: 2.5,
reactance: 1.3 },
        { resistance: 2, reactance: 1.2 }, { resistance: 1.5,
reactance: 1 },
        { resistance: 1, reactance: 0.8 }, { resistance: 0.5,
reactance: 0.4 },
        { resistance: 0.3, reactance: 0.2 }, { resistance: 0,
reactance: 0.15 },
      ],
    }
  ],
});
smithchart.appendTo('#container');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 for Smith chart </title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Essential JS 2 for Smithchart UI
Control">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
charts/styles/material.css" rel="stylesheet">

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Title trim

Both title and subtitle of the smithchart can be trimmed if it exceeds the certain length. Trimming is enabled using [enableTrim] for title as well as subtitle. This length can be changed using the property [maximumWidth]. Also [font], [textAlignment] and [visibility] can be customized for title as well as subtitle.

INDEX.TS

```

import { Smithchart } from '@syncfusion/ej2-charts';
let smithchart: Smithchart = new Smithchart({
    title : {
        enableTrim: true,
        maximumWidth: 70,
        textAlignment: 'Center',
        visible: true,
        text: 'Impedance Transmission',
        subtitle: {
            text: 'Transmission',
            visible: true,
            textAlignment: 'Far',
            enableTrim: true,
            maximumWidth: 40
        }
    },

Smith chart axis in EJ2 JavaScript Smithchart control

Like chart, Smithchart is having support for two types of axis.

- Horizontal axis - axis drawn as straight line in the horizontal direction of the chart.
- Radial axis - axis is drawn as circular path.

Labels Customization

Axis labels are used to denote what kind of data is bound for smithchart. Using axis labels, you can easily identify in which interval chart is rendered. Using following properties we can customize the axis labels for horizontal and radial axis.

- `[labelPosition]` - used to place the labels either inside or outside the axis line.
- `[labelIntersectAction]` - used to hide the labels when intersect with other one.
- `[labelStyle]` - used to customize the properties such as font size, family, weight, opacity.

INDEX.TS

```
import { Smithchart } from '@syncfusion/ej2-charts';
let smithchart: Smithchart = new Smithchart({
  radialAxis : {
    labelPosition: 'Inside',
    labelIntersectAction: 'Hide',
    labelStyle: {
      fontFamily: 'Times New Roman',
      fontWeight: 'bold',
      fontStyle: 'Italic',
      opacity: 0.75,
      size: '14px'
    }
  },
  horizontalAxis: {
    labelPosition: 'Inside',
    labelIntersectAction: 'Hide',
    labelStyle: {
      fontFamily: 'Times New Roman',
      fontWeight: 'bold',
      fontStyle: 'Italic',
      opacity: 0.75,
      size: '14px'
    }
  },
  series: [
    {
      points: [
        { resistance: 10, reactance: 25 }, { resistance: 8,
reactance: 6 },
        { resistance: 6, reactance: 4.5 }, { resistance: 4.5,
reactance: 2 },
        { resistance: 3.5, reactance: 1.6 }, { resistance: 2.5,
reactance: 1.3 },
        { resistance: 2, reactance: 1.2 }, { resistance: 1.5,
reactance: 1 },
```

```

        { resistance: 1, reactance: 0.8 }, { resistance: 0.5,
reactance: 0.4 },
        { resistance: 0.3, reactance: 0.2 }, { resistance: 0,
reactance: 0.15 },
        ],
    }, {

Gridlines

To make the data in a chart that displays axes easier to read, you can display horizontal and radial axis gridlines. Gridlines extend from any horizontal and radial axes across the plot area of the smithchart.

Both horizontal and radial axis are having support for major as well as minor gridlines. Major gridlines are drawn from the position in which labels are rendered. Minor gridlines are drawn between two major gridlines as per the count we set in settings.

We can customize following things, in major as well as minor gridlines.

- **[width]** - used to customize the width of gridlines.
- **[dashArray]** - used to customize whether gridline have to render as normal line or dashed line.
- **[visible]** - used to enable or disable the visibility of the gridlines.
- **[opacity]** - used to customize the opacity of the major gridlines.
- **[count]** - used to customize the count of the minor gridlines.

INDEX.TS

```

import { Smithchart } from '@syncfusion/ej2-charts';
let smithchart: Smithchart = new Smithchart({
  horizontalAxis: {
    majorGridLines: {
      visible: true,
      opacity: 0.8,
      width: 10
    }
  },
  series: [

</body></html>
```

Axisline

As name suggests that, it is a line in smithchart that can be configured to denotes the axis. By default, visibility of the axis line is true. You can customize its visibility by using visible property in axis Line. Other than visibility of the axis line, you can customize the following properties of the axis line.

- **[width]** - used to customize the width of the axis line.
- **[dashArray]** - used to render the axis line as dashed line.
- **[visible]** - used to enable or disable the visibility of the axis line.

INDEX.TS

```
import { Smithchart } from '@syncfusion/ej2-charts';
let smithchart: Smithchart = new Smithchart({

Smith chart legend in EJ2 JavaScript Smithchart control

Legend is a key used in smithchart, that contains symbol and descriptions. It provides valuable information for interpreting what the smithchart is displaying and can be represented in various colors, shapes or other identifiers based on the data. In simple words, we can define that legend is used to denote the series rendered in the smithchart.

Position and Alignment

By default visibility of the legend is false. To enable the legend, kindly set visible as true in legendSettings. Default position for the legend is bottom. By using [position] property, you can change

the position of the legend. You can either place the legend at bottom, top, right and left side of the smithchart. To use the legend in smithchart, you need to import and inject the SmithchartLegend from chart.

INDEX.TS

```
import { Smithchart, SmithchartLegend } from '@syncfusion/ej2-charts';
Smithchart.Inject(SmithchartLegend);
let smithchart: Smithchart = new Smithchart({
  legendSettings: {
    visible: true,
    position: 'Top'
  },
  series: [
    {
      points: [
        { resistance: 10, reactance: 25 }, { resistance: 8,
reactance: 6 },
        { resistance: 6, reactance: 4.5 }, { resistance: 4.5,
reactance: 2 },
        { resistance: 3.5, reactance: 1.6 }, { resistance: 2.5,
reactance: 1.3 },
        { resistance: 2, reactance: 1.2 }, { resistance: 1.5,
reactance: 1 },
        { resistance: 1, reactance: 0.8 }, { resistance: 0.5,
reactance: 0.4 },
        { resistance: 0.3, reactance: 0.2 }, { resistance: 0,
reactance: 0.15 },
      ],
      name: 'Transmission1'
    }, {
      points: [
        { resistance: 20, reactance: -50 }, { resistance: 10,
reactance: -10 },
        { resistance: 9, reactance: -4.5 }, { resistance: 8,
reactance: -3.5 },
        { resistance: 7, reactance: -2.5 }, { resistance: 6,
reactance: -1.5 },
        { resistance: 5, reactance: -1 }, { resistance: 4.5,
reactance: -0.5 },
        { resistance: 3.5, reactance: 0 }, { resistance: 2.5,
reactance: 0.4 },
        { resistance: 2, reactance: 0.5 }, { resistance: 1.5,
reactance: 0.5 },
        { resistance: 1, reactance: 0.4 }, { resistance: 0.5,
reactance: 0.2 },
        { resistance: 0.3, reactance: 0.1 }, { resistance: 0,
reactance: 0.05 },
      ],
      name: 'Transmission2'
    },
  ],
});
smithchart.appendTo('#container');
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

</body></html>

```

Other than these positions, you can place the legend anywhere in the smithchart. To achieve this, you have to set position as custom in legendSettings and specify the x and y coordinates using the x and y properties in the location.

INDEX.TS

```

import { Smithchart, SmithchartLegend } from '@syncfusion/ej2-charts';
Smithchart.Inject(SmithchartLegend);
let smithchart: Smithchart = new Smithchart({
  legendSettings: {
    visible: true,
    position: 'Custom',
    location: {
      x: 80,
      y: 100
    }
  }
});

```

```

    }

```

Legend Alignment

Other than positioning the legend in the smithchart, you can customize its alignment also. By default, legend is aligned in center position. Using the `[alignment]` property, you can align the legend in near and far locations of the smithchart.

INDEX.TS

```

import { Smithchart, SmithchartLegend } from '@syncfusion/ej2-charts';
Smithchart.Inject(SmithchartLegend);
let smithchart: Smithchart = new Smithchart({
    legendSettings: {
        visible: true,

Customization

Legend Shape

By default, legend is rendered in the circle shape and the color of the shape is as same as series color in the smithchart. Using the property `[shape]` in legend settings, you can change the icon shape of the legend as rectangle, triangle and so on.

INDEX.TS

```
import { Smithchart, SmithchartLegend } from '@syncfusion/ej2-charts';
Smithchart.Inject(SmithchartLegend);
let smithchart: Smithchart = new Smithchart({
  legendSettings: {
    visible: true,
    position: 'Top',
    shape: 'Rectangle'
  },
  series: [
    {
      points: [
        { resistance: 10, reactance: 25 }, { resistance: 8,
reactance: 6 },
        { resistance: 6, reactance: 4.5 }, { resistance: 4.5,
reactance: 2 },
        { resistance: 3.5, reactance: 1.6 }, { resistance: 2.5,
reactance: 1.3 },
        { resistance: 2, reactance: 1.2 }, { resistance: 1.5,
reactance: 1 },
        { resistance: 1, reactance: 0.8 }, { resistance: 0.5,
reactance: 0.4 },
        { resistance: 0.3, reactance: 0.2 }, { resistance: 0,
reactance: 0.15 },
      ],
      name: 'Transmission1'
    }, {
      points: [
        { resistance: 20, reactance: -50 }, { resistance: 10,
reactance: -10 },
        { resistance: 9, reactance: -4.5 }, { resistance: 8,
reactance: -3.5 },
        { resistance: 7, reactance: -2.5 }, { resistance: 6,
reactance: -1.5 },
        { resistance: 5, reactance: -1 }, { resistance: 4.5,
reactance: -0.5 },
        { resistance: 3.5, reactance: 0 }, { resistance: 2.5,
reactance: 0.4 },
        { resistance: 2, reactance: 0.5 }, { resistance: 1.5,
reactance: 0.5 },
        { resistance: 1, reactance: 0.4 }, { resistance: 0.5,
reactance: 0.2 },
        { resistance: 0.3, reactance: 0.1 }, { resistance: 0,
reactance: 0.05 },
      ],
      name: 'Transmission2'
    },
  ],
});
```

```
smithchart.appendTo('#container');
```

INDEX.HTML

```

Legend Size

By default, legend takes 20% - 25% of the chart's height horizontally, when it is placed on top or bottom position and 20% - 25% of the width vertically, while placing on left or right position of the chart. You can change this default legend size by using the [width] and [height] property of the legendSettings.

INDEX.TS

```
import { Smithchart, SmithchartLegend } from '@syncfusion/ej2-charts';
Smithchart.Inject(SmithchartLegend);
let smithchart: Smithchart = new Smithchart({
```

```

    legendSettings: {
        visible: true,

Padding

You can customize the space between two legend items and space between legend shape and text as per your requirement. For customizing the space between two legend items, you can use `[itemPadding]` property. To control space between legend shape and text, you can use `[shapePadding]` property.

INDEX.TS

```

import { Smithchart, SmithchartLegend } from '@syncfusion/ej2-charts';
Smithchart.Inject(SmithchartLegend);
let smithchart: Smithchart = new Smithchart({
    legendSettings: {
        visible: true,

Smith chart tooltip in EJ2 JavaScript Smithchart control

Smithchart will display details about the points through tooltip, when the mouse is moved over the point. By default, tooltip is disabled. To enable the tooltip for smithchart, you need to import and inject TooltipRender module from chart. And also set the property visible as true, in tooltip settings. You can customize the tooltip's visibility and appearance differently each series in the smithchart.

INDEX.TS

```

import { Smithchart, TooltipRender } from '@syncfusion/ej2-charts';
Smithchart.Inject(TooltipRender);
let smithchart: Smithchart = new Smithchart({
    series: [
        {
            points: [
                { resistance: 10, reactance: 25 }, { resistance: 8,

Smith chart marker in EJ2 JavaScript Smithchart control

Markers and Datalabels are used to provide information about the data points in the series. You can add a shape to adorn each data point. By default marker and datalabel both are disabled in smithchart. You can enable both of them by setting visible property as true in marker and datalabel settings

Marker

Default visibility of marker is false. You can enable the marker by setting property visible as true in marker settings. This will add marker for each point in the series. Using marker setting, you can customize marker differently for each series in smithchart.

INDEX.TS

```

import { Smithchart } from '@syncfusion/ej2-charts';
let smithchart: Smithchart = new Smithchart({
    series: [
        {
            points: [
                { resistance: 10, reactance: 25 }, { resistance: 8,
reactance: 6 },
                { resistance: 6, reactance: 4.5 }, { resistance: 4.5,
reactance: 2 },
                { resistance: 3.5, reactance: 1.6 }, { resistance: 2.5,
reactance: 1.3 },
                { resistance: 2, reactance: 1.2 }, { resistance: 1.5,
reactance: 1 },
                { resistance: 1, reactance: 0.8 }, { resistance: 0.5,
reactance: 0.4 },
                { resistance: 0.3, reactance: 0.2 }, { resistance: 0,
reactance: 0.15 },
            ],
            name: 'Transmission1',
            marker: {
                visible: true
            }
        }
    ],
});
smithchart.appendTo('#container');

```

```

Marker Customization

Using marker settings in series, you can customize the marker for each series differently. Using marker settings, you can customize following properties differently for each series in the smithchart.

- [width] - To control the width of the marker.
- [height] - To control the height of the marker.
- [fill] - Used to customize the fill color of the marker.
- [opacity] - Used to customize the opacity of the marker.
- [border] - Used to control the width and color of the marker's border.
- [shape] - Used to change the shape of the marker.

INDEX.TS

```
import { Smithchart } from '@syncfusion/ej2-charts';
let smithchart: Smithchart = new Smithchart({
  series: [
    {
      points: [
        { resistance: 10, reactance: 25 }, { resistance: 8,
reactance: 6 },
        { resistance: 6, reactance: 4.5 }, { resistance: 4.5,
reactance: 2 },
        { resistance: 3.5, reactance: 1.6 }, { resistance: 2.5,
reactance: 1.3 },

Datalabel customization

Using datalabel settings in marker, you can customize the datalabel for each series differently. In datalabel, you can customize the following properties differently for each series.

- **[fill]** - Used to changes the fill color of the data label's shape.

- **[opacity]** - Used to control the opacity of the data label's shape.
- **[border]** - Used to customize the width and color of the border.
- **[textStyle]** - Used to customize the font color, width and size.

Smith chart series in EJ2 JavaScript Smithchart control

You can add any number of series to the smithchart as per your requirement. You can use series setting to either add or customize the data. For the points or datasource added in the series, line is drawn. You can customize the each series as per your requirement with marker, datalabel, animation, opacity and so on.

points or datasource

For adding values in the smithchart, you can use either points or datasource in the series. Points and datasource both should be array of object which should contain the field names resistance and reactance.

INDEX.TS

```

import { Smithchart } from '@syncfusion/ej2-charts';
let smithchart: Smithchart = new Smithchart({
    series: [
        {
            points: [
                { resistance: 10, reactance: 25 }, { resistance: 8,
reactance: 6 },
                { resistance: 6, reactance: 4.5 }, { resistance: 4.5,
reactance: 2 },
                { resistance: 3.5, reactance: 1.6 }, { resistance: 2.5,
reactance: 1.3 },
                { resistance: 2, reactance: 1.2 }, { resistance: 1.5,
reactance: 1 },

```

```

        { resistance: 1, reactance: 0.8 }, { resistance: 0.5,
reactance: 0.4 },
        { resistance: 0.3, reactance: 0.2 }, { resistance: 0,
reactance: 0.15 },
    ]
    },
    ],
});
smithchart.appendTo('#container');
```

INDEX.HTML

```

```

Series customization

Using following options in series settings, you can customize each series in smithchart as per your requirement.

- **[fill]** - Used to customize the fill color for the series.
- **[enableSmartLabels]** - Used to place the data labels on the smithchart without overlapping with each other.
- **[visibility]** - Used to handle the visibility of the series.
- **[opacity]** - Used to control the opacity of the series line.
- **[width]** - Used to customize the width of the series line.

Accessibility in EJ2 JavaScript Smithchart control

The Smith chart control followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Smith chart control is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support | |

| [Section 508](#) Support | |

| Screen Reader Support | |

| Color Contrast | |

| Mobile Device Support | |

| Keyboard Navigation Support | |

| [Accessibility Checker](#) Validation | |

| [Axe-core](#) Accessibility Validation | |

```

<style>
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
</style>

<div> - All
features of the control meet the requirement.</div>

<div> - Some features of the control do not meet the requirement.</div>

<div> - The control does not meet the requirement.</div>

```

WAI-ARIA attributes

The Smith chart control followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Smith chart control:

- `img` (role)
- `region` (role)
- `aria-label` (attribute)
- `aria-hidden` (attribute)

Keyboard interaction

The Smith chart control followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Smith chart control.

| **Press** | **To do this** |

| --- | --- |

| **Tab** | Moves the focus to the next element in the Smith chart. |

| **Shift + Tab** | Moves the focus to the previous element in the Smith chart. |

| **Ctrl + P** | Prints the Smith chart. |

Ensuring accessibility

The Smith chart control's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Smith chart control is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Smith chart control with accessibility tools.

Sparkline

Sparkline dimensions in EJ2 JavaScript Sparkline control

Size for container

Sparkline can be rendered to its container size. You can set the size through inline or CSS as shown in the following code.

```
,
<div id='container'>
<div id='element' style="width:650px; height:350px;"></div>
</div>
,
```

INDEX.TS

```
import { Sparkline } from '@syncfusion/ej2-charts';
let sparkline: Sparkline = new Sparkline({
  dataSource: [
    { x: 0, xval: '2005', yval: 20090440 },
    { x: 1, xval: '2006', yval: 20264080 },
    { x: 2, xval: '2007', yval: 20434180 },
    { x: 3, xval: '2008', yval: 21007310 },
    { x: 4, xval: '2009', yval: 21262640 },
    { x: 5, xval: '2010', yval: 21515750 },
    { x: 6, xval: '2011', yval: 21766710 },
    { x: 7, xval: '2012', yval: 22015580 },
    { x: 8, xval: '2013', yval: 22262500 },
    { x: 9, xval: '2014', yval: 22507620 },
  ],
  // Assign the dataSource values to series of sparkline 'xName and yName'
  xName: 'xval', yName: 'yval'
});
sparkline.appendTo("#element");
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 for Sparkline </title>
  <meta charset="utf-8">

```

```
<body>

  <div id="container" style="margin-top: 15%;">
    <div id="element" align="center"></div>
  </div>
<script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Size for sparkline

You can also set the size for sparkline directly using the [width](#) and [height](#) properties.

In pixel

You can set the size for sparkline in pixel as demonstrated in the following code.

INDEX.TS

```
import { Sparkline } from '@syncfusion/ej2-charts';
let sparkline: Sparkline = new Sparkline({
  width: '350', height: '150',
  dataSource: [
    { x: 0, xval: '2005', yval: 20090440 },
    { x: 1, xval: '2006', yval: 20264080 },
    { x: 2, xval: '2007', yval: 20434180 },
    { x: 3, xval: '2008', yval: 21007310 },
    { x: 4, xval: '2009', yval: 21262640 },
    { x: 5, xval: '2010', yval: 21515750 },
    { x: 6, xval: '2011', yval: 21766710 },
    { x: 7, xval: '2012', yval: 22015580 },
    { x: 8, xval: '2013', yval: 22262500 },
    { x: 9, xval: '2014', yval: 22507620 },
  ],
  // Assign the dataSource values to series of sparkline 'xName and
  yName'
  xName: 'xval', yName: 'yval'
});
sparkline.appendTo("#element");
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 for Sparkline </title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Essential JS 2 for Sparkline UI
  Control">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
  charts/styles/material.css" rel="stylesheet">
```

```

<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container" style="margin-top: 15%;">
        <div id="element" align="center"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

In percentage

By setting values in percentage, sparkline gets its dimension with respect to its container. For example, when the height is set to '50%', sparkline is rendered to half of its container height.

INDEX.TS

```

import { Sparkline, SparklineTooltip } from '@syncfusion/ej2-charts';
Sparkline.Inject(SparklineTooltip);
let sparkline: Sparkline = new Sparkline({
    width: '80%', height: '50%',
    dataSource: [
        { x: 0, xval: '2005', yval: 20090440 },
        { x: 1, xval: '2006', yval: 20264080 },
        { x: 2, xval: '2007', yval: 20434180 },
        { x: 3, xval: '2008', yval: 21007310 },
        { x: 4, xval: '2009', yval: 21262640 },
        { x: 5, xval: '2010', yval: 21515750 },
        { x: 6, xval: '2011', yval: 21766710 },
        { x: 7, xval: '2012', yval: 22015580 },
        { x: 8, xval: '2013', yval: 22262500 },
        { x: 9, xval: '2014', yval: 22507620 },
    ],
    // Assign the dataSource values to series of sparkline 'xName and
    yName'
    xName: 'xval', yName: 'yval'
});
sparkline.appendTo("#element");

```

Sparkline types in EJ2 JavaScript Sparkline control

Different types of shapes can be used to represent the sparkline. You can change the sparkline type by setting the type property. Sparkline supports the following types:

- Line
- Column
- Win-Loss
- Pie
- Area

The following code sample shows different types of sparklines.

Line

The [Line] type is used to render the sparkline series as line.

INDEX.TS

```

import { Sparkline, SparklineTooltip } from '@syncfusion/ej2-charts';
Sparkline.Inject(SparklineTooltip);
let sparkline: Sparkline = new Sparkline({
    height: '100px',
    width: '70%',
    dataSource: [
        { x: 0, xval: '2005', yval: 20090440 },
        { x: 1, xval: '2006', yval: 20264080 },
        { x: 2, xval: '2007', yval: 20434180 },
        { x: 3, xval: '2008', yval: 21007310 },
    ]
});

```

```

        { x: 4, xval: '2009', yval: 21262640 },
        { x: 5, xval: '2010', yval: 21515750 },
        { x: 6, xval: '2011', yval: 21766710 },
        { x: 7, xval: '2012', yval: 22015580 },
        { x: 8, xval: '2013', yval: 22262500 },
        { x: 9, xval: '2014', yval: 22507620 },
    ],
    // Assign the dataSource values to series of sparkline 'xName and yName'
    xName: 'xval', yName: 'yval',
    // Assign 'Line' as type of the sparkline
    type: 'Line'
});
sparkline.appendTo("#element");

```

INDEX.HTML

```

Axis customization in EJ2 JavaScript Sparkline control

You can customize axis value types and min and max values of the sparkline.

Change value type of the sparkline

You can change the sparkline value type by setting the `[valueType]` property to `[Numeric]`, `[Category]`, or `[DateTime]`.

DateTime

You can assign date-time values to the sparkline by setting the `[valueType]` property to `[DateTime]`.

INDEX.TS

```

import { Sparkline } from '@syncfusion/ej2-charts';
let sparkline: Sparkline = new Sparkline({
    height: '150px',
    width: '130px',
    dataSource: [
        { xDate: new Date(2018, 0, 1), x: 0, yval: 4 },
        { xDate: new Date(2018, 0, 2), x: 1, yval: 4.5 },
        { xDate: new Date(2018, 0, 3), x: 2, yval: 8 },
        { xDate: new Date(2018, 0, 4), x: 3, yval: 7 },
        { xDate: new Date(2018, 0, 5), x: 4, yval: 6 },
        { xDate: new Date(2018, 0, 8), x: 5, yval: 8 },
        { xDate: new Date(2018, 0, 9), x: 6, yval: 8 },
        { xDate: new Date(2018, 0, 10), x: 7, yval: 6.5 },
        { xDate: new Date(2018, 0, 11), x: 8, yval: 4 },
        { xDate: new Date(2018, 0, 12), x: 9, yval: 5.5 }
    ],
    // Assign the dataSource values to series of sparkline 'xName and yName'
    xName: 'xDate', yName: 'yval',
    // Assign the "Column" as type of the sparkline
    type: 'Column',
    // Assign the "DateTime" as value type to the sparkline
    valueType: 'DateTime'
});
sparkline.appendTo("#element");

```

</body></html>
```

Change min and max values of axis

You can change the min and max values of x-axis by setting the [minX] and [maxX] values to the [axisSettings] property. You can also change the min and max values of y-axis by setting the [minY] and [maxY] values to the [axisSettings] property.

INDEX.TS

```
import { Sparkline } from '@syncfusion/ej2-charts';
let sparkline: Sparkline = new Sparkline({
  height: '150px',
  width: '130px',
  dataSource: [
    { x: 0, yval: 50 },
    { x: 1, yval: 30 },
    { x: 2, yval: 20 },
```

```

        { x: 3, yval: 30 },
        { x: 4, yval: 50 },
        { x: 5, yval: 40 },
        { x: 6, yval: 20 },
        { x: 7, yval: 10 },
        { x: 8, yval: 30 },
        { x: 9, yval: 10 },
        { x: 10, yval: 40 }
    ],
    // Assign the dataSource values to series of sparkline 'xName and yName'
    xName: 'x', yName: 'yval',
    // Set min and max values to the y-axis of sparkline
    axisSettings: {
        minY: 0, maxY: 150
    },
    // Assign the 'Column' as type of the sparkline
    type: 'Column',
    // Assign the 'Numeric' as value type of the sparkline
    valueType: 'Numeric'
});
sparkline.appendTo("#element");

```

</body></html>

```

Change value of axis

You can set horizontal axis line value of the sparkline by setting [value] to the [axisSettings] property. The following code example shows this.

INDEX.TS

```
import { Sparkline } from '@syncfusion/ej2-charts';
let sparkline: Sparkline = new Sparkline({
    height: '150px',
    width: '130px',
    dataSource: [
        { x: 0, yval: 50 },
        { x: 1, yval: 30 },
        { x: 2, yval: 20 },
        { x: 3, yval: 30 },
        { x: 4, yval: 50 },
        { x: 5, yval: 40 },
        { x: 6, yval: 20 },
        { x: 7, yval: 10 },
        { x: 8, yval: 30 },
        { x: 9, yval: 10 },
        { x: 10, yval: 40 }
    ],
    // Assign the dataSource values to series of sparkline 'xName and yName'
    xName: 'x', yName: 'yval',
    // Set the value to horizontal axis of sparkline
    axisSettings: {
        value: 25
    },
    // Assign the 'Column' as type of the sparkline
    type: 'Column',
    // Assign the 'Numeric' as value type of the sparkline
    valueType: 'Numeric'
});
sparkline.appendTo("#element");
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 for Sparkline </title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Axis line customization

Axis of the sparkline can be collapsed using the `visible` property in `lineSettings`; this is not applicable for win-loss. You can customize the `color`, `width`, `opacity`, and `dashArray` of axis line.

INDEX.TS

```

import { Sparkline } from '@syncfusion/ej2-charts';
let sparkline: Sparkline = new Sparkline({
  height: '150px',
  width: '130px',
  dataSource: [
    { x: 0, yval: 50 },
    { x: 1, yval: 30 },
    { x: 2, yval: 20 },
    { x: 3, yval: 30 },
    { x: 4, yval: 50 },
    { x: 5, yval: 40 },
    { x: 6, yval: 20 },
    { x: 7, yval: 10 },
    { x: 8, yval: 30 },
    { x: 9, yval: 10 },
    { x: 10, yval: 40 }
  ],
  // Assign the dataSource values to series of sparkline 'xName and yName'
  xName: 'x', yName: 'yval',
  // Set the value to horizontal axis
  axisSettings: {
    // To configure axis line settings
    lineSettings: {
      visible: true,
      color: "#ff14ae",
      dashArray: '5,3'
    }
  },
  // Assign the value type as 'Numeric' to the sparkline
  valueType: 'Numeric'
});
sparkline.appendTo("#element");

```

INDEX.HTML

```

```

Special points customization in EJ2 JavaScript Sparkline control

You can customize the points by initializing the point colors. The customization options allows to differentiate the [start], [end], [positive], [negative], and [low] points. This customization is only applicable for line, column, and area type sparklines.

INDEX.TS

```

import { Sparkline } from '@syncfusion/ej2-charts';
let sparkline: Sparkline = new Sparkline({
    height: '150px',
    width: '130px',
    dataSource: [
        { x: 0, xval: 'AUDI', yval: 1 },
        { x: 1, xval: 'BMW', yval: 5 },
        { x: 2, xval: 'BUICK', yval: -1 },
        { x: 3, xval: 'CETROEN', yval: -6 },
        { x: 4, xval: 'CHEVROLET', yval: 0 },
        { x: 5, xval: 'FIAT', yval: 1 },
        { x: 6, xval: 'FORD', yval: -2 },
        { x: 7, xval: 'HONDA', yval: 7 },
        { x: 8, xval: 'HYUNDAI', yval: -9 },
        { x: 9, xval: 'JEEP', yval: 0 },
        { x: 10, xval: 'KIA', yval: -10 },
        { x: 11, xval: 'MAZDA', yval: 3 }
    ],

```

```
// Assign the dataSource values to series of sparkline 'xName and
yName'
xName: 'xval', yName: 'yval',
// Assign 'Column' as type of the sparkline
type: 'Column',
// Assign "Category" as the value type of the sparkline
valueType: 'Category',
// To configure sparkline series highest y value point color.
highPointColor: 'blue',
// To configure sparkline series lowest y value point color.
lowPointColor: 'orange',
// To configure sparkline series first x value point color.
startPointColor: 'green',
// To configure sparkline series last x value point color.
endPointColor: 'green',
// To configure sparkline series negative y value point color.
negativePointColor: 'red'
});
sparkline.appendTo("#element");
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>

```

Range band in EJ2 JavaScript Sparkline control

This section explains how to customize the sparkline with multiple range bands.

Range band customization

The range band feature is used to highlight a particular range along with the y-axis using the [startRange] and [endRange] properties. You can also customize the [color] and [opacity] of the range band.

INDEX.TS

```
import { Sparkline } from '@syncfusion/ej2-charts';
let sparkline: Sparkline = new Sparkline({
    height: '150px',
    width: '150px',
    lineWidth: 2,
    fill: '#0d3c9b',
    dataSource: [0, 6, 4, 1, 3, 2, 5],
    // To configure range band settings
    rangeBandSettings: [
        {
            startRange: 1,
            endRange: 3,
            color: '#bfd4fc',
            opacity: 0.4
        }
    ]
});
sparkline.appendTo("#element");
```

INDEX.HTML

<script src="index.js" type="text/javascript"></script>
</body></html>
```

Multiple range band customization

You can define multiple range bands to a sparkline as shown in the following code sample.

INDEX.TS

```
import { Sparkline } from '@syncfusion/ej2-charts';
let sparkline: Sparkline = new Sparkline({
  height: '150px',
  width: '150px',
  lineWidth: 2,
  fill: '#0d3c9b',
  dataSource: [0, 6, 4, 1, 3, 2, 5],
  rangeBandSettings: [
    {
      startRange: 1,
      endRange: 2,
      color: '#bfd4fc',
      opacity: 0.4
    },
    {
      startRange: 4,
      endRange: 5,
      color: 'red',
      opacity: 0.4
    }
  ]
});
sparkline.appendTo("#element");
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 for Sparkline </title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

  <div id="container" style="margin-top: 15%;">
    <div id="element" align="center"></div>
  </div>
```

```
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Marker in EJ2 JavaScript Sparkline control

This section explains how to add markers to the sparklines.

Adding marker to the sparkline

To add marker to the sparkline, specify the **visible** of **markerSettings** as following values. The **visible** will accept multiple values too.

- All - Enables markers for all points.
- Start - Enables marker for the start point.
- End - Enables marker for the end point.
- High - Enables marker for the high point.
- Low - Enables marker for the low point.
- Negative - Enables markers for the negative points.

The following code example shows enabling markers for all points.

INDEX.TS

```
import { Sparkline } from '@syncfusion/ej2-charts';
let sparkline: Sparkline = new Sparkline({
    height: '200px',
    width: '350px',
    axisSettings: {
        minX: -1, maxX: 7, maxY: 7, minY: -1
    },
    dataSource: [0, 6, 4, 1, 3, 2, 5],
    // To enable markers for all points
    markerSettings: {
        visible: ['All']
    }
});
sparkline.appendTo("#element");
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
<title>Essential JS 2 for Sparkline </title>
<meta charset="utf-8">
<meta name="viewport" content="width=device-width, initial-scale=1.0">
<meta name="description" content="Essential JS 2 for Sparkline UI
Control">
<meta name="author" content="Syncfusion">
<link href="index.css" rel="stylesheet">
```

```

<link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
charts/styles/material.css" rel="stylesheet">

<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container" style="margin-top: 15%;">
        <div id="element" align="center"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Adding marker to special point

In sparkline, markers can be enabled for particular points such as the start, end, low, high, or negative. The following code examples shows enabling markers for the high and low points.

INDEX.TS

```

import { Sparkline } from '@syncfusion/ej2-charts';
let sparkline: Sparkline = new Sparkline({
    height: '200px',
    width: '350px',
    axisSettings: {
        minX: -1, maxX: 7, maxY: 7, minY: -1
    },
    dataSource: [3, 6, 4, 1, 3, 2, 5],
    // To enable marker for high and low points with color customization
    highPointColor: 'blue',
    lowPointColor: 'red',
    markerSettings: {
        visible: ['High', 'Low']
    }
});
sparkline.appendTo("#element");

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>Essential JS 2 for Sparkline </title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Essential JS 2 for Sparkline UI
Control">
    <meta name="author" content="Syncfusion">

```

```

<link href="index.css" rel="stylesheet">
<link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
charts/styles/material.css" rel="stylesheet">

<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container" style="margin-top: 15%;">
        <div id="element" align="center"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Customizing markers

Sparkline markers can be customized in terms of fill color, border color, width, opacity, and size. The following code example shows customizing marker's fill, border, and size.

INDEX.TS

```

import { Sparkline } from '@syncfusion/ej2-charts';
let sparkline: Sparkline = new Sparkline({
    height: '200px',
    width: '350px',
    axisSettings: {
        minX: -1, maxX: 7, maxY: 7, minY: -1
    },
    dataSource: [3, 6, 4, 1, 3, 2, 5],
    // To enable marker for high and low points with color customization
    fill: 'blue',
    markerSettings: {
        visible: ['All'],
        size: 5, fill: 'white', border: { color: 'blue', width: 2}
    }
});
sparkline.appendTo("#element");

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>Essential JS 2 for Sparkline </title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Essential JS 2 for Sparkline UI
Control">

type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container" style="margin-top: 15%;">
        <div id="element" align="center"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Data labels in EJ2 JavaScript Sparkline control

Data labels are used to display values of data points to improve the readability.

Enable data label

To enable data label for sparkline series, provide **visible** of the **dataLabelSettings** as following possible values:

- All - Enables data label of all points.
- Start - Enables data label of the start point.
- End - Enables data label of the end point.
- High - Enables data label of the high point.
- Low - Enables data label of the low point.
- Negative - Enables data labels of the negative points.

The following example shows enabling sparkline data label for all points.

INDEX.TS

```

import { Sparkline } from '@syncfusion/ej2-charts';
let sparkline: Sparkline = new Sparkline({
    height: '200px',
    width: '350px',
    axisSettings: {
        minX: -1, maxX: 7, maxY: 7, minY: -1
    },
    fill: 'blue',
    dataSource: [0, 6, 4, 1, 3, 2, 5],
    // To enable data label for all points
    dataLabelSettings: {

```

```

        visible: ['All']
    },
});
sparkline.appendTo("#element");

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 for Sparkline </title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Essential JS 2 for Sparkline UI
Control">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
charts/styles/material.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container" style="margin-top: 15%;">
    <div id="element" align="center"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Customize data label

Data labels can be customized using the fill, border, opacity, and textStyle. The following code example shows customizing data label border, text color, and fill color.

INDEX.TS

```

import { Sparkline } from '@syncfusion/ej2-charts';
let sparkline: Sparkline = new Sparkline({
  height: '200px',
  width: '350px',
  axisSettings: {
    minX: -1, maxX: 7, maxY: 8, minY: -1
  },
  fill: 'blue',
  dataSource: [0, 6, 4, 1, 3, 2, 5],
  // To customize data label fill, border, and text color
  dataLabelSettings: {

```

```

        visible: ['All'],
        border: { color: 'blue', width: 1},
        fill: 'blue', opacity: 0.4,
        textStyle: {
            color: 'white'
        }
    },
});
sparkline.appendTo("#element");

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 for Sparkline </title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Essential JS 2 for Sparkline UI
Control">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
charts/styles/material.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container" style="margin-top: 15%;">
    <div id="element" align="center"></div>
  </div>
<script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Format data label text

The text of data labels can be formatted using the `format` API in the sparkline `dataLabelSettings`. By default, data label shows the y-value of point. The following code example shows how to display x and y-values for points.

INDEX.TS

```

import { Sparkline } from '@syncfusion/ej2-charts';
let sparkline: Sparkline = new Sparkline({
  height: '200px',
  width: '500px',
  axisSettings: {

```

```

        minX: -1, maxX: 7, maxY: 8, minY: -1
    },
    fill: 'blue',
    valueType: 'Category',
    xName: 'x', yName: 'y',
    dataSource: [{x: 'Mon', y: 3 }, {x: 'Tue', y: 5 }, {x: 'Wed', y: 2 }, {x:
'Thu', y: 4 }, {x: 'Fri', y: 6 }, ],
    // To enable data label for all points
    dataLabelSettings: {
        format: '${x} : ${y}',
        visible: ['All'],
        border: { color: 'blue', width: 1},
        fill: 'blue', opacity: 0.4,
        textStyle: {
            color: 'white'
        }
    },
    },
});
sparkline.appendTo("#element");

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 for Sparkline </title>
  <meta charset="utf-8">

if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

User interaction in EJ2 JavaScript Sparkline control

Sparkline has two user interaction features: tooltip and tracker line.

Tooltip

The sparkline provides options to display details about values of data points through tooltips when hovering the mouse over data point. To use tooltip in sparkline, inject the `SparklineTooltip` module to sparkline using the inject method.

The following code example shows enabling tooltip for sparkline with format.

INDEX.TS

```
import { Sparkline, SparklineTooltip } from '@syncfusion/ej2-charts';
Sparkline.Inject(SparklineTooltip);
let sparkline: Sparkline = new Sparkline({
    height: '200px',
    width: '500px',
    axisSettings: {
        minX: -1, maxX: 7, maxY: 8, minY: -1
    },
    fill: 'blue',
    valueType: 'Category',
    xName: 'x', yName: 'y',
    dataSource: [{x: 'Mon', y: 3 }, {x: 'Tue', y: 5 }, {x: 'Wed', y: 2 }, {x:
'Thu', y: 4 }, {x: 'Fri', y: 6 },],
    // To enable tooltip for sparkline
    tooltipSettings: {
        visible: true,
        // formatting tooltip text
        format: '${x} : ${y}'
    }
});
sparkline.appendTo("#element");
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
    <title>Essential JS 2 for Sparkline </title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Essential JS 2 for Sparkline UI
Control">
    <meta name="author" content="Syncfusion">
    <link href="index.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
charts/styles/material.css" rel="stylesheet">

    <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
    <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container" style="margin-top: 15%;">
        <div class="spark" id="element" align="center"></div>
    </div>
<style>
```

```

        .sparktooltip {
            border-radius: 5px;
            background: #008cff;
            color: #FFFFFF !important;
            font-size: 16px;
            font-style: italic;
            padding: 8px;
        }
    </style>
    <script>
    var ele = document.getElementById('container');
    if(ele) {
        ele.style.visibility = "visible";
    }
    </script>
    <script src="index.js" type="text/javascript"></script>
</body></html>

```

Tooltip customization

The fill color, text styles, format, and border of the tooltip can be customized. The following code example shows customization of tooltip's fill color and text style.

INDEX.TS

```

import { Sparkline, SparklineTooltip } from '@syncfusion/ej2-charts';
Sparkline.Inject(SparklineTooltip);
let sparkline: Sparkline = new Sparkline({
    height: '200px',
    width: '500px',
    axisSettings: {
        minX: -1, maxX: 7, maxY: 8, minY: -1
    },
    fill: '#033e96',
    valueType: 'Category',
    xName: 'x', yName: 'y',
    dataSource: [{x: 'Mon', y: 3 }, {x: 'Tue', y: 5 }, {x: 'Wed', y: 2 }, {x:
'Thu', y: 4 }, {x: 'Fri', y: 6 },],
    // To enable tooltip for sparkline with fill color customization
    tooltipSettings: {
        visible: true,
        format: '${x} : ${y}',
        fill: '#033e96',
        textStyle: {
            color: 'white'
        },
    },
});
sparkline.appendTo("#element");

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>Essential JS 2 for Sparkline </title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">

```

```

<meta name="description" content="Essential JS 2 for Sparkline UI
Control">
<meta name="author" content="Syncfusion">
<link href="index.css" rel="stylesheet">
<link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
charts/styles/material.css" rel="stylesheet">

type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container" style="margin-top: 15%;">
        <div class="spark" id="element" align="center"></div>
    </div>
<style>
    .sparktooltip {
        border-radius: 5px;
        background: #008cff;
        color: #FFFFFF !important;
        font-size: 16px;
        font-style: italic;
        padding: 8px;
    }
</style>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Tooltip template

Sparkline tooltip has template support. By using tooltip template, you can customize tooltips. The following code example shows more customization options provided to `sparktooltip` css class that is used in tooltip template div. Using this template, images also can be added to tooltip.

```

.sparktooltip {
border-radius: 5px;
background: #008cff;
color: #FFFFFF !important;
font-size: 16px;
font-style: italic;
padding: 8px;

```

```

}
,

```

INDEX.TS

```

import { Sparkline, SparklineTooltip } from '@syncfusion/ej2-charts';
Sparkline.Inject(SparklineTooltip);
let sparkline: Sparkline = new Sparkline({
    height: '200px',
    width: '500px',
    axisSettings: {
        minX: -1, maxX: 7, maxY: 8, minY: -1
    },
    fill: '#033e96',
    valueType: 'Category',
    xName: 'x', yName: 'y',
    dataSource: [{x: 'Mon', y: 3 }, {x: 'Tue', y: 5 }, {x: 'Wed', y: 2 }, {x:
'Thu', y: 4 }, {x: 'Fri', y: 6 }, ],
    // To enable tooltip template for sparkline with fill color, border
    radius and padding customization
    tooltipSettings: {
        visible: true,
        template: '<div class="sparktooltip">${x} : ${y}<div>'
    }
});
sparkline.appendTo("#element");

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>Essential JS 2 for Sparkline </title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Essential JS 2 for Sparkline UI
Control">
    <meta name="author" content="Syncfusion">
    <link href="index.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
charts/styles/material.css" rel="stylesheet">

    <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
    <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container" style="margin-top: 15%;">
        <div class="spark" id="element" align="center"></div>
    </div>
<style>
    .sparktooltip {
        border-radius: 5px;
        background: #008cff;
        color: #FFFFFF !important;
    }

```

```

        font-size: 16px;
        font-style: italic;
        padding: 8px;
    }
</style>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Track line

The track line tracks data points that are closer to the mouse position or touch contact.

To enable track lines for sparkline, specify the `visible` option of `trackLineSettings` to true. Based on theme, tracker color will be changed. The default value of tracker color is black.

To use track line in sparkline, inject the `SparklineTooltip` module to sparkline using the inject method.

INDEX.TS

```

import { Sparkline, SparklineTooltip } from '@syncfusion/ej2-charts';
Sparkline.Inject(SparklineTooltip);
let sparkline: Sparkline = new Sparkline({
    height: '200px',
    width: '500px',
    axisSettings: {
        minX: -1, maxX: 46, maxY: 10, minY: -1
    },
    fill: '#033e96',
    dataSource: [5, 3, 4, 6, 8, 7, 9, 1, 3, 5, 3, 4, 6, 8, 7, 9, 1, 3, 5,
2, 4, 6, 7, 9, 5, 8, 3, 6, 1, 7, 4, 2, 5, 2, 4, 6, 7, 9, 5, 8, 3, 6, 1, 7,
4, 2],
    // To enable tooltip template for sparkline with fill color, border
    radius and padding customization
    tooltipSettings: {
        trackLineSettings: {
            visible: true,
            color: '#033e96',
            width: 1
        }
    }
});
sparkline.appendTo("#element");

```

Appearance in EJ2 JavaScript Sparkline control

The appearance of the sparkline can be customized using margin, containerArea border, and containerArea background.

Sparkline border

The **containerArea border** of the sparkline is used to render border to cover sparkline area.

The following code example shows the sparkline with overall border.

INDEX.TS

```

import { Sparkline } from '@syncfusion/ej2-charts';
let sparkline: Sparkline = new Sparkline({
    // To render border around the sparkline
    containerArea: {
        border: { color: '#033e96', width: 2 }
    },
    border: { color: '#033e96', width: 1 },
    height: '200px',
    width: '350px',
    type: 'Area',

```

```

    fill: '#b2cfff',
    dataSource: [3, 6, 4, 1, 3, 2, 5]
  });
  sparkline.appendTo("#element");

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 for Sparkline </title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Essential JS 2 for Sparkline UI
Control">
  <meta name="author" content="Syncfusion">

type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container" style="margin-top: 15%;">
    <div class="spark" id="element" align="center"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Sparkline padding

Padding is used to specify padding value between container and sparkline. By default, padding value of the sparkline is 5. Sparkline padding values are specified by the left, right, top, and bottom.

The following code example shows the sparkline with overall padding is set to 20.

INDEX.TS

```

import { Sparkline } from '@syncfusion/ej2-charts';
let sparkline: Sparkline = new Sparkline({
  containerArea: {
    border: { color: '#033e96', width: 2 }
  },
  // To render sparkline with padding
  padding: { left: 20, right: 20, bottom: 20, top: 20 },
  border: { color: '#033e96', width: 1 },
  height: '200px',
  width: '350px',

```

```

    type: 'Area',
    fill: '#b2cfff',
    dataSource: [3, 6, 4, 1, 3, 2, 5]
  });
  sparkline.appendTo("#element");

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Sparkline area customization

The background color of the sparkline area can be customized using the `containerArea` background color. By default, the sparkline background color is `transparent`.

INDEX.TS

```

import { Sparkline } from '@syncfusion/ej2-charts';
let sparkline: Sparkline = new Sparkline({
  containerArea: {
    border: { color: '#033e96', width: 2 },
    // To render sparkline with background
    background: '#eff1f4',
  },
  padding: { left: 20, right: 20, bottom: 20, top: 20 },
  border: { color: '#033e96', width: 2 },
  height: '200px',

```

```

width: '350px',
type: 'Area',
fill: '#b2cfff',
dataSource: [3, 6, 4, 1, 3, 2, 5]
});
sparkline.appendTo("#element");

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 for Sparkline </title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Essential JS 2 for Sparkline UI
Control">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
charts/styles/material.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container" style="margin-top: 15%;">
    <div class="spark" id="element" align="center"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Sparkline theme

Datalabel and trackline colors of the sparkline will be changed based on theme. For example, for dark theme, the color of datalabel and trackline should be white; for light theme, their value should be black. The possible values for sparkline theme are **Material**, **Fabric**, **Bootstrap**, and **Highcontrast**.

The following code example shows the color for datalabel and trackline is set to white for dark theme.

INDEX.TS

```

import { Sparkline, SparklineTooltip } from '@syncfusion/ej2-charts';
Sparkline.Inject(SparklineTooltip);
document.getElementById('container').style = 'background: #000000; margin-
top: 15%;';
let sparkline: Sparkline = new Sparkline({
  // To specify theme

```

```

theme: 'HighContrast',
dataLabelSettings: { visible: ['All'] },
tooltipSettings: {
  trackLineSettings: { visible: true }
},
axisSettings: {
  minX: -1, maxX: 7
},
lineWidth: 3,
border: { color: 'transparent', width: 2 },
height: '200px',
width: '350px',
type: 'Line',
fill: '#007dd1',
dataSource: [3, 6, 4, 1, 3, 2, 5]
});
sparkline.appendTo("#element");

```

if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Localization in EJ2 JavaScript Sparkline control

The sparkline control supports localization. The default culture for localization is **en-US**. You can change the culture using the **setCulture** method.

Tooltip format

Sparkline tooltip supports localization. The following code sample shows tooltip text with currency format based on culture.

INDEX.TS

```
import { Sparkline, SparklineTooltip } from '@syncfusion/ej2-charts';
Sparkline.Inject(SparklineTooltip);
let sparkline: Sparkline = new Sparkline({
  containerArea: {
    border: { color: '#033e96', width: 2 }
  },
  tooltipSettings: {
    visible: true
  },
  // To specify currency format
  format: 'c0',
  useGroupingSeparator: true,
  lineWidth: 3,
  padding: { left: 20, right: 20, bottom: 20, top: 20 },
  border: { color: '#033e96', width: 2 },
  height: '200px',
  width: '350px',
  type: 'Area',
  fill: '#b2cfff',
  dataSource: [30000, 60000, 40000, 10000, 30000, 20000, 50000]
});
sparkline.appendTo("#element");
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 for Sparkline </title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

="text/javascript"></script>
</head>
<body>

  <div id="container" style="margin-top: 15%;">
    <div class="spark" id="element" align="center"></div>
  </div>
<script>
var ele = document.getElementById('container');
if(ele) {
```

```

    ele.style.visibility = "visible";
  }
  </script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

RTL

If you set the `enableRtl` property to true, then the sparkline will be rendered from right-to-left direction.

The following example shows the sparkline is render from "Right-to-left".

INDEX.TS

```

import { Sparkline } from '@syncfusion/ej2-charts';
let sparkline: Sparkline = new Sparkline({
  height: '150px',
  width: '150px',
  enableRtl: true,
  dataSource: [0, 6, 4, 1, 3, 2, 5]
});
sparkline.appendTo("#element");

```

</body></html>

```

Accessibility in EJ2 JavaScript Sparkline control

The Sparkline control followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Sparkline control is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support | |

| [Section 508](#) Support | |

| Screen Reader Support | |

| Right-To-Left Support | |

| Color Contrast | |

| Mobile Device Support | |

| Keyboard Navigation Support | |

| [Accessibility Checker](#) Validation | |

| [Axe-core](#) Accessibility Validation | |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<div> - All features of the control meet the requirement.</div>

<div> - Some features of the control do not meet the requirement.</div>

<div> - The control does not meet the requirement.</div>

WAI-ARIA attributes

The Sparkline control followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Sparkline control:

- `img` (role)
- `aria-label` (attribute)
- `aria-hidden` (attribute)

Keyboard interaction

The Sparkline control followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Sparkline control.

| **Press** | **To do this** |

| --- | --- |

| **Ctrl + P** | Prints the Sparkline. |

Ensuring accessibility

The Sparkline control's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Sparkline control is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Sparkline control with accessibility tools.

Ej1 api migration in EJ2 JavaScript Sparkline control

This article describes the API migration process of Accordion component from Essential JS 1 to Essential JS 2.

Sparkline Types

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

|Type| **Property:** `type`
`$("#container").ejSparkline({ type : 'line' });` | **Property:** `type`
`let sparkline: Sparkline = new Sparkline({
 type: 'Line'
 });`

`sparkline.appendTo('#container');` |

Databinding

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

|Datasource| **Property:** `dataSource`
`$("#container").ejSparkline({ dataSource : 'data' });` | **Property:** `dataSource`
`let sparkline: Sparkline = new Sparkline({
 dataSource: data
 });`

`sparkline.appendTo('#container');` |

| Binding X values with datasource| **Property:** *xName*

 `$("#container").ejSparkline({ xName : "XValue" });` | **Property:** *xName*

 `let sparkline: Sparkline = new Sparkline({
 xName: 'XValue'
 });`
 `sparkline.appendTo('#container');` |

| Binding Y values with datasource| **Property:** *yName*

 `$("#container").ejSparkline({ yName : "YValue" });` | **Property:** *yName*

 `let sparkline: Sparkline = new Sparkline({
 yName: 'YValue'
 });`
 `sparkline.appendTo('#container');` |

Markers

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Enable markers| **Property:** *markerSettings.visible*

 `$("#container").ejSparkline({
 markerSettings: { visible : true }
 });` | **Property:** *markerSettings.visible*

 `let sparkline: Sparkline = new Sparkline({
 markerSettings: {
 visible: ['All']
 }
 });`
 `sparkline.appendTo('#container');` |

| Color| **Property:** *markerSettings.fill*

 `$("#container").ejSparkline({
 markerSettings: { fill : "green" }
 });` | **Property:** *markerSettings.fill*

 `let sparkline: Sparkline = new Sparkline({
 markerSettings: {
 fill: "green"
 }
 });`
 `sparkline.appendTo('#container');` |

| Size| **Property:** *markerSettings.width*

 `$("#container").ejSparkline({
 markerSettings: { width : 5 }
 });` | **Property:** *markerSettings.size*

 `let sparkline: Sparkline = new Sparkline({
 markerSettings: {
 size: 5
 }
 });`
 `sparkline.appendTo('#container');` |

| Opacity| **Property:** *markerSettings.opacity*

 `$("#container").ejSparkline({
 markerSettings: { opacity : 0.5 }
 });` | **Property:** *markerSettings.opacity*

 `let sparkline: Sparkline = new Sparkline({
 markerSettings: {
 opacity: 0.5
 }
 });`
 `sparkline.appendTo('#container');` |

| Border color| **Property:** *markerSettings.border.color*

 `$("#container").ejSparkline({
 markerSettings: {
 border: { color: "green" } }
 });` | **Property:** *markerSettings.border.fill*

 `let sparkline: Sparkline = new Sparkline({
 markerSettings: {
 border: { fill: 'green' }
 }
 });`
 `sparkline.appendTo('#container');` |

| Border width| **Property:** *markerSettings.border.width*

 `$("#container").ejSparkline({
 markerSettings: {
 border: { width: 2 } }
 });` | **Property:** *markerSettings.border.width*

 `let sparkline: Sparkline = new Sparkline({
 markerSettings: {
 border: { width: 2 }
 }
 });`
 `sparkline.appendTo('#container');` |

| Border opacity| **Property:** *markerSettings.border.opacity*

 `$("#container").ejSparkline({
 markerSettings: {
 border: { opacity: 0.7 } }
 });` | Not applicable |

Data labels

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

|Enable data labels| Not applicable |**Property:** *dataLabelSettings.visible*
 Sparkline = new Sparkline({ dataLabelSettings: { visible: ['All'] } };
 sparkline.appendTo('#container');

|Color| Not applicable |**Property:** *dataLabelSettings.fill*
 Sparkline = new Sparkline({ dataLabelSettings: { fill: "green" } };
 sparkline.appendTo('#container');

|Size| Not applicable |**Property:** *dataLabelSettings.size*
 Sparkline = new Sparkline({ dataLabelSettings: { size: 5 } };
 sparkline.appendTo('#container');

|Opacity| Not applicable |**Property:** *dataLabelSettings.opacity*
 Sparkline = new Sparkline({ dataLabelSettings: { opacity: 0.5 } };
 sparkline.appendTo('#container');

|Border color| Not applicable |**Property:** *dataLabelSettings.border.fill*
 Sparkline = new Sparkline({ dataLabelSettings: { border: { fill: 'green' } } };
 sparkline.appendTo('#container');

|Border width| Not applicable |**Property:** *dataLabelSettings.border.width*
 Sparkline = new Sparkline({ dataLabelSettings: { border: { width: 2 } } };
 sparkline.appendTo('#container');

|Format| Not applicable |**Property:** *dataLabelSettings.format*
 Sparkline = new Sparkline({ dataLabelSettings: { format: '\$ {xval}: \$ {yval}' } };
 sparkline.appendTo('#container');

|Horizontal Offset| Not applicable |**Property:** *dataLabelSettings.offset.x*
 Sparkline = new Sparkline({ dataLabelSettings: { offset: { x: 10 } } };
 sparkline.appendTo('#container');

|Vertical Offset| Not applicable |**Property:** *dataLabelSettings.offset.y*
 Sparkline = new Sparkline({ dataLabelSettings: { offset: { y: 10 } } };
 sparkline.appendTo('#container');

|Font color| Not applicable |**Property:** *dataLabelSettings.textStyle.color*
 Sparkline = new Sparkline({ dataLabelSettings: { textStyle: { color: 'black' } } };
 sparkline.appendTo('#container');

|Font family| Not applicable |**Property:** *dataLabelSettings.textStyle.fontFamily*
 Sparkline = new Sparkline({ dataLabelSettings: { textStyle: { fontFamily: 'Arial' } } };
 sparkline.appendTo('#container');

|Font style| Not applicable |**Property:** *dataLabelSettings.textStyle.fontStyle*
 Sparkline = new Sparkline({ dataLabelSettings: { textStyle: { fontStyle: 'normal' } } };
 sparkline.appendTo('#container');

|Font weight| Not applicable |**Property:** *dataLabelSettings.textStyle.fontWeight*
 Sparkline = new Sparkline({ dataLabelSettings: { textStyle: { fontWeight: 'bold' } } };
 sparkline.appendTo('#container');

|Font opacity| Not applicable |**Property:** *dataLabelSettings.textStyle.opacity*
 Sparkline = new Sparkline({ dataLabelSettings: { textStyle: { opacity: 0.7 } } };
 sparkline.appendTo('#container');

|Font size| Not applicable | **Property:** *dataLabelSettings.textStyle.fontSize*
 Sparkline = new Sparkline({ dataLabelSettings: { textStyle: { fontSize: '12px' } };
 sparkline.appendTo('#container');

Range band

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

|Color| **Property:** *rangeBandSettings.fill*
 rangeBandSettings :{ fill : "green" }; | **Property:** *rangeBandSettings.fill*
 Sparkline = new Sparkline({ rangeBandSettings: { fill: "green" };
 sparkline.appendTo('#container');

|Opacity| **Property:** *rangeBandSettings.opacity*
 rangeBandSettings :{ opacity : 0.5 }; | **Property:** *rangeBandSettings.opacity*
 sparkline: Sparkline = new Sparkline({ rangeBandSettings: { opacity: 0.5 };
 sparkline.appendTo('#container');

|Start range| **Property:** *rangeBandSettings.startRange*
 rangeBandSettings :{ startRange: 5 }; | **Property:** *rangeBandSettings.startRange*
 let sparkline: Sparkline = new Sparkline({ rangeBandSettings: { startRange: 5 };
 sparkline.appendTo('#container');

|End range| **Property:** *rangeBandSettings.endRange*
 rangeBandSettings :{ endRange: 10 }; | **Property:** *rangeBandSettings.endRange*
 let sparkline: Sparkline = new Sparkline({ rangeBandSettings: { endRange: 10 };
 sparkline.appendTo('#container');

Special points customization

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

|High point color| **Property:** *highPointColor*
 highPointColor: 'green' }; | **Property:** *highPointColor*
 Sparkline = new Sparkline({ highPointColor: 'green' };
 sparkline.appendTo('#container');

|Low point color| **Property:** *lowPointColor*
 lowPointColor: 'red' }; | **Property:** *lowPointColor*
 Sparkline = new Sparkline({ lowPointColor: 'red' };
 sparkline.appendTo('#container');

|Negative point color| **Property:** *negativePointColor*
 negativePointColor: 'orange' }; | **Property:** *negativePointColor*
 Sparkline = new Sparkline({ negativePointColor: 'orange' };
 sparkline.appendTo('#container');

|Start point color| **Property:** *startPointColor*
 startPointColor: 'orange' }; | **Property:** *startPointColor*
 Sparkline = new Sparkline({ startPointColor: 'orange' };
 sparkline.appendTo('#container');

|End point color| **Property:** *endPointColor*
 endPointColor: 'orange' }; | **Property:** *endPointColor*
 Sparkline = new Sparkline({ endPointColor: 'orange' };
 sparkline.appendTo('#container');

| Tie point color| **Property:** *tiePointColor*

 \$(" #container").ejSparkline({ tiePointColor: 'orange' }); | **Property:** *tiePointColor*

 let sparkline: Sparkline = new Sparkline({ tiePointColor: 'orange' });
 sparkline.appendTo('#container');|

Axis customization

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Show axis line| **Property:** *axisSettings.visible*

 \$(" #container").ejSparkline({

 sparkline.appendTo('#container'); |

SpeedDial

Items in EJ2 JavaScript Speed dial control

The JavaScript(ES5) Speed Dial action items can be added by using [items](#) property.

| Fields | Type | Description |

|-----|-----|-----|

| [text](#) | string | Defines the text content of SpeedDialItem. |

| [iconCss](#) | string | Defines one or more CSS classes to include an icon or image in Speed Dial item. |

| [disabled](#) | boolean | Defines whether to enable or disable the SpeedDialItem. |

| [id](#) | string | Defines a unique value for the SpeedDialItem which can be used to identify the item in event args. |

| [title](#) | string | Defines the title of SpeedDialItem to display tooltip. |

Icons in SpeedDial items

You can customize the icon and text of Speed Dial action items using [iconCss](#) and [text](#) properties.

Icon only

You can show icon only in SpeedDial items by setting [iconCss](#) property. You can show tooltip on hover to show additional details to end-user by setting [title](#) property.

INDEX.JS

```
ej.base.enableRipple(true);
// Initialize action items with icon only
var items = [
  { iconCss: 'e-icons e-cut', title: 'Cut' },
  { iconCss: 'e-icons e-copy', title: 'Copy' },
  { iconCss: 'e-icons e-paste', title: 'Paste' }
];
// Initialize the SpeedDial control
var speedDial = new ej.buttons.SpeedDial({
  items: items,
  openIconCss: 'e-icons e-edit',
  closeIconCss: 'e-icons e-close',
  target: '#targetElement'
});
// Render initialized SpeedDial
speedDial.appendTo('#speeddial');
```

    position: absolute;
    top: 45%;
    width: 30%;
}

```

Animation

The Speed Dial items can be animated during the opening and closing of the popup action items. You can customize the animation's effect, delay, and duration by setting [animation](#) property. By default, Speed Dial animates with a fade effect and supports all [speeddialanimation](#) effects.

Below example demonstrates the Speed Dial items with applied Zoom effect.

INDEX.JS

```

ej.base.enableRipple(true);
// Initialize action items
var items = [
    { text: 'Cut', iconCss: 'e-icons e-cut' },
    { text: 'Copy', iconCss: 'e-icons e-copy' },
    { text: 'Paste', iconCss: 'e-icons e-paste' }
];
// Intialize animation effect

```

```

var animation = { effect: 'Zoom' };
// Initialize the SpeedDial component
var speedDial = new ej.buttons.SpeedDial({
  items: items,
  openIconCss: 'e-icons e-edit',
  closeIconCss: 'e-icons e-close',
  content: 'Edit',
  animation: animation,
  target: '#targetElement'
});
// Render initialized SpeedDial
speedDial.appendTo('#speeddial');

```

  color: #008cff;
}

```

```
height: 40px;
left: 45%;
position: absolute;
top: 45%;
width: 30%;
}
```

Template

The Speed Dial supports to customize the action items and entire pop-up container by setting [itemTemplate](#) and [popupTemplate](#) properties. For more details about templates, check out the link [here](#).

Positions in EJ2 JavaScript Speed dial control

The Speed dial control can be positioned anywhere on the [target](#) using the [position](#) property. If the [target](#) is not defined, then Speed Dial is positioned based on the browser viewport.

The position values of Speed Dial are as follows:

- TopLeft
- TopCenter
- TopRight
- MiddleLeft
- MiddleCenter
- MiddleRight
- BottomLeft
- BottomCenter
- BottomRight

INDEX.JS

```
ej.base.enableRipple(true);
// Initialize action items
var items = [
  { iconCss: 'e-icons e-cut' },
  { iconCss: 'e-icons e-copy' },
  { iconCss: 'e-icons e-paste' }
];
// Initialize the SpeedDial component in linear mode
var linearSpeeddial = new ej.buttons.SpeedDial({
  items: items,
  openIconCss: 'e-icons e-edit',
  mode: 'Linear',
  direction: 'Left',
  target: '#targetElement'
});
// Render initialized SpeedDial
linearSpeeddial.appendTo('#speeddial');
```

INDEX.HTML

    position: absolute;
    top: 45%;
    width: 30%;
}

```

Opens items on hover

You can open the Speed Dial action items on mouse hover by setting the [opensOnHover](#) property.

```

`js
// Initialize action items
var items = [

```

```
{ iconCss: 'e-icons e-cut' },
{ iconCss: 'e-icons e-copy' },
{ iconCss: 'e-icons e-paste' }
];
// Initialize the SpeedDial control
var speedDial = new ej.buttons.SpeedDial({
  items: items,
  openIconCss: 'e-icons e-edit',
  closeIconCss: 'e-icons e-close',
  opensOnHover: true,
  target: '#targetElement'
});
// Render initialized SpeedDial
speedDial.appendTo('#speedDial');
```

Programmatically show/hide SpeedDial items

You can open/close the Speed Dial action items programmatically using [show](#) and [hide](#) methods.

Below example demonstrates open/close action items on button click.

INDEX.JS

```
ej.base.enableRipple(true);
// Initialize action items
var items = [
  { iconCss: 'e-icons e-cut' },
  { iconCss: 'e-icons e-copy' },
  { iconCss: 'e-icons e-paste' }
];
// Initialize the SpeedDial component
var speedDial = new ej.buttons.SpeedDial({
  items: items,
  openIconCss: 'e-icons e-edit',
  closeIconCss: 'e-icons e-close',
  opensOnHover: true,
  target: '#targetElement'
});
// Render initialized SpeedDial
speedDial.appendTo('#speeddial');
// Show and Hide button click event handler
document.getElementById('show').addEventListener('click', function () {
  speedDial.show();
});
document.getElementById('hide').addEventListener('click', function() {
  speedDial.hide();
});
```

INDEX.HTML

}
```

Programmatically refresh the position

You can refresh the position of the Speed Dial using [refreshPosition](#) method when the **target** position is changed.

INDEX.JS

```
ej.base.enableRipple(true);
// Initialize action items
var items = [
  { iconCss: 'e-icons e-cut' },
  { iconCss: 'e-icons e-copy' },
  { iconCss: 'e-icons e-paste' }
];
// Initialize the SpeedDial control
var speedDial = new ej.buttons.SpeedDial({
  items: items,
  openIconCss: 'e-icons e-edit',
  closeIconCss: 'e-icons e-close',
  position: 'MiddleRight',
  target: '#targetElement'
});
// Render initialized SpeedDial
speedDial.appendTo('#speeddial');
// Refresh button click event handler
document.getElementById('refresh').addEventListener('click', function () {
  document.getElementById("targetElement").style.minHeight = "300px";
  speedDial.refreshPosition();
});
```

INDEX.HTML

    font-size: 15px;
}

```

Display modes in EJ2 JavaScript Speed dial control

The action items in JavaScript(ES5) Speed Dial can be displayed in **Linear** and **Radial** display modes by setting [mode](#) property.

Linear display mode

In **Linear** display mode, Speed Dial action items are displayed in a list-like format either horizontally or vertically. By default, Speed Dial items are displayed in **Linear** mode.

Direction

You can open the action items on the top, left, up, and down side of the Speed Dial button by setting [direction](#) property. The default value is `Auto` where the action items are displayed based on the [position](#) of the Speed Dial.

The `Linear` directions of Speed Dial are as follows:

- Left - Action items are displayed on the left side of the button.
- Right - Action items are displayed on the right side of the button.
- Up - Action items are displayed on the top of the button.
- Down - Action items are displayed on the bottom of the button.
- Auto - Action items display direction auto calculated based on `position` of the Speed Dial. If Speed Dial is position at bottom right, then action items displayed at top.

INDEX.JS

```
ej.base.enableRipple(true);
// Initialize action items
var items = [
  { iconCss: 'e-icons e-cut' },
  { iconCss: 'e-icons e-copy' },
  { iconCss: 'e-icons e-paste' }
];
// Initialize the SpeedDial component in linear mode
var linearSpeeddial = new ej.buttons.SpeedDial({
  items: items,
  openIconCss: 'e-icons e-edit',
  mode: 'Linear',
  direction: 'Left',
  target: '#targetElement'
});
// Render initialized SpeedDial
linearSpeeddial.appendTo('#speeddial');
```

INDEX.HTML

  ="text/javascript"></script>
```

```

</head>
<body>

    <div id="container">
        <!-- Elements to render the SpeedDial component. -->
        <div id="targetElement" style="position:relative;min-
height:350px;border:1px solid;"></div>
        <button id="speeddial" title="Edit"></button>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

STYLES.CSS

```

#container {
    visibility: hidden;
}
#loader {
    color: #008cff;
    height: 40px;
    left: 45%;
    position: absolute;
    top: 45%;
    width: 30%;
}

```

Radial display mode (Radial Menu)

In **Radial** mode, Speed Dial action items are displayed in a circular pattern like a radial menu. For more details about radial mode, check out the link [here](#).

Radial menu in EJ2 JavaScript Speed dial control

The JavaScript(ES5) Speed Dial action items can be displayed in a circular pattern like a radial menu by setting **mode** property. You can customize the **direction**, **startAngle**, **endAngle** and **offset** by setting **radialSettings** property.

Radial menu direction

You can open the action items in either clockwise or anticlockwise by setting **direction** property. The default value is **Auto** where the action items are displayed based on the **position** property of the Speed Dial.

```

`js
// Initialize action items
var items = [
    { iconCss: 'e-icons e-cut' },
    { iconCss: 'e-icons e-copy' },

```

```
{ iconCss: 'e-icons e-paste' }  
];  
// Initialize the SpeedDial control in anticlockwise direction  
var radialSettings = { direction: 'AntiClockwise' };  
// Initialize the SpeedDial control  
var speedDial = new ej.buttons.SpeedDial({  
  items: items,  
  openIconCss: 'e-icons e-edit',  
  target: '#targetElement',  
  mode: 'Radial',  
  radialSettings: radialSettings  
});  
// Render initialized SpeedDial  
speedDial.appendTo('#speedDial');  
`
```

Radial menu start and end angle

You can modify the start and end angle of action items by setting [startAngle](#) and [endAngle](#) properties. If the angle is not defined, the action items are displayed based on the [position](#) property of the Speed Dial.

```
`js  
// Initialize action items  
var items = [  
  { iconCss: 'e-icons e-cut' },  
  { iconCss: 'e-icons e-copy' },  
  { iconCss: 'e-icons e-paste' },  
];  
// Initialize radial direction with start and end angles  
var radialSettings = { direction: 'AntiClockwise', startAngle: 180, endAngle: 360 };  
// Initialize the SpeedDial control  
var speedDial = new ej.buttons.SpeedDial({  
  items: items,  
  openIconCss: 'e-icons e-edit',  
  target: '#targetElement',  
  mode: 'Radial',
```

```
position: 'MiddleCenter',
radialSettings: radialSettings
});
// Render initialized SpeedDial
speedDial.appendTo('#speedDial');
`
```

Offset

You can modify the offset distance between action items and Speed Dial button using [offset](#) property.

```
`js
// Initialize action items
var items = [
{ iconCss: 'e-icons e-cut' },
{ iconCss: 'e-icons e-copy' },
{ iconCss: 'e-icons e-paste' }
];
// Initialize radial direction with offset
var radialSettings = { offset: '80px' };
// Initialize the SpeedDial control
var speedDial = new ej.buttons.SpeedDial({
items: items,
openIconCss: 'e-icons e-edit',
target: '#targetElement',
mode: 'Radial',
radialSettings: radialSettings
});
// Render initialized SpeedDial
speedDial.appendTo('#speedDial');
`
```

Below example demonstrates the radial menu settings of the Speed Dial.

INDEX.JS

```
ej.base.enableRipple(true);
// Initialize action items
var items = [
  { iconCss: 'e-icons e-cut' },
  { iconCss: 'e-icons e-copy' },
  { iconCss: 'e-icons e-paste' },
```

```

    { iconCss:'e-icons e-edit'},
    { iconCss:'e-icons e-save'}
  ];
  // Initialize radial direction
  var radialSettings = { offset: '80px', direction: 'AntiClockwise',
    startAngle: 90, endAngle: 270 };
  // Initialize the SpeedDial component
  var speedDial = new ej.buttons.SpeedDial({
    items: items,
    openIconCss:'e-icons e-edit',
    target: '#targetElement',
    mode: 'Radial',
    position: 'MiddleRight',
    radialSettings: radialSettings
  });
  // Render initialized SpeedDial
  speedDial.appendTo('#speeddial');

```

Template in EJ2 JavaScript Speed dial control

This section explains available templates in SpeedDial control and its usage.

Item template

You can use the [itemTemplate](#) property to set a template content for the SpeedDial items. The template content is defined as a child content of `itemTemplate` tag directive.

INDEX.JS

```
ej.base.enableRipple(true);
// Initialize action items
var items = [
    { text: 'Cut', iconCss: 'e-icons e-cut' },
    { text: 'Copy', iconCss: 'e-icons e-copy' },
    { text: 'Paste', iconCss: 'e-icons e-paste' }
];
// Initialize the SpeedDial component
var speeddial = new ej.buttons.SpeedDial({
    items: items,
    openIconCss: 'e-icons e-edit',
    content: 'Edit',
    target: '#targetElement',
    itemTemplate: '#itemTemplate'
});
// Render initialized SpeedDial
speeddial.appendTo('#speeddial');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 SpeedDial</title>

6px -2px;
background: #f5f5f5;
padding: 15px;
}

```

Popup template

You can use the [popupTemplate](#) property to set a template content for popup of SpeedDial control. The template content is defined as a child content of `popupTemplate` tag directive.

INDEX.JS

```

ej.base.enableRipple(true);
// Initialize action items
var items = [
  { text: 'Cut', iconCss: 'e-icons e-cut' },
  { text: 'Copy', iconCss: 'e-icons e-copy' },
  { text: 'Paste', iconCss: 'e-icons e-paste' }
];
// Initialize the SpeedDial component
var speeddial = new ej.buttons.SpeedDial({
  items: items,
  openIconCss: 'e-icons e-edit',
  content: 'Edit',
  target: '#targetElement',
  popupTemplate: '#popupTemplate'
});
// Render initialized SpeedDial
speeddial.appendTo('#speeddial');

```

Styles in EJ2 JavaScript Speed dial control

This section briefs different ways to style SpeedDial control.

SpeedDial button

You can customize the icon and text of JavaScript(ES5) Speed Dial button using [openIconCss](#), [closeIconCss](#) and [content](#) properties.

Icon only

You can use the [openIconCss](#) and [closeIconCss](#) properties to show icons in speed dial button. You can also show tooltip on hover to show additional details to end-user by setting `title` attribute.

INDEX.JS

```
ej.base.enableRipple(true);
// Initialize the SpeedDial control with icon only
var speeddial = new ej.buttons.SpeedDial({
  openIconCss: 'e-icons e-edit',
  closeIconCss: 'e- icons e-close',
  target: '#targetElement'
});
// Render initialized SpeedDial
speeddial.appendTo('#speeddial');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 SpeedDial</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
```

```

    height: 40px;
    left: 45%;
    position: absolute;
    top: 45%;
    width: 30%;
}

```

Text only

You can show only text in Speed Dial button by setting [content](#) property without setting icon properties..

INDEX.JS

```

ej.base.enableRipple(true);
// Initialize the SpeedDial control with text only
var speeddial = new ej.buttons.SpeedDial({

```

```

        content: 'Edit',
        target: '#targetElement'
    });
    // Render initialized SpeedDial.
    speeddial.appendTo('#speeddial');

```

  width: 30%;

```

```
}

```

Icon with text

You show icon and text in SpeedDial button using [openIconCss](#), [closeIconCss](#) and [content](#) properties together.

INDEX.JS

```
ej.base.enableRipple(true);
// Initialize the SpeedDial control with icon and text
var speeddial = new ej.buttons.SpeedDial({
  content: 'Edit',
  openIconCss: 'e-icons e-edit',
  closeIconCss: 'e- icons e-close',
  target: '#targetElement'
});
// Render initialized SpeedDial
speeddial.appendTo('#speeddial');
```

    position: absolute;
    top: 45%;
    width: 30%;
}
```

Disabled

You can enable or disable the SpeedDial control using [disabled](#) property.

```
`js
```

```
// Initialize the SpeedDial control in disabled state
```

```
var speeddial = new ej.buttons.SpeedDial({
```

```
content: 'Edit',
```

```
target: '#targetElement',
```

```
disabled: true
```

```
});
```

```
// Render initialized SpeedDial
```

```
speeddial.appendTo('#speeddial');
```

```
,
```

cssClass

The JavaScript(ES5) Speed Dial supports the following predefined styles that can be defined using the [cssClass](#) property. You can customize by setting the `cssClass` property with the below defined class.

cssClass	Description
-----	-----
e-primary	Used to represent a primary action.
e-outline	Used to represent an appearance of button with outline.
e-info	Used to represent an informative action.
e-success	Used to represent a positive action.
e-warning	Used to represent an action with caution.
e-danger	Used to represent a negative action.

INDEX.JS

```

ej.base.enableRipple(true);
// Initialize the SpeedDial with applied warning style
var speeddial = new ej.buttons.SpeedDial({
  content: 'Edit',
  target: '#targetElement',
  cssClass: 'e-warning'
});
// Render initialized SpeedDial
speeddial.appendTo('#speeddial');

```

INDEX.HTML

```

  height: 40px;
}

```

```

left: 45%;
position: absolute;
top: 45%;
width: 30%;
}

```

Visible

You can set the Speed Dial button to visible/hidden state using [visible](#) property.

```

`js
// Initialize the SpeedDial control in hidden state
var speeddial = new ej.buttons.SpeedDial({
  content: 'Edit',
  target: '#targetElement',
  visible: false
});
// Render initialized SpeedDial
speeddial.appendTo('#speeddial');
`

```

Tooltip

You can show tooltip on hover to show additional details to end-user by setting [title](#) to Speed Dial button.

INDEX.JS

```

ej.base.enableRipple(true);
// Initialize action items with tooltip
var items = [
  { iconCss: 'e-icons e-cut', title: 'Cut' },
  { iconCss: 'e-icons e-copy', title: 'Copy' },
  { iconCss: 'e-icons e-paste', title: 'Paste' }
];
// Initialize the SpeedDial control
var speeddial = new ej.buttons.SpeedDial({
  openIconCss: 'e-icons e-edit',
  items: items,
  target: '#targetElement'
});
// Render initialized SpeedDial
speeddial.appendTo('#speeddial');

```

    position: absolute;
    top: 45%;
    width: 30%;
}

```

Opens on hover

You can use [opensOnHover](#) property to open actions items on hover itself. By default action items displayed only when clicking the speed dial button.

INDEX.JS

```

ej.base.enableRipple(true);
// Initialize action items
var items = [
    { iconCss: 'e-icons e-cut' },

```

```

    { iconCss: 'e-icons e-copy' },
    { iconCss: 'e-icons e-paste' }
  ];
  // Initialize the SpeedDial control
  let speedDial = new ej.buttons.SpeedDial({
    items: items,
    openIconCss: 'e-icons e-edit',
    closeIconCss: 'e-icons e-close',
    opensOnHover: true,
    target: '#targetElement'
  });
  // Render initialized SpeedDial
  speedDial.appendTo('#speeddial');

```

Modal in EJ2 JavaScript Speed dial control

You can use the [modal](#) property to set the Speed Dial as modal which adds an overlay to prevent the background interaction.

INDEX.JS

```

ej.base.enableRipple(true);
// Initialize action items
var items = [
  { iconCss: 'e-icons e-cut' },
  { iconCss: 'e-icons e-copy' },
  { iconCss: 'e-icons e-paste' }
];
// Initialize the SpeedDial control with modal
var speeddial = new ej.buttons.SpeedDial({
  items: items,
  openIconCss: 'e-icons e-edit',
  target: '#targetElement',
  modal: true
});
// Render initialized SpeedDial
speeddial.appendTo('#speeddial');

```

```

Event in EJ2 JavaScript Speed dial control

This section explains the Speed Dial events that will be triggered when appropriate actions are performed.

clicked

The SpeedDial control triggers the [clicked](#) event with [SpeedDialItemEventArgs](#) argument when an action item is clicked. You can use this event to perform the required action.

```

`js
// Initialize action items
var items = [
    { text: 'Cut'},
    { text: 'Copy'},
    { text: 'Paste'}
];
// Initialize the SpeedDial control
var speeddial= new ej.buttons.SpeedDial({
    items: items,

```

```
content: 'Edit',
target: '#targetElement',
clicked: (args)=> {
//Your required action here
}
});
// Render initialized SpeedDial
speeddial.appendTo('#speeddial');
```

[created](#)

The Speed Dial control triggers the [created](#) event when SpeedDial control rendering is completed.

```
`js
// Initialize action items
var items = [
{ text: 'Cut'},
{ text: 'Copy'},
{ text: 'Paste'}
];
// Initialize the SpeedDial control
var speeddial: = new ej.buttons.SpeedDial({
items: items,
content: 'Edit',
target: '#targetElement',
created: ()=> {
//Your required action here
}
});
// Render initialized SpeedDial
speeddial.appendTo('#speeddial');
```

[beforeOpen](#)

The SpeedDial control triggers the [beforeOpen](#) event with [SpeedDialBeforeOpenCloseEventArgs](#) argument before the SpeedDial popup is opened.

```
`js
```

```
// Initialize action items
var items = [
  { text: 'Cut'},
  { text: 'Copy'},
  { text: 'Paste'}
];
// Initialize the SpeedDial control
var speeddial = new ej.buttons.SpeedDial({
  items: items,
  content: 'Edit',
  target: '#targetElement',
  beforeOpen: (args)=> {
    //Your required action here
  }
});
// Render initialized SpeedDial
speeddial.appendTo('#speeddial');
```

onOpen

The SpeedDial control triggers the [onOpen](#) event with [SpeedDialOpenCloseEventArgs](#) argument when SpeedDial popup is opened.

```
`js
// Initialize action items
var items = [
  { text: 'Cut'},
  { text: 'Copy'},
  { text: 'Paste'}
];
// Initialize the SpeedDial control
var speeddial = new ej.buttons.SpeedDial({
  items: items,
  content: 'Edit',
  target: '#targetElement',
  onOpen: (args)=> {
```

```
//Your required action here
}
});
// Render initialized SpeedDial
speeddial.appendTo('#speeddial');
`
```

beforeClose

The SpeedDial control triggers the [beforeClose](#) event with [SpeedDialBeforeOpenCloseEventArgs](#) argument before the SpeedDial popup is closed.

```
`js
// Initialize action items
var items = [
{ text: 'Cut'},
{ text: 'Copy'},
{ text: 'Paste'}
];
// Initialize the SpeedDial control
var speeddial = new ej.buttons.SpeedDial({
items: items,
content: 'Edit',
target: '#targetElement',
beforeClose: (args)=> {
//Your required action here
}
});
// Render initialized SpeedDial
speeddial.appendTo('#speeddial');
`
```

onClose

The SpeedDial control triggers the [onClose](#) event with [SpeedDialOpenCloseEventArgs](#) argument when SpeedDial popup is closed.

```
`js
// Initialize action items
var items = [
```

```
{ text: 'Cut'},
{ text: 'Copy'},
{ text: 'Paste'}
];
// Initialize the SpeedDial control
var speeddial = new ej.buttons.SpeedDial({
  items: items,
  content: 'Edit',
  target: '#targetElement',
  onClose: (args)=> {
    //Your required action here
  }
});
// Render initialized SpeedDial.
speeddial.appendTo('#speeddial');
```

[beforeItemRender](#)

The SpeedDial control triggers the [beforeItemRender](#) event with [SpeedDialItemEventArgs](#) argument for each SpeedDialItem once it is rendered.

```
`js
// Initialize action items
var items = [
  { text: 'Cut'},
  { text: 'Copy'},
  { text: 'Paste'}
];
// Initialize the SpeedDial control
var speeddial = new ej.buttons.SpeedDial({
  items: items,
  content: 'Edit',
  target: '#targetElement',
  beforeItemRender: (args)=> {
    //Your required action here
  }
});
```

```
});  
// Render initialized SpeedDial  
speeddial.appendTo('#speeddial');  
`
```

Below example demonstrates the clicked event of the Speed Dial control.

INDEX.JS

```
ej.base.enableRipple(true);  
// Initialize action items  
var items = [  
  { text: 'Cut' },  
  { text: 'Copy' },  
  { text: 'Paste' }  
];  
// Initialize SpeedDial control with clicked event  
var speeddial = new ej.buttons.SpeedDial({  
  items: items,  
  content: 'Edit',  
  target: '#targetElement',  
  clicked: actionClicked  
});  
// Render initialized SpeedDial.  
speeddial.appendTo('#speeddial');  
function actionClicked(args) {  
  alert(args.item.text + " is clicked");  
}
```

```

Accessibility in EJ2 JavaScript Speed dial control

Accessibility is achieved in the Speed Dial control through WAI-ARIA standard and keyboard navigations. The Speed Dial control can be effectively accessed through assistive technologies such as screen readers.

Keyboard interaction

The Speed Dial control is interactive with below keyboard shortcuts.

| Keyboard shortcuts | Actions |

|-----|-----|

| Enter | Open/close the menu. If a SpeedDial item is focused, should triggers the clicked event for the item. |

| Up-arrow | Navigates up or to the previous menu item. |

| Left-Arrow | Navigates left or to the previous menu item. |

| Down-Arrow | Navigates down or to the previous menu item. |

| Right-Arrow | Navigates right or to the previous menu item. |

| Home | Navigates to the first menu item. |

| End | Navigates to the last menu item. |

| Esc | Closes the menu. |

ARIA attributes

The following ARIA attributes are used in SpeedDial control based on its state.

Properties	Functionality
role	This attribute is added to the input element to describe the actual role.
aria-label	Attribute provides the text label with some default description for the SpeedDial and its items.
aria-expanded	It indicates whether the SpeedDial current state is expanded or collapsed.
aria-haspopup	It indicates whether the SpeedDial has popup items or not.
aria-controls	Attribute is set to the SpeedDial button and it points to the corresponding content.
aria-disabled	It indicates the disabled state of the SpeedDial and its items.

Spinner

Template in EJ2 JavaScript Spinner control

You can use custom templates on the Spinner instead of the default Spinner by specifying the template in the `setSpinner` method.

The following steps explain you on how to define template for Spinner.

- Import the `setSpinner` method from `ej2-popups` library into your `app.ts` as shown in below.

```
`ts
import { setSpinner } from '@syncfusion/ej2-popups';
`
```

- Pass your custom template to the `setSpinner` method like as below.

```
`ts
// Specify the template content to be displayed in the Spinner
setSpinner({ template: '<div style="width:100%;height:100%" class="custom-rolling"><div></div></div>'});
`
```

You should set the template to the Spinner before creating the respective Essential JS 2 component. Also, until we replace `setSpinner` template, the further Essential JS 2 component rendering is created with given template only.

- Now, render the Essential JS 2 component. It's render the Spinner with the template specified in the `setSpinner` method.

In the below sample, we have rendered the Grid component with custom Spinner using `setSpinner` method. You have to define the styles for the template in `styles.css`.

INDEX.TS

```
import { createSpinner, setSpinner, showSpinner } from '@syncfusion/ej2-
popups';
import { Grid } from '@syncfusion/ej2-grids';
import { data } from './datasource.ts';
let gridData: Object[] = data.slice(0, 7);
// By default, Spinner is rendered with specified theme inside the Grid
component.
let grid: Grid = new Grid({
    dataSource: gridData,
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign:
'right', width: 120, type: 'number' },
        { field: 'CustomerID', width: 140, headerText: 'Customer
ID', type: 'string' },
        { field: 'Freight', headerText: 'Freight', textAlign:
'right', width: 120, format: 'C' },
        { field: 'OrderDate', headerText: 'Order Date', width: 140,
format: 'yMd' }
    ]
});
grid.appendTo('#Grid');
grid.hideSpinner = () => true;
// Specify the template content to be displayed in the Spinner
setSpinner({ template: '<div style="width:100%;height:100%" class="custom-
rolling"><div></div></div>' });
let gridData2: Object[] = data.slice(0, 7);
// Spinner is rendered with template specified in the setSpinner method.
let grid2: Grid = new Grid({
    dataSource: gridData2,
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'right',
width: 120, type: 'number' },
        { field: 'CustomerID', width: 140, headerText: 'Customer ID', type:
'string' },
        { field: 'Freight', headerText: 'Freight', textAlign: 'right',
width: 120, format: 'C' },
        { field: 'OrderDate', headerText: 'Order Date', width: 140, format:
'yMd' }
    ]
});
grid2.appendTo('#Grid2');
grid2.hideSpinner = () => true;
```

INDEX.HTML

        <h5> Spinner is rendered with specified theme</h5>
        <div id="Grid" class="spinner-grid">
        </div>
        <h5> Spinner is rendered with specified template in setSpinner</h5>
        <div id="Grid2" class="spinner-grid">
        </div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Types in EJ2 JavaScript Spinner control

By default, the Spinner is loaded in the applicable Essential JS 2 component based on the theme imported into the page. Based on the theme, the type is set to the Spinner.

The available types are:

- Material
- Fabric
- Bootstrap

You can change the Essential JS 2 component spinner type by passing the type of the spinner as parameter to the `setSpinner` method like as below.

```

`ts
// Specify the type of the Spinner to be displayed
setSpinner({ type: 'Bootstrap'});
`

```

After Essential JS 2 component creation only, you can change the Essential JS 2 component spinner type.

INDEX.TS

```
import { createSpinner, setSpinner , showSpinner } from '@syncfusion/ej2-
popups';
import { Grid } from '@syncfusion/ej2-grids';
import { data } from './datasource.ts';
let gridData: Object[] = data.slice(0, 7);
// By default, Spinner is rendered with specified theme inside the Grid
component.
let grid: Grid = new Grid({
  dataSource: gridData,
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'right',
width: 120, type: 'number' },
    { field: 'CustomerID', width: 140, headerText: 'Customer ID', type:
'string' },
    { field: 'Freight', headerText: 'Freight', textAlign: 'right',
width: 120, format: 'C' },
    { field: 'OrderDate', headerText: 'Order Date', width: 140, format:
'yMd' }
  ]
});
grid.appendTo('#Grid');
grid.hideSpinner = () => true;
// Specify the type of the Spinner to be displayed in the Grid.
setSpinner({ type: 'Bootstrap' });
```

<script src="index.js" type="text/javascript"></script>
</body></html>

```

Style in EJ2 JavaScript Spinner control

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

Customizing the spinner

Use the following CSS to customize the spinner stroke color.

Material theme

```

`css
.e-spinner-pane .e-spinner-inner .e-spin-material {
stroke: green;
}
`

```

Fabric theme

```

`css
.e-spinner-pane .e-spinner-inner .e-spin-fabric {
stroke: green;
}
`

```

Bootstrap theme

```

`css
.e-spinner-pane .e-spinner-inner .e-spin-bootstrap {
fill: green;
stroke: green;
}
`

```

Bootstrap4 theme

```

`css
.e-spinner-pane .e-spinner-inner .e-spin-bootstrap4 {
stroke: green;
}
`

```

```

}
`

```

High Contrast theme

```
`css
```

```
.e-spinner-pane .e-spinner-inner .e-spin-high-contrast .e-path-arc {
stroke: green;
}
`

```

SplitButton

Icons and separator in EJ2 JavaScript Split button control

SplitButton icons

SplitButton can have an icon to provide the visual representation of the action. To place the icon on a SplitButton, set the [iconCss](#) property to `e-icons` with the required icon CSS. By default, the icon is positioned to the left side of the SplitButton. You can customize the icon's position by using the [iconPosition](#) property.

In the following example, the SplitButton with default iconPosition and `iconPosition` as `Top` is showcased:

INDEX.TS

```
import { SplitButton, ItemModel } from '@syncfusion/ej2-splitbuttons';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
let items: ItemModel[] = [
    {
        text: 'Undo'
    },
    {
        text: 'Redo'
    },
    {
        text: 'Cut'
    },
    {
        text: 'Copy'
    },
    {
        text: 'Paste'
    }
];
//To place the icon in SplitButton.
let splitBtn: SplitButton = new SplitButton({ iconCss: 'e-sb-icons e-paste',
items: items }, '#iconbutton');
let splitBtnObj: SplitButton = new SplitButton({ iconCss: 'e-sb-icons e-
paste', items: items, iconPosition: "Top" }, '#iconpstn');
```

INDEX.HTML

}
```

The Essential JS 2 provides a set of icons that can be loaded by applying **e-icons** class name to the element.

You can also use third party icons on the splitBtn using the [iconCss](#) property.

Vertical button

Vertical Button in SplitButton can be achieved by adding **e-vertical** class using [cssClass](#) property.

The following example illustrates how to provide vertical support in SplitButton component.

INDEX.TS

```
import { SplitButton, ItemModel } from '@syncfusion/ej2-splitbuttons';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
let items: ItemModel[] = [
    {
        text: 'Undo'
    },
    {
        text: 'Redo'
    },
    {
        text: 'Cut'
    },
    {
        text: 'Copy'
    },
    {
        text: 'Paste'
    }
];
//To position the icon to the top of the text on a SplitButton.
let splitBtn: SplitButton = new SplitButton({ iconCss: 'e-sb-icons e-paste',
cssClass: 'e-vertical', items: items, iconPosition: 'Top' }, '#iconbutton');
```

```

The Essential JS 2 provides a set of icons that can be loaded by applying **e-icons** class name to the element. You can also use third party icons on the SplitButton using the [iconCss](#) property.

Separator

The Separators are the horizontal lines that are used to separate the popup items. You **cannot** select the separators. You can enable separators to group the popup items using the **separator** property.

The following example illustrates how to enable separator support in SplitButton component.

INDEX.TS

```

import { SplitButton, ItemModel } from '@syncfusion/ej2-splitbuttons';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
let items: ItemModel[] = [
  {
    text: 'Cut',

```

```

        iconCss: 'e-sb-icons e-cut'
    },
    {
        text: 'Copy',
        iconCss: 'e-icons e-copy'
    },
    {
        text: 'Paste',
        iconCss: 'e-sb-icons e-paste'
    },
    {
        separator: true
    },
    {
        text: 'Font',
        iconCss: 'e-sb-icons e-font'
    },
    {
        text: 'Paragraph',
        iconCss: 'e-sb-icons e-paragraph'
    }
    ]];
//To position the separator in SplitButton.
let splitBtn: SplitButton = new SplitButton({ iconCss: 'e-sb-icons e-paste',
items: items }, '#iconbutton');
```

- [SplitButton popup with icons](#)

Popup items in EJ2 JavaScript Split button control

Icons

The Popup action item have an icon or image to provide visual representation of the action. To place the icon on a popup item, set the [iconCss](#) property to e-icons with the required icon CSS. By default, the icon is positioned to the left side of the popup action item.

In the following sample, the icons for Cut, Copy, and Paste menu items are added using the iconCss property.

INDEX.TS

```

import { SplitButton, ItemModel } from '@syncfusion/ej2-splitbuttons';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
let items: ItemModel[] = [
    {
        text: 'Cut',

```

```

        iconCss: 'e-sb-icons e-cut'
    },
    {
        text: 'Copy',
        iconCss: 'e-icons e-copy'
    },
    {
        text: 'Paste',
        iconCss: 'e-sb-icons e-paste'
    }
  ]];
//To position the icons in SplitButton.
let splitBtn: SplitButton = new SplitButton({ iconCss: 'e-sb-icons e-paste',
items: items }, '#iconbutton');

```

}

```

Template

Item templating

Popup items can be customized by using the [beforeItemRender](#) event. The item render event triggers while rendering each Popup action item. The event argument will be used to identify the action item and customize it based on the requirement.

In the following example, the icons in each `[li]` items is right aligned by appending span element while `[li]` rendering:

INDEX.TS

```

import { SplitButton, ItemModel, SplitButtonModel, MenuEventArgs } from
 '@syncfusion/ej2-splitbuttons';
import { enableRipple, createElement } from '@syncfusion/ej2-base';
enableRipple(true);
let items: ItemModel[] = [
  {
    text: 'Cut',
  },
  {
    text: 'Copy',
  },
  {
    text: 'Paste',
  }
];
let menuOptions: SplitButtonModel = {
  items: items,
  iconCss: 'e-sb-icons e-paste',
  beforeItemRender: (args: MenuEventArgs) => {
    let shortCutSpan: HTMLElement = createElement('span');
    let text: string = args.item.text;
    args.element.appendChild(shortCutSpan);
    shortCutSpan.setAttribute('class', 'shortcut');
    let clsName: string = (text === 'Copy') ? 'e-icons' : 'e-sb-
icons';
    shortCutSpan.classList.add(clsName);
    (text === 'Cut') ? shortCutSpan.classList.add('e-cut') : (text
=== 'Paste') ? shortCutSpan.classList.add('e-paste') :
shortCutSpan.classList.add('e-copy');

```

```

    }
    };
    let splitBtn: SplitButton = new SplitButton(menuOptions, '#action');

```

INDEX.HTML

```

  content: '\e70a';
}
.e-split-btn-wrapper{
  margin: 20px 20px 5px 5px;
}
```

Popup templating

The whole popup can be customized as per the requirement and it can be customized by handling it in [target](#) property.

In the following sample, the whole popup item is customized as color palette by giving `div` as target and it can be achieved using `target` property.

INDEX.TS

```
import { SplitButton, SplitButtonModel } from '@syncfusion/ej2-splitbuttons';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
let menuOptions: SplitButtonModel = {
  target: '#dropdowntarget',
  iconCss: 'e-sb-icons e-color',
};
let splitBtn: SplitButton = new SplitButton(menuOptions, '#action');
```

Accessibility in EJ2 JavaScript Split button control

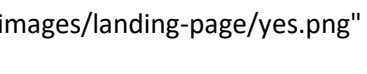

The Split button component followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

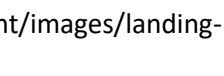

The accessibility compliance for the Split button component is outlined below.

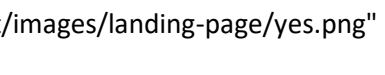

| Accessibility Criteria | Compatibility |

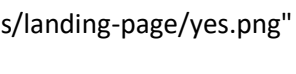

| -- | -- |

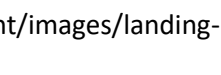

| [WCAG 2.2](#) Support |  |

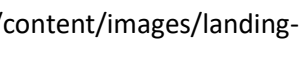

| [Section 508](#) Support |  |

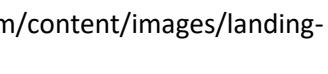

| Screen Reader Support |  |

| Right-To-Left Support |  |

| Color Contrast |  |

| Mobile Device Support |  |

| Keyboard Navigation Support |  |

| [Accessibility Checker](#) Validation |  |

| [Axe-core](#) Accessibility Validation |  |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<div> - All features of the component meet the requirement.</div>

```
<div> - Some features of the component do not meet the requirement.</div>
```

```
<div> - The component does not meet the requirement.</div>
```

WAI-ARIA attributes

The Split button component followed the [WAI-ARIA] patterns to meet the accessibility. The following ARIA attributes are used in the Split button component:

| Attributes | Purpose |

| --- | --- |

| **role** | Indicates the Split button component as **button**, Split button popup as **menu**, and the Split button popup action items as **menuitem**. |

| **aria-haspopup** | Indicates the availability and type of interactive Split button popup element. |

| **aria-expanded** | Indicates whether the Split button popup can be expanded or collapsed, as well as indicates whether its current state is expanded or collapsed. |

| **aria-owns** | Identifies an elements in order to define a visual, functional, or contextual parent/child relationship between DOM elements where the DOM hierarchy cannot be used to represent the relationship. |

| **aria-disabled** | Indicates that the element is perceivable but disabled, so it is not editable or otherwise operable. |

Keyboard interaction

The Split button component followed the [keyboard interaction] guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Split button component.

| Press | To do this |

| --- | --- |

| **Esc** | Closes the opened popup. |

| **Enter** | Opens the popup, or activates the highlighted item and closes the popup. |

| **Spacer** | Opens the popup. |

| **Up** | Navigates up or to the previous action item. |

| **Down** | Navigates down or to the next action item. |

| **Alt + Up Arrow** | Closes the popup. |

| **Alt + Down Arrow** | Opens the popup. |

Ensuring accessibility

The Split button component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Split button component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Split button component with accessibility tools.

How To

Create right to left splitbutton in EJ2 JavaScript Split button control

SplitButton component has RTL support. This can be achieved by setting [enableRtl](#) as `true`.

The following example illustrates how to enable right-to-left support in SplitButton component.

INDEX.TS

```
import { SplitButton, ItemModel } from '@syncfusion/ej2-splitbuttons';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
let items: ItemModel[] = [
    {
        text: 'Autosum'
    },
    {
        text: 'Average'
    },
    {
        text: 'Count numbers',
    },
    {
        text: 'Min'
    },
    {
        text: 'Max'
    }
];
//To enable RTL in SplitButton.
let splitBtn: SplitButton = new SplitButton({ iconCss: 'e-sb e-sigma',
items: items, enableRtl: true }, '#iconbutton');
```

Group items in popup in EJ2 JavaScript Split button control

Items in popup can be grouped in SplitButton by templating entire popup with ListView. To achieve grouping in ListView, check [ListView Grouping](#) documentation. To template ListView in popup, create ListView with id `listview` and provide it as `target` for SplitButton.

The following example illustrates how to group items in popup using ListView component.

INDEX.TS

```

import { SplitButton } from '@syncfusion/ej2-splitbuttons';
import { ListView } from '@syncfusion/ej2-lists';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
let listItems: { [key: string]: Object }[] = [
  {
    'text': 'Cut',
    'category': 'Basic'
  },
  {
    'text': 'Copy',
    'category': 'Basic'
  },
  {
    'text': 'Paste',
    'category': 'Basic'
  },
  {
    'text': 'Paste as Formula',
    'category': 'Advanced'
  }
]

```

```

    },
    {
        'text': 'Paste as Hyperlink',
        'category': 'Advanced'
    },
];
let listView: ListView = new ListView({
    dataSource: listItems,
    sortOrder: 'Descending',
    fields: { groupBy: 'category' }
}, '#listview');
let splitBtn: SplitButton = new SplitButton({ content: 'ClipBoard', target:
listView.element }, '#element');
```

INDEX.HTML

Open a dialog on popup item click in EJ2 JavaScript Split button control

This section explains about how to open a dialog on SplitButton popup item click. This can be achieved by handling dialog open in [select](#) event of the SplitButton.

In the following example, Dialog will open while selecting **Update...** item.

INDEX.TS

```
import { SplitButton, ItemModel, MenuEventArgs } from '@syncfusion/ej2-splitbuttons';
import { Dialog } from '@syncfusion/ej2-popups';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
let dialogObj: Dialog = new Dialog({
    width: '250px',
    header: 'Software Update',
    content: 'Are you sure want to update?',
    target: document.getElementById('container'),
    visible: false,
    buttons: [
        {
            click: () => {
                dialogObj.hide();
            },
            buttonModel: { content: 'OK', isPrimary: true }
        },
        {
            click: () =>{
                dialogObj.hide();
            },
            buttonModel: { content: 'Cancel', isPrimary: true }
        }
    ],
});
dialogObj.appendTo('#dialog');
let items: ItemModel[] = [
    {
        text: 'Help'
    },
    {
        text: 'About'
    }
];
```

```

    },
    {
        text: 'Update...'
    }
];
let splitBtn: SplitButton = new SplitButton(
{
    content: 'Help',
    items: items,
    select: (args: MenuEventArgs) => {
        if (args.item.text === 'Update...') {
            dialogObj.show();
        }
    }
}, '#element');

```

INDEX.HTML

Set the disabled state in EJ2 JavaScript Split button control

SplitButton component can be enabled or disabled using [disabled](#) property. To disable SplitButton component, set the disabled property as `true`.

The following example illustrates how to set the disable state in SplitButton component.

INDEX.TS

```
import { SplitButton, ItemModel } from '@syncfusion/ej2-splitbuttons';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
let items: ItemModel[] = [
    {
        text: 'Autosum'
    },
    {
        text: 'Average'
    },
    {
        text: 'Count numbers',
    },
    {
        text: 'Min'
    },
    {
        text: 'Max'
    }
];
//To disable the SplitButton.
let splitBtn: SplitButton = new SplitButton({ iconCss: 'e-sb e-sigma',
items: items, disabled: true }, '#iconbutton');
```

INDEX.HTML

```

Underline a character in a text in EJ2 JavaScript Split button control

Underline a particular character in a text can be handled in [beforeItemRender](#) event by adding `<u>` tag in between the text and given as innerHTML in `li` rendering.

In the following example, **C** is underlined in the text **Copy**.

INDEX.TS

```

import { SplitButton, ItemModel, MenuEventArgs } from '@syncfusion/ej2-splitbuttons';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
//Initialize action items.
let items: ItemModel[] = [
  {
    text: 'Cut'
  },

```

```

    {
        text: 'Copy'
    },
    {
        text: 'Paste'
    }
  ];
let splitBtn: SplitButton = new SplitButton({
  content: 'Paste',
  items: items,
  beforeItemRender: (args: MenuEventArgs) => {
    if (args.item.text === 'Copy') {
      args.element.innerHTML = '<u>C</u>opy';
    }
  }
}, '#element');
```

INDEX.HTML

Ej1 api migration in EJ2 JavaScript Split button control

This article describes the API migration process of SplitButton component from Essential JS 1 to Essential JS 2.

Properties

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Specifies the text of the SplitButton | **Property:** *text*

 \$("#splitbutton").ejSplitButton({
target: "#target",
 text: "Split Button"
}); | **Property:** *content*

 var splitButton = new ej.splitbuttons.SplitButton({
 content: "Split Button"
});
splitButton.appendTo("#splitbutton"); |

| Popup content | **Property:** *target*

 \$("#splitbutton").ejSplitButton({
 target: "#target",
 text: "Split Button"
}); | **Property:** *target*

 var splitButton = new ej.splitbuttons.SplitButton({
target: "#target",
 content: "Split Button"
});
splitButton.appendTo("#splitbutton"); |

| Popup items | Not applicable | **Property:** *items*

 var splitButton = new ej.splitbuttons.SplitButton({
 items: items,
 content: "Split Button"
});
splitButton.appendTo("#splitbutton");
 var items = [
 {
 text: 'Cut'
 },
 {
 text: 'Copy'
 },
 {
 text: 'Paste'
 }
]; |

| Arrow position | **Property:** *arrowPosition*

 \$("#splitbutton").ejSplitButton({
arrowPosition: ej.ArrowPosition.Left,
 target: "#target",
 text: "Split Button"
}); | Not applicable |

| Button mode | **Property:** *buttonMode*

 \$("#splitbutton").ejSplitButton({
buttonMode: ej.ButtonMode.Dropdown,
 target: "#target",
 text: "Split Button"
}); | Not applicable |

| Content type | **Property:** *contentType*

 \$("#splitbutton").ejSplitButton({
contentType: ej.ContentType.TextOnly,
text:"login",
 target: "#target"
}); | Not applicable |

| Adding custom css class | **Property:** *cssClass*

 \$("#splitbutton").ejSplitButton({
cssClass: "e-custom-class",
 target: "#target",
 text: "Split Button"
}); | **Property:** *cssClass*

 var splitButton = new ej.splitbuttons.SplitButton({
cssClass: "e-custom-class",
 items: items,
 content: "Split Button"
});
splitButton.appendTo("#splitbutton"); |

| Disabled state | **Property:** *enabled*

 `$("#splitbutton").ejSplitButton({
enabled: false,
 target: "#target",
 text: "Split Button"
});` | **Property:** *disabled*

 `var splitButton = new ej.splitbuttons.SplitButton({
disabled: true,
 items: items,
 content: "Split Button"
});
splitButton.appendTo("#splitbutton");` |

| RTL | **Property:** *enableRTL*

 `$("#splitbutton").ejSplitButton({
enableRTL: true,
 target: "#target",
 text: "Split Button"
});` | **Property:** *enableRtl*

 `var splitButton = new ej.splitbuttons.SplitButton({
enableRtl: true,
 items: items,
 content: "Split Button"
});
splitButton.appendTo("#splitbutton");` |

| Height | **Property:** *height*

 `$("#splitbutton").ejSplitButton({
height: 30,
 target: "#target",
 text: "Split Button"
});` | Not applicable |

| Width | **Property:** *width*

 `$("#splitbutton").ejSplitButton({
width: 100,
 target: "#target",
 text: "Split Button"
});` | Not applicable |

| HTML attributes | **Property:** *htmlAttributes*

 `$("#splitbutton").ejSplitButton({
htmlAttributes : { disabled:"disabled" },
 target: "#target",
 text: "Split Button"
});` | Not applicable |

| Icons | **Property:** *prefixIcon*

 `$("#splitbutton").ejSplitButton({
prefixIcon:"e-icon e-handup",
contentType: ej.ContentType.TextAndImage,
target: "#target",
 text: "Split Button"
});` | **Property:** *iconCss*

 `var splitButton = new ej.splitbuttons.SplitButton({
iconCss: 'e-icons e-handup',
 content: "Split Button"
});
splitButton.appendTo("#splitbutton");` |

| Icon position | **Property:** *imagePosition*

 `$("#splitbutton").ejSplitButton({
imagePosition: ej.ImagePosition.ImageTop,
 prefixIcon:"e-icon e-handup",
contentType: ej.ContentType.TextAndImage,
target: "#target",
 text: "Split Button"
});` | **Property:** *iconPosition*

 `var splitButton = new ej.splitbuttons.SplitButton({
iconPosition: "Top",
 iconCss: 'e-icons e-handup',
 content: "Split Button"
});
splitButton.appendTo("#splitbutton");` |

| Secondary icon | **Property:** *suffixIcon*

 `$("#splitbutton").ejSplitButton({
suffixIcon:"e-icon e-icon-closed",
prefixIcon:"e-icon e-handup",
contentType: ej.ContentType.ImageTextImage,
target: "#target",
 text: "Split Button"
});` | Not applicable |

| Show rounded corner | **Property:** *showRoundedCorner*

 `$("#splitbutton").ejSplitButton({
showRoundedCorner: true,
 target: "#target",
 text: "Split Button"
});` | Not applicable |

| Size | **Property:** *size*

 `$("#splitbutton").ejSplitButton({
size: ej.ButtonSize.Small,
 target: "#target",
 text: "Split Button"
});` | **Property:** *cssClass*

 `var splitButton = new ej.splitbuttons.SplitButton({
cssClass: "e-small",
 content: "Split Button"
});
splitButton.appendTo("#splitbutton");` |

Methods

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Destroy method | **Method:** *destroy*

 `$("#splitbutton").ejSplitButton({
 target: "#target",
 text: "Split Button"
});
var splitButton =`

`$("#splitbutton").data("ejSplitButton");` `
` `splitButton.destroy();` | **Method:** *destroy* `

` `var splitButton = new ej.splitbuttons.SplitButton({` `
` `content: "Split Button"
});` `
` `splitButton.appendTo("#splitbutton");` `
` `splitButton.destroy();` |

| Disable method | **Method:** *disable* `

` `$("#splitbutton").ejSplitButton({` `
` `target: "#target",` `
` `text: "Split Button"
});` `
` `var splitButton =` `$("#splitbutton").data("ejSplitButton");` `
` `splitButton.disable();` | Not applicable |

| Enable method | **Method:** *enable* `

` `$("#splitbutton").ejSplitButton({` `
` `target: "#target",` `
` `text: "Split Button"
});` `
` `var splitButton = $("#splitbutton").data("ejSplitButton");` `
` `splitButton.enable();` | Not applicable |

| Hide popup | **Method:** *hide* `

` `$("#splitbutton").ejSplitButton({` `
` `target: "#target",` `
` `text: "Split Button"
});` `
` `var splitButton = $("#splitbutton").data("ejSplitButton");` `
` `splitButton.hide();` | **Method:** *toggle* `

` `var splitButton = new ej.splitbuttons.SplitButton({` `
` `items: items,` `
` `content: "Split Button"
});` `
` `splitButton.appendTo("#splitbutton");` `
` `splitButton.toggle();` |

| Show popup | **Method:** *show* `

` `$("#splitbutton").ejSplitButton({` `
` `target: "#target",` `
` `text: "Split Button"
});` `
` `var splitButton = $("#splitbutton").data("ejSplitButton");` `
` `splitButton.show();` | **Method:** *toggle* `

` `var splitButton = new ej.splitbuttons.SplitButton({` `
` `items: items,` `
` `content: "Split Button"
});` `
` `splitButton.appendTo("#splitbutton");` `
` `splitButton.toggle();` |

Events

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| BeforeOpen event | **Event:** *beforeOpen* `

` `$("#splitbutton").ejSplitButton({` `
` `beforeOpen: function(args) { / code block / },` `
` `target: "#target",` `
` `text: "Split Button"
});` | **Event:** *beforeOpen* `

` `var splitButton = new ej.splitbuttons.SplitButton({` `
` `beforeOpen: function(args) { / code block / },` `
` `items: items,` `
` `content: "Split Button"
});` `
` `splitButton.appendTo("#splitbutton");` |

| Click event | **Event:** *click* `

` `$("#splitbutton").ejSplitButton({` `
` `click: function(args) { / code block / },` `
` `target: "#target",` `
` `text: "Split Button"
});` | **Event:** *click* `

` `var splitButton = new ej.splitbuttons.SplitButton({` `
` `click: function(args) { / code block / },` `
` `items: items,` `
` `content: "Split Button"
});` `
` `splitButton.appendTo("#splitbutton");` |

| Close event | **Event:** *close* `

` `$("#splitbutton").ejSplitButton({` `
` `close: function(args) { / code block / },` `
` `target: "#target",` `
` `text: "Split Button"
});` | **Event:** *close* `

` `var splitButton = new ej.splitbuttons.SplitButton({` `
` `close: function(args) { / code block / },` `
` `items: items,` `
` `content: "Split Button"
});` `
` `splitButton.appendTo("#splitbutton");` |

| Create event | **Event:** *create* `

` `$("#splitbutton").ejSplitButton({` `
` `create: function(args) { / code block / },` `
` `target: "#target",` `
` `text: "Split Button"
});` | **Event:** *created* `

` `var splitButton = new ej.splitbuttons.SplitButton({` `
` `created: function() { / code block / },` `
` `items: items,` `
` `content: "Split Button"
});` `
` `splitButton.appendTo("#splitbutton");` |

| Destroy event | **Event:** *destroy* `

` `$("#splitbutton").ejSplitButton({` `
` `destroy: function(args) { / code block */ },` `
` `target: "#target",` `
` `text: "Split Button"
});` | Not applicable |

| ItemMouseOut event | **Event:** *itemMouseOut*

 \$("#splitbutton").ejSplitButton({

itemMouseOut: function(args) { / code block */ },
 target: "#target",
 text: "Split Button"

}); | Not applicable |

| ItemMouseOver event | **Event:** *itemMouseOver*

 \$("#splitbutton").ejSplitButton({

itemMouseOver: function(args) { / code block */ },
 target: "#target",
 text: "Split
Button"
}); | Not applicable |

| Item select event | **Event:** *itemSelected*

 \$("#splitbutton").ejSplitButton({

itemSelected: function(args) { / code block / },
 target: "#target",
 text: "Split Button"

}); | **Event:** *select*

 var splitButton = new ej.splitbuttons.SplitButton({
select:
function(args) { / code block / },
target: "#target",
 content: "Split Button"
});

splitButton.appendTo("#splitbutton");|

| Open event | **Event:** *open*

 \$("#splitbutton").ejSplitButton({
open: function(args) { /
code block / },
 target: "#target",
 text: "Split Button"
}); | **Event:** *open*

 var
splitButton = new ej.splitbuttons.SplitButton({
open: function(args) { / code block / },
 items:
items,
 content: "Split Button"
});
splitButton.appendTo("#splitbutton");|

| BeforeClose event | Not applicable | **Event:** *beforeClose*

 var splitButton = new
ej.splitbuttons.SplitButton({
beforeClose: function(args) { / code block */ },
 items: items,

 content: "Split Button"
});
splitButton.appendTo("#splitbutton");|

| BeforeItemRender event | Not applicable | **Event:** *beforeItemRender*

 var splitButton = new
ej.splitbuttons.SplitButton({
beforeItemRender: function(args) { / code block */ },
 items:
items,
 content: "Split Button"
});
splitButton.appendTo("#splitbutton");|

Splitter

Pane sizing in EJ2 JavaScript Splitter control

Splitter allows you to provide pane sizes either in pixel or percentage formats.

Auto size panes

The splitter's panes are adjusted automatically during resizing if the size is not specified externally to panes, because the panes are designed based on flex layout by default. When add/remove or show/hide the panes, the panes are auto aligned within its container.

INDEX.TS

```
import { Splitter } from '@syncfusion/ej2-layouts';
let splitObj: Splitter = new Splitter({
  height: '200px',
  width: '600px'
});
splitObj.appendTo('#splitter');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 Splitter </title>

```

Pane content in EJ2 JavaScript Splitter control

This section explains how to provide plain text content or HTML markup or integrate other JavaScript UI controls as content of splitter.

HTML Markup

Splitter is a layout based container control. You can render the pane contents from existing HTML markups. Converting HTML markup as splitter pane is easy way to add the panes content dynamically.

INDEX.TS

```
import { Splitter } from '@syncfusion/ej2-layouts';
let splitObj: Splitter = new Splitter({
    height: '200px',
    paneSettings: [
        { size: '200px',
          content: '<div class="content"><h3 class="h3">PARIS </h3>Paris, the
city of lights and love - this short guide is full of ideas for how to make
the most of the romanticism...</div>'
        },
        { size: '200px',
          content: '<div class="content"><h3 class="h3">CAMEMBERT </h3>The
village in the Orne département of Normandy where the famous French cheese
is originated from.</div>'
        },
        { size: '200px',
          content: '<div class="content"><h3 class="h3">GRENOBLE </h3>The
capital city of the French Alps and a major scientific center surrounded by
many ski resorts, host of the Winter Olympics in 1968.</div>'
        }
    ],
    width: '600px'
});
splitObj.appendTo('#splitter');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 Splitter </title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Essential JS 2 Uploader Component">
  <meta name="author" content="Syncfusion">

</head>
<body>

  <div id="container">
    <!--element which is going to render the splitter-->
```

```

        <div id="splitter">
            <div></div>
            <div></div>
            <div></div>
        </div>
    </div>
</script>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Also, you can provide the pane content inner HTML.

INDEX.TS

```

import { Splitter } from '@syncfusion/ej2-layouts';
let splitObj: Splitter = new Splitter({
    height: '200px',
    paneSettings: [
        { size: '200px' },
        { size: '200px' },
        { size: '200px' }
    ],
    width: '600px'
});
splitObj.appendTo('#splitter');

```

if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

JavaScript UI controls

You can render any JavaScript UI controls along with their native and control events within splitter as pane content.

You can refer [Accordion within splitter](#) and [Listview within splitter](#) examples.

Plain content

You can add the plain text as a pane contents using either inner HTML or [content](#) API

INDEX.TS

```

import { Splitter } from '@syncfusion/ej2-layouts';
let splitObj: Splitter = new Splitter({
  height: '200px',
  paneSettings: [
    { size: '200px', content: 'Left pane' },
    { size: '200px', content: 'Middle pane' },
    { size: '200px', content: 'Right pane' }
  ]
});

```

```

    ],
    width: '600px'
  });
  splitObj.appendTo('#splitter');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 Splitter </title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Essential JS 2 Uploader Component">
  <meta name="author" content="Syncfusion">

  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Pane content using selector

You can set HTML element as pane [content](#) using the query selectors such as ID or CSS class selectors.

The following code demonstrates how to fetch an element from the document and load it to pane using its ID.

INDEX.TS

```

import { Splitter } from '@syncfusion/ej2-layouts';
/**

```

```

* Splitter pane content as html element using ID selector
*/
let splitObj1: Splitter = new Splitter({
    height: '200px',
    paneSettings: [
        { size: '25%', min: '60px', content: '#left-pane-content' },
        { size: '50%', min: '60px', content: '#middle-pane-content' },
        { size: '25%', min: '60px', content: '#last-pane-content' }
    ],
    width: '100%',
    separatorSize: 4
});
splitObj1.appendTo('#horizontal');

```

INDEX.HTML

```

```

Split panes in EJ2 JavaScript Splitter control

This section explain about split panes behaviours.

Horizontal layout

By default, splitter will render in horizontal orientation. Splitter container will be splitted as panes in horizontal flow direction with vertical seperator.

INDEX.TS

```

import { Splitter } from '@syncfusion/ej2-layouts';
// Initialize Splitter control
let splitObject: Splitter = new Splitter({
    height: '250px',
    paneSettings: [
        { size: '200px' },
        { size: '200px' },
        { size: '200px' }
    ],
    width: '600px'
});
// Render initialized Splitter
splitObject.appendTo('#splitter');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>Essential JS 2 Splitter </title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Essential JS 2 Uploader Component">
    <meta name="author" content="Syncfusion">
    <link href="index.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
layouts/styles/material.css" rel="stylesheet">

```

```

<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <!--element which is going to render the splitter-->
        <div id="splitter">
            <div>
                <div class="content">
                    <h3 class="h3">Grid </h3>
                    The ASP.NET DataGrid control, or DataTable is a feature-
rich control used to display data in a tabular format.
                </div>
            </div>
            <div>
                <div class="content">
                    <h3 class="h3">Schedule </h3>
                    The ASP.NET Scheduler, a.k.a. event calendar,
facilitates almost all calendar features, thus allowing users to manage
their time efficiently
                </div>
            </div>
            <div>
                <div class="content">
                    <h3 class="h3">Chart </h3>
                    ASP.NET charts, a well-crafted easy-to-use charting
package, is used to add beautiful charts in web and mobile applications
                </div>
            </div>
        </div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Vertical layout

By setting [orientation](#) API as **Vertical**, splitter will render in vertical orientation. Splitter container will be splitted as panes in vertical flow direction with horizontal separator.

INDEX.TS

```

import { Splitter } from '@syncfusion/ej2-layouts';
// Initialize Splitter control
let splitObject: Splitter = new Splitter({
    height: '305px',
    paneSettings: [
        { size: '100px' },
        { size: '100px' },
    ]
});

```

```

        { size: '100px' }
    ],
    width: '600px',
    orientation: 'Vertical'
});
// Render initialized Splitter
splitObject.appendTo('#splitter');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

You can also render multiple panes in splitter with both **Horizontal/Vertical** orientations.

Separator

By default, pane separator will be render with **1px** width/height. You can customize the separator size by using [separatorSize](#) API.

For horizontal orientation, it will be considered as separator width.

For vertical orientation, it will be considered as separator height.

INDEX.TS

```

import { Splitter } from '@syncfusion/ej2-layouts';
// Initialize Splitter control
let splitObject: Splitter = new Splitter({
    height: '250px',
    paneSettings: [
        { size: '200px' },
        { size: '200px' },
        { size: '200px' }
    ],
    width: '600px',
    separatorSize: '5'
});
// Render initialized Splitter
splitObject.appendTo('#splitter');

```

INDEX.HTML

if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Nested Splitter

Splitter provides support to render the nested pane to achieve the complex layouts. You can use the same `<div>` element for splitter pane and nested splitter.

Also you can render the nested splitter using direct child of the splitter pane. For this, nested splitter should have 100% width and height to match with the parent pane dimensions.

INDEX.TS

```

import { Splitter } from '@syncfusion/ej2-layouts';
let horizontalObj: Splitter = new Splitter({
  height: '316px',
  paneSettings: [
    { size: '200px' },
    { size: '200px' },
    { size: '200px' }
  ],
},

```

```

        width: '600px'
    });
    horizontalObj.appendTo('#Horizontal_splitter');
    let verticalObj: Splitter = new Splitter({
        height: '308px',
        paneSettings: [
            { size: '150px', min: '20%' },
            { size: '100px', min: '20%' }
        ],
        orientation: 'Vertical'
    });
    verticalObj.appendTo('#vertical_splitter');

```

INDEX.HTML

```

Add or remove pane

You can add the panes programmatic but it will makes you complex. For this, you can use the `addPane/removePane` methods to add and remove the panes dynamically in the splitter.

Add pane

You can add the panes dynamically in the splitter by passing [paneProperties](#) along with index to the [addPane](#) method

INDEX.TS

```
import { Splitter, PanePropertiesModel } from '@syncfusion/ej2-layouts';
let splitObj: Splitter = new Splitter({
    height: '200px',
    paneSettings: [
        { size: '190px' },
        { size: '190px' }
    ],
    width: '600px',
    created: onSplitterCreate
});
splitObj.appendTo('#splitter');
let paneDetails : PanePropertiesModel = {
    size: '190px',
    content: 'New Pane',
    min: '30px',
    max: '250px',
}
function onSplitterCreate() {
    document.getElementById('addpane').addEventListener('click', () => {
        splitObj.addPane(paneDetails, 1);
    });
}
```

```

    })
}

```

Expand and collapse in EJ2 JavaScript Splitter control

Collapsible panes

The Splitter panes can be configured with built-in expand and collapse functionalities. By default, the collapsible behavior is disabled. Enable the [collapsible](#) behavior in the paneSettings property to show or hide the expand or collapse icons in the panes. You can dynamically expand and collapse the panes by the corresponding icons.

The following code shows how to enable collapsible behavior.

INDEX.TS

```

import { Splitter } from '@syncfusion/ej2-layouts';
let splitObj: Splitter = new Splitter({
    height: '250px',
    paneSettings: [
        { collapsible: true },
        { collapsible: true },
        { collapsible: true }
    ],
    separatorSize: 2,
    width: '100%'
});
splitObj.appendTo('#splitter');

```

Programmatically control the expand and collapse action

The Splitter provides public method to control the expand and collapse behavior programmatically using the [expand](#) and [collapse](#) methods. Refer to the following code example.

INDEX.TS

```
import { Splitter } from '@syncfusion/ej2-layouts';
let splitObj: Splitter = new Splitter({
    height: '230px',
    paneSettings: [
        { collapsible: true },
        { collapsible: true },
        { collapsible: true }
    ],
    width: '100%'
});
splitObj.appendTo('#splitter');
document.getElementById('expand').onclick = (): void => {
    splitObj.expand(0);
}
document.getElementById('collapse').onclick = (): void => {
    splitObj.collapse(0);
}
```

INDEX.HTML

```

Specify initial state to panes

You can render specific panes with collapsed state on page load. Specify a Boolean value to the [collapsed](#) property to control this behavior. The following code explains how to collapse panes on rendering (the second panes renders with collapsed state).

INDEX.TS

```

import { Splitter } from '@syncfusion/ej2-layouts';
let splitObj: Splitter = new Splitter({
    height: '250px',
    paneSettings: [
        { collapsible: true },
        { collapsible: true, collapsed: true },
        { collapsible: true }
    ],
    width: '100%'
});
splitObj.appendTo('#splitter');

```

- [Resizable split panes](#)

Resizing in EJ2 JavaScript Splitter control

By default, resizing will be enable for split panes. Resizing gripper element will be add to the separator to makes the resize easy.

Horizontal splitter will allows to resize in horizontal directions.

Vertical splitter will allows to resize in vertical directions.

While resizing, previous and next panes will be adjust its dimensions automatically.

Min and Max validation

Splitter allows you to set the [minimum](#) and [maximum](#) sizes for each pane. Resizing will not be occur over the minimum and maximum values.

INDEX.TS

```
import { Splitter } from '@syncfusion/ej2-layouts';
let splitObj: Splitter = new Splitter({
  height: '200px',
  paneSettings: [
    { size: '200px', min: '20%', max: '40%' },
    { size: '200px', min: '30%', max: '60%' },
    { size: '200px' }
  ],
  width: '600px'
});
splitObj.appendTo('#splitter');
```

Different layouts in EJ2 JavaScript Splitter control

By using splitter control, you can create the different layouts with multiple and nested panes.

Code editor style layout

Step 1:

Create the element with two child to render the outer splitter.

```

`
<div id="VerticalSplitter">
<div id="HorizontalSplitter">
</div>
<div>
<div class="content">
<h3 class="h3">Preview of sample</h3>
<div class="splitter-image">

</div>
</div>
</div>
</div>
</div>
`

```

```

`javascript
let VerticalSplitObj: Splitter = new Splitter({
height: '400px',
paneSettings: [
{ size: '53%', min: '30%' },
],
orientation: 'Vertical'
});
VerticalSplitObj.appendTo('#VerticalSplitter');
`

```

Step 2 :

Render the first pane of vertical splitter as a horizontal splitter.

```

<div id="VerticalSplitter">
<div id="HorizontalSplitter">
<div>
<div class="content">
<h3 class="h3">HTML</h3>

```

```

<div class="code-preview">
<<span>!DOCTYPE html></span>
<div><<span>html></span></div>
<div><<span>body></span></div>
<<span>div</span> id="custom-image">
<div style="margin-left: 5px"><<span>img</span>src="src/albert.png"></div>
<div><<span>div</span>></div>
<div><<span>/body></span></div>
<div><<span>/html></span></div>
</div>
</div>
</div>
<div>
<div class="content">
<h3 class="h3">CSS</h3>
<div class="code-preview">
<span>img {</span>
<div id="code-text">margin:<span>0 auto;</span></div>
<div id="code-text">display:<span>flex;</span></div>
<div id="code-text">height:<span>70px;</span></div>
<span> }</span>
</div>
</div>
</div>
<div>
<div class="content">
<h3 class="h3">JavaScript</h3>
<div class="code-preview">
<span>var</span> image = document.getElementById("custom-image");
<div>image.addEventListener("click", function() {</div>
<div style="padding-left: 20px;">// Code block for click action</div>
<span> }</span>
</div>

```

```

</div>
</div>
</div>
<div class="content">
<h3 class="h3">Preview of sample</h3>
<div class="splitter-image">

</div>
</div>
</div>
</div>
`
`javascript
let HorizontalSplitObj: Splitter = new Splitter({
height: '220px',
paneSettings: [
{ size: '29%', min: '23%' },
{ size: '20%', min: '15%' },
{ size: '35%', min: '35%' }
],
width: '100%'
});
HorizontalSplitObj.appendTo('#HorizontalSplitter');
`
`
.code-preview {
margin-top: 15px;
font-size: 12px;
}
.content {
padding: 12px;
}
.splitter-image {

```

```
margin: 0 auto;
display: flex;
height: 115px;
margin-top: 10px;
}
,
```

Once the above configurations has been completed, you will get the output like [this](#)

Outlook style layout

Step 1:

Create the element with three panes and place the elements within the pane to render **treeview**, **listview** and **RTE**.

,

```
<div id="splitter1">
<div>
<div class="content">
<div id="tree"></div>
</div>
</div>
<div>
<div class="content">
<div id="groupedList" tabIndex="1"></div>
</div>
</div>
<div>
<div class="content">
<div style="width: 100%; padding: 15px;">
```

To...	
Cc...	
Subject	

```
</div>
<div class="forum">
<div id="createpostholder">
```

```

<div id="defaultRTE"> </div>
<div id="buttonSection">
<button class="e-btn e-primary" id="send">Send</button>
<button class="e-btn" id="discard">Discard</button>
</div>
</div>
</div>
</div>
</div>
</div>
</div>
,

```

Step 2 :

Place the template script to render the treeview.

```

`javascript
<script id="treeTemplate" type="text/x-template">
<div>
<div class="treeviewdiv">
<div style="float:left">
<span class="treeName">${name}</span>
</div>
${if(count)}
<div style="margin-right: 5px; float:right">
<span class="treeCount e-badge e-badge-primary">${count}</span>
</div>
${/if}
</div>
</div>
</div>
</script>
,

```

Step 3 :

Render the listed controls one by one.

```

`javascript
let splitObj1: Splitter = new Splitter({

```

```
height: '493px',
paneSettings: [
{ size: '28%', min: '27%' },
{ size: '33%', min: '23%' },
{ size: '37%', min: '30%' }
],
width: '100%'
});
splitObj1.appendTo('#splitter1');
let inputobj1: TextBox = new TextBox({
});
inputobj1.appendTo('#firstname');
let inputobj2: TextBox = new TextBox({
});
inputobj2.appendTo('#lastname');
let inputobj3: TextBox = new TextBox({
});
inputobj3.appendTo('#subject');
// Data source for TreeView component
let mailBox: { [key: string]: Object }[] = [
{ id: 1, name: 'Favorites', hasChild: true},
{ id: 2, pid: 1, name: 'Sales Reports', count: '4' },
{ id: 3, pid: 1, name: 'Sent Items'},
{ id: 4, pid: 1, name: 'Marketing Reports ', count: '6'},
{ id: 5, name: 'Andrew Fuller', hasChild: true, expanded: true },
{ id: 6, pid: 5, name: 'Inbox', selected: true , count: '20'},
{ id: 7, pid: 5, name: 'Drafts', count: '5'},
{ id: 15, pid: 5, name: 'Archive'},
{ id: 8, pid: 5, name: 'Deleted Items'},
{ id: 9, pid: 5, name: 'Sent Items'},
{ id: 10, pid: 5, name: 'Sales Reports' , count: '4'},
{ id: 11, pid: 5, name: 'Marketing Reports', count: '6' },
{ id: 12, pid: 5, name: 'Outbox'},
```

```

{ id: 13, pid: 5, name: 'Junk Email'},
{ id: 14, pid: 5, name: 'RSS Feed'},
{ id: 15, pid: 5, name: 'Trash' }
];

// Render the TreeView using template option
let treeObj: TreeView = new TreeView({
fields: { dataSource: mailBox, id: 'id', parentID: 'pid', text: 'name', hasChildren: 'hasChild' },
nodeTemplate: '#treeTemplate',
});
treeObj.appendTo('#tree');

// tslint:disable:max-line-length
//Define an array of JSON data
let dataSource: any = [
{ Name: 'Selma Tally', content: '<div><div class="status">Apology marketing email</div><div id="list-
message">Hello Ananya Singleton</div>', id: '1', order: 0 },
{ Name: 'Illa Russo', content: '<div><div class="status">Annual conference</div><div id="list-
message">Hi jeani Moresa</div></div>', id: '4', order: 0 },
{ Name: 'Camden Macmellon', content: '<div><div class="status">Reference request- Camden
hester</div><div id="list-message">Hello Kerry Best,</div></div>', order: 0 },
{ Name: 'Garth Owen', content: '<div><div class="status">Application for job Title</div><div id="list-
message">Hello Illa Russo</div></div>', id: '2', order: 0 },
{ Name: 'Ursula Patterson', content: '<div><div class="status">Programmaer Position
Applicant</div><div id="list-message">Hello Kerry best,</div></div>', id: '2', order: 0 }
];

// Initialize ListView component
let listObj: ListView = new ListView({
//Set defined data to dataSource property
dataSource: dataSource,
cssClass: 'e-list-template',
//Map the appropriate columns to fields property
fields: { text: 'Name', groupBy: 'order' },
//Set customized group-header template
groupTemplate: '<div class="e-list-wrapper"><span class="e-list-item-content"></span></div>',
//Set customized list template
template: '<div class="settings e-list-wrapper e-list-multi-line e-list-avatar">' +

```

```
'<span class="e-list-item-header">${Name}</span>' +
'<span class="e-list-content">${content}</span>' +
'</div>'
});
//Render initialized ListView component
listObj.appendTo('#groupedList');
let button1: Button = new Button({ isPrimary: true });
button1.appendTo('#rteSubmit');
let button2: Button = new Button();
button2.appendTo('#rteCancel');
let defaultRTE: RichTextEditor = new RichTextEditor({ height: '262px'});
defaultRTE.appendTo('#defaultRTE');
`
`
<style>
target {
margin: 20px auto;
max-width: 820px;
}
.e-treeview .e-list-text {
width: 100%;
}
groupedList.e-listview .e-list-group-item {
height: 0;
}
splitter1 .settings.e-list-wrapper.e-list-multi-line.e-list-avatar {
padding: 15px;
}
buttonSection {
padding: 7px;
}
</style>
`
```

Once the above configurations has been completed, you will get the output like [this](#).

Style in EJ2 JavaScript Splitter control

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

Customizing the split bar

Use the following CSS to customize the split bar properties.

Horizontal split bar

```
`css

/ default split bar color /

.e-splitter .e-split-bar.e-split-bar-horizontal{
background: blue;
}

/ split bar color in hover and active state /

.e-splitter .e-split-bar.e-split-bar-horizontal.e-split-bar-hover,
.e-splitter .e-split-bar.e-split-bar-horizontal.e-split-bar-active {
background: green;
}
`
```

Vertical split bar

```
`css

/ default split bar color /

.e-splitter .e-split-bar.e-split-bar-vertical {
background: blue;
}

/ split bar color in hover and active state /

.e-splitter .e-split-bar.e-split-bar-vertical.e-split-bar-hover,
.e-splitter .e-split-bar.e-split-bar-vertical.e-split-bar-active {
background: green;
}
`
```

Customizing the split bar resize handle

Use the following CSS to customize the split bar resize handle.

Horizontal split bar resize handle``css`*/ default split bar resize handle color /*`.e-splitter .e-split-bar.e-split-bar-horizontal .e-resize-handler {``color: rgba(20, 27, 233, 0.54);``}`*/ default split bar resize handle color in hover and active state /*`.e-splitter .e-split-bar.e-split-bar-horizontal.e-split-bar-hover .e-resize-handler,``.e-splitter .e-split-bar.e-split-bar-horizontal.e-split-bar-active .e-resize-handler {``color: green;``}``,`*Vertical split bar resize handle*``css`*/ default split bar resize handle color /*`.e-splitter .e-split-bar.e-split-bar-vertical .e-resize-handler {``color: rgba(20, 27, 233, 0.54);``}`*/ default split bar resize handle color in hover and active state /*`.e-splitter .e-split-bar.e-split-bar-vertical.e-split-bar-hover .e-resize-handler,``.e-splitter .e-split-bar.e-split-bar-vertical.e-split-bar-active .e-resize-handler {``color: green;``}``,`*Customizing the split bar arrows*

Use the following CSS to customize the split bar arrows.

Horizontal split bar resize arrows``css`*/ split bar arrows /*`.e-splitter .e-split-bar.e-split-bar-horizontal.e-split-bar-hover .e-navigate-arrow.e-arrow-left::before, .e-``splitter .e-split-bar.e-split-bar-horizontal.e-split-bar-active .e-navigate-arrow.e-arrow-left::before, .e-``splitter .e-split-bar.e-split-bar-horizontal.e-split-bar-hover .e-navigate-arrow.e-arrow-left::after, .e-``splitter .e-split-bar.e-split-bar-horizontal.e-split-bar-active .e-navigate-arrow.e-arrow-left::after, .e-``splitter .e-split-bar.e-split-bar-horizontal.e-split-bar-hover .e-navigate-arrow.e-arrow-right::before, .e-``splitter .e-split-bar.e-split-bar-horizontal.e-split-bar-active .e-navigate-arrow.e-arrow-right::before, .e-`

```
splitter .e-split-bar.e-split-bar-horizontal.e-split-bar-hover .e-navigate-arrow.e-arrow-right::after, .e-splitter .e-split-bar.e-split-bar-horizontal.e-split-bar-active .e-navigate-arrow.e-arrow-right::after {
background-color: green;
}
```

/ split bar arrows - circular border /

```
.e-splitter .e-split-bar.e-split-bar-horizontal.e-split-bar-hover .e-navigate-arrow.e-arrow-left, .e-splitter .e-split-bar.e-split-bar-horizontal.e-split-bar-hover .e-navigate-arrow.e-arrow-right {
border-color: rgba(33, 227, 22, 0.5);
}
```

,

Vertical split bar resize arrows

`css

/ split bar arrows /

```
.e-splitter .e-split-bar.e-split-bar-vertical.e-split-bar-hover .e-navigate-arrow.e-arrow-up::before, .e-splitter .e-split-bar.e-split-bar-vertical.e-split-bar-active .e-navigate-arrow.e-arrow-up::before, .e-splitter .e-split-bar.e-split-bar-vertical.e-split-bar-hover .e-navigate-arrow.e-arrow-up::after, .e-splitter .e-split-bar.e-split-bar-vertical.e-split-bar-active .e-navigate-arrow.e-arrow-up::after, .e-splitter .e-split-bar.e-split-bar-vertical.e-split-bar-hover .e-navigate-arrow.e-arrow-down::before, .e-splitter .e-split-bar.e-split-bar-vertical.e-split-bar-active .e-navigate-arrow.e-arrow-down::before, .e-splitter .e-split-bar.e-split-bar-vertical.e-split-bar-hover .e-navigate-arrow.e-arrow-down::after, .e-splitter .e-split-bar.e-split-bar-vertical.e-split-bar-active .e-navigate-arrow.e-arrow-down::after {
```

```
background-color: green;
```

```
}
```

/ split bar arrows - circular border /

```
.e-splitter .e-split-bar.e-split-bar-vertical.e-split-bar-hover .e-navigate-arrow.e-arrow-up, .e-splitter .e-split-bar.e-split-bar-vertical.e-split-bar-hover .e-navigate-arrow.e-arrow-down {
```

```
border-color: rgba(33, 227, 22, 0.5);
```

```
}
```

,

To hide the resize handle in Splitter

Use the following CSS to hide the resize handler in the split bar

Hide the horizontal split bar resize arrow

`css

```
.e-splitter .e-split-bar.e-split-bar-horizontal .e-resize-handler {
```

```
display: none;
```

```
}
```

,

Hide the vertical split bar resize arrow

```
`css
.e-splitter .e-split-bar.e-split-bar-vertical .e-resize-handler {
display: none;
}
`
```

Accessibility in EJ2 JavaScript Splitter control

The Splitter component followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Splitter component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2 Support](#) | |

| [Section 508 Support](#) | |

| [Screen Reader Support](#) | |

| [Right-To-Left Support](#) | |

| [Color Contrast](#) | |

| [Mobile Device Support](#) | |

| [Keyboard Navigation Support](#) | |

| [Accessibility Checker Validation](#) | |

| [Axe-core Accessibility Validation](#) | |

<style>

```
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
```

</style>

<div> - All features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

Keyboard interaction

You can use the following key shortcuts to access the splitter without interruptions:

| **Keyboard shortcuts** | **Actions** |

| --- | --- |

| Tab | Helps in focusing the splitter on the page and switching between the consecutive splitter bars. |

| Shift + Tab | Helps in focusing the previous splitter bar element on the splitter. |

| Right arrow | Helps in moving the active horizontal orientated splitter bar to its Right side. |

| Left arrow | Helps in moving the active horizontal orientated splitter bar to its Left side. |

| Up arrow | Helps in moving the active vertical orientated splitter bar to its Up side. |

| Down arrow | Helps in moving the active vertical orientated splitter bar to its Down side. |

| Enter | Helps to toggle between expand and collapse actions of the splitter bar when it is active. |

Ensuring accessibility

The Splitter component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Splitter component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Splitter component with accessibility tools.

Ej1 api migration in EJ2 JavaScript Splitter control

This article describes the API migration process of Splitter component from Essential JS 1 to Essential JS 2.

Common

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Adding custom class | **Property:** `cssClass`
 < /> \$("#splitter").ejSplitter({
 cssClass: "custom-class"
 });
 | **Property:** `cssClass`
 < /> var obj = new ej.layouts.Splitter({
 cssClass: "custom-class"
 });
 obj.appendTo("#ej2_splitter") |

| Adjusting Height | **Property:** *height* `

 $("#splitter").ejSplitter({
Property: height

 var obj = new ej.layouts.Splitter({`

| Adjusting Width | **Property:** *width* `

 $("#splitter").ejSplitter({
Property: width

 var obj = new ej.layouts.Splitter({`

| Orientation | **Property:** *orientation* `

 $("#splitter").ejSplitter({
Property: orientation

 var obj = new`

| Separator Size | Not Available | **Property:** *separatorSize* `

 var obj = new ej.layouts.Splitter({`

| Adding HTML attributes | **Property:** *htmlAttributes* `

 $("#splitter").ejSplitter({`

| Customize expand/collapse icons | **Property:** `
 expanderTemplate`

| Make control flexible for mobile view | **Property:** *isResponsive* `

 $("#splitter").ejSplitter({`

| Refresh the Splitter | **Method:** *refresh()* `

 $('#splitter').ejSplitter('refresh')
Method: refresh()

 var obj = new ej.layouts.Splitter()`

| Destroy the Control | **Method:** *destroy()* `

 $('#splitter').ejSplitter('destroy')
Method: destroy()

 var obj = new ej.layouts.Splitter()`

| Event triggers after the Splitter created successfully | **Event:** *create* `

 $("#splitter").ejSplitter({
Event: created`

| Event triggers when Splitter has been destroyed | **Event:** *destroy* `

 $("#splitter").ejSplitter({`

Accessibility and Localization

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Keyboard Navigation | **Property:** *allowKeyboardNavigation* `

 $("#splitter").ejSplitter({`

| Right to Left | **Property:** *enableRTL* `

 $("#splitter").ejSplitter({
Property: enableRtl

 var obj = new`

Control State

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Enable/Disable the control | Not Available | **Property:** *enabled* `

 var obj = new
 ej.layouts.Splitter({
 enabled: true
 })
 obj.appendTo("#ej2_splitter")` |

State Maintenance

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Save the model value in local storage or cookies | Not Available | **Property:** *enablePersistence* `

 var obj = new
 ej.layouts.Splitter({
 enablePersistence: false
 })
 obj.appendTo("#ej2_splitter")` |

Pane Properties

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Default | **Property:** *properties* `

 $("#splitter").ejSplitter({
 properties: []
 });
` | **Property:** *paneSettings* `

 var obj = new
 ej.layouts.Splitter({
 paneSettings: []
 })
 obj.appendTo("#ej2_splitter")` |

| Pane Content | Not Available | **Property:** *content* `

 var obj = new
 ej.layouts.Splitter({
 paneSettings: [{ content:
'First Pane Content']
 })
 obj.appendTo("#ej2_splitter")` |

| Change the size of the pane | **Property:** *paneSize* `

 $("#splitter").ejSplitter({
 properties: [{ paneSize: "30px"}]
 });
` | **Property:** *size* `

 var obj = new
 ej.layouts.Splitter({
 paneSettings: [{ size: '25%'}]
 })
 obj.appendTo("#ej2_splitter")` |

| Minimum pane size | **Property:** *minSize* `

 $("#splitter").ejSplitter({
 properties: [{ minSize: 30 }]
 });
` | **Property:** *min* `

 var obj = new
 ej.layouts.Splitter({
 paneSettings: [{ min: '60px'}]
 })
 obj.appendTo("#ej2_splitter")` |

| Maximum pane size | **Property:** *maxSize* `

 $("#splitter").ejSplitter({
 properties: [{maxSize: 30 }]
 });
` | **Property:** *max* `

 var obj = new
 ej.layouts.Splitter({
 paneSettings: [{ max: '60px'}]
 })
 obj.appendTo("#ej2_splitter")` |

| Enable/Disable the Pane Resizable behavior | **Property:** *resizable* `

 $("#splitter").ejSplitter({
 properties: [{ resizable: false }]
 });
` | **Property:** *resizable* `

 var obj = new
 ej.layouts.Splitter({
 paneSettings: [{ resizable:
 false }]
 })
 obj.appendTo("#ej2_splitter")` |

 properties: [{ collapsible: true }]
 });
` | **Property:** *collapsible* `

 var obj = new
 ej.layouts.Splitter({
 paneSettings: [{ collapsible:
 true }]
 })
 obj.appendTo("#ej2_splitter")` |

| Expandable | **Property:** *expandable* `

 $("#splitter").ejSplitter({
 properties: [{expandable: true }]
 });
` | Not Available |

| Collapsed | Not Available | **Property:** *collapsed*

 var obj = new

ej.layouts.Splitter({
 paneSettings: [{ collapsed:
 true }]
 })

obj.appendTo("#ej2_splitter") |

| Add Pane | **Method:** *addItem()*

 \$("#splitter").ejSplitter("addItem",
 "New Pane 0", {

 paneSize: 20, minSize: 20, maxSize:
 100}, 0); | **Method:** *addPane()*

 var obj =
new
 ej.layouts.Splitter();
 obj.appendTo("#ej2_splitter")
 obj.addPane({size: "25%", <br

 content: "Pane"}, 0) |

| Remove Pane | **Method:** *removeItem()*

 \$("#splitter").ejSplitter("removeItem",
 0)<br

 | **Method:** *removePane()*

 var obj = new
 ej.layouts.Splitter();

obj.appendTo("#ej2_splitter")
 obj.removePane(0); |

| Collapse Pane | **Method:** *collapse()*

 \$("#splitter").ejSplitter("collapse", 0)
 | **Method:**
collapse()

 var obj = new
 ej.layouts.Splitter();
 obj.appendTo("#ej2_splitter") <br

 obj.collapse(0); |

| Expand Pane | **Method:** *expand()*

 \$("#splitter").ejSplitter("expand", 0)
 | **Method:**
expand()

 var obj = new
 ej.layouts.Splitter();
 obj.appendTo("#ej2_splitter")<br

 obj.expand(0); |

| Event triggers when before panes get expanded/collapsed | **Event:** *beforeExpandCollapse*

\$("#splitter").ejSplitter({
 beforeExpandCollapse: function
 (args) {}
 });
 | **Event:**
beforeExpand

 var obj = new ej.layouts.Splitter({
 beforeExpand: function() {}
 })

 obj.appendTo('#ej2splitter')

 Event: *beforeCollapse*
 var obj = new
ej.layouts.Splitter({
 beforeCollapse: function() {}
 })
 obj.appendTo('#ej2splitter') |

| Event triggers when after panes get expanded/collapsed | **Event:** *expandCollapse*
 <br

 \$("#splitter").ejSplitter({
 beforeCollapse: function
 (args) {}
 });
 | **Event:**
expand

 var obj = new ej.layouts.Splitter({
 expand: function() {}
 })

obj.appendTo('#ej2splitter')

 Event: *collapse*
 var obj = new ej.layouts.Splitter({

collapse: function() {}
 })
 obj.appendTo('#ej2splitter') |

| Event triggers when Resizing the pane | **Event:** *resize*

 \$("#splitter").ejSplitter({

resize: function
 (args) {}
 });
 | **Event:** *resizing*

 var obj = new
ej.layouts.Splitter({
 resizing: function() {}
 })
 obj.appendTo('#ej2_splitter') |

| Event triggers when pane is started to resize | Not Available | **Event:** *resizeStart*

 var obj =
new ej.layouts.Splitter({
 resizeStart: function() {}
 })
 obj.appendTo('#ej2_splitter') |

| Event triggers when pane is stopped to resize | Not Available | **Event:** *resizeStop*

 var obj =
new ej.layouts.Splitter({
 resizeStop: function() {}
 })
 obj.appendTo('#ej2_splitter') |

| Event triggers when click template icon | **Event:** *clickOnExpander*

\$("#splitter").ejSplitter({
 clickOnExpander: function
 (args) {}
 });
 | Not Available
|

Animation

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| EnableAnimation | **Property:** *enableAnimation*

 \$("#splitter").ejSplitter({

enableAnimation: true
 });
 | Not Available |

| AnimationSpeed | **Property:** *animationSpeed*

 \$("#splitter").ejSplitter({
 animationSpeed: 150
 });
 | Not Available |

Spreadsheet

Overview of the EJ2 JavaScript Spreadsheet control

The Spreadsheet is an user interactive control to organize and analyze data in tabular format with configuration options for customization. It will load data by importing an Excel/CSV file or from local and remote data sources such as JSON, RESTful services, OData services, and more. The populated data can be exported as Excel with xlsx, xls, CSV and PDF formats.

Key features

- [Data sources](#): Bind the Spreadsheet control with an array of objects or data from a web service using **DataManager**.
- [Virtualization](#): Provides the option to load large amount of data without performance degradation.
- [Selection](#): Provides the option to select a cell or range of cells.
- [Editing](#): Provides the option to dynamically edit a cell.
- [Formulas](#): Provides built-in calculation library with pre-defined formulas and named range support.
- [Clipboard](#): Provides the option to perform clipboard operations.
- [Cell formatting](#): Provides the option to customize the appearance of cells.
- [Number formatting](#): Provides the option to format the cell value.
- [Open](#): Provides the option to open Excel and CSV files in Spreadsheet.
- [Save](#): Provides the option to save Spreadsheet data as Excel, CSV, and PDF documents.
- [Sorting](#): Helps you to arrange the data to particular order in a selected range of cells.
- [Filtering](#): Helps you to view specific rows in the Spreadsheet by hiding the other rows.
- [Undo Redo](#): Provides the option to perform undo redo operations in Spreadsheet.
- [Collaborative editing](#): Provides the option for real time changes across multiple users in the Spreadsheet.
- [Hyperlink](#): Provides the option to navigate to web link or cell reference within the sheet or to other sheet in Spreadsheet.
- [Resize](#): Allows you to change the row height and column width. Auto fit the rows and columns based on its content.
- [Wrap text](#): Provides the option to display the large content as multiple lines in a single cell.
- [Data validation](#): Provides the option to validate edited values based on data validation rules defined for a cell or range of cells.
- [Find and replace](#): Provides the option to find the data and replace it across all sheets in Spreadsheet.
- [Protect sheet](#): Provides the option to restrict user actions like cell editing, row and column insertion, deletion, and resizing.
- [Borders](#): Provides the option to customize cell gridlines such as color and its style for enhanced UI.
- [Show/hide](#): Provides the option to show/hide rows, columns and sheets.
- [Insert/delete](#): Provides the option to insert/delete rows, columns and sheets.
- [Merge cells](#): Provides the option to combine two or more cells located in the same row or column into a single cell.

- [Conditional formatting](#): Provides the option to format a cell or range of cells based on conditions applied.
- [Autofill](#): Provides the option to fill or copy a series or pattern of values and formats into adjacent cells in any direction.
- [Clear](#): Provides the option to clear the content, formats, and hyperlinks applied to a cell or range of cells in a Spreadsheet.
- [Aggregates](#): Provides the option to check the sum, average, count, and more for the selected cells or range in the sheet.
- [Picture](#): Allows you to view, insert, and modify a picture in a Spreadsheet with customizing options.
- [Chart](#): Transforms your Spreadsheet data to an intuitive overview for better understanding and to make smart business decisions.
- [Freeze panes](#): Allows you to keep the specified rows and columns always visible at the top and left side of the sheet while scrolling through the sheet.
- [Password protection](#): Allows you to protect the workbook with a password.
- [Multi-line editing](#): Allows you to insert a line break between paragraphs of the text within a cell in a Spreadsheet.
- [Calculate range selection](#): Helps you to select a range or multiple ranges when editing a formula in a cell.
- [Right-to-left \(RTL\)](#): Aligns content in the Spreadsheet control from right to left.
- [Templates](#): Templates can be used to create custom user experiences in the Spreadsheet.
- [Globalization](#): Personalize the Spreadsheet control with different languages, as well as culture-specific number, date, and time formatting.
- [Accessibility](#): Provides with built-in accessibility support which helps to access all the Spreadsheet control features through the keyboard, screen readers, or other assistive technology devices.

Getting started in EJ2 JavaScript Spreadsheet control

This section explains the steps to create a simple Essential JS 2 Spreadsheet control in a JavaScript application.

Dependencies

The following list of dependencies is required to use the Spreadsheet control in your application:

```
`js
|-- @syncfusion/ej2-spreadsheet
|-- @syncfusion/ej2-base
|-- @syncfusion/ej2-dropdowns
|-- @syncfusion/ej2-navigations
|-- @syncfusion/ej2-grids
`
```

Setup for local development

Refer to the following steps to setup your local environment.

Step 1: Create a root folder `myapp` for your application.

Step 2: Create `myapp/resources` folder to store local scripts and styles files.

Step 3: Create `myapp/index.js` and `myapp/index.html` files for initializing Essential JS 2 Spreadsheet control.

Adding Syncfusion resources

The Essential JS 2 Spreadsheet control can be initialized by using any of the following two ways:

- Using local script and style.
- Using CDN link for script and style.

Using local script and style

You can get the global scripts and styles from the [Essential Studio JavaScript \(Essential JS 2\)](#) build installed location.

After installing the Essential JS 2 product build, you can copy the Spreadsheet and its dependencies scripts and style file into the resources folder.

Refer to the following code to find Spreadsheet's script and style file location.

Syntax:

Script: `(installed location)/Syncfusion/Essential Studio/JavaScript-EJ2/{RELEASEVERSION}/Web(Essential JS 2)/JavaScript/{PACKAGENAME}/dist/global/{PACKAGE_NAME}.min.js`

Styles: `(installed location)/Syncfusion/Essential Studio/JavaScript-EJ2/{RELEASEVERSION}/Web(Essential JS 2)/JavaScript/{PACKAGENAME}/styles/material.css`

Example:

Script: `C:/Program Files (x86)/Syncfusion/Essential Studio/JavaScript-EJ2/23.1.36/Web(Essential JS 2)/JavaScript/ej2-spreadsheet/dist/global/ej2-spreadsheet.min.js`

Styles: `C:/Program Files (x86)/Syncfusion/Essential Studio/JavaScript-EJ2/23.1.36/Web(Essential JS 2)/JavaScript/ej2-spreadsheet/styles/material.css`

After copying the files, then you can refer the Spreadsheet's scripts and styles into the `index.html` file. The following html code example shows the minimal dependency of Spreadsheet.

```
`html
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<title>Essential JS 2 Spreadsheet</title>
<!-- Essential JS 2 Spreadsheet's dependents material theme -->
<link href="resources/base/styles/material.css" rel="stylesheet" type="text/css"/>
```

```
<link href="resources/inputs/styles/material.css" rel="stylesheet" type="text/css"/>
<link href="resources/buttons/styles/material.css" rel="stylesheet" type="text/css"/>
<link href="resources/splitbuttons/styles/material.css" rel="stylesheet" type="text/css"/>
<link href="resources/lists/styles/material.css" rel="stylesheet" type="text/css"/>
<link href="resources/navigations/styles/material.css" rel="stylesheet" type="text/css"/>
<link href="resources/popups/styles/material.css" rel="stylesheet" type="text/css"/>
<link href="resources/dropdowns/styles/material.css" rel="stylesheet" type="text/css"/>
<link href="resources/dropdowns/styles/material.css" rel="stylesheet" type="text/css"/>
<link href="resources/grids/styles/material.css" rel="stylesheet" type="text/css"/>
<!-- Essential JS 2 Spreadsheet's material theme -->
<link href="resources/spreadsheet/styles/material.css" rel="stylesheet" type="text/css"/>
<!-- Essential JS 2 Spreadsheet's dependents script -->
<script src="resources/scripts/ej2-base.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-buttons.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-popups.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-splitbuttons.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-inputs.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-lists.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-data.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-dropdowns.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-navigations.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-excel-export.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-pdf-export.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-calenders.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-compression.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-file-utils.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-grids.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-svg-base.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-charts.min.js" type="text/javascript"></script>
<!-- Essential JS 2 Spreadsheet global script -->
<script src="resources/scripts/ej2-spreadsheet.min.js" type="text/javascript"></script>
</head>
<body>
```

```
</body>
</html>
`
```

Using CDN link for script and style

Using CDN link, you can directly refer the Spreadsheet control's script and style into the `index.html`.

Refer to the Spreadsheet's CDN links as follows.

Syntax:

Script: `https://cdn.syncfusion.com/ej2/{PACKAGENAME}/dist/global/{PACKAGENAME}.min.js`

Styles: `https://cdn.syncfusion.com/ej2/{PACKAGE_NAME}/styles/material.css`

Example:

Script: <http://cdn.syncfusion.com/ej2/ej2-spreadsheet/dist/global/ej2-spreadsheet.min.js>

Styles: <http://cdn.syncfusion.com/ej2/ej2-spreadsheet/styles/material.css>

The following HTML code example shows the minimal dependency of Spreadsheet.

```
`html
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<title>Essential JS 2 Spreadsheet</title>
<!-- Essential JS 2 Spreadsheet's dependents material theme -->
<link href="http://cdn.syncfusion.com/ej2/ej2-base/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-inputs/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-buttons/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-splitbuttons/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-lists/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-navigations/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-popups/styles/material.css" rel="stylesheet"
type="text/css"/>
```

```
<link href="http://cdn.syncfusion.com/ej2/ej2-dropdowns/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-grids/styles/material.css" rel="stylesheet"
type="text/css"/>
<!-- Essential JS 2 Spreadsheet material theme -->
<link href="http://cdn.syncfusion.com/ej2/ej2-spreadsheet/styles/material.css" rel="stylesheet"
type="text/css"/>
<!-- Essential JS 2 Spreadsheet's dependents script -->
<script src=http://cdn.syncfusion.com/ej2/ej2-base/dist/global/ej2-base.min.js
type="text/javascript"></script>
<script src=http://cdn.syncfusion.com/ej2/ej2-buttons/dist/global/ej2-buttons.min.js
type="text/javascript"></script>
<script src=http://cdn.syncfusion.com/ej2/ej2-popups/dist/global/ej2-popups.min.js
type="text/javascript"></script>
<script src=http://cdn.syncfusion.com/ej2/ej2-splitbuttons/dist/global/ej2-splitbuttons.min.js
type="text/javascript"></script>
<script src=http://cdn.syncfusion.com/ej2/ej2-inputs/dist/global/ej2-inputs.min.js
type="text/javascript"></script>
<script src=http://cdn.syncfusion.com/ej2/ej2-lists/dist/global/ej2-lists.min.js
type="text/javascript"></script>
<script src=http://cdn.syncfusion.com/ej2/ej2-data/dist/global/ej2-data.min.js
type="text/javascript"></script>
<script src=http://cdn.syncfusion.com/ej2/ej2-dropdowns/dist/global/ej2-dropdowns.min.js
type="text/javascript"></script>
<script src=http://cdn.syncfusion.com/ej2/ej2-navigations/dist/global/ej2-navigations.min.js
type="text/javascript"></script>
<script src=http://cdn.syncfusion.com/ej2/ej2-excel-export/dist/global/ej2-excel-export.min.js
type="text/javascript"></script>
<script src=http://cdn.syncfusion.com/ej2/ej2-pdf-export/dist/global/ej2-pdf-export.min.js
type="text/javascript"></script>
<script src=http://cdn.syncfusion.com/ej2/ej2-calendars/dist/global/ej2-calendars.min.js
type="text/javascript"></script>
<script src=http://cdn.syncfusion.com/ej2/ej2-compression/dist/global/ej2-compression.min.js
type="text/javascript"></script>
<script src=http://cdn.syncfusion.com/ej2/ej2-file-utils/dist/global/ej2-file-utils.min.js
type="text/javascript"></script>
```

```
<script src=http://cdn.syncfusion.com/ej2/ej2-grids/dist/global/ej2-grids.min.js
type="text/javascript"></script>
<script src=http://cdn.syncfusion.com/ej2/ej2-svg-base/dist/global/ej2-svg-base.min.js
type="text/javascript"></script>
<script src=http://cdn.syncfusion.com/ej2/ej2-charts/dist/global/ej2-charts.min.js
type="text/javascript"></script>
<script src=http://cdn.syncfusion.com/ej2/ej2-spreadsheet/dist/global/ej2-spreadsheet.min.js
type="text/javascript"></script>
</head>
<body>
</body>
</html>
`
```

Add Spreadsheet control

Now, you can start adding Spreadsheet control in the application. For getting started, add a `div` element for Spreadsheet control in `index.html`. Then, refer the `index.js` file into the `index.html` file.

```
`html
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<title>Essential JS 2 Spreadsheet</title>
<!-- Essential JS 2 Spreadsheet's dependents material theme -->
<link href="http://cdn.syncfusion.com/ej2/ej2-base/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-inputs/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-buttons/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-splitbuttons/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-lists/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-navigations/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-popups/styles/material.css" rel="stylesheet"
type="text/css"/>
```

```
<link href="http://cdn.syncfusion.com/ej2/ej2-dropdowns/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-grids/styles/material.css" rel="stylesheet"
type="text/css"/>
<!-- Essential JS 2 Spreadsheet material theme -->
<link href="http://cdn.syncfusion.com/ej2/ej2-spreadsheet/styles/material.css" rel="stylesheet"
type="text/css"/>
<!-- Essential JS 2 Spreadsheet's dependents script -->
<script src=http://cdn.syncfusion.com/ej2/ej2-base/dist/global/ej2-base.min.js
type="text/javascript"></script>
<script src=http://cdn.syncfusion.com/ej2/ej2-buttons/dist/global/ej2-buttons.min.js
type="text/javascript"></script>
<script src=http://cdn.syncfusion.com/ej2/ej2-popups/dist/global/ej2-popups.min.js
type="text/javascript"></script>
<script src=http://cdn.syncfusion.com/ej2/ej2-splitbuttons/dist/global/ej2-splitbuttons.min.js
type="text/javascript"></script>
<script src=http://cdn.syncfusion.com/ej2/ej2-inputs/dist/global/ej2-inputs.min.js
type="text/javascript"></script>
<script src=http://cdn.syncfusion.com/ej2/ej2-lists/dist/global/ej2-lists.min.js
type="text/javascript"></script>
<script src=http://cdn.syncfusion.com/ej2/ej2-data/dist/global/ej2-data.min.js
type="text/javascript"></script>
<script src=http://cdn.syncfusion.com/ej2/ej2-dropdowns/dist/global/ej2-dropdowns.min.js
type="text/javascript"></script>
<script src=http://cdn.syncfusion.com/ej2/ej2-navigations/dist/global/ej2-navigations.min.js
type="text/javascript"></script>
<script src=http://cdn.syncfusion.com/ej2/ej2-excel-export/dist/global/ej2-excel-export.min.js
type="text/javascript"></script>
<script src=http://cdn.syncfusion.com/ej2/ej2-pdf-export/dist/global/ej2-pdf-export.min.js
type="text/javascript"></script>
<script src=http://cdn.syncfusion.com/ej2/ej2-calendars/dist/global/ej2-calendars.min.js
type="text/javascript"></script>
<script src=http://cdn.syncfusion.com/ej2/ej2-compression/dist/global/ej2-compression.min.js
type="text/javascript"></script>
<script src=http://cdn.syncfusion.com/ej2/ej2-file-utils/dist/global/ej2-file-utils.min.js
```

```

type="text/javascript"></script>
<script src=http://cdn.syncfusion.com/ej2/ej2-grids/dist/global/ej2-grids.min.js
type="text/javascript"></script>
<script src=http://cdn.syncfusion.com/ej2/ej2-svg-base/dist/global/ej2-svg-base.min.js
type="text/javascript"></script>
<script src=http://cdn.syncfusion.com/ej2/ej2-charts/dist/global/ej2-charts.min.js
type="text/javascript"></script>
<script src=http://cdn.syncfusion.com/ej2/ej2-spreadsheet/dist/global/ej2-spreadsheet.min.js
type="text/javascript"></script>
</head>
<body>
<!-- Add the HTML <div> element for Spreadsheet -->
<div id="element"></div>
<script src="index.js" type="text/javascript"></script>
</body>
</html>

```

Place the following Spreadsheet code in the `index.js`.

```

`javascript
//Initialize the Spreadsheet control
var spreadsheet = new ej.spreadsheet.Spreadsheet();
//Render the initialized Spreadsheet
spreadsheet.appendTo('#element');
`

```

[Run the application](#)

Now, run the `index.html` in web browser, it will render the Essential JS 2 Spreadsheet control.

Output will be displayed as follows.

INDEX.JS

```

// Initialize the Spreadsheet componenet.
var spreadsheet = new ej.spreadsheet.Spreadsheet({});
// Render initialized Spreadsheet.
spreadsheet.appendTo('#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Spreadsheet</title>

```

```

}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

You can refer to our [JavaScript Spreadsheet](#) feature tour page for its groundbreaking feature representations. You can also explore our [JavaScript Spreadsheet example](#) to know how to present and manipulate data, including editing, formulas, formatting, importing, and exporting.

See Also

- [Data Binding](#)
- [Open and Save](#)

Data binding in EJ2 JavaScript Spreadsheet control

The Spreadsheet uses [DataManager](#), which supports both RESTful JSON data services and local JavaScript object array binding to a range. The `dataSource` property can be assigned either with the instance of [DataManager](#) or JavaScript object array collection.

To bind data to a cell, use `cell data binding` support.

Local data

To bind local data to the Spreadsheet, you can assign a JavaScript object array to the `dataSource` property.

Refer to the following code example for local data binding.

INDEX.TS

```
import { Spreadsheet } from '@syncfusion/ej2-spreadsheet';
import { data } from './datasource.ts';
//Initialize the SpreadSheet control
let spreadsheet: Spreadsheet = new Spreadsheet({
  sheets: [{
    ranges: [{ dataSource: data }],
    columns: [{ width: 80 }, { width: 80 }, { width: 80 },
              { width: 160 }, { width: 100 }, { width: 150 }]
  }],
});
spreadsheet.appendTo('#spreadsheet');
```

INDEX.HTML

```

</body></html>

```

The local data source can also be provided as an instance of the [DataManager](#). By default, [DataManager](#) uses [JsonAdaptor](#) for local data-binding.

Remote data

To bind remote data to the Spreadsheet control, assign service data as an instance of [DataManager](#) to the `dataSource` property. To interact with remote data source, provide the service endpoint `url`.

Refer to the following code example for remote data binding.

INDEX.TS

```

import { DataManager, ODataAdaptor } from '@syncfusion/ej2-data';
import { Spreadsheet } from '@syncfusion/ej2-spreadsheet';
class CustomAdaptor extends ODataAdaptor {
    public processResponse(): Object {
        let result: Object[] = [];
        let original: { result: Object[], count: number } =
super.processResponse.apply(this, arguments);
        original.result.forEach((item: { SNo: number }, idx: number) => {
            result[idx] = {};

```

```

        Object.keys(item).forEach((key: string) => {
            if (['OrderID', 'CustomerID', 'ShipName', 'ShipCity',
'ShipCountry'].indexOf(key) > -1) {
                result[idx][key] = item[key];
            }
        });
    });
    return { result: result, count: original.count };
}
}
//Initialize DataManager.
let data: DataManager = new DataManager({
    //Remote service url.
    url: 'https://services.syncfusion.com/js/production/api/Orders',
    adaptor: new CustomAdaptor,
    crossDomain: true
});
let spreadsheet: Spreadsheet = new Spreadsheet({
    sheets: [
        {
            rows: [{
                cells: [{ value: 'Order ID' }, { value: 'Customer Name' }, {
value: 'Ship Name' },
                { value: 'Ship City' }, { value: 'Ship Country' }]
            }],
            ranges: [{ dataSource: data, showFieldAsHeader: false,
startCell: 'A2' }],
            columns: [
                { width: 80 }, { width: 100 }, { width: 82 },
                { width: 160 }, { width: 110 }, { width: 130 }
            ]
        }
    ]
});
spreadsheet.appendTo('#spreadsheet');

```

By default, **DataManager** uses **ODataAdaptor** for remote data-binding.

Binding with OData services

OData is a standardized protocol for creating and consuming data. You can retrieve data from OData service using the **DataManager**. Refer to the following code example for remote Data binding using OData service.

INDEX.TS

```

import { Spreadsheet } from '@syncfusion/ej2-spreadsheet';
import { DataManager, ODataAdaptor } from '@syncfusion/ej2-data';
//Initialize DataManager.
let data: DataManager = new DataManager({
  url: 'https://services.syncfusion.com/js/production/api/Orders',
  adaptor: new ODataAdaptor(),
  crossDomain: true
});
let spreadsheet: Spreadsheet = new Spreadsheet({
  sheets: [

```

```

    {
      name: 'Order details',
      ranges: [{ dataSource: data }],
      columns: [
        { width: 80 },
        { width: 80 },
        { width: 80 },
        { width: 80 },
        { width: 80 },
        { width: 80 },
        { width: 280 },
        { width: 180 },
        { width: 80 },
        { width: 180 },
        { width: 180 },
      ]
    }
  ],
  created: (): void => {
    //Applies cell and number formatting to specified range of the active
    sheet.
    spreadsheet.cellFormat({ fontWeight: 'bold', textAlign: 'center',
    verticalAlign: 'middle' },
      'A1:K1');
  }
});
spreadsheet.appendTo('#spreadsheet');

```

INDEX.HTML

```

  <script src="index.js" type="text/javascript"></script>
</body>
</html>

```

Web API

You can use WebApiAdaptor to bind spreadsheet with Web API created using OData endpoint.

INDEX.TS

```

import { Spreadsheet } from '@syncfusion/ej2-spreadsheet';
import { DataManager, WebApiAdaptor } from '@syncfusion/ej2-data';
//Initialize DataManager.
let data: DataManager = new DataManager({
  url: 'https://services.syncfusion.com/js/production/api/Orders',
  crossDomain: true,
  adaptor: new WebApiAdaptor()
});
let spreadsheet: Spreadsheet = new Spreadsheet({
  sheets: [
    {
      name: 'Order details',
      ranges: [{ dataSource: data }],
      columns: [
        { width: 80 },
        { width: 80 },
        { width: 80 },
        { width: 80 },
        { width: 80 },
        { width: 80 },
        { width: 280 },
        { width: 180 },
      ],
    },
  ],
});

```

```

        { width: 80 },
        { width: 180 },
        { width: 180 },
    ]
}
],
created: (): void => {
    //Applies cell and number formatting to specified range of the active
    sheet.
    spreadsheet.cellFormat({ fontWeight: 'bold', textAlign: 'center',
    verticalAlign: 'middle' },
    'A1:K1');
}
});
spreadsheet.appendTo('#spreadsheet');

```

</body>
</html>

```

Cell data binding

The Spreadsheet control can bind the data to individual cell in a sheet . To achieve this you can use the **value** property.

Refer to the following code example for cell data binding.

INDEX.TS

```

import { Spreadsheet } from '@syncfusion/ej2-spreadsheet';
//Initialize the SpreadSheet control
let spreadsheet: Spreadsheet = new Spreadsheet({
  sheets: [
    {
      name: 'Monthly Budget',
      selectedRange: 'D13',
      rows: [
        {
          cells: [
            { value: 'Category', style: { fontWeight: 'bold',
textAlign: 'center' } },
            { value: 'Planned cost', style: { fontWeight:
'bold', textAlign: 'center' } },
            { value: 'Actual cost', style: { fontWeight: 'bold',
textAlign: 'center' } },
            { value: 'Difference', style: { fontWeight: 'bold',
textAlign: 'center' } }
          ]
        },
        {
          cells: [
            { value: 'Food' },
            { value: '$7000' },
            { value: '$8120' },
            { formula: '=B2-C2', format: '$#,##0.00' }
          ]
        }
      ]
    },
    {
      cells: [

```

```

        { value: 'Loan' },
        { value: '$1500' },
        { value: '$1500' },
        { formula: '=B3-C3', format: '$#,##0.00' }
    ]
},
{
    cells: [
        { value: 'Medical' },
        { value: '$300' },
        { value: '$0' },
        { formula: '=B4-C4', format: '$#,##0.00' }
    ]
},
{
    index: 5,
    cells: [
        { index: 2, value: 'Total Difference:', style: {
fontWeight: 'bold', textAlign: 'right' } },
        { formula: '=D2+D4', format: '$#,##0.00', style: {
fontWeight: 'bold' } }
    ]
}
],
columns: [
    { width: 110 }, { width: 115 }, { width: 110 }, { width: 100
}
]
}
]);
//Render the initialized SpreadSheet
spreadsheet.appendTo('#spreadsheet');
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

The cell data binding also supports formula, style, number format, and more.

Dynamic data binding and Datasource change event

You can dynamically change the datasource of the spreadsheet by changing the `dataSource` property of the `range` object of the `sheet`. The `dataSourceChanged` event handler will be triggered when editing, inserting, and deleting a row in the datasource range. This event will be triggered with a parameter named `action` which indicates the `edit`, `add` and `delete` actions for the respective ones.

The following table defines the arguments of the `dataSourceChanged` event.

Property	Type	Description
action	string	Indicates the type of action such as <code>edit</code> , <code>add</code> , and <code>delete</code> performed in the datasource range.
data	object[]	Modified data for <code>edit</code> action; New data for <code>add</code> action; Deleted data for <code>delete</code> action.

| rangeIndex | number | Specifies the range index of the datasource. |

| sheetIndex | number | Specifies the sheet index of the datasource. |

For **add** action, the value for all the fields will be **null** in the data. In the case that you do not want the primary key field to be null which needs to be updated in the backend service, you can use **edit** action after updating the primary key field to update in the backend service.

For inserting a row at the end of the datasource range, you should insert a row below at the end of the range to trigger the **dataSourceChanged** event with action **add**.

INDEX.TS

```
import { Spreadsheet, DataSourceChangedEventArgs } from '@syncfusion/ej2-spreadsheet';
import { data, itemData } from './datasource.ts';
let spreadsheet: Spreadsheet = new Spreadsheet({
    showRibbon: false,
    showFormulaBar: false,
    sheets: [
        {
            ranges: [{ dataSource: data }],
            columns: [
                { width: 90 }, { width: 100 }, { width: 96 },
                { width: 120 }, { width: 130 }, { width: 120 }
            ]
        }
    ],
    dataSourceChanged: (args: DataSourceChangedEventArgs) => {
        appendElement("Data source changed with" + "<b>&#160;" +
args.action + "</b> action<hr>");
    }
});
spreadsheet.appendTo('#spreadsheet');
document.getElementById('changeDataBtn').addEventListener('click', () => {
    spreadsheet.sheets[0].ranges[0].dataSource = itemData;
});
document.getElementById('clearBtn').addEventListener('click', () => {
    document.getElementById('EventLog').innerHTML = "";
});
function appendElement(html: string): void {
    let span: HTMLElement = document.createElement("span");
    span.innerHTML = html;
    let log: HTMLElement = document.getElementById('EventLog');
    log.insertBefore(span, log.firstChild);
}
```

Open save in EJ2 JavaScript Spreadsheet control

The native data format for Spreadsheet is **JSON**. When you open an excel file, it needs to be read and converted to client side Spreadsheet model. The converted client side Spreadsheet model is sent as JSON which is used to render Spreadsheet. Similarly, when you save the Spreadsheet, the client Spreadsheet model is sent to the server as JSON for processing and saved as Excel file formats. [Server configuration](#) is used for this process.

Open

The Spreadsheet control opens an Excel document with its data, style, format, and more. To enable this feature, set [allowOpen](#) as **true** and assign service url to the [openUrl](#) property.

User Interface:

In user interface you can open an Excel document by clicking **File > Open** menu item in ribbon.

The following sample shows the **Open** option by using the [openUrl](#) property in the Spreadsheet control. You can also use the [beforeOpen](#) event to trigger before opening an Excel file.

INDEX.TS

```

import { Spreadsheet, BeforeOpenEventArgs } from '@syncfusion/ej2-spreadsheet';
//Initialize the Spreadsheet control
let spreadsheet: Spreadsheet = new Spreadsheet({
    allowOpen: true,
    openUrl:
    'https://services.syncfusion.com/js/production/api/spreadsheet/open',
    beforeOpen: (args: BeforeOpenEventArgs) => {
        // your code snippets here
    }
});
//Render the initialized Spreadsheet
spreadsheet.appendTo('#spreadsheet');

```

```

Please find the below table for the beforeOpen event arguments.

Parameter	Type	Description
-----------	------	-------------

| ---- | ---- | ---- |

| file | FileList or string or File | To get the file stream. **FileList** - contains length and item index.

File - specifies the file lastModified and file name. |

| cancel | boolean | To prevent the open operation. |

| requestData | object | To provide the Form data. |

* Use **Ctrl + O** keyboard shortcut to open Excel documents.

* The default value of the [allowOpen](#) property is **true**. For demonstration purpose, we have showcased the [allowOpen](#) property in previous code snippet.

Open an external URL excel file while initial load

You can achieve to access the remote excel file by using the [created](#) event. In this event you can fetch the excel file and convert it to a blob. Convert this blob to a file and [open](#) this file by using Spreadsheet component open method.

INDEX.TS

```
import { Spreadsheet } from '@syncfusion/ej2-spreadsheet';
//Initialize the Spreadsheet control
let spreadsheet: Spreadsheet = new Spreadsheet({
  openUrl:
    'https://services.syncfusion.com/js/production/api/spreadsheet/open',
  saveUrl:
    'https://services.syncfusion.com/js/production/api/spreadsheet/save',
  created: (): void => {

    fetch("https://cdn.syncfusion.com/scripts/spreadsheet/Sample.xlsx") // fetch
    the remote url
      .then((response) => {
        response.blob().then((fileBlob) => { // convert the
        excel file to blob
          let file = new File([fileBlob], "Sample.xlsx");
          //convert the blob into file
          spreadsheet.open({ file: file }); // open the file into
          Spreadsheet
        })
      })
  }
});
//Render the initialized Spreadsheet
spreadsheet.appendTo('#spreadsheet');
```

```

To add custom header during open

You can add your own custom header to the open action in the Spreadsheet. For processing the data, it has to be sent from server to client side and adding customer header can provide privacy to the data with the help of Authorization Token. Through the [beforeOpen](#) event, the custom header can be added to the request during open action.

INDEX.TS

```
import { BeforeOpenEventArgs, Spreadsheet } from '@syncfusion/ej2-spreadsheet';
//Initialize the Spreadsheet control
let spreadsheet: Spreadsheet = new Spreadsheet({
    openUrl:
    'https://services.syncfusion.com/js/production/api/spreadsheet/open',
    saveUrl:
    'https://services.syncfusion.com/js/production/api/spreadsheet/save',
    beforeOpen: (args: BeforeOpenEventArgs) => {
        args.requestData['headers'] = {
            Authorization: 'YOUR TEXT',
        }
    }
});
//Render the initialized Spreadsheet
spreadsheet.appendTo('#spreadsheet');

Open excel file into a read-only mode

You can open excel file into a read-only mode by using the [openComplete](#) event. In this event, you must protect all the sheets and lock its used range cells by using [protectSheet](#) and [lockCells](#) methods.

INDEX.TS

```

import {
    Spreadsheet,
    ProtectSettingsModel,
    SheetModel,
    getRangeAddress,
} from '@syncfusion/ej2-spreadsheet';
//Initialize Spreadsheet component
let spreadsheet: Spreadsheet = new Spreadsheet({
    openUrl:
        'https://services.syncfusion.com/js/production/api/spreadsheet/open',
    saveUrl:
        'https://services.syncfusion.com/js/production/api/spreadsheet/save',
    openComplete: (): void => {
        let sheets: SheetModel[] = spreadsheet.sheets;
        for (let index: number = 0; index < sheets.length; index++) {
            let name: string = spreadsheet.sheets[index].name;
            let protectSetting: ProtectSettingsModel = {
                selectCells: true,
                formatCells: false,
            };
            //To protect the sheet using sheet name
            spreadsheet.protectSheet(name, protectSetting);
            let address: string = getRangeAddress([
                0,
                0,
                sheets[index].usedRange.rowIndex,
                sheets[index].usedRange.colIndex,
            ]);
            //To lock the used range cells
            spreadsheet.lockCells(name + '!' + address, true);
        }
    },
},

```

```
});
spreadsheet.appendTo('#spreadsheet');
```

</body></html>
```

External workbook confirmation dialog

When you open an excel file that contains external workbook references, you will see a confirmation dialog. This dialog allows you to either continue with the file opening or cancel the operation. This confirmation dialog will appear only if you set the `AllowExternalWorkbook` property value to **false** during the open request, as shown below. This prevents the spreadsheet from displaying inconsistent data.

```
`csharp
public IActionResult Open(IFormCollection openRequest)
{
    OpenRequest open = new OpenRequest();
    open.AllowExternalWorkbook = false;
    open.File = openRequest.Files[0];
    return Content(Workbook.Open(open));
}
```

This feature is only applicable when importing an Excel file and not when loading JSON data or binding cell data.

![External workbook confirmation dialog](./images/external-reference-dialog-alert%20.png)

Supported file formats

The following list of Excel file formats are supported in Spreadsheet:

- MS Excel (.xlsx)
- MS Excel 97-2003 (.xls)
- Comma Separated Values (.csv)
- Excel Macro-Enabled Workbook (.xlsm)
- Excel Binary Workbook(.xlsb)

Save

The Spreadsheet control saves its data, style, format, and more as Excel file document. To enable this feature, set `allowSave` as **true** and assign service url to the `saveUrl` property.

User Interface:

In user interface, you can save Spreadsheet data as Excel document by clicking **File > Save As** menu item in ribbon.

The following sample shows the **Save** option by using the `saveUrl` property in the Spreadsheet control. You can also use the `beforeSave` event to trigger before saving the Spreadsheet as an Excel file.

INDEX.TS

```

import { Spreadsheet, SheetModel, BeforeSaveEventArgs } from
 '@syncfusion/ej2-spreadsheet';
let sheet: SheetModel[] = [{
    rows: [{
        cells: [
            { index: 0, value: 'Order ID', style: { fontWeight:
'bold' } }},

</body></html>

```

Please find the below table for the beforeSave event arguments.

Parameter	Type	Description
url	string	Specifies the save url.
fileName	string	Specifies the file name.
saveType	SaveType	Specifies the saveType like Xlsx, Xls, Csv and Pdf.
customParams	object	Passing the custom parameters from client to server while performing save operation.
isFullPost	boolean	It sends the form data from client to server, when set to true. It fetches the data from client to server and returns the data from server to client, when set to false.
needBlobData	boolean	You can get the blob data if set to true.
cancel	boolean	To prevent the save operations.

* Use **Ctrl + S** keyboard shortcut to save the Spreadsheet data as Excel file.

* The default value of [allowSave](#) property is **true**. For demonstration purpose, we have showcased the [allowSave](#) property in previous code snippet.

* Demo purpose only, we have used the online web service url link.

To send and receive custom params from client to server

Passing the custom parameters from client to server by using [beforeSave](#) event.

INDEX.TS

```

import { Spreadsheet } from '@syncfusion/ej2-spreadsheet';
import { data } from './datasource.ts';
//Initialize the SpreadSheet control
let spreadsheet: Spreadsheet = new Spreadsheet({
  sheets: [{
    ranges: [{ dataSource: data }],
    columns: [{ width: 80 }, { width: 80 }, { width: 80 },
              { width: 160 }, { width: 100 }, { width: 150 }]
  }],

```

```

        saveUrl:
        'https://services.syncfusion.com/js/production/api/spreadsheet/save',
        beforeSave: (args: BeforeSaveEventArgs) => {
            args.customParams = { customParams: 'you can pass custom
params in server side'}; // you can pass the custom params
        }
    });
spreadsheet.appendTo('#spreadsheet');

```

</script>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Server side code snippets:

```
`c#
```

```
public IActionResult Save(SaveSettings saveSettings, string customParams)
```

```
{
```

```
    Console.WriteLine(customParams); // you can get the custom params in controller side
```

```
    return Workbook.Save(saveSettings);
```

```
}
```

```
`
```

To add custom header during save

You can add your own custom header to the save action in the Spreadsheet. For processing the data, it has to be sent from client to server side and adding customer header can provide privacy to the data with the help of Authorization Token. Through the [fileMenuItemSelect](#) event, the custom header can be added to the request during save action.

To change the PDF orientation

By default, the PDF document is created in **Portrait** orientation. You can change the orientation of the PDF document by using the `args.pdfLayoutSettings.orientation` argument settings in the [beforeSave](#) event.

The possible values are:

- **Portrait** - Used to display content in a vertical layout.
- **Landscape** - Used to display content in a horizontal layout.

Supported file formats

The following list of Excel file formats are supported in Spreadsheet:

- MS Excel (.xlsx)
- MS Excel 97-2003 (.xls)
- Comma Separated Values (.csv)
- Portable Document Format (.pdf)

Methods

To save the Spreadsheet document as an `xlsx`, `xls`, `csv`, or `pdf` file, by using [save](#) method should be called with the `url`, `fileName` and `saveType` as parameters. The following code example shows to save the spreadsheet file as an `xlsx`, `xls`, `csv`, or `pdf` in the button click event.

INDEX.TS

```

import { Spreadsheet, ColumnModel } from '@syncfusion/ej2-spreadsheet';
import { data } from './datasource.ts';
import { DropDownButton, ItemModel } from '@syncfusion/ej2-splitbuttons';
//Initialize action items.
let items: ItemModel[] = [
  {
    text: "Save As xlsx"
  },
  {
    text: "Save As xls"
  },
  {
    text: "Save As csv"
  },
  {
    text: "Save As pdf"
  }
];
// Initialize the DropDownButton component.
let drpDownBtn: DropDownButton = new DropDownButton({
  items: items,
  cssClass: "e-round-corner",
  select: (args: MenuEventArgs) => {
    if (args.item.text === 'Save As xlsx')

Server Configuration

Import and export are processed in **server-side** using Spreadsheet server library. The following code snippets shows server configuration using **WebAPI** service,

```

`c#
[Route("api/[controller]")]
public class SpreadsheetController : Controller
{
    //To open excel file
    [AcceptVerbs("Post")]
    [HttpPost]
    [EnableCors("AllowAllOrigins")]
    [Route("Open")]
    public IActionResult Open(IFormCollection openRequest)
    {
        OpenRequest open = new OpenRequest();
        open.File = openRequest.Files[0];
        return Content(Workbook.Open(open));
    }
    //To save as excel file

```

```
[AcceptVerbs("Post")]
[HttpPost]
[EnableCors("AllowAllOrigins")]
[Route("Save")]
public IActionResult Save([FromForm]SaveSettings saveSettings)
{
    return Workbook.Save(saveSettings);
}
}
```

Server Dependencies

Open and save helper functions are shipped in the Syncfusion.EJ2.Spreadsheet package, which is available in Essential Studio and [nuget.org](https://www.nuget.org). Following list of dependencies required for Spreadsheet open and save operations.

- Syncfusion.EJ2
- Syncfusion.EJ2.Spreadsheet
- Syncfusion.Compression.Base
- Syncfusion.XlsIO.Base

And also refer [this](#) for more information.

Worksheet in EJ2 JavaScript Spreadsheet control

Worksheet is a collection of cells organized in the form of rows and columns that allows you to store, format, and manipulate the data.

Add sheet

You can dynamically add or insert a sheet by one of the following ways,

- Click the **Add Sheet** button in the sheet tab. This will add a new empty sheet next to current active sheet.
- Right-click on the sheet tab, and then select **Insert** option from the context menu to insert a new empty sheet before the current active sheet.
- Using [insertSheet](#) method, you can insert one or more sheets at your desired index.

The following code example shows the insert sheet operation in spreadsheet.

INDEX.TS

```

import { Spreadsheet, SheetModel } from '@syncfusion/ej2-spreadsheet';
import { data } from './datasource.ts';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
let sheets: SheetModel[] = [{
    name: 'Price Details',
    ranges: [{ dataSource: data }],
    columns: [{ width: 150 }, { width: 110 }, { width: 110 }, { width: 85 },
{ width: 85 }, { width: 85 }, { width: 85 },
    { width: 85 }]
}];
let spreadsheet: Spreadsheet = new Spreadsheet({
    sheets: sheets,
    created: (): void => {
        // Applies style formatting to the active sheet before inserting a
        new sheet
        spreadsheet.cellFormat({ fontWeight: 'bold', textAlign: 'center' },
'A1:H1');
        spreadsheet.cellFormat({ textAlign: 'center' }, 'D2:H11');
        // inserting a new sheet with data at 1st index
        // You can also insert empty sheets by specifying the start and end
        sheet index instead of sheet model
        spreadsheet.insertSheet([{
            index: 1,
            name: 'Inserted Sheet',
            ranges: [{ dataSource: data }],
            columns: [{ width: 150 }, { width: 110 }, { width: 110 }, {
width: 85 }, { width: 85 }, { width: 85 }, { width: 85 },
            { width: 85 }]
        }]);
        // Applies style formatting for the inserted sheet
        spreadsheet.cellFormat({ fontWeight: 'bold', textAlign: 'center' },
'Inserted Sheet!A1:H1');
        spreadsheet.cellFormat({ textAlign: 'center' }, 'Inserted
Sheet!D2:H11');
    },
    // Removed the unwanted support for this samples
    showRibbon: false, showFormulaBar: false
});
spreadsheet.appendTo('#spreadsheet');

Delete sheet

The Spreadsheet has support for removing an existing worksheet. You can dynamically delete the existing sheet by the following way,

- Right-click on the sheet tab, and then select **Delete** option from context menu.
- Using [delete](#) method to delete the sheets.

Rename sheet

You can dynamically rename an existing worksheet in the following way,

- Right-click on the sheet tab, and then select **Rename** option from the context menu.

Headers

By default, the row and column headers are visible in worksheets. You can dynamically show or hide worksheet headers by using one of the following ways,

- Switch to **View** tab, and then select **Hide Headers** option to hide both the row and column headers.
- Set **showHeaders** property in sheets as **true** or **false** to show or hide the headers at initial load. By default, the **showHeaders** property is enabled in each worksheet.

Gridlines

Gridlines act as a border like appearance of cells. They are used to distinguish cells on the worksheet. You can dynamically show or hide gridlines by using one of the following ways,

- Switch to **View** tab, and then select **Hide Gridlines** option to hide the gridlines in worksheet.
- Set **showGridLines** property in sheets as **true** or **false** to show or hide the gridlines at initial load. By default, the **showGridLines** property is enabled in each worksheet.

The following code example shows the headers and gridlines operation in spreadsheet.

INDEX.TS

```
import { Spreadsheet, SheetModel, ColumnModel } from '@syncfusion/ej2-spreadsheet';
import { data } from './datasource.ts';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
let columns: ColumnModel[] = [{ width: 150 }, { width: 110 }, { width: 110 }, { width: 85 }, { width: 85 }, { width: 85 }, { width: 85 }, { width: 85 }];
let sheets: SheetModel[] = [{
  name: 'Price Details',
  ranges: [{ dataSource: data }],
  columns: columns,
  // Hiding the gridlines in 'Price Details' sheet
  showGridLines: false,
  // Hiding the headers in 'Price Details' sheet
  showHeaders: false
}];
let spreadsheet: Spreadsheet = new Spreadsheet({
  sheets: sheets,
  created: (): void => {
    spreadsheet.cellFormat({ fontWeight: 'bold', textAlign: 'center' }, 'A1:H1');
    spreadsheet.cellFormat({ textAlign: 'center' }, 'D2:H11');
    // The gridlines have been removed to set border for the range of cells
    spreadsheet.setBorder({ border: '1px solid #e0e0e0' }, 'A1:H11');
  },
  // Removed the unwanted support for this samples
  showFormulaBar: false, showSheetTabs: false
});
```

```
});
spreadsheet.appendTo('#spreadsheet');
```

var ele = document.getElementById('container');
if(ele) {
```

```

    ele.style.visibility = "visible";
  }
  </script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Sheet visibility

Hiding a worksheet can help prevent unauthorized or accidental changes to your file.

There are three visibility state as like Microsoft Excel,

State	Description
Visible	You can see the worksheet once the component is loaded.
Hidden	This worksheet is not visible, but you can unhide by selecting the sheet from List All Sheets dropdown menu.
VeryHidden	This worksheet is not visible and cannot be unhidden. Changing the state property to Visible is the only way to view this sheet.

The following code example shows the three types of sheet visibility state.

INDEX.TS

```

import { Spreadsheet, SheetModel } from '@syncfusion/ej2-spreadsheet';
import { enableRipple } from '@syncfusion/ej2-base';
import { data } from './datasource.ts';
enableRipple(true);
let sheets: SheetModel[] = [{
  name: 'Visible Sheet',
  ranges: [{ dataSource: data }],
  columns: [{ width: 150 }, { width: 110 }, { width: 110 }, { width: 85 },
{ width: 85 }, { width: 85 }, { width: 85 },
{ width: 85 }],
  // By default, state is set as `visible`. We don't need to said it in
the sample
  state: 'Visible'
},
{
  name: 'Very Hidden Sheet',
  ranges: [{ dataSource: data }],
  columns: [{ width: 150 }, { width: 110 }, { width: 110 }, { width: 85 },
{ width: 85 }, { width: 85 }, { width: 85 },
{ width: 85 }],
  // Sets sheet state as `VeryHidden`. It can't be unhidden.
  state: 'VeryHidden'
},
{
  name: 'Hidden Sheet',
  ranges: [{ dataSource: data }],
  columns: [{ width: 150 }, { width: 110 }, { width: 110 }, { width: 85 },
{ width: 85 }, { width: 85 }, { width: 85 },
{ width: 85 }],
  // Sets sheet state as `Hidden`. It can be unhidden dynamically.
}

```

```

        state: 'Hidden'
    }];
let spreadsheet: Spreadsheet = new Spreadsheet({
    sheets: sheets,
    created: (): void => {
        // Applies style formatting to active visible sheet
        spreadsheet.cellFormat({ fontWeight: 'bold', textAlign: 'center' },
        'A1:H1');
        spreadsheet.cellFormat({ textAlign: 'center' }, 'D2:H11');
        // Applies style formatting to active hidden sheet
        spreadsheet.cellFormat({ fontWeight: 'bold', textAlign: 'center' },
        'Hidden Sheet!A1:H1');
        spreadsheet.cellFormat({ textAlign: 'center' }, 'Hidden

Cell range in EJ2 JavaScript Spreadsheet control

A group of cells in a sheet is known as cell range.

Wrap text

Wrap text allows you to display large content as multiple lines in a single cell. By default, the wrap text support is enabled. Use the [allowWrap](#) property to enable or disable the wrap text support in spreadsheet.

Wrap text can be applied or removed to a cell or range of cells in the following ways,

- Using the `wrap` property in `cell`, you can enable or disable wrap text to a cell at initial load.
- Select or deselect wrap button from ribbon toolbar to apply or remove the wrap text to the selected range.
- Using the [wrap](#) method, you can apply or remove the wrap text once the component is loaded.

The following code example shows the wrap text functionality in spreadsheet.

INDEX.TS

```
import { Spreadsheet, SheetModel, ColumnModel, RowModel } from
 '@syncfusion/ej2-spreadsheet';
import { data } from './datasource.ts';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
let columns: ColumnModel[] = [{ index: 1, width: 100 }, { width: 140 }, {
width: 90 }, { width: 150 }, { width: 120 }, { width: 90 }, { width: 180 }];
// Set wrap text to H2 to H5 cells through cell binding
let rows: RowModel[] = [{ height: 30 }, { cells: [{ index: 7, wrap: true } ]
}, { cells: [{ index: 7, wrap: true } ] }, { cells: [{ index: 7, wrap: true
} ] }, { cells: [{ index: 7, wrap: true } ] }];
let sheets: SheetModel[] = [{ name: 'Movie List', ranges: [{ dataSource:
data }], rows: rows, columns: columns }];
let spreadsheet: Spreadsheet = new Spreadsheet({
  sheets: sheets,
  created: (): void => {
    spreadsheet.cellFormat({ fontWeight: 'bold', textAlign: 'center' },
'A1:H1');
    spreadsheet.cellFormat({ verticalAlign: 'middle' }, 'A1:H5');
    spreadsheet.cellFormat({ textAlign: 'center' }, 'A2:B5');
    spreadsheet.cellFormat({ textAlign: 'center' }, 'D2:D5');
    // To wrap the cells from E2 to E5 range
    spreadsheet.wrap('E2:E5');
    // To unwrap the H3 cell
    spreadsheet.wrap('H3', false);
  },
  // Removed the unwanted support for this samples
  showFormulaBar: false
});
spreadsheet.appendTo('#spreadsheet');
```

```

Limitations of Wrap text

The following features have some limitations in wrap text:

- Sorting with wrap text applied data.
- Merge with wrap text.

Merge cells

Merge cells allows users to span two or more cells in the same row or column into a single cell. When cells with multiple values are merged, top-left most cell data will be the data for the merged cell. By default, the merge cells option is enabled. Use [allowMerge](#) property to enable or disable the merge cells option in spreadsheet.

You can merge the range of cells in the following ways,

- Set the `rowSpan` and `colSpan` property in `cell` to merge the number of cells at initial load.
- Select the range of cells and apply merge by selecting the desired option from ribbon toolbar.
- Use [merge](#) method to merge the range of cells, once the component is loaded.

The available merge options in spreadsheet are,

Type	Action
----- -----	
Merge All	Combines all the cells in a range in to a single cell (default).
Merge Horizontally	Combines cells in a range as row-wise.
Merge Vertically	Combines cells in a range as column-wise.
UnMerge	Splits the merged cells into multiple cells.

The following code example shows the merge cells operation in spreadsheet.

INDEX.TS

```
import { Spreadsheet, SheetModel, ColumnModel, RowModel } from
 '@syncfusion/ej2-spreadsheet';
import { data } from './datasource.ts';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
let columns: ColumnModel[] = [{ width: 90 }, { width: 150 }, { width: 100 },
 { width: 100 }, { width: 100 }, { width: 100 }, { width: 100 }, { width: 100 },
 { width: 100 }, { width: 100 }, { width: 120 }, { width: 120 }, { width:
 120 }, { width: 120 }, { width: 120 }, { width: 120 }, { width: 100 }, {
 width: 100 }, { width: 100 }];
let rows: RowModel[] = [{ height: 35 }, { height: 35, cells: [
  // Merging the 2nd cells of rows 2 and 3 through cell binding.
  { index: 1, rowSpan: 2 },
  // Merging the 2nd row's 3rd and 4th cells through cell binding.
  { colSpan: 2 },
  // Merging the 2nd row's 7th, 8th and 9th cells through cell binding.
  { index: 6, colSpan: 3 },
  // Merging the 2nd and 3rd rows 11th, 12th and 13th cells through cell
  binding.
  { index: 10, rowSpan: 2, colSpan: 3 },
  { index: 13, colSpan: 2 }, { index: 17, colSpan: 2 } ] },
 { height: 35, cells: [{ index: 3, colSpan: 3 }, { index: 6, colSpan: 4

Limitations of Merge

The following features have some limitations in Merge:

- Merge with filter.
- Merge with wrap text.

Data Validation

Data Validation is used to restrict the user from entering the invalid data. You can use the [allowDataValidation](#) property to enable or disable data validation.

* The default value for `allowDataValidation` property is `true`.

Apply Validation

You can apply data validation to restrict the type of data or the values that users enter into a cell.

You can apply data validation by using one of the following ways,

- Select the Data tab in the Ribbon toolbar, and then choose the Data Validation item.
- Use the [addDataValidation\(\)](#) method programmatically.

Clear Validation

Clear validation feature is used to remove data validations from the specified ranges or the whole worksheet.

You can clear data validation rule by one of the following ways,

- Select the Data tab in the Ribbon toolbar, and then choose the Clear Validation item.
- Use the [removeDataValidation\(\)](#) method programmatically.

Highlight Invalid Data

Highlight invalid data feature is used to highlight the previously entered invalid values.

You can highlight an invalid data by using one of the following ways,

- Select the Data tab in the Ribbon toolbar, and then choose the Highlight Invalid Data item.
- Use the [addInvalidHighlight\(\)](#) method programmatically.

Clear Highlighted Invalid Data

Clear highlight feature is used to remove the highlight from invalid cells.

You can clear the highlighted invalid data by using the following ways,

- Select the Data tab in the Ribbon toolbar, and then choose the Clear Highlight item.
- Use the [removeInvalidHighlight\(\)](#) method programmatically.

INDEX.TS

```
import { Spreadsheet } from '@syncfusion/ej2-spreadsheet';

Limitations of Data validation

The following features have some limitations in Data Validation:

- Entire row data validation.
- Insert row between the data validation.
- Copy/paste with data validation.
- Delete cells between data validation applied range.

Auto Fill

Auto Fill is used to fill the cells with data based on adjacent cells. It also follows a pattern from adjacent cells if available. There is no need to enter the repeated data manually. You can use `allowAutoFill` property to enable/disable the auto fill support. You can also use `showFillOptions` property to enable/disable the fill option and `fillType` property to change the default auto fill option which is available in `autoFillSettings`.

You can do this by one of the following ways,

- Using “AutoFillOptions” menu which is open, while drag and drop the cell using fill handle element.
- Use the `autoFill()` method programmatically.

The available parameters in `autoFill()` method are,

Parameter	Type	Description
fillRange	string	Specifies the fill range.
dataRange	string	Specifies the data range.
direction	AutoFillDirection	Specifies the direction("Up","Right","Down","Left") to be filled.
fillType	AutoFillType	Specifies the fill type("CopyCells","FillSeries","FillFormattingOnly","FillWithoutFormatting") for autofill action.

In Auto Fill we have following options,

- Copy Cells
- Fill Series
- Fill Formatting Only
- Fill Without Formatting

* The default auto fill option is “FillSeries” which can be referred from `fillType` property.

Copy Cells

To copy the selected cell content to the adjacent cells. You can do this by one of the following ways,

- Using fill handle to select the adjacent cell range and “Copy Cells” option in “AutoFillOptions” menu to fill the adjacent cells.
- Using “CopyCells” as fill type in `autoFill` method to fill the adjacent cells.

Fill Series

To fill the series of numbers, characters, or dates based on selected cell content to the adjacent cells with their formats.

You can do this by one of the following ways,

- Using fill handle to select the adjacent cell range and “Fill Series” option in “AutoFillOptions” menu to fill the adjacent cells.
- Using “FillSeries” as fill type in `autoFill` method to fill the adjacent cells.

Fill Formatting Only

To fill the cell style and number formatting based on the selected cell content to the adjacent cells without their content.

You can do this by one of the following ways,

- Using fill handle to select the adjacent cell range and “Fill Formatting Only” option in “AutoFillOptions” menu to fill the adjacent cells.
- Using “FillFormattingOnly” as fill type in `autoFill` method to fill the adjacent cells.

Fill Without Formatting

To fill series of numbers, characters, or dates based on the selected cells to the adjacent cells without their formats.

You can do this by one of the following ways,

- Using fill handle to select the adjacent cell range and “Fill Without Formatting” option in “AutoFillOptions” menu to fill the adjacent cells.
- Using “FillWithoutFormatting” as fill type in `autoFill` method to fill the adjacent cells.

In the following sample, you can enable/disable the fill option on the button click event by using the `showFillOptions` property in `autoFillSettings`.

```

Limitations of Autofill

The following features have some limitations in Autofill:

- Flash Fill option in Autofill feature.
- Fill with Conditional Formatting applied cells.

Clear

Clear feature helps you to clear the cell contents (formulas and data), formats (including number formats, conditional formats, and borders) in a spreadsheet. When you apply clear all, both the contents and the formats will be cleared simultaneously.

Apply Clear Feature

You can apply clear feature by using one of the following ways,

- Select the clear icon in the Ribbon toolbar under the Home Tab.
- Using the [clear\(\)](#) method to clear the values.

Clear has the following types in the spreadsheet,

| Options | Uses |

|-----|-----|

| **Clear All** | Used to clear all contents, formats, and hyperlinks. |

| **Clear Formats** | Used to clear the formats (including number formats, conditional formats, and borders) in a cell. |

| **Clear Contents** | Used to clear the contents (formulas and data) in a cell. |

| **Clear Hyperlinks** | Used to clear the hyperlink in a cell. |

Methods

Clear the cell contents and formats in the Spreadsheet document by using the [clear](#) method. The [clear](#) method has **type** and **range** as parameters. The following code example shows how to clear the cell contents and formats in the button click event.

INDEX.TS

```
import { Spreadsheet } from '@syncfusion/ej2-spreadsheet';
import { DropDownButton, ItemModel } from '@syncfusion/ej2-splitbuttons';
import { orderData } from './datasource.ts';
//Initialize action items.
let items: ItemModel[] = [
    {
        text: "Clear All"
    },
    {
        text: "Clear Formats"
    },
    {
        text: "Clear Contents"
    },
    {
        text: "Clear Hyperlinks"
    }
];
// Initialize the DropDownButton component.
let drpDownBtn: DropDownButton = new DropDownButton({
    items: items,
    cssClass: "e-round-corner",
    select: (args: MenuEventArgs) => {
        if (args.item.text === 'Clear All')
            spreadsheet.clear({ type: 'Clear All', range: 'D1:D10' }); // Clear
            the content, formats and hyperlinks applied in the provided range.
        if (args.item.text === 'Clear Formats')
            spreadsheet.clear({ type: 'Clear Formats', range: 'B1:B10' }); //
            Clear the formats applied in the provided range
        if (args.item.text === 'Clear Contents')
            spreadsheet.clear({ type: 'Clear Contents', range: 'A1:A10' }); //
            Clear the content in the provided range
        if (args.item.text === 'Clear Hyperlinks')
            spreadsheet.clear({ type: 'Clear Hyperlinks', range: 'F2:F6' }); //
            Clear the hyperlinks applied in the provided range
    }
});
```

```

});
// Render initialized DropDownButton.
drpDownBtn.appendTo("#element");
//Initialize the SpreadSheet control
let spreadsheet: Spreadsheet = new Spreadsheet({
  sheets: [{

Editing in EJ2 JavaScript Spreadsheet control

You can edit the contents of a cell directly in the cell or by typing in the formula bar. By default, the editing feature is enabled in the spreadsheet. Use the [allowEditing](#) property to enable or disable the editing feature.

Edit cell

You can start editing by one of the following ways,

- Double click a cell to start the edit mode.
- Press **F2** key to edit the active cell.
- Use formula bar to perform editing.
- Use **BACKSPACE** or **SPACE** key to clear the cell content and start the edit mode.
- Using the [startEdit](#) method.

Save cell

If the cell is in editable state, you can save the edited cell by one of the following ways,

- Perform mouse click on any other cell rather than the current editing cell.
- Press **Enter** or **Tab** keys to save the edited cell content.
- Using the [endEdit](#) method.

Cancel editing

To cancel the editing without saving the changes, you can use one of the following ways,

- Press **ESCAPE** key, this will remove the editable state and update the unchanged cell content.
- Using the [closeEdit](#) method.

The following sample shows how to prevent the editing and cell save. Here **E** column prevent the editing by using cancel argument as true in [cellEdit](#) event. In **D** column, prevent saving the edited changes by using cancel argument as true in [beforeCellSave](#) and use [closeEdit](#) method in spreadsheet.

INDEX.TS

```
import { Spreadsheet, SheetModel, ColumnModel, RowModel } from
 '@syncfusion/ej2-spreadsheet';
import { data } from './datasource.ts';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
let columns: ColumnModel[] = [{ width: 120 }, { width: 180 }, { width: 100
 }, { width: 120 }, { width: 120 }];
let rows: RowModel[] = [{
    index: 10, cells: [{ index: 3, value: 'Total Amount:', style: {
fontWeight: 'bold' } }, { formula: '=SUM(E2:E10)' }]
}];

Formulas in EJ2 JavaScript Spreadsheet control

Formulas are used for calculating the data in a worksheet. You can refer the cell reference from same sheet or from different sheets.

Usage

You can set formula for a cell in the following ways,

- Using the `formula` property from `cell`, you can set the formula or expression to each cell at initial load.
- Set the formula or expression through data binding.
- You can set formula for a cell by [editing](#).
- Using the [updateCell](#) method, you can set or update the cell formula.

Create User Defined Functions / Custom Functions

The Spreadsheet includes a number of built-in formulas. For your convenience, a list of supported formulas can be found [here](#).

You can define and use an unsupported formula, i.e. a user defined/custom formula, in the spreadsheet by using the [addCustomFunction](#) function. Meanwhile, remember that you should define a user defined/custom formula whose results should only return a single value. If a user-defined/custom formula returns an array, it will be time-consuming to update adjacent cell values.

The following code example shows an unsupported formula in the spreadsheet.

INDEX.TS

```
import {
  Spreadsheet,
  SheetModel,
  ColumnModel,
  RowModel,
} from '@syncfusion/ej2-spreadsheet';
import { data } from './datasource.ts';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
let columns: ColumnModel[] = [
  { width: 150 },
```

```

    { width: 120 },
    { width: 120 },
    { width: 120 },
    { width: 140 },
    { width: 150 },
];
let rows: RowModel[] = [
    {
        height: 40,
        customHeight: true,
        cells: [
            {
                value: 'Monthly Expense',
                colSpan: 5,
                style: {
                    textAlign: 'center',
                    fontWeight: 'bold',
                    verticalAlign: 'middle',
                    fontStyle: 'italic',
                    fontSize: '15pt',
                },
            },
        ],
    },
    { height: 30 },
    {
        index: 11,
        cells: [
            { value: 'Totals', style: { fontStyle: 'italic', fontWeight: 'bold' } },
            { formula: '=SUM(B3:B11)' },
            // Calculating total of each column data through cell binding.
            { formula: '=SUM(C3:C11)' },
            { formula: '=SUM(D3:D11)' },
        ],
    },
    {
        cells: [
            {
                index: 1,
                value: 'Number of Categories',

  {
    return Number(firstCell) / Number(secondCell);
  }
  // Custom function to calculate round down for values.
  function roundDownHandler(value: number, digit: number): number {
    let multiplier: number = Math.pow(10, digit);
    return Math.floor(value * multiplier) / multiplier;
  }
  let spreadsheet: Spreadsheet = new Spreadsheet({
    sheets: sheets,
    created: (): void => {
      spreadsheet.cellFormat(
        { fontWeight: 'bold', textAlign: 'center' },
        'A2:F2'
      );
      spreadsheet.numberFormat('$#,##0', 'B3:D12');
      spreadsheet.numberFormat('0%', 'E3:E12');
      // Adding custom function for calculating the percentage between two
      // cells.
      spreadsheet.addCustomFunction(calculatePercentage, 'PERCENTAGE');
      // Adding custom function for calculating round down for the value.
      spreadsheet.addCustomFunction(roundDownHandler, 'ROUNDDOWN');
      // Calculate percentage using custom added formula in E12 cell.
      spreadsheet.updateCell({ formula: '=PERCENTAGE(C12,D12)' }, 'E12');
      // Calculate round down for average values using custom added formula in
      // F12 cell.
      spreadsheet.updateCell(

```

```

        { formula: '=ROUNDDOWN(F11,1)' },
        'F12'
    );
},
showRibbon: false,
showSheetTabs: false,
});
spreadsheet.appendTo('#spreadsheet');

```

INDEX.HTML

```

js/2.4.1/shim.min.js"></script>
    <script src="es5-datasource.js" type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="es5-datasource.js" type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>
    <!--Element which is going to render-->

```

```

        <div id="container">
            <div id="spreadsheet"></div>
        </div>
</script>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Second, if you want to directly compute any formula or expression, you can use the [computeExpression](#) method. This method will work for both built-in and used-defined/custom formula.

The following code example shows how to use `computeExpression` method in the spreadsheet.

INDEX.TS

```

import {
    Spreadsheet,
    SheetModel,
    ColumnModel,
    RowModel,
} from '@syncfusion/ej2-spreadsheet';
import { data } from './datasource.ts';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
let columns: ColumnModel[] = [
    { width: 150 },
    { width: 120 },
    { width: 120 },
    { width: 120 },
    { width: 140 },
    { width: 150 },
];
let rows: RowModel[] = [
    {
        height: 40,
        customHeight: true,
        cells: [
            {
                value: 'Monthly Expense',
                colSpan: 5,
                style: {
                    textAlign: 'center',
                    fontWeight: 'bold',
                    verticalAlign: 'middle',
                    fontStyle: 'italic',
                    fontSize: '15pt',
                },
            },
        ],
    },
    { height: 30 },
    {

```

```

        index: 11,
        cells: [
            { value: 'Totals', style: { fontStyle: 'italic', fontWeight: 'bold' } },
        ],
        { formula: '=SUM(B3:B11)' },
        // Calculating total of each column data through cell binding.
        { formula: '=SUM(C3:C11)' },
        { formula: '=SUM(D3:D11)' },

```

Formula bar

Formula bar is used to edit or enter cell data in much easier way. By default, the formula bar is enabled in the spreadsheet. Use the [showFormulaBar](#) property to enable or disable the formula bar.

Named Ranges

You can define a meaningful name for a cell range and use it in the formula for calculation. It makes your formula much easier to understand and maintain. You can add named ranges to the Spreadsheet in the following ways,

- Using the [definedNames](#) collection, you can add multiple named ranges at initial load.
- Use the [addDefinedName](#) method to add a named range dynamically.
- You can remove an added named range dynamically using the [removeDefinedName](#) method.
- Select the range of cells, and then enter the name for the selected range in the **Name box**.

The following code example shows the usage of named ranges support.

INDEX.TS

```
import { Spreadsheet, SheetModel, ColumnModel, RowModel, DefineNameModel }
from '@syncfusion/ej2-spreadsheet';
import { data } from './datasource.ts';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);

let columns: ColumnModel[] = [{ width: 150 }, { width: 120 }, { width: 120 }, { width: 120 }, { width: 120 }, { width: 120 }];
// Setting names for `categories`, `monthly spendings` and `annual spendings` ranges.
let definedNames: DefineNameModel[] = [
    { name: 'Categories', refersTo: '=Budget Details!A3:A11' },
    { name: 'MonthlySpendings', refersTo: '=Budget Details!B3:B11' },
    { name: 'AnnualSpendings', refersTo: '=Budget Details!C3:C11' }
];

let rows: RowModel[] = [
    {
        height: 40, customHeight: true, cells: [{ value: 'Monthly Expense', colSpan: 5, style: { textAlign: 'center', fontWeight: 'bold', verticalAlign: 'middle', fontStyle: 'italic', fontSize: '15pt' } }],
        { height: 30 },
        {
            index: 11, cells: [{ value: 'Totals', style: { fontStyle: 'italic', fontWeight: 'bold' } }, { formula: '=SUM(MonthlySpendings)' },
            // Initializing the formulas using defined names.
            { formula: '=SUM(AnnualSpendings)' }, { formula: '=SUM(LastYearSpendings)' }, { formula: '=C12/D12' } ]
        },
        {
            cells: [{ index: 1, value: 'Number of Categories', colSpan: 2, style: { fontWeight: 'bold', textAlign: 'right' } },
            { index: 3, formula: '=COUNTA(Categories)' } ]
        },
        {
            cells: [{ index: 1, value: 'Average Spend', colSpan: 2, style: { fontWeight: 'bold', textAlign: 'right' } },
            { index: 3, formula: '=AVERAGE(MonthlySpendings)', format: '$#,##0' } ]
        },
        {

```

```

        cells: [{ index: 1, value: 'Min Spend', colSpan: 2, style: {
fontWeight: 'bold', textAlign: 'right' } }],
        { index: 3, formula: '=MIN(MonthlySpending)', format: '$#,##0'
    }]
    },
    {
        cells: [{ index: 1, value: 'Max Spend', colSpan: 2, style: {
fontWeight: 'bold', textAlign: 'right' } }],
        { index: 3, formula: '=MAX(MonthlySpending)', format: '$#,##0'
    }]
    }
];
let sheets: SheetModel[] = [{ name: 'Budget Details', ranges: [{ dataSource:
data, startCell: 'A2' }], columns: columns, rows }];
let spreadsheet: Spreadsheet = new Spreadsheet({
    sheets: sheets,
    definedNames: definedNames,
    beforeDataBound: (): void => {
        // Adding name dynamically for `last year spending` and `percentage
change` ranges.
        spreadsheet.addDefinedName({ name: 'LastYearSpending', refersTo:
'=D3:D11' });
        spreadsheet.addDefinedName({ name: 'PercentageChange', refersTo:
'=E3:E11' });
    },
    created: (): void => {
        // Removing the unwanted `PercentageChange` named range
        spreadsheet.removeDefinedName('PercentageChange', '');
        spreadsheet.cellFormat({ fontWeight: 'bold', textAlign: 'center' },
'A2:E2');
        spreadsheet.numberFormat('$#,##0', 'B3:D12');
        spreadsheet.numberFormat('0%', 'E3:E12');
    },
    showRibbon: false, showSheetTabs: false
});
spreadsheet.appendTo('#spreadsheet');

```

Supported Formulas

The following are the list of formulas supported in spreadsheet,

Formula	Description
---------	-------------

-----	-----
-------	-------

ABS	Returns the value of a number without its sign.
-----	---

ADDRESS	Returns a cell reference as text, given specified row and column numbers.
---------	---

AND	Returns TRUE if all the arguments are TRUE, otherwise returns FALSE.
-----	--

AVERAGE	Calculates average for the series of numbers and/or cells excluding text.
---------	---

AVERAGEA	Calculates the average for the cells evaluating TRUE as 1, text and FALSE as 0.
----------	---

AVERAGEIF	Clears content of the active cell and enables edit mode.
-----------	--

| AVERAGEIFS | Calculates average for the cells based on specified conditions. |

| CEILING | Rounds a number up to the nearest multiple of a given factor. |

| CHOOSE | Returns a value from list of values, based on index number. |

| CHAR | Returns the character from the specified number. |

| CODE | Returns the numeric code for the first character in a given string. |

| CONCAT | Concatenates a list or a range of text strings. |

| CONCATENATE | Combines two or more strings together. |

| COUNT | Counts the cells that contain numeric values in a range. |

| COUNTA | Counts the cells that contains values in a range. |

| COUNTBLANK | Returns the number of empty cells in a specified range of cells. |

| COUNTIF | Counts the cells based on specified condition. |

| COUNTIFS | Counts the cells based on specified conditions. |

| DATE | Returns the date based on given year, month, and day. |

| DATEVALUE | Converts a date string into date value. |

| DAY | Returns the day from the given date. |

| DAYS | Returns the number of days between two dates. |

| DECIMAL | Converts a text representation of a number in a given base into a decimal number. |

| DEGREES | Converts radians to degrees. |

| DOLLAR | Converts the number to currency formatted text. |

| EDATE | Returns a date with given number of months before or after the specified date. |

| EOMONTH | Returns the last day of the month that is a specified number of months before or after an initially supplied start date. |

| EVEN | Rounds a positive number up and negative number down to the nearest even integer. |

| EXACT | Checks whether a two text strings are exactly same and returns TRUE or FALSE. |

| EXP | Returns e raised to the power of the given number. |

| FACT | Returns the factorial of a number. |

| FIND | Returns the position of a string within another string, which is case sensitive. |

| FLOOR | Rounds a number down to the nearest multiple of a given factor. |

| HLOOKUP | Looks for a value in the top row of the array of values and then returns a value in the same column from a row in the array that you specify. |

| HOUR | Returns the number of hours in a specified time string. |

| IF | Returns value based on the given expression. |

| IFERROR | Returns value if no error found else it will return specified value. |

| IFS | Returns value based on the given multiple expressions. |

| INDEX | Returns a value of the cell in a given range based on row and column number. |

| INT | Rounds a number down to the nearest integer. |

| INTERCEPT | Calculates the point of the Y-intercept line via linear regression. |

| ISNUMBER | Returns true when the value parses as a numeric value. |

| LARGE | Returns the **k-th** largest value in a given array. |

| LEN | Returns a number of characters in a given string. |

| LN | Returns the natural logarithm of a number. |

| LOG | Returns the logarithm of a number to the base that you specify. |

| LOOKUP | Looks for a value in a one-row or one-column range, then returns a value from the same position in a second one-row or one-column range. |

| MATCH | Returns the relative position of a specified value in given range. |

| MAX | Returns the largest number of the given arguments. |

| MEDIAN | Returns the median of the given set of numbers. |

| MINUTE | Returns the number of minutes in a specified time string. |

| MIN | Returns the smallest number of the given arguments. |

| MOD | Returns a remainder after a number is divided by divisor. |

| MONTH | Returns the number of months in a specified date string. |

| NOT | Returns the inverse of a given logical expression. |

| NOW | Returns the current date and time. |

| ODD | Rounds a positive number up and negative number down to the nearest odd integer. |

| OR | Returns TRUE if any of the arguments are TRUE, otherwise returns FALSE. |

| PI | Returns the value of pi. |

| POWER | Returns the result of a number raised to power. |

| PRODUCT | Multiplies a series of numbers and/or cells. |

| RADIANS | Converts degrees into radians. |

| RAND | Returns a random number between 0 and 1. |

| RANDBETWEEN | Returns a random integer based on specified values. |

| ROUND | Rounds a number to the specified number of digits. |

| ROUNDDOWN | Rounds a number down, toward zero. |

| ROUNDUP | Rounds a number up, away from zero. |

| RSQ | Returns the square of the Pearson product moment correlation coefficient based on data points in *knowny's and knownx's*. |

| SECOND | Returns the number of seconds in a specified time string. |

| SMALL | Returns the **k-th** smallest value in a given array. |

- | SLOPE | Returns the slope of the line from linear regression of the data points. |
- | SORT | Sorts the contents of a column, range, or array in ascending or descending order. |
- | SQRT | Returns the square root of a positive number. |
- | SUBTOTAL | Returns subtotal for a range using the given function number. |
- | SUM | Adds a series of numbers and/or cells. |
- | SUMIF | Adds the cells based on specified condition. |
- | SUMIFS | Adds the cells based on specified conditions. |
- | SUMPRODUCT | Returns the sum of the products of the corresponding array in given arrays. |
- | T | Checks whether a value is text or not and returns the text. |
- | TEXT | Converts the supplied value into text by using the user-specified format. |
- | TIME | Converts hours, minutes, seconds to the time formatted text. |
- | TODAY | Returns the current date. |
- | TRUNC | Truncates a supplied number to a specified number of decimal places. |
- | UNIQUE | Returns a unique values from a range or array. |
- | VLOOKUP | Looks for a specific value in the first column of a lookup range and returns a corresponding value from a different column within the same row. |

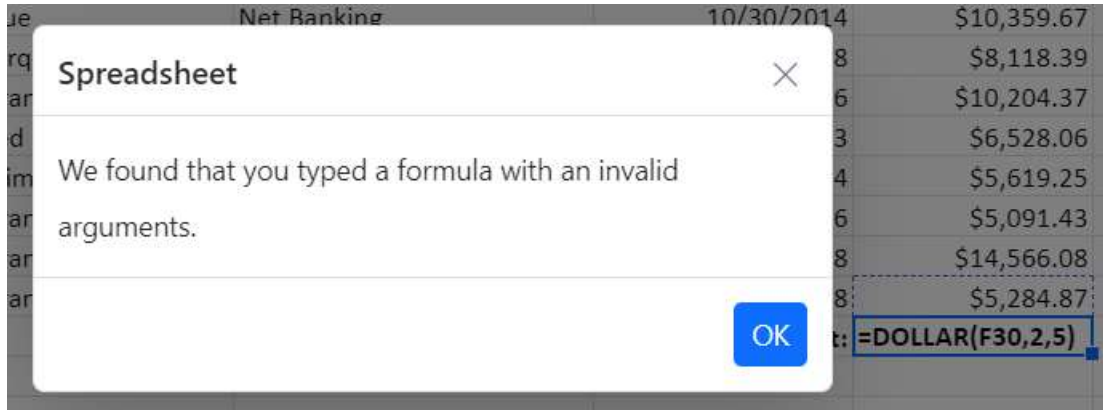

Formula Error Dialog

If you enter an invalid formula in a cell, an error dialog with an error message will appear. For instance, a formula with the incorrect number of arguments, a formula without parenthesis, etc.

Error Message	Reason
----- -----	
We found that you typed a formula with an invalid arguments	Occurs when passing an argument even though it wasn't needed.
We found that you typed a formula with an empty expression	Occurs when passing an empty expression in the argument.
We found that you typed a formula with one or more missing opening or closing parenthesis	Occurs when an open parenthesis or a close parenthesis is missing.
We found that you typed a formula which is improper	Occurs when passing a single reference but a range was needed.
We found that you typed a formula with a wrong number of arguments	Occurs when the required arguments were not passed.
We found that you typed a formula which requires 3 arguments	Occurs when the required 3 arguments were not passed.
We found that you typed a formula with a mismatched quotes	Occurs when passing an argument with mismatched quotes.

| We found that you typed a formula with a circular reference | Occurs when passing a formula with circular cell reference. |

| We found that you typed a formula which is invalid | Except in the cases mentioned above, all other errors will fall into this broad category. |

Formatting in EJ2 JavaScript Spreadsheet control

Formatting options make your data easier to view and understand. The different types of formatting options in the Spreadsheet are,

- Number Formatting
- Text Formatting
- Cell Formatting

Number Formatting

Number formatting provides a type for your data in the Spreadsheet. Use the [allowNumberFormatting](#) property to enable or disable the number formatting option in the Spreadsheet. The different types of number formatting supported in Spreadsheet are,

| Types | Format |

|-----|-----|

| General(default) | NA |

| Number | 0.00 |

| Currency | \$#,##0.00 |

| Accounting | (\$ #,##0.00);(\$ (#,##0.00);(\$* "-"??);(@_) |

| ShortDate | mm-dd-yyyy |

LongDate	dddd, mmmm dd, yyyy
Time	h:mm:ss AM/PM
Percentage	0.00%
Fraction	# ?/?
Scientific	0.00E+00
Text	@

Number formatting can be applied in following ways,

- Using the `format` property in `cell`, you can set the desired format to each cell at initial load.
- Using the `numberFormat` method, you can set the number format to a cell or range of cells.
- Selecting the number format option from ribbon toolbar.

Custom Number Formatting

Spreadsheet supports custom number formats to display your data as numbers, dates, times, percentages, and currency values. If the pre-defined number formats do not meet your needs, you can set your own custom formats using custom number formats dialog or `numberFormat` method.

The different types of custom number formatting supported in Spreadsheet are,

Types	Format
General(default)	NA
Number	0
Number	0.00
Number	#,##0
Number	#,##0.00
Number	#,##0_);(##,##0)
Number	`##,##0_);Red`
Number	#,##0.00_);(##,##0.00)
Number	`##,##0.00_);Red`
Currency	\$##,##0_);(\$##,##0)
Currency	`\$##,##0_);Red`
Currency	\$##,##0.00_);(\$##,##0.00)
Currency	`\$##,##0.00_);Red`
Percentage	0%
Percentage	0.00%

Scientific	0.00E+00
Scientific	##0.0E+0
Fraction	# ?/?
Fraction	# ??/??
ShortDate	dd-mm-yy
Custom	dd-mmm-yy
Custom	dd-mmm
Custom	mmm-yy
Custom	h:mm AM/PM
Custom	h:mm:ss AM/PM
Custom	h:mm
Custom	h:mm:ss
Custom	dd-mm-yy h:mm
Custom	mm:ss
Custom	mm:ss.0
Text	@
Custom	[h]:mm:ss
Accounting	(\$ #,##0);(\$ (#,##0);(\$* "-");(@_)
Accounting	(#,##0);((#,##0);(* "-");(@_)
Accounting	(\$ #,##0.00);(\$ (#,##0.00);(\$* "-"?);(@_)
Accounting	(#,##0.00);((#,##0.00);(* "-"?);(@_)

Custom Number formatting can be applied in following ways,

- Using the [numberFormat](#) method, you can set your own custom number format to a cell or range of cells.
- Selecting the custom number format option from custom number formats dialog or type your own format in dialog input and then click apply button. It will apply the custom format for selected cells.

The following code example shows the number formatting in cell data.

INDEX.TS

```
import { Spreadsheet, SheetModel, ColumnModel, RowModel, getFormatFromType,
NumberFormatType } from '@syncfusion/ej2-spreadsheet';
import { data } from './datasource.ts';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
```

```

let columns: ColumnModel[] = [{ width: 140 }, { width: 140 }, { width: 160 }, { width: 160 }, { width: 160 }, { width: 120 }];
let rows: RowModel[] = [{
    height: 35, customHeight: true,
    cells: [{ value: 'Sales Team Summary', colSpan: 6,
        style: { verticalAlign: 'middle', textAlign: 'center', fontSize: '16pt',
fontWeight: 'bold',
            border: '1px solid #e0e0e0', backgroundColor: '#EEEEEE', color: '#279377' } }],
},
{
    index: 10, cells: [{ index: 1, value: 'Total:', style: { fontWeight: 'bold', fontStyle: 'italic' } },
        // If the format string is not known, you can get the format string
        // using `getFormatFromType` function like below
        { formula: '=SUM(C3:C10)', format:
getFormatFromType(<NumberFormatType>'Accounting') },
        // Applied number format to C11, D11 & E11 through cell binding
        { formula: '=SUM(D3:D10)', format: '_($* #,##0.00_);_($* (#,##0.00);_($*
"-"??_);_(@_) ' },
        { formula: '=SUM(E3:E10)', format: '_($* #,##0.00_);_($* (#,##0.00);_($*
"-"??_);_(@_) ' } ]
    }];
let sheets: SheetModel[] = [{
    ranges: [{ dataSource: data, startCell: 'A2' }],
    columns: columns, rows: rows, showGridLines: false, selectedRange: 'U15'
}];
let spreadsheet: Spreadsheet = new Spreadsheet({
    sheets: sheets,
    // Applied number formatting to the range of cells using 'numberFormat'
    // method once the component is loaded
    created: (): void => {
        spreadsheet.cellFormat({ fontWeight: 'bold', fontSize: '12pt',
            backgroundColor: '#279377', textAlign: 'center', color: '#ffffff',
            borderBottom: '1px solid #e0e0e0' }, 'A2:F2');
        spreadsheet.cellFormat({ borderTop: '1px solid #e0e0e0',
            backgroundColor: '#EEEEEE' }, 'A11:F11');
        spreadsheet.setBorder({ border: '1px solid #e0e0e0' }, 'A2:F11',
            'Outer');
        // Applied Accounting format to the cells from C3 to E10 range.
        spreadsheet.numberFormat('_($* #,##0.00_);_($* (#,##0.00);_($* "-"
"??_);_(@_) ', 'C3:E10');
        // Applied Percentage format to the cells from C3 to E11 range.
        spreadsheet.numberFormat('0%', 'F3:F10');
        // applied the custom number format for cell form D3 to D10 range
        spreadsheet.numberFormat('[Red] [<=2000] $#,##0.00; [Blue] [>2000] $#,##0.00',
            'D3:D10');
        // applied the custom number format for cell from F3 to F10 range
        spreadsheet.numberFormat('#,##0.00_); [Red] (#,##0.00) ', 'F3:F10');
    },
    // Removed the unwanted support for this samples
    showRibbon: false, showFormulaBar: false, showSheetTabs: false,
    allowInsert: false, allowDelete: false
});
spreadsheet.appendTo('#spreadsheet');

Text and cell formatting

Text and cell formatting enhances the look and feel of your cell. It helps to highlight a particular cell or range of cells from a whole workbook. You can apply formats like font size, font family, font color, text alignment, border etc. to a cell or range of cells. Use the [allowCellFormatting](#) property to enable or disable the text and cell formatting option in Spreadsheet. You can set the formats in following ways,

- Using the `style` property, you can set formats to each cell at initial load.
- Using the [cellFormat](#) method, you can set formats to a cell or range of cells.
- You can also apply by clicking the desired format option from the ribbon toolbar.

Fonts

Various font formats supported in the spreadsheet are font-family, font-size, bold, italic, strike-through, underline and font color.

Text Alignment

You can align text in a cell either vertically or horizontally using the `textAlign` and `verticalAlign` property.

Indents

To enhance the appearance of text in a cell, you can change the indentation of a cell content using `textIndent` property.

Fill color

To highlight cell or range of cells from whole workbook you can apply background color for a cell using `backgroundColor` property.

Borders

You can add borders around a cell or range of cells to define a section of worksheet or a table. The different types of border options available in the spreadsheet are,

| Types | Actions |

|-----|-----|

| Top Border | Specifies the top border of a cell or range of cells.|

| Left Border | Specifies the left border of a cell or range of cells.|

| Right Border | Specifies the right border of a cell or range of cells.|

| Bottom Border | Specifies the bottom border of a cell or range of cells.|

| No Border | Used to clear the border from a cell or range of cells.|

| All Border | Specifies all border of a cell or range of cells.|

| Horizontal Border | Specifies the top and bottom border of a cell or range of cells.|

| Vertical Border | Specifies the left and right border of a cell or range of cells.|

| Outside Border | Specifies the outside border of a range of cells.|

| Inside Border | Specifies the inside border of a range of cells.|

You can also change the color, size, and style of the border. The size and style supported in the spreadsheet are,

| Types | Actions |

|-----|-----|

| Thin | Specifies the **1px** border size (default).|

| Medium | Specifies the **2px** border size.|

| Thick | Specifies the **3px** border size.|

| Solid | Used to create the **solid** border (default).|

| Dashed | Used to create the **dashed** border.|

| Dotted | Used to create the **dotted** border.|

| Double | Used to create the **double** border.|

Borders can be applied in the following ways,

- Using the **border**, **borderLeft**, **borderRight**, **borderBottom** properties, you can set the desired border to each cell at initial load.
- Using the **setBorder** method, you can set various border options to a cell or range of cells.
- Selecting the border options from ribbon toolbar.

The following code example shows the style formatting in text and cells of the spreadsheet.

INDEX.TS

```
import { Spreadsheet, SheetModel, ColumnModel, RowModel, CellStyleModel }
from '@syncfusion/ej2-spreadsheet';
import { data } from './datasource.ts';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
let columns: ColumnModel[] = [{ width: 100 }, { width: 200 }, { width: 110 }, { width: 140 }, { width: 90 }];
let rows: RowModel[] = [{
    height: 40, customHeight: true,
    cells: [{ value: 'Order Summary', colSpan: 5,
        // Applied styles to 'A1' cell through cell property binding
        style: { fontFamily: 'Axettac Demo', verticalAlign: 'middle',
        textAlign: 'center', fontSize: '18pt', fontWeight: 'bold', color: '#279377',
        border: '1px solid #e0e0e0' }
    } ] },
    {
        // Applied styles to 'C2' cell through cell property binding
        height: 30, cells: [{ index: 2, style: { textAlign: 'right' } } ]
    },
    { height: 30 }, { height: 30 }, { height: 30 }, { height: 30 }, {
height: 30 },
    { height: 30 }, { height: 30 }, { height: 30 }, { height: 30 }, {
height: 30 }];

```

Limitations of Formatting

The following features are not supported in Formatting:

- Insert row/column between the formatting applied cells.
- Formatting support for row/column.

Conditional Formatting

Conditional formatting helps you to format a cell or range of cells based on the conditions applied. You can enable or disable conditional formats by using the [allowConditionalFormat](#) property.

The default value for the `allowConditionalFormat` property is `true`.

Apply Conditional Formatting

You can apply conditional formatting by using one of the following ways,

- Select the conditional formatting icon in the Ribbon toolbar under the Home Tab.
- Using the [conditionalFormat\(\)](#) method to define the condition.
- Using the `conditionalFormats` in sheets model.

Conditional formatting has the following types in the spreadsheet,

Highlight cells rules

Highlight cells rules option in the conditional formatting enables you to highlight cells with a preset color depending on the cell's value.

The following options can be given for the highlight cells rules as type,

'GreaterThan', 'LessThan', 'Between', 'EqualTo', 'ContainsText', 'DateOccur', 'Duplicate', 'Unique'.

The following preset colors can be used for formatting styles,

`"RedFT"` - Light Red Fill with Dark Red Text,

`"YellowFT"` - Yellow Fill with Dark Yellow Text,

`"GreenFT"` - Green Fill with Dark Green Text,

`"RedF"` - Red Fill,

`"RedT"` - Red Text.

Top bottom rules

Top bottom rules option in the conditional formatting allows you to apply formatting to the cells that satisfy a statistical condition with other cells in the range.

The following options can be given for the top bottom rules as type,

'Top10Items', 'Bottom10Items', 'Top10Percentage', 'Bottom10Percentage', 'BelowAverage', 'AboveAverage'.

Data Bars

You can apply data bars to represent the data graphically inside a cell. The longest bar represents the highest value and the shorter bars represent the smaller values.

The following options can be given for the data bars as type,

'BlueDataBar', 'GreenDataBar', 'RedDataBar', 'OrangeDataBar', 'LightBlueDataBar', 'PurpleDataBar'.

Color Scales

Using color scales, you can format your cells with two or three colors, where different color shades represent the different cell values. In the Green-Yellow-Red(GYR) Color Scale, the cell that holds the minimum value is colored as red. The cell that holds the median is colored as yellow, and the cell that holds the maximum value is colored as green. All other cells are colored proportionally.

The following options can be given for the color scales as type,

'GYRColorScale', 'RYGColorScale', 'GWRCColorScale', 'RWGColorScale', 'BWRColorScale', 'RWBColorScale', 'WRCColorScale', 'RWColorScale', 'GWColorScale', 'WGColorScale', 'GYColorScale', 'YGColorScale'.

Icon Sets

Icon sets will help you to visually represent your data with icons. Every icon represents a range of values. In the Three Arrows(colored) icon, the green arrow icon represents the values greater than 67%, the yellow arrow icon represents the values between 33% to 67%, and the red arrow icon represents the values less than 33%.

The following options can be given for the icon sets as type,

'ThreeArrows', 'ThreeArrowsGray', 'FourArrowsGray', 'FourArrows', 'FiveArrowsGray', 'FiveArrows', 'ThreeTrafficLights1', 'ThreeTrafficLights2', 'ThreeSigns', 'FourTrafficLights', 'FourRedToBlack', 'ThreeSymbols', 'ThreeSymbols2', 'ThreeFlags', 'FourRating', 'FiveQuarters', 'FiveRating', 'ThreeTriangles', 'ThreeStars', 'FiveBoxes'.

Custom Format

Using the custom format for conditional formatting you can set cell styles like color, background color, font style, font weight, and underline.

In the MAY and JUN columns, we have applied conditional formatting custom format.

In the Conditional format, custom format supported for Highlight cell rules and Top bottom rules.

Clear Rules

You can clear the defined rules by using one of the following ways,

- Using the “Clear Rules” option in the Conditional Formatting button of HOME Tab in the ribbon to clear the rule from selected cells.
- Using the [clearConditionalFormat\(\)](#) method to clear the defined rules.

INDEX.TS

```
import { Spreadsheet, SheetModel, ColumnModel, RowModel } from
 '@syncfusion/ej2-spreadsheet';
import { conditionalFormatData } from './datasource.ts';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);

Freeze pane in EJ2 JavaScript Spreadsheet control

Freeze Panes helps you to keep particular rows or columns visible when scrolling the sheet content in the spreadsheet. You can specify the number of frozen rows and columns using the [frozenRows](#) and [frozenColumns](#) properties inside the [Sheet](#) property.

Apply freezepanes on UI

User Interface:

In the active spreadsheet, click the cell where you want to create freeze panes. Freeze panes can be done in any of the following ways:

- Select the View tab in the Ribbon toolbar and choose the **Freeze Panes** item.
- Use the [freezePanes](#) method programmatically.

FrozenRows

It allows you to keep a certain number of rows visible while scrolling vertically through the rest of the worksheet.

User Interface:

In the active spreadsheet, select the cell where you want to create frozen rows. Frozen rows can be done in any one of the following ways:

- Select the View tab in the Ribbon toolbar and choose the **Freeze Rows** item.
- You can specify the number of frozen rows using the **frozenRows** property inside the **Sheet** property.

FrozenColumns

It allows you to keep a certain number of columns visible while scrolling horizontally through the rest of the worksheet.

User Interface:

In the active spreadsheet, select the cell where you want to create frozen columns. Frozen columns can be done in any one of the following ways:

- Select the View tab in the Ribbon toolbar and choose the **Freeze Columns** item.
- You can specify the number of frozen columns using the **frozenColumns** property inside the **Sheet** property.

In this demo, the frozenColumns is set as '2', and the frozenRows is set as '2'. Hence, the two columns on the left and the top two rows are frozen.

INDEX.TS

```
import { Spreadsheet, SheetModel } from '@syncfusion/ej2-spreadsheet';
import { tradeData } from './datasource.ts';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
let columns: ColumnModel[] = [{ width: 180 }, { width: 180 }, { width: 180 },
    { width: 180 }, { width: 180 }, { width: 180 },
    { width: 180 }, { width: 180 }, { width: 180 }, { width: 180 }, { width:
180 }, { width: 180}]
let spreadsheet: Spreadsheet = new Spreadsheet({
    sheets: [{ ranges: [{ dataSource: tradeData }], columns: columns
        // Specifies the number of frozen rows
        frozenRows: 2,
        // Specifies the number of frozen columns
        frozenColumns: 2
    }],
});
```

```
spreadsheet.appendTo('#spreadsheet');
```

```

Limitations

Here, we have listed out the limitations with Freeze Panes feature.

- Merging the cells between freeze and unfreeze area.
- If images and charts are added inside the freeze area cells, their portion in the unfreeze area will not move when scrolling.

Context menu in EJ2 JavaScript Spreadsheet control

Context Menu is used to improve user interaction with Spreadsheet using the popup menu. This will open when right-clicking on Cell/Column Header/Row Header/ Pager in the Spreadsheet. You can use [enableContextMenu](#) property to enable/disable context menu.

The default value for the `enableContextMenu` property is `true`.

Context Menu Items in Row Cell

Please find the table below for default context menu items and their actions.

Context Menu items	Action
Cut	Cut the selected cells data to the clipboard, you can select a cell where you want to move the data.
Copy	Copy the selected cells data to the clipboard, so that you can paste it to somewhere else.
Paste	Paste the data from clipboard to spreadsheet.
Paste Special	Values - Paste the data values from clipboard to spreadsheet. Formats - Paste the data formats from clipboard to spreadsheet.
Filter	Perform filtering to the selected cells based on an active cell's value.
Sort	Perform sorting to the selected range of cells by ascending or descending.
Hyperlink	Create a link in the spreadsheet to navigate to web links or cell reference within the sheet or other sheets in the Spreadsheet.

Context Menu Items in Row Header / Column Header

Please find the table below for default context menu items and their actions.

Context Menu items	Action
-----	-----

| [Cut](#) | Cut the selected row/column header data to the clipboard, you can select a cell where you want to move the data. |

| [Copy](#) | Copy the selected row/column header data to the clipboard, so that you can paste it to somewhere else. |

| [Paste](#) | Paste the data from clipboard to spreadsheet. |

| [Paste Special](#) | **Values** - Paste the data values from clipboard to spreadsheet. **Formats** - Paste the data formats from clipboard to spreadsheet. |

| [Insert Columns](#) | Insert new rows or columns into the worksheet. |

| [Delete Columns](#) | Delete existing rows or columns from the worksheet. |

| [Hide Columns](#) | Hide the rows and columns. |

| [UnHide Columns](#) | Show the hidden rows and columns. |

Context Menu Items in Pager

Please find the table below for default context menu items and their actions.

Context Menu items	Action
----- -----	
Insert	Insert a new worksheet in front of an existing worksheet in the spreadsheet.
Delete	Delete the selected worksheet from the spreadsheet.
Rename	Rename the selected worksheet.
Protect Sheet	Prevent unwanted changes from others by limiting their ability to edit.
Hide	Hide the selected worksheet.

Context Menu Customization

You can perform the following context menu customization options in the spreadsheet

- Add Context Menu Items
- Remove Context Menu Items
- Enable/Disable Context Menu Items

Add Context Menu Items

You can add the custom items in context menu using the [addContextMenuItems](#) in **contextmenuBeforeOpen** event

In this demo, Custom Item is added after the Paste item in the context menu.

INDEX.TS

```
import { enableRipple } from '@syncfusion/ej2-base';
import { Spreadsheet } from '@syncfusion/ej2-spreadsheet';
//Initialize Spreadsheet component
let spreadsheet: Spreadsheet = new Spreadsheet({
  contextMenuBeforeOpen: (args): void => {
    if (args.element.id === spreadsheet.element.id + '_contextmenu')
    {
      // To add context menu items.
    }
  }
});
```

```

        spreadsheet.addContextMenuItems([ { text: 'Custom Item' } ],
        'Paste Special', false);
        //To pass the items, Item before / after that the element to be
        inserted, Set false if the items need to be inserted before the text.
    }
}
});
//Render initialized Spreadsheet component
spreadsheet.appendTo('#spreadsheet');

Remove Context Menu Items

You can remove the items in context menu using the [removeContextMenuItems](#) in `contextmenuBeforeOpen` event

In this demo, Insert Column item has been removed from the row/column header context menu.

INDEX.TS

```

import { enableRipple } from '@syncfusion/ej2-base';
import { Spreadsheet } from '@syncfusion/ej2-spreadsheet';
//Initialize Spreadsheet component
let spreadsheet: Spreadsheet = new Spreadsheet({
    // To remove existing context menu items.
    contextMenuBeforeOpen: (): void => {
        spreadsheet.removeContextMenuItems(["Insert Column"], false);
    }
});
//Items that needs to be removed, Set `true` if the given `text` is a unique id.
//Render initialized Spreadsheet component
spreadsheet.appendTo('#spreadsheet');

```

Template in EJ2 JavaScript Spreadsheet control

Cell Template is used for adding HTML elements into Spreadsheet. You can add the cell template in spreadsheet by using the `template` property and specify the address using the `address` property inside the `ranges` property. You can customize the HTML elements similar to Syncfusion components (TextBox, DropDownList, RadioButton, MultiSelect, DatePicker etc) by using the `beforeCellRender` event. In this demo, Cell template is applied to C2:C9 and instantiated with HTML input components like TextBox, RadioButton, TextArea. You need to bind the events to perform any operations through HTML elements or Syncfusion components. Here, we have added `change` event in to the MultiSelect control, and we have updated the selected data into the spreadsheet cell through that change event.

The following code example describes the above behavior.

INDEX.TS

```
import { TextBox } from '@syncfusion/ej2-inputs';
import { RadioButton } from '@syncfusion/ej2-buttons';
import { DatePicker } from '@syncfusion/ej2-calendars';
import { DropDownList, MultiSelect } from '@syncfusion/ej2-dropdowns';
import { Spreadsheet, CellRenderEventArgs, BeforeSelectEventArgs,
getRangeIndexes, ChangeEventArgs } from '@syncfusion/ej2-spreadsheet';
/**
 * Cell template
 */
//Initialize Spreadsheet component
let spreadsheet: Spreadsheet = new Spreadsheet({
  showRibbon: false,
  showFormulaBar: false,
  allowOpen: false,
  allowSave: false,
  allowEditing: false,
  selectionSettings: { mode: 'None' },
  scrollSettings: {
    isFinite: true
  },
  sheets: [{
    rowCount: 40,
    showGridLines: false,
    name: 'Registration Form',
    rows: [{
      height: 55,
      cells: [{
        index: 1,
        value: 'Interview Registration Form',
        style: {
          fontSize: '12pt',
          fontWeight: 'bold',
          textAlign: 'center',
          verticalAlign: 'middle',
          textDecoration: 'underline'
        }
      }]
    }]
  }]
});
```

```

    }
  }, {
    height: 45,
    cells: [{
      index: 1,
      value: 'Name:'
    }],
  }, {
    height: 45,
    cells: [{
      index: 1,
      value: 'Date of Birth:'
    }],
  }, {

Illustrations in EJ2 JavaScript Spreadsheet control

Illustrations help you to insert an image, shapes, and graphic objects in the Essential JS 2 spreadsheet.

Image

Adding images to a spreadsheet can enhance the visual appeal and help to convey information more clearly.

The default value for the `allowImage` property is `true`.

Insert Image

You can insert the image by using one of the following ways,

- Selecting the Insert tab in the Ribbon toolbar, and then choose the Image tab.
- Use the `insertImage()` method programmatically.

The available parameters in `insertImage()` method are,

Parameter	Type	Description
-----------	------	-------------

Parameter	Type	Description
images	ImageModel	Specifies the options to insert image in spreadsheet.
range(optional)	string	Specifies the range in spreadsheet.

The available arguments in `ImageModel` are:

- `src`: Specifies the image source.
- `id`: Specifies the image element id.
- `height`: Specifies the height of the image.
- `width`: Specifies the width of the image.
- `top`: Specifies the top position of the image.
- `left`: Specifies the left side of the image.

In a spreadsheet, you can add many types of image files, including IMAGE, JPG, PNG, GIF, and JPEG files.

Delete Image

- If you want to delete the image, just select the image, and then press the Delete key.
- Use the `deleteImage()` method programmatically.

The available parameters in `deleteImage()` method are,

Parameter	Type	Description
id	string	Specifies the id of the image element to be deleted.
range(optional)	string	Specifies the range in spreadsheet.

Image Customization

Image feature allows you to view and insert an image in a spreadsheet, and you can change the height and width of the image by resizing and moving it to another position.

Height and Width

- You can change the height and width of the image by resizing.
- Use the `height` and `width` property in the `insertImage()` method programmatically.

Top and Left

- You can change the position of the image by drag and drop.
- Use the `top` and `left` property in the `insertImage()` method programmatically.

Limitations of Image

The following features have some limitations in Image:

- Corner resizing option in the image element.
- Copy and paste the external image.

Chart

A chart is a graphical representation of data, that organizes and represents a set of numerical or qualitative data. It mostly displays the selected range of data in terms of x-axis and y-axis. You can use the [allowChart](#) property to enable or disable the chart functionality.

The default value for the [allowChart](#) property is `true`.

Types of chart

The following types of charts are available in the Spreadsheet.

- * Column Chart
- * Bar Chart
- * Area Chart
- * Line Chart
- * Pie Chart
- * Scatter Chart

Insert Chart

You can insert the chart by using one of the following ways,

- Select the chart icon in the Ribbon toolbar under the Insert Tab.
- Use the [insertChart\(\)](#) method programmatically.

The available parameter in the [insertChart\(\)](#) method is,

Parameter	Type	Description
chart	<code>ChartModel</code>	Specifies the options to insert a chart in the spreadsheet.

The available arguments in the `ChartModel` are:

- `type`: Specifies the type of chart.
- `theme`: Specifies the theme of a chart.
- `isSeriesInRows`: Specifies to switch the row or a column.
- `range`: Specifies the selected range or specified range.

- **id:** Specifies the chart element id.
- **markerSettings:** Specifies the marker settings. The marker is used to provide information about the data points in the series and is currently only applicable to the line chart.

Delete Chart

- If you want to delete the chart, just select the chart, and then press the Delete key.
- Use the [deleteChart\(\)](#) method programmatically.

The available parameter in the [deleteChart\(\)](#) method is,

Parameter	Type	Description
id	string	Specifies the id of the chart element to be deleted.

Chart Customization

Chart feature allows you to view and insert a chart in a spreadsheet, and you can change the height and width of the chart by resizing and moving it to another position.

- You can change the height and width of the chart by resizing.
- You can change the position of the chart by drag and drop.

Rows and columns in EJ2 JavaScript Spreadsheet control

Spreadsheet is a tabular format consisting of rows and columns. The intersection point of rows and columns are called as cells. The list of operations that you can perform in rows and columns are,

- Insert
- Delete
- Show and Hide

Insert

You can insert rows or columns anywhere in a spreadsheet. Use the [allowInsert](#) property to enable or disable the insert option in Spreadsheet.

Row

The rows can be inserted in the following ways,

- Using [insertRow](#) method, you can insert the rows once the component is loaded.
- Using context menu, insert the empty rows in the desired position.

The following code example shows the options for inserting rows in the spreadsheet.

INDEX.TS

```
import { Spreadsheet, SheetModel, ColumnModel, RowModel } from
 '@syncfusion/ej2-spreadsheet';
import { data } from './datasource.ts';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
let columns: ColumnModel[] = [
  { width: 20 }, { width: 90 }, { width: 220 }, { width: 90 }, { width:
  140 }, { width: 90 }, { width: 100 }, { width: 100 }
];
let sheets: SheetModel[] = [{ ranges: [{ dataSource: data, startCell: 'B1'
  }], columns: columns }];
// Rows model that is going to insert dynamically
let rowsModel: RowModel[] = [{
  index: 9, // Need to specify the index for the first row collection, the
  specified rows will be inserted in this index.
  cells: [{ value: '' }, { value: '8' }, { value: 'Northwoods Cranberry
  Sauce' }, { value: '3' }, { value: '12 - 12 oz jars' },
    { value: '40.00' }, { value: '6' }, { value: 'false' } ]
},
{
  cells: [{ value: '' }, { value: '9' }, { value: 'Mishi Kobe Niku' }, {
  value: '4' }, { value: '18 - 500 g pkgs.' }, { value: '97.00' }, { value:
  '29' }, { value: 'true' } ]
}];
let spreadsheet: Spreadsheet = new Spreadsheet({
  sheets: sheets,
  created: (): void => {
    // Applies style formatting before inserting the rows
    spreadsheet.cellFormat({ fontWeight: 'bold', textAlign: 'center' },
    'B1:H1');
    // inserting a empty row at 0th index
    spreadsheet.insertRow();
    // inserting 2 rows at the 9th index with data
    spreadsheet.insertRow(rowsModel);
    // Applies style formatting after the rows are inserted
    spreadsheet.cellFormat({ textAlign: 'center' }, 'B3:B12');
    spreadsheet.cellFormat({ textAlign: 'center' }, 'D3:D12');
    spreadsheet.cellFormat({ textAlign: 'center' }, 'F3:H12');
  },
  // Removed the unwanted support for this samples
  showRibbon: false, showFormulaBar: false, showSheetTabs: false
});
```

```
spreadsheet.appendTo('#spreadsheet');
```

Column

The columns can be inserted in the following ways,

- Using [insertColumn](#) method, you can insert the columns once the component is loaded.
- Using context menu, insert the empty columns in the desired position.

The following code example shows the options for inserting columns in the spreadsheet.

INDEX.TS

```

import { Spreadsheet, SheetModel, ColumnModel, CellModel, getCellAddress }
from '@syncfusion/ej2-spreadsheet';
import { data } from './datasource.ts';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
let columns: ColumnModel[] = [{ width: 90 }, { width: 220 }, { width: 90 },
{ width: 140 }, { width: 100 }, { width: 100 }];
let sheets: SheetModel[] = [{ ranges: [{ dataSource: data, startCell: 'A2'
}], columns: columns }];
// Cells model that you are going to update in the inserted 5th column
dynamically
let cellsModel: CellModel[] = [{ value: 'Unit Price', style: { fontWeight:
'bold', textAlign: 'center' } }, { value: '18.00' },
{ value: '19.00' }, { value: '10.00' }, { value: '22.00' }, { value:
'21.35' }, { value: '25.00' }, { value: '30.00' },
{ value: '21.00' }, { value: '40.00' }, { value: '97.00' }];
let spreadsheet: Spreadsheet = new Spreadsheet({
  sheets: sheets,
  created: (): void => {
    // Applies style formatting before inserting the column
    spreadsheet.cellFormat({ fontWeight: 'bold', textAlign: 'center' },
'A2:G2');
    // inserting a empty column at 0th index
    spreadsheet.insertColumn();
    // inserting 1 column at the 5th index with column model
    spreadsheet.insertColumn([{ index: 5, width: 90 }]);
    let rowIndex: number = 1;
    // Updating the 5th column data
    cellsModel.forEach((cell: CellModel): void => {
      spreadsheet.updateCell(cell, getCellAddress(rowIndex, 5));
      rowIndex++;
    });
    // Applies style formatting after the columns are inserted
    spreadsheet.cellFormat({ textAlign: 'center' }, 'B3:B12');
    spreadsheet.cellFormat({ textAlign: 'center' }, 'D3:D12');
    spreadsheet.cellFormat({ textAlign: 'center' }, 'F3:H12');
  },
  // Removed the unwanted support for this samples
  showRibbon: false, showFormulaBar: false, showSheetTabs: false
});

```

```
spreadsheet.appendTo('#spreadsheet');
```

Delete

Delete support provides an option for deleting the rows and columns in the spreadsheet. Use [allowDelete](#) property to enable or disable the delete option in Spreadsheet.

The rows and columns can be deleted dynamically in the following ways,

- Using [delete](#) method, you can delete the loaded rows and columns.
- Using context menu, you can delete the selected rows and columns.

The following code example shows the delete operation of rows and columns in the spreadsheet.

INDEX.TS

```

import { Spreadsheet, SheetModel, ColumnModel } from '@syncfusion/ej2-spreadsheet';
import { data } from './datasource.ts';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
let columns: ColumnModel[] = [{ width: 90 }, { width: 220 }, { width: 90 }, { width: 140 }, { width: 90 }, { width: 100 }, { width: 100 }];
let sheets: SheetModel[] = [{ name: 'Sheet1', ranges: [{ dataSource: data }], columns: columns }, { name: 'Sheet2', ranges: [{ dataSource: data }], columns: columns }];
let spreadsheet: Spreadsheet = new Spreadsheet({
    sheets: sheets,
    allowDelete: true, // to enable or disable the delete option in Spreadsheet
    created: (): void => {
        spreadsheet.cellFormat({ fontWeight: 'bold', textAlign: 'center' }, 'A1:H1');
        // deleting the rows from 8th to 10th index. To delete row, the third argument of enum type is passed as 'Row', the last argument specifies the sheet name or index in which the delete operation will perform. By default, active sheet will be considered. It is applicable only for model type Row and Column.
        spreadsheet.delete(8, 10, 'Row', 0); // startIndex, endIndex, Row, sheet index
        // deleting the 2nd and 5th indexed columns
        spreadsheet.delete(2, 2, 'Column', 'Sheet2');
        spreadsheet.delete(5, 5, 'Column');
        spreadsheet.delete(0, 0, "Sheet"); // delete the first sheet. sheet index starts from 0
        // Applies style formatting after deleted the rows and columns
        spreadsheet.cellFormat({ textAlign: 'center' }, 'A2:A8');
        spreadsheet.cellFormat({ textAlign: 'center' }, 'D2:G8');
    },
    // Removed the unwanted support for this samples
    showRibbon: false, showFormulaBar: false
});
spreadsheet.appendTo('#spreadsheet');

```

Limitations of insert and delete

The following features have some limitations in Insert/Delete:

- Insert row/column between the formatting applied cells.
- Insert row/column between the data validation.
- Insert row/column between the conditional formatting applied cells.
- Insert/delete row/column between the filter applied cells.

Hide and show

You can show or hide the rows and columns in the spreadsheet through property binding, method, and context menu.

Row

The rows can be hidden or shown through the following ways,

- Using `hidden` property in row, you can hide/show the rows at initial load.
- Using `hideRow` method, you can hide the rows by specifying the start and end row index, set the last argument `hide` as `false` to unhide the hidden rows.
- Right-click on the row header and select the desired option from context menu

Column

The columns can be hidden or shown through following ways,

- Using `hidden` property in columns, you can hide/show the columns at initial load.
- Using `hideColumn` method, you can hide the columns by specifying the start and end column index, set the last argument `hide` as `false` to unhide the hidden columns.
- Right-click on the column header and select the desired option from context menu

The following code example shows the hide/show rows and columns operation in the spreadsheet.

INDEX.TS

```

import { Spreadsheet, SheetModel, ColumnModel, RowModel } from
 '@syncfusion/ej2-spreadsheet';
import { data } from './datasource.ts';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
// Hiding the 1st and 2nd column index through property binding
let columns: ColumnModel[] = [{ width: 150 }, { width: 100, hidden: true },
 { width: 100, hidden: true }, { width: 80 }, { width: 80 }, { width: 80 }, {
 width: 80 }, { width: 80 }];
// Hiding the 2nd and 3rd row index through property binding
let rows: RowModel[] = [{ index: 2, hidden: true }, { hidden: true }];
let sheets: SheetModel[] = [{ ranges: [{ dataSource: data }], columns:
 columns, rows: rows }];
let spreadsheet: Spreadsheet = new Spreadsheet({
  sheets: sheets,

```

```

created: (): void => {
    spreadsheet.cellFormat({ fontWeight: 'bold', textAlign: 'center' },
    'A1:H1');
    // Unhide the 2nd index hidden column
    spreadsheet.hideColumn(1, 1, false);
    // Unhide the 3rd index hidden row
    spreadsheet.hideRow(3, 3, false);
    // Hiding the 6th index column
    spreadsheet.hideColumn(6);
    // Hiding the 8th and 9th index row
    spreadsheet.hideRow(8, 9);
    spreadsheet.cellFormat({ textAlign: 'center' }, 'D2:H11');
},
// Removed the unwanted support for this samples
showRibbon: false, showFormulaBar: false, showSheetTabs: false
});
spreadsheet.appendTo('#spreadsheet');

```

```

Size

You can change the size of rows and columns in the spreadsheet by using [setRowsHeight](#) and [setColumnsWidth](#) methods.

Row

You can change the height of single or multiple rows by using the [setRowsHeight](#) method.

You can provide the following type of ranges to the method:

- Single row range: ['2:2']
- Multiple rows range: ['1:100']
- Multiple rows with discontinuous range: ['1:10', '15:25', '30:40']
- Multiple rows with different sheets: [Sheet1!1:50, 'Sheet2!1:50', 'Sheet3!1:50']

The following code example shows how to change the height for single/multiple rows in the spreadsheet.

INDEX.TS

```

import { Spreadsheet, SheetModel, ColumnModel, RowModel } from
'@syncfusion/ej2-spreadsheet';
import { data } from './datasource.ts';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
let sheets: SheetModel[] = [{ ranges: [{ dataSource: data }] }];
let spreadsheet: Spreadsheet = new Spreadsheet({
    sheets: sheets,
    created: (): void => {
        // To change height for single row
        spreadsheet.setRowsHeight(40, ['2']);
        // To change height for multiple rows
        spreadsheet.setRowsHeight(40, ['4:8', '10:12']);
    },
},

```

```
});
spreadsheet.appendTo('#spreadsheet');
```

INDEX.HTML

<script src="index.js" type="text/javascript"></script>
</body></html>

```

Column

You can change the width of single or multiple columns by using the [setColumnsWidth](#) method.

You can provide the following type of ranges to the method:

- Single column range: ['F:F']
- Multiple columns range: ['A:F']
- Multiple columns with discontinuous range: ['A:C', 'G:I', 'K:M']
- Multiple columns with different sheets: [Sheet1!A:H, 'Sheet2!A:H', 'Sheet3!A:H']

The following code example shows how to change the width for single/multiple columns in the spreadsheet.

INDEX.TS

```

import { Spreadsheet, SheetModel, ColumnModel, RowModel } from
 '@syncfusion/ej2-spreadsheet';
import { data } from './datasource.ts';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
let sheets: SheetModel[] = [{ ranges: [{ dataSource: data }] }];
let spreadsheet: Spreadsheet = new Spreadsheet({
  sheets: sheets,
  created: (): void => {
    // To change width of single column
    spreadsheet.setColumnsWidth(100, ['F']);
    // To change width of multiple columns
    spreadsheet.setColumnsWidth(120, ['A:C', 'G:I', 'K:M']);
  },
});
spreadsheet.appendTo('#spreadsheet');

```

```

Changing text in column headers

Using the [beforeCellRender](#) event, you can change the text in the column headers. In that event, you can use the `e-header-cell` class to identify the header cell element and update its text value.

The following code example shows how to change the text in the column headers.

INDEX.TS

```

import { Spreadsheet, CellRenderEventArgs } from '@syncfusion/ej2-
spreadsheet';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);

```

```

let spreadsheet: Spreadsheet = new Spreadsheet({
  beforeCellRender: (args: CellRenderEventArgs) => {
    if (
      args.colIndex >= 0 &&
      args.colIndex <= 10 &&
      args.element.classList.contains('e-header-cell')
    ) {
      let text: string = 'custom header ' + args.colIndex.toString();
      args.element.innerText = text;
    }
  }
});
spreadsheet.appendTo('#spreadsheet');

```

INDEX.HTML

```

Filter in EJ2 JavaScript Spreadsheet control

Filtering helps you to view specific rows in the spreadsheet by hiding the other rows. You can use the [allowFiltering](#) property to enable or disable filtering functionality.

* The default value for `allowFiltering` property is `true`.

By default, the `Filter` module is injected internally into Spreadsheet to perform filtering.

Apply filter on UI

In the active sheet, select a range of cells to filter by value of the cell. The filtering can be done by any of the following ways:

- Select the filter item in the Ribbon toolbar.
- Right-click the sheet, select the filter item in the context menu.
- Use the [applyFilter\(\)](#) method programmatically.
- Use `Ctrl + Shift + L` keyboard shortcut to apply the filter.

* Use `Alt + Up/Down` keyboard shortcut to open the filter dialog.

Filter by criteria

The [applyFilter\(\)](#) method will apply the filter UI, based on the predicate and range given in the arguments.

* The [beforeFilter](#) event will be triggered before filtering the specified range.

* The [filterComplete](#) event will be triggered after the filter action is completed successfully.

The following code example shows `filter` functionality in the Spreadsheet control.

INDEX.TS

```
import { Spreadsheet, ColumnModel } from '@syncfusion/ej2-spreadsheet';
import { tradeData } from './datasource.ts';
let columns: ColumnModel[] = [{ width: 100 }, { width: 130 }, { width: 96 },
    { width: 130 }, { width: 130 }, { width: 96 },
    { width: 100 }, { width: 100 }, { width: 110 }, { width: 100 }, { width:
130 }, { width: 150 }];
let spreadsheet: Spreadsheet = new Spreadsheet({
    sheets: [{ ranges: [{ dataSource: tradeData }], columns: columns }],
    allowFiltering: true,
    dataBound: function () {
        if (spreadsheet.activeSheetIndex === 0) {
            let departments: string[] = ['Sweden', 'Canada', 'UK'];
            let predicateList: PredicateModel[] = []
            departments.forEach((department: string) => {
                predicateList.push({ field: 'D', predicate: 'or', operator: 'equal', value:
                department });
            });
            spreadsheet.applyFilter(predicateList);
        }
    });
//Render the initialized Spreadsheet
spreadsheet.appendTo('#spreadsheet');
```

```

Filter by cell value

To apply a filter for a cell value, right-click the cell and choose filter -> **Filter By Selected Cell's Value** option from the menu. It applies the filter based on the value of the selected cell in the current sheet.

Clear filter

After applying filter to a certain column, you may want to clear it to make all filtered rows visible again. It can be done in the following ways,

- Choose **Clear** option in ribbon toolbar under **Filter and Sort**. It clears the filters applied in the spreadsheet for all fields.
- Use the [clearFilter\(\)](#) method programmatically, to clear the applied filters in spreadsheet for all fields.

Clear filter on a field

After filtering, you can clear/reset the filter for a field alone. It can be done in the following ways,

- Click filter icon in the column's header and then choose **Clear Filter** option from the filter dialog.
- You can right-click on a filtered column cell and choose **Clear Filter from** . option from the context menu.
- Use the [clearFilter\(field\)](#) method programmatically, to clear the filter in a particular column.

Reapply filter

When you want to reapply the filter after some changes happened in the rows. It can be done in the following ways,

- You can choose **Reapply** option in ribbon toolbar under **Filter and Sort** to reapply the filtered columns again.
- You can right-click on a filtered cell and choose **Reapply** option from the context menu. It reapplies the filters again in the Spreadsheet for all the fields.

Known error validations

The following errors have been handled for filtering,

- *Out of range validation:* When the selected range is not a used range of the active sheet, it is considered as invalid and the out of range alert with the message **Select a cell or range inside the used range and try again** will be displayed. No filter will be performed if the range is invalid.

Limitations

The following features have some limitations in Filter:

- Insert/delete row/column between the filter applied cells.
- Merge cells with filter.
- Copy/cut paste the filter applied cells.

Sort in EJ2 JavaScript Spreadsheet control

Sorting helps arranging the data to a specific order in a selected range of cells. You can use the [allowSorting](#) property to enable or disable sorting functionality.

* The default value for [allowSorting](#) property is **true**.

By default, the **sort** module is injected internally into Spreadsheet to perform sorting.

Sort by cell value

In the active Spreadsheet, select a range of cells to sort by cell value. The range sort can be done by any of the following ways:

- Select the sort item in the Ribbon toolbar and choose the ascending or descending item.
- Right-click the sheet, select the sort item in the context menu and choose the ascending/descending item.
- Use the [sort\(\)](#) method programmatically.

The cell values can be sorted in the following orders:

- Ascending
- Descending

* Ascending is the default order for sorting.

The `sort()` method with empty arguments will sort the selected range by active cell's column as sort column in ascending order.

* The `beforeSort` event will be triggered before sorting the specified range.

* The `sortComplete` event will be triggered after the sort action is completed successfully.

The following code example shows `Sort` functionality in the Spreadsheet control.

INDEX.TS

```
import { Spreadsheet } from '@syncfusion/ej2-spreadsheet';
import { defaultData } from './datasource.ts';
let spreadsheet: Spreadsheet = new Spreadsheet({
  sheets: [{ ranges: [{ dataSource: defaultData }] }],
  allowSorting: true,
  beforeSort: function (args) {
    //code here to handle sorting arguments.
  },
  sortComplete: function (args) {
    spreadsheet.selectRange(args.range);
    // code here.
  },
  dataBound: function () {
    if (spreadsheet.activeSheetIndex === 0) {
      spreadsheet.sort({ containsHeader: true }, 'A1:H11');
    }
  }
});
//Render the initialized Spreadsheet
spreadsheet.appendTo('#spreadsheet');
```

INDEX.HTML

    <div id="container">
        <div id="spreadsheet"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Data contains header

You can specify whether the selected range of cells contains header. To specify, you need to set the [containsHeader](#) property to `true` and pass it as `sortOption` arguments of the `sort()` method.

* If the `containsHeader` property is not set and active cell column's first cell value type is differed from the second cell value type, the first row data in the range are marked as column headers.

You can also enable or disable this property using `beforeSort` event arguments,

```
`ts
```

```
let spreadsheet: Spreadsheet = new Spreadsheet({
  beforeSort: function (args) {
    args.sortOptions.containsHeader = true;
```

```

}
});
`

```

In the custom sort dialog, the **Data contains header** checkbox is checked on load. Thus, the default value for **containsHeader** is **true** in custom sort dialog.

Case sensitive sort

The default sort functionality of Spreadsheet is a case insensitive sorting. When you want to perform sorting with case sensitive, you need to set the [caseSensitive](#) property to **true** and pass it as **sortOption** arguments of the `sort()` method.

Case sensitive sorting is applicable only for cells with alphabets. In ascending order sorting with case sensitive enabled, the cells with lower case text will be placed above the cells with upper case text.

* The default value for the **caseSensitive** property is **false**.

You can also enable or disable this property using **beforeSort** event arguments,

```
`ts
```

```

let spreadsheet: Spreadsheet = new Spreadsheet({
  beforeSort: function (args) {
    args.sortOptions.caseSensitive = true;
  }
});
`

```

In the custom sort dialog, the **Case sensitive** checkbox is unchecked on load as the default value is **false**.

Sort multiple columns

When you want to perform sorting on multiple columns, it can be done by any of the following ways:

- Select the **Custom sort...** menu item from the Ribbon toolbar item or context menu item.
- Use the `sort()` method programmatically by providing sort criteria.

* The current sorting functionality supports sorting based on cell values only.

Custom sort dialog

The custom sort dialog helps sorting multiple columns in the selected range by utilizing the rich UI. This dialog will be appeared while choosing the **Custom sort...** from the Ribbon item or context menu item. By default, sort criteria with the first column name from the selected range will be appeared in the dialog on initial load and it cannot be removed.

You can add multiple criteria using the **Add Column** button at the bottom of the dialog. Thus, multiple columns can be specified with different sort order. The newly added sort criteria items can be removed using the **delete** icons at the end of each items.

You can refer to the [Data contains header](#) topic to learn more about **Data contains header** checkbox. To learn more about **Case sensitive** checkbox, you can refer to [Case sensitive sort](#) topic.

Passing sort criteria manually

The multi-column sorting can also be performed manually by passing sort options to the **sort()** method programmatically. The **sortOption** have the following arguments:

- [sortDescriptors](#) – Sort criteria collection that holds the collection of field name, sort order, and [sortComparer](#).
- **containsHeader** – Boolean argument that specifies whether the range has headers in it.
- **caseSensitive** – Boolean argument that specifies whether the range needs to consider case.

* All the arguments are optional.

* When a **sortDescriptor** is specified without field, the field of the first **sortDescriptor** from the collection will be assigned from active cell's column name and others will be ignored. Hence, it will act as single column sorting.

INDEX.TS

```
import { Spreadsheet, SortDescriptor } from '@syncfusion/ej2-spreadsheet';
import { DataManager } from '@syncfusion/ej2-data';
import { tradeData } from './datasource.ts';
let spreadsheet: Spreadsheet = new Spreadsheet({
  sheets: [{ ranges: [{ dataSource: tradeData }] }],
  allowSorting: true,
  sortComplete: function (args) {
    spreadsheet.selectRange(args.range);
    // code here.
  },
  dataBound: function () {
    let sortDescriptors: SortDescriptor[] = [
      {
        field: 'F',
        order: 'Ascending'
      },
      {
        field: 'E',
        order: 'Ascending'
      },
      {
        field: 'C',
        order: 'Descending'
      }
    ];
    if (spreadsheet.activeSheetIndex === 0) {
      spreadsheet.sort({ sortDescriptors: sortDescriptors,
        containsHeader: true }, 'A1:H30');
    }
  }
});
//Render the initialized Spreadsheet
spreadsheet.appendTo('#spreadsheet');
```

Custom sort comparer

The [sortDescriptor](#) holds the [sortComparer](#) property, which is a function and it is used to customize the sort comparer for specific sort criteria. Each [sortDescriptor](#) can be customized using the custom sort comparer function.

By customizing sort comparer, you can define the sort action as desired.

* The [sortComparer](#) is an optional property of [sortDescriptor](#).

For custom sort comparer example, refer to the [Sort a range by custom list](#) in the [how-to](#) section.

Known error validations

The following errors have been handled for sorting,

- *Out of range validation:* When the selected range is not a used range of the active sheet, it is considered as invalid and the out of range alert with the message [Select a cell or range inside the used range and try again](#) will be displayed. No sort will be performed if the range is invalid.
- *Empty field validation:* When the sort criteria does not have a column selected (empty) in the custom sort dialog, it will become invalid, and an error message [Sort criteria column should not be empty](#) will be displayed on [OK](#) button click.
- *Duplicate field validation:* When the column names of added sort criteria are repeated more than once in the custom sort dialog, it will become invalid and an error message [is mentioned more than once. Duplicate columns must be removed](#) will be displayed on [OK](#) button click.

Limitations

- Sorting is not supported with formula contained cells.

Link in EJ2 JavaScript Spreadsheet control

Hyperlink is used to navigate to web links or cell reference within the sheet or to other sheets in Spreadsheet. You can use the [allowHyperlink](#) property to enable or disable hyperlink functionality.

* The default value for [allowHyperlink](#) property is [true](#).

Insert Link

You can insert a hyperlink in a worksheet cell for quick access to related information.

User Interface:

In the active spreadsheet, click the cell where you want to create a hyperlink. Insert hyperlink can be done by any of the following ways:

- Select the INSERT tab in the Ribbon toolbar and choose the **Link** item.
- Right-click the cell and then click Hyperlink item in the context menu.
- Use **Ctrl + K** keyboard shortcut to apply the hyperlink.
- Use the [addHyperlink](#) method programmatically.

Edit Hyperlink

You can change an existing hyperlink in your workbook by changing its destination or the text that is used to represent it.

User Interface:

In the active spreadsheet, Select the cell that contains the hyperlink that you want to change. Editing the hyperlink while opening the dialog can be done by any one of the following ways:

- Select the INSERT tab in the Ribbon toolbar and choose the **Link** item.
- Right-click the cell and then click Edit Hyperlink item in the context menu, or you can press **Ctrl+K**.

In the Edit Link dialog box, make the changes that you want, and click UPDATE.

Remove Hyperlink

Performing this operation remove a single hyperlink without losing the display text.

User Interface:

In the active spreadsheet, click the cell where you want to remove a hyperlink. remove hyperlink can be done by any of the following ways:

- Right-click the cell and then click Remove Hyperlink item in the context menu.
- Use the [removeHyperlink\(\)](#) method programmatically.

How to change target attribute

There is an event named **beforeHyperlinkClick** which triggers only on clicking hyperlink. You can customize where to open the hyperlink by using the **target** property in the arguments of that event.

INDEX.TS

- [Sorting](#)
- [Filtering](#)
- [Undo Redo](#)

Clipboard in EJ2 JavaScript Spreadsheet control

The Spreadsheet provides support for the clipboard operations (cut, copy, and paste). Clipboard operations can be enabled or disabled by setting the [enableClipboard](#) property in Spreadsheet.

By default, the `enableClipboard` property is true.

Cut

It is used to cut the data from selected range of cells, rows or columns in a spreadsheet and make it available in the clipboard.

User Interface:

Cut can be done in one of the following ways.

- Using Cut button in the Ribbon's HOME tab to perform cut operation.
- Using Cut option in the Context Menu.
- Using **Ctrl + X** | **Command + X** keyboard shortcut.
- Using the [cut](#) method.

Copy

It is used to copy the data from selected range of cells, rows or columns in a spreadsheet and make it available in the clipboard.

User Interface:

Copy can be done in one of the following ways.

- Using Copy button in the Ribbon's HOME tab to perform copy operation.
- Using Copy option in the Context Menu.
- Using **Ctrl + C** | **Command + C** keyboard shortcut.
- Using the [copy](#) method.

Paste

It is used to paste the clipboard data to the selected range, rows or columns. You have the following options in Paste,

- **Paste Special** - You can paste the values with formatting.
- **Paste** - You can paste only the values without formatting.

It also performs for external clipboard operation. If you perform cut and paste, clipboard data will be cleared, whereas in copy and paste the clipboard contents will be maintained. If you perform paste inside the copied range, the clipboard data will be cleared.

User Interface:

Paste can be done in one of the following ways.

- Using Paste button in the Ribbon's HOME tab to perform paste operation.
- Using Paste option in the Context Menu.
- Using **Ctrl + V** | **Command + V** keyboard shortcut.
- Using the [paste](#) method.

If you use the Keyboard shortcut key for cut (**Ctrl + X**) | copy (**Ctrl + C**) from other sources, you should use **Ctrl + V** shortcut while pasting into the spreadsheet.

Prevent the paste functionality

The following example shows, how to prevent the paste action in spreadsheet. In [actionBegin](#) event, you can set `cancel` argument as false in paste request type.

INDEX.TS

```

import { Spreadsheet, ColumnModel } from '@syncfusion/ej2-spreadsheet';
import { defaultData } from './datasource.ts';
import { DropDownButton, ItemModel } from "@syncfusion/ej2-splitbuttons";
//Initialize action items.
let items: ItemModel[] = [
    {
        text: "Copy"
    },
    {
        text: "Cut"
    },
    {
        text: "Paste"
    }
];
// Initialize the DropDownButton component.
let drpDownBtn: DropDownButton = new DropDownButton({
    items: items,
    cssClass: "e-round-corner",
    select: (args: MenuEventArgs) => {
        if (args.item.text === 'Copy')
            spreadsheet.copy();
        if (args.item.text === 'Cut')
            spreadsheet.cut();
        if (args.item.text === 'Paste')
            spreadsheet.paste();
    }
});
// Render initialized DropDownButton.
drpDownBtn.appendTo("#element");
let columns: ColumnModel[] = [
    {
        width: 130
    },
    {
        width: 92
    },
    {
        width: 96
    }
];
let spreadsheet: Spreadsheet = new Spreadsheet({
    sheets: [{ name: 'Price Details', ranges: [{ dataSource: defaultData }] },
    columns: columns }],
    enableClipboard: true,
    created: (): void => {
        spreadsheet.cellFormat({ fontWeight: 'bold', textAlign:
'center', verticalAlign: 'middle' }, 'A1:F1');
    },
    // Triggers before the action begins.
    actionBegin: (pasteArgs: any) => {
        const args: { action: string, eventArgs: BeforePasteEventArgs } = {
            action: pasteArgs.args.eventArgs.requestType,
            eventArgs: pasteArgs.args.eventArgs };
        // To cancel the paste action.

```

```

        if (args.action === 'paste') {
            args.eventArgs.cancel = true;
        }
    });
    //Render the initialized Spreadsheet
    spreadsheet.appendTo('#spreadsheet');

```

if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Limitations

- External clipboard is not fully supported while copying data from another source and pasting into a spreadsheet, it only works with basic supports (Values, Number, cell, and Text formatting).
- If you copy =SUM(A2,B2) and paste, the formula reference will change depending on the pasted cell address but we don't have support for nested formula(formula reference will be same).
- Clipboard is not supported with conditional formatting (values only pasting).
- We have limitation while copying the whole sheet data and pasting it into another sheet.

Scrolling in EJ2 JavaScript Spreadsheet control

Scrolling helps you to move quickly to different areas of the worksheet. It moves faster if we use horizontal and vertical scroll bars. Scrolling can be enabled by setting the [allowScrolling](#) as true.

By default, the `allowScrolling` property is true.

You have the following options in Scrolling by using [scrollSettings](#).

- Finite scrolling.
- Virtual scrolling.

Finite Scrolling

Finite scrolling supports two type of modes in scrolling. You can use the [isFinite](#) property in [scrollSettings](#) to specify the mode of scrolling.

- Finite - This mode does not create a new row/column when the scrollbar reaches the end. This can be achieved by setting the [isFinite](#) property as `true`.
- Infinite - This mode creates a new row/column when the scrollbar reaches the end. This can be achieved by setting the [isFinite](#) property as `false`.

By Default, the `isFinite` property is `false`.

Virtual Scrolling

- Virtual scrolling allows you to load data that you require (load data based on viewport size) without buffering the entire huge database. You can set the `enableVirtualization` property in `scrollSettings` as `true`.

In virtual scrolling `enableVirtualization` is set to true means, it allows you to load the spreadsheet data while scrolling.

By Default, the `enableVirtualization` property is `true`.

User Interface:

You can scroll through the worksheet using one of the following ways,

- Using the `arrow` keys.
- Using the Horizontal and Vertical `scroll` bars.
- Using the `mouse` wheel.

Finite scrolling with defined rows and columns

If you want to perform scrolling with defined rows and columns, you must define `rowCount` and `colCount` in the `sheets` property and set `isFinite` as true and `enableVirtualization` as false in `scrollSettings`.

The following code example shows the finite scrolling with defined rows and columns in the spreadsheet. Here, we used `rowCount` as 20 and `colCount` as 20, after reaching the 20th row or 20th column you can't able to scroll.

INDEX.TS

```
import { Spreadsheet, ColumnModel } from '@syncfusion/ej2-spreadsheet';
import { defaultData } from '../datasource.ts';
let columns: ColumnModel[] = [
    {
        width: 100
    },
    {
        width: 92
    },
    {
        width: 96
    },
    {
        width: 110
    },
    {
        width: 92
    },
    {
        width: 96
    },
    {
        width: 96
    }
];
let spreadsheet: Spreadsheet = new Spreadsheet({
    sheets: [{ name: 'Price Details', ranges: [{ dataSource: defaultData }] },
    columns: columns, rowCount: 9, colCount: 7 ]},
    allowScrolling: true,
    scrollSettings: { isFinite: true },
    created: (): void => {
```

```

        spreadsheet.cellFormat({ fontWeight: 'bold', textAlign:
'center', verticalAlign: 'middle' }, 'A1:G1');
    }
});
//Render the initialized Spreadsheet
spreadsheet.appendTo('#spreadsheet');

```

</body></html>
```

Selection in EJ2 JavaScript Spreadsheet control

Selection provides interactive support to highlight the cell, row, or column that you select. Selection can be done through Mouse, Touch, or Keyboard interaction. To enable selection, set **mode** as **Single** | **Multiple** in [selectionSettings](#). If you set **mode** to **None**, it disables the UI selection.

* The default value for **mode** in **selectionSettings** is **Multiple**.

You have the following options in Selection,

- Cell selection
- Row selection
- Column selection

Cell selection

Cell selection is used to select a single or multiple cells. It can be performed using the [selectRange](#) method.

User Interface:

- Click on a cell to select it (or) use the **arrow** keys to navigate to it and select it.
- To select a range, select a cell, then use the left mouse button to select and drag over to other cells (or) use the **Shift + arrow** keys to select the range.
- To select non-adjacent cells and cell ranges, hold **Ctrl** and select the cells.

You can quickly locate and select specific cells or ranges by entering their names or cell references in the Name box, which is located to the left of the formula bar, and also select named or unnamed cells or ranges by using the Go To (**Ctrl+G**) command.

Row selection

Row selection is used to select a single or multiple rows.

User Interface:

You can perform row selection in any of the following ways,

- By clicking the row header.
- To select multiple rows, select a row header with the left mouse button and drag over to other row headers (or) use the **Shift + arrow** keys to select multiple rows.
- To select non-adjacent rows, hold **Ctrl** and select the row header.
- You can also use the [selectRange](#) method for row selection.

The following sample shows the row selection in the spreadsheet, here selecting the 5th row using the `selectRange` method.

INDEX.TS

```
import { Spreadsheet, ColumnModel, getRangeAddress } from '@syncfusion/ej2-spreadsheet';
import { budgetData } from './datasource.ts';
let columns: ColumnModel[] = [
    {
        width: 130
    },
    {
        width: 92
    },
    {
        width: 96
    }
];
let spreadsheet: Spreadsheet = new Spreadsheet({
    sheets: [{ name: 'Budget', ranges: [{ dataSource: budgetData }] },
    columns: columns }],
    selectionSettings: { mode: 'Multiple' },
    created: (): void => {
        spreadsheet.cellFormat({ fontWeight: 'bold', textAlign:
'center', verticalAlign: 'middle' }, 'A1:D1');
        let colCount: number = spreadsheet.getActiveSheet().colCount;
        spreadsheet.selectRange(getRangeAddress([4, 0, 4, colCount]));
    }
});
//Render the initialized Spreadsheet
spreadsheet.appendTo('#spreadsheet');

Column selection

Column selection is used to select a single or multiple columns.

User Interface:

You can perform column selection in any of the following ways,

- By clicking the column header.
- To select multiple columns, select a column header with the left mouse button and drag over to other column headers (or) use the **Shift + arrow** keys to select the multiple columns.
- To select non-adjacent columns, hold **Ctrl** and select the column header.
- You can also use the **selectRange** method for row selection.

The following sample shows the column selection in the spreadsheet, here selecting the 3rd column using the **selectRange** method.

INDEX.TS

```
import { Spreadsheet, ColumnModel, getRangeAddress } from '@syncfusion/ej2-spreadsheet';
import { budgetData } from './datasource.ts';
let columns: ColumnModel[] = [
    {
        width: 130
    },
    {
        width: 92
    },
    {
        width: 96
    }
];
let spreadsheet: Spreadsheet = new Spreadsheet({
    sheets: [{ name: 'Budget', ranges: [{ dataSource: budgetData }] },
    columns: columns ],
    selectionSettings: { mode: 'Multiple' },
    created: (): void => {
        spreadsheet.cellFormat({ fontWeight: 'bold', textAlign: 'center', verticalAlign: 'middle' }, 'A1:D1');
        let rowCount: number = spreadsheet.getActiveSheet().rowCount;
        spreadsheet.selectRange(getRangeAddress([0, 2, rowCount, 2]));
    }
});
//Render the initialized Spreadsheet
spreadsheet.appendTo('#spreadsheet');
```

How to remove selection in the spreadsheet

The following sample shows, how to remove the selection in the spreadsheet. Here changing the **mode** as **None** in [selectionSettings](#) to disable's the UI selection.

INDEX.TS

```

import { Spreadsheet, ColumnModel } from '@syncfusion/ej2-spreadsheet';
import { budgetData } from './datasource.ts';
let columns: ColumnModel[] = [
    {
        width: 130
    },
    {
        width: 92
    },
    {
        width: 96
    }
];
let spreadsheet: Spreadsheet = new Spreadsheet({
    sheets: [{ name: 'Budget', ranges: [{ dataSource: budgetData }] },
    columns: columns },
    selectionSettings: { mode: 'None' },
    created: (): void => {

```

```

        spreadsheet.cellFormat({ fontWeight: 'bold', textAlign:
'center', verticalAlign: 'middle' }, 'A1:D1');
    },
    // Triggers before going to the editing mode.
    cellEdit: (args: CellEditEventArgs): void => {
        args.cancel = true;
    }
});
//Render the initialized Spreadsheet
spreadsheet.appendTo('#spreadsheet');

```

Limitations

- We have a limitation while performing the Select All(**ctrl + A**). You can do this only by clicking the Select All button at the top left corner.

Protect sheet in EJ2 JavaScript Spreadsheet control

Sheet protection helps you to prevent the users from modifying the data in the spreadsheet.

Protect Sheet

Protect sheet feature helps you to prevent the unknown users from accidentally changing, editing, moving, or deleting data in a spreadsheet. And you can also protect the sheet with password.

You can use the [isProtected](#) property to enable or disable the Protecting functionality.

The default value for **isProtected** property is **false**.

By default in protected sheet, selecting, formatting, inserting, deleting functionalities are disabled. To enable some of the above said functionalities

the **protectSettings** options are used in a protected spreadsheet.

The available **protectSettings** options in spreadsheet are,

Options	Uses
-----	-----
Select Cells	Used to perform Cell Selection.
Format Cells	Used to perform Cell formatting.
Format Rows	Used to perform Row formatting.
Format Columns	Used to perform Column formatting.
Insert Link	Used to perform Hyperlink Insertions.

The default value for all **protectSettings** options are **false**.

By default, the **Protect Sheet** module is injected internally into the Spreadsheet to perform sheet protection function.

User Interface:

In the active Spreadsheet, the sheet protection can be done by any of the following ways:

- Select the Protect Sheet item in the Ribbon toolbar under the Data Tab, and then select your desired options.
- Right-click the sheet tab, select the Protect Sheet item in the context menu, and then select your desired options.
- Use the [protectSheet\(\)](#) method programmatically.

The following example shows **Protect Sheet** functionality with password in the Spreadsheet control.

INDEX.TS

```
import { Spreadsheet, ColumnModel } from '@syncfusion/ej2-spreadsheet';
import { budgetData, salaryData } from './datasource.ts';
let columns: ColumnModel[] = [{ width: 100 }, { width: 100 }, { width: 100 },
    { width: 100 }];
let spreadsheet: Spreadsheet = new Spreadsheet({
    sheets: [{ name: 'Budget', ranges: [{ dataSource: budgetData }] },
    columns: columns, isProtected: true, protectSettings: { selectCells: true } },
    { name: 'Salary', ranges: [{ dataSource: salaryData }] },
    columns: columns}],
    dataBound: function () {
        spreadsheet.cellFormat({ fontWeight: 'bold', textAlign:
'center' }, 'A1:D1');
        spreadsheet.cellFormat({ fontWeight: 'bold' }, 'A11:D11');
        spreadsheet.protectSheet(1, { selectCells: false },
"syncfusion"); // protect sheet with password
    }
});
spreadsheet.appendTo('#spreadsheet');
```

}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Limitations of Protect sheet

- Password encryption is not supported

Unprotect Sheet

Unprotect sheet is used to enable all the functionalities that are already disabled in a protected spreadsheet.

User Interface:

In the active Spreadsheet, the sheet Unprotection can be done by any of the following ways:

- Select the **Unprotect Sheet** item in the Ribbon toolbar under the Data Tab.
- Right-click the sheet tab, select the **Unprotect Sheet** item in the context menu.
- Use the [unprotectSheet\(\)](#) method programmatically.

Unlock the particular cells in the protected sheet

In protected spreadsheet, to make some particular cell or range of cells are editable, you can use [lockCells\(\)](#) method, with the parameter `range` and `isLocked` property as false.

INDEX.TS

```
import { Spreadsheet, ColumnModel } from '@syncfusion/ej2-spreadsheet';
import { Button } from '@syncfusion/ej2-buttons';
import { Dialog } from '@syncfusion/ej2-popups';
import { budgetData, salaryData } from './datasource.ts';
let columns: ColumnModel[] = [{ width: 100 }, { width: 100 }, { width: 100 },
    { width: 100 }]

Protect Workbook

Protect workbook feature helps you to protect the workbook so that users cannot insert, delete, rename, hide the sheets in the spreadsheet.

You can use the [password](#) property to protect workbook with password.

You can use the [isProtected](#) property to protect or unprotect the workbook without the password.

The default value for `isProtected` property is `false`.

User Interface:

In the active Spreadsheet, you can protect the worksheet by selecting the Data tab in the Ribbon toolbar and choosing the **Protect Workbook** item. Then, enter the password and confirm it and click on OK.

The following example shows **Protect Workbook** by using the [isProtected](#) property in the Spreadsheet control.

INDEX.TS

```
import { Spreadsheet, ColumnModel } from '@syncfusion/ej2-spreadsheet';
import { budgetData } from './datasource.ts';
let columns: ColumnModel[] = [{ width: 100 }, { width: 100 }, { width: 100 },
    { width: 100 }];
let spreadsheet: Spreadsheet = new Spreadsheet({
    // To protect the workbook
    isProtected: true,
    sheets: [{ name: 'Budget', ranges: [{ dataSource: budgetData } ]},
    columns: columns }],
    dataBound: function () {
        spreadsheet.cellFormat({ fontWeight: 'bold', textAlign:
'center' }, 'A1:D1');
        spreadsheet.cellFormat({ fontWeight: 'bold'}, 'A11:D11');
    }
});
spreadsheet.appendTo('#spreadsheet');
```

Unprotect Workbook

Unprotect Workbook is used to enable the insert, delete, rename, move, copy, hide or unhide sheets feature in the spreadsheet.

User Interface:

In the active Spreadsheet, the workbook Unprotection can be done in any of the following ways:

- Select the **Unprotect Workbook** item in the Ribbon toolbar under the Data Tab and provide the valid password in the dialog box.

- [Hyperlink](#)

Searching in EJ2 JavaScript Spreadsheet control

Find and Replace helps you to search for the target text and replace the found text with alternative text within the sheet or workbook. You can use the [allowFindAndReplace](#) property to enable or disable the Find and Replace functionality.

* The default value for **allowFindAndReplace** property is **true**.

Find

Find feature is used to select the matched contents of a cell within the sheet or workbook. It is extremely useful when working with large set of data source.

User Interface:

Find can be done by any of the following ways:

- Select the Search icon in the Ribbon toolbar or use **Ctrl + F** key to open the Find dialog.
- Use find Next and find Previous buttons to search the given value in the workbook.
- Select the option button in Find dialog to open the Find and Replace dialog. Then, select the below properties for enhanced searching.

* **Search within**: To search the target in a sheet (default) or in an entire workbook.

* **Search by**: It enhance the search, either By Rows (default), or By Columns.

* **Match case**: To find the matched value with case sensitive.

* **Match exact cell contents:** To find the exact matched cell value with entire match cases.

- Using [find\(\)](#) method to perform find operation.

Replace

Replace feature is used to change the find contents of a cell within sheet or workbook. Replace All is used to change all the matched contents of a cell within sheet or workbook.

User Interface:

Replace can be done by any of the following ways:

- Use **Ctrl + H** key to open the Find and Replace dialog.
- Use Replace button to change the found value in sheet or workbook.
- Using Replace All button, all the matched criteria can be replaced with find value based on sheet or workbook.
- Using [replace\(\)](#) method to perform replace operation by passing the argument `args.replaceby` as `replace`.
- Using [replace\(\)](#) method to perform replace all operation by passing the argument `args.replaceby` as `replaceall`.

Go to

Go to feature is used to navigate to a specific cell address in the sheet or workbook.

User Interface:

- Use **Ctrl + G** key to open the Go To dialog.
- Use [goTo\(\)](#) method to perform Go To operation.

In the following sample, searching can be done by following ways:

- Select the Home tab in the Ribbon toolbar, and then select the Search icon.
- Enter any value in the search textbox.
- Select the next (or) previous button to find the entered value in the spreadsheet.
- You can have more options to find values by selecting the more options in the search toolbar.

INDEX.TS

```
import { Spreadsheet, ColumnModel } from '@syncfusion/ej2-spreadsheet';
import { defaultData, budgetData } from '../datasource.ts';
let columns: ColumnModel[] = [
    {
        width: 130
    },
    {
        width: 92
    },
    {
        width: 96
    }
];

Limitations

- Undo/redo for Replace All is not supported in this feature.

Keyboard shortcuts in EJ2 JavaScript Spreadsheet control

The keyboard shortcuts supported in the spreadsheet are,

Shortcut	Description
----- -----	
Ctrl + O	Displays dialog to open a file.
Ctrl + S / Alt + F2	Saves the workbook.
F2	Enables edit mode.
ESC	Cancel edit mode and discard the changes.
Backspace and SPACE	Clears content of the active cell and enables edit mode.
Ctrl + C	Copies the selected cells.
Ctrl + X	Cuts the selected cells.
Ctrl + V	Paste the clipboard(cut or copied) content in the new selected range.
Ctrl + B	Applies or removes bold formatting.
Ctrl + I	Applies or removes <i>italic</i> formatting.
Ctrl + U	Applies or removes <u>underline</u> .
Ctrl + 5	Applies or removes strikethrough .
Ctrl + Z	Reverses (Undo) the last action.
Ctrl + Y	Repeats (Redo) the last reversed action.
Ctrl + K	It opens the Insert Hyperlink dialog for adding new hyperlink to a cell. If the selected cell already contains hyperlink, it opens the Edit Hyperlink dialog.
Ctrl + F / Shift + F5	Opens Find dialog.
Ctrl + H	Opens Find and Replace dialog.

- | Ctrl + G | Opens **GoTo** dialog, which helps to navigate to cell. |
- | Ctrl + Shift + L | Applies filter to the first row of the selected range or used range. |
- | Alt + F | Opens the **File** menu. |
- | Alt + H | Go to **Home** tab. |
- | Alt + N | Go to **Insert** tab. |
- | Alt + M | Go to **Formulas** tab. |
- | Alt + A | Go to **Data** tab. |
- | Alt + W | Go to **View** tab. |
- | Tab | Navigate the active cell to the next cell in the same row. |
- | Shift + Tab | Navigate the active cell to the previous cell in the same row. |
- | Right or Left arrow | Move the focus to next or previous item in the tab if the focus is on ribbon tab. |
- | Up arrow | When a menu is open, move focus to the next item. |
- | Down arrow | When a menu is open, move focus to the previous item. |
- | Spacebar or Enter | Activate a selected button. |
- | Ctrl + F8 | Expand or collapse the ribbon content. |
- | Ctrl + Shift + U | Expand or collapse the formula bar. |
- | Ctrl + 9 | Hide the selected row. |
- | Ctrl + 0 | Hide the selected column. |
- | Home | Moves the selection to starting column in worksheet. |
- | Ctrl + Home | Move the selection to the first visible cell on a worksheet. |
- | Ctrl + Shift + Home | Extend the selection of cells to the beginning of the worksheet. |
- | Ctrl + End | Move to the last cell on a worksheet, right most last column and last row cell. |
- | Ctrl + & | Apply an outline border to the selected cells. |
- | Ctrl + Shift + & | Apply an outline border to the cells that you've chosen. |
- | Ctrl + Shift + ~ | Apply the **General** number format. |
- | Ctrl + Shift + \$ | Apply the **Currency** format with two decimal places (negative numbers in parentheses). |
- | Shift + F10 | Open the context menu. |
- | Ctrl + % | Apply the **Percentage** format with no decimal places. |
- | Ctrl + ^ | Apply the **Scientific** number format with two decimal places. |
- | Ctrl + Shift + # | Apply the **Date** format with the day, month, and year. |
- | Ctrl + Shift + @ | Apply the **Time** format with the hour and minute, and AM or PM. |

| Ctrl + Shift + ! | Apply the **Number** format with two decimal places, thousands separator, and minus sign (-) for negative values. |

| Ctrl + Spacebar | Select an entire column in a worksheet. |

| Shift + Spacebar | Select an entire row in a worksheet. |

| Shift + F3 | Opens **Insert Function** dialog. |

| Ctrl + Alt + N | Opens new workbook. |

| Shift + Page Down | Perform page down by selecting all cells between. |

| Shift + Page Up | Perform page up by selecting all cells between. |

| Ctrl + Left | Navigate to the non-blank cell before the active cell in the same row. |

| Ctrl + Right | Navigate to the last non-blank cell in the same row as the active cell. |

| Ctrl + Up | Navigate to the first non-blank cell in the same row as the active cell. |

| Ctrl + Down | Navigate to the last cell that is not blank in the same column as the active cell. |

| Ctrl + Shift + Left | Extend the cell selection to the previous non-blank cell in the same row as the active cell. |

| Ctrl + Shift + Right | Extend the cell selection to the last non-blank cell in the same row as the active cell. |

| Ctrl + Shift + Up | Extend the selection of cells to the first non-blank cell in the same row as the active cell. |

| Ctrl + Shift + Down | Extend the selection of cells to the last non-blank cell in the same row as the active cell. |

| Shift + Alt + K | Open the **List All Sheets** dropdown option. |

| Up arrow | Navigate from the active cell to the previous cell in the same column. |

| Down arrow | Navigate from the active cell to the next cell in the same column. |

| Left arrow | Navigate from the active cell to the previous cell in the same row. |

| Right arrow | Navigate from the active cell to the next cell in the same row. |

| Page Up | Move page up. |

| Page Down | Move page down. |

| Shift + Up | Extend the selection of cells to the previous row. |

| Shift + Down | Extend the selection of cells to the next row. |

| Shift + Left | Extend the selection of cells to the previous column. |

| Shift + Right | Extend the selection of cells to the next column. |

| Ctrl + Top | Navigate to the non-blank cell before the active cell in the same column. |

| Ctrl + Shift + Top | Extend the cell selection to the previous non-blank cell in the same column as the active cell. |

| Ctrl + Shift + Bottom | Extend the cell selection to the last non-blank cell in the same column as the active cell. |

| Enter | Navigate the active cell to the next cell in the same column. |

| Shift + Enter | Navigate to the previous cell in the same column from the active cell. |

| Alt + Down | Open the list data validation menu and filter menu. |

| Alt + Up | Close the list data validation menu and filter menu. |

| Delete | Remove the contents of the cell. |

| Shift + Home | Extend the cell selection to the first column of a worksheet. |

| Shift + F11 | Add a new sheet. |

| Ctrl + Shift + 9 | Unhide the selected rows. |

| Ctrl + Shift + 0 | Unhide the selected columns. |

| Ctrl + D | Fill the cell down. |

| Ctrl + R | Fill the cell right. |

| Alt + Enter | While editing, add a new line. |

| Enter | Complete the cell editing and select the cell below in the same column. |

| Shift + Enter | Complete the cell editing and select the cell above in the same column. |

| Tab | Complete the cell editing and select the next cell in the same row. |

| Shift + Tab | Complete the cell editing and select the previous cell in the same row. |

| Alt | Focus on the active ribbon tab. |

| Left | Move the focus to the previous items in the ribbon content. |

| Right | Move the focus to the next items in the ribbon content. |

| Alt + Down | Open the ribbon dropdown menu. |

| Esc / Alt + Up | Close the ribbon dropdown menu. |

Ribbon in EJ2 JavaScript Spreadsheet control

It helps to organize a spreadsheet's features into a series of tabs. By clicking the expand or collapse icon, you can expand or collapse the ribbon toolbar dynamically.

Ribbon Customization

You can customize the ribbon using the following methods,

| Method | Action |

|-----|-----|

| [hideRibbonTabs](#) | Used to show or hide the existing ribbon tabs. |

- | [enableRibbonTabs](#) | Used to enable or disable the existing ribbon tabs. |
- | [addRibbonTabs](#) | Used to add custom ribbon tabs. |
- | [hideToolbarItems](#) | Used to show or hide the existing ribbon toolbar items. |
- | [enableToolbarItems](#) | Used to enable or disable the specified toolbar items. |
- | [addToolbarItems](#) | Used to add the custom items in ribbon toolbar. |
- | [hideFileMenuItems](#) | Used to show or hide the ribbon file menu items. |
- | [enableFileMenuItems](#) | Used to enable or disable file menu items. |
- | [addFileMenuItems](#) | Used to add custom file menu items. |

The following code example shows the usage of ribbon customization.

INDEX.TS

```
import { Spreadsheet, SheetModel, ColumnModel, MenuSelectEventArgs } from
 '@syncfusion/ej2-spreadsheet';
import { enableRipple, select } from '@syncfusion/ej2-base';
import { ClickEventArgs } from '@syncfusion/ej2-navigations';
import { data } from './datasource.ts';
enableRipple(true);
let columns: ColumnModel[] = [{ width: 180 }, { width: 130 }, { width: 130
 }, { width: 180 }, { width: 130 }, { width: 120 }];
let sheets: SheetModel[] = [{ ranges: [{ dataSource: data }], columns:
 columns }];
let spreadsheet: Spreadsheet = new Spreadsheet({
  sheets: sheets,
  created: (): void => {
    spreadsheet.cellFormat({ fontWeight: 'bold', textAlign: 'center' },
 'A1:F1');
    // Hiding the `Insert` from ribbon.
    spreadsheet.hideRibbonTabs(['Insert']);
    // Set disabled state to `View` ribbon tab.
    spreadsheet.enableRibbonTabs(['View'], false);
    // Adding the `Help` ribbon tab at the last index.
    // Specify the ribbon tab header text in last optional
    argument(`insertBefore`) for inserting new tab before any existing tab.
    spreadsheet.addRibbonTabs([{ header: { text: 'Help' }, content: [{
    text: 'Feedback', tooltipText: 'Feedback',
      click: (args: ClickEventArgs): void => { /* Any click action for
    this toolbar item will come here. */ } } ]});
    // Hiding the unwanted toolbar items from `Home` by specifying its
    index.
    spreadsheet.hideToolbarItems('Home', [0, 1, 2, 4, 14, 15, 21, 24]);
    // Set disable state to `Underline`, `Wrap text` toolbar items from
    `Home` by specifying the item id.
    spreadsheet.enableToolbarItems('Home',
    [`${spreadsheet.element.id}_underline`, `${spreadsheet.element.id}_wrap`],
    false);
    // Set disable state to `Protect Sheet` toolbar item from `Data` by
    mentioning its index.
    spreadsheet.enableToolbarItems('Data', [0], false);
    // Adding the new `Custom Formulas` toolbar item under `Formulas`
    tab for adding custom formulas.
```

```

spreadsheet.addToolBarItems(
    'Formulas', [{ type: 'Separator' }, {
        text: 'Custom Formulas', tooltipText: 'Custom Formulas',
        // You can set click handler for each new custom toolbar
item
        click: (args: ClickEventArgs): void => {
            // You can add custom formulas here.
        }
    }]);
    // Adding new custom item `Import` after the existing `Open` item.
    By default, new item will add after the specified item.
    spreadsheet.addFileMenuItems([{ text: 'Import', iconCss: 'e-open e-
icons' }], 'Open');
    // Adding new custom item `Export As` after the existing `Save As`
item.
    // Set `insertAfter` optional argument as `false` for adding new
item before the specified item.
    spreadsheet.addFileMenuItems(
        [{
            text: 'Export As', iconCss: 'e-save e-icons', items: [{
text: 'XLSX', iconCss: 'e-xlsx e-icons' },
                { text: 'XLS', iconCss: 'e-xls e-icons' }, { text:
'CSV', iconCss: 'e-csv e-icons' }]
        }],
        'Save As', false);
    },
    fileMenuBeforeOpen: (): void => {
        // Because the file menu items are created dynamically, you need to
perform the hide or show and enable/disable operations
        // under filemenu before open event.
        // Hiding the `Save As` and `Open` item.
        spreadsheet.hideFileMenuItems(['Save As', 'Open']);
        // Set disable state to `New` item. You can perform any file menu
items customization by specifying the item id,
        // if it has more than one same item text. Set the last argument
`isUniqueId` as true for using the item id.
        spreadsheet.enableFileMenuItems(['${spreadsheet.element.id}_New`,
false, true);
    },
    fileMenuItemSelect: (args: MenuSelectEventArgs): void => {
        // Custom file menu items select handler
        switch (args.item.text) {
            case 'Import': select(`${spreadsheet.element.id}_fileUpload`,
spreadsheet.element).click();
                break;
            case 'XLSX': spreadsheet.save({ saveType: 'Xlsx' });
                break;
            case 'XLS': spreadsheet.save({ saveType: 'Xls' });
                break;
            case 'CSV': spreadsheet.save({ saveType: 'Csv' });
                break;
        }
    },
    openUrl:
'https://services.syncfusion.com/js/production/api/spreadsheet/open',
    saveUrl:
'https://services.syncfusion.com/js/production/api/spreadsheet/save',

```

```
// Removed the unwanted support for this samples
showFormulaBar: false, showSheetTabs: false, allowInsert: false,
allowDelete: false, allowMerge: false
});
spreadsheet.appendTo('#spreadsheet');
```

MobileFormulaBarPlaceHolder | Enter value or Formula

PasteAlert | You can't paste it here because the copy area and paste area aren't in the same size. Please try pasting in a different range.

DestroyAlert | Are you sure you want to destroy the current workbook without saving and create a new workbook?

SheetRenameInvalidAlert | Sheet name contains invalid character.

SheetRenameEmptyAlert | Sheet name cannot be empty.

SheetRenameAlreadyExistsAlert | Sheet name already exists. Please enter another name.

DeleteSheetAlert | Are you sure you want to delete this sheet?

DeleteSingleLastSheetAlert | A Workbook must contain at least one visible worksheet.

PickACategory | Pick a category

Description | Description

UnsupportedFile | Unsupported File

InvalidUrl | Invalid Url

SUM | Adds a series of numbers and/or cells.

SUMIF | Adds the cells based on the specified condition.

SUMIFS | Adds the cells based on the specified conditions.

ABS | Returns the value of a number without its sign.

RAND | Returns a random number between 0 and 1.

RANDBETWEEN | Returns a random integer based on the specified values.

FLOOR | Rounds a number down to the nearest multiple of a given factor.

CEILING | Rounds a number up to the nearest multiple of a given factor.

PRODUCT | Multiplies a series of numbers and/or cells.

AVERAGE | Calculates average for the series of numbers and/or cells excluding text.

AVERAGEIF | Calculates average for the cells based on the specified criterion.

AVERAGEIFS | Calculates average for the cells based on the specified conditions.

AVERAGEA | Calculates the average for the cells evaluating TRUE as 1 text and FALSE as 0.

COUNT | Counts the cells that contain numeric values in a range.

COUNTIF | Counts the cells based on the specified condition.

COUNTIFS | Counts the cells based on specified conditions.

COUNTA | Counts the cells that contain values in a range.

MIN | Returns the smallest number of the given arguments.

MAX | Returns the largest number of the given arguments.

DATE | Returns the date based on the given year, month, and day.

DAY | Returns the day from the given date.

DAYS | Returns the number of days between two dates.

IF | Returns value based on the given expression.

IFS | Returns value based on the given multiple expressions.

AND | Returns TRUE if all the arguments are TRUE otherwise returns FALSE.

OR | Returns TRUE if any of the arguments are TRUE otherwise returns FALSE.

IFERROR | Returns value if no error found else it will return specified value.

CHOOSE | Returns a value from the list of values based on the index number.

INDEX | Returns the value of the cell in a given range based on row and column number.

FIND | Returns the position of a string within another string which is case sensitive.

CONCATENATE | Combines two or more strings together.

CONCAT | Concatenates a list or a range of text strings.

SUBTOTAL | Returns subtotal for a range using the given function number.

RADIANS | Converts degrees into radians.

MATCH | Returns the relative position of a specified value in the given range.

DefineNameExists | This name already exists try a different name.

CircularReference | When a formula refers to one or more circular references this may result in an incorrect calculation.

ShowRowsWhere | Show rows where |

Loading translations

To load translation object in an application, use [load](#) function of the [L10n](#) class.

The following example demonstrates the Spreadsheet in **French** culture. In the below sample we have translated the ribbon tab names and Home tab content (clipboard, cell style).

INDEX.TS

```
import { Spreadsheet, SheetModel } from '@syncfusion/ej2-spreadsheet';
import { defaultData } from './datasource.ts';
import { L10n, enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
L10n.load({
  'fr-CH': {
    'spreadsheet': {
      'File': 'Fichier',
      'Home': 'Accueil',
      'Insert': 'Insérer',
      'Formulas': 'Formules',
      'Data': 'Les données',
      'View': 'Vue',
      'Cut': 'Coupe',
      'Copy': 'Copie',
      'Paste': 'Pâte',
      'PasteSpecial': 'Pâte spéciale',
      'All': 'Tous les',
      'Values': 'Valeurs',
      'Formats': 'Les formats',
      'Font': 'fonte',
      'FontSize': 'Taille de police',
      'Bold': 'Audacieux',
      'Italic': 'Italique',
      'Underline': 'Souligner',
      'Strikethrough': 'Barré',
      'TextColor': 'Couleur du texte',
      'FillColor': 'La couleur de remplissage',
      'HorizontalAlignment': 'Alignement horizontal',
      'AlignLeft': 'Alignez à gauche',
    }
  }
});
```

```

        'AlignCenter': 'centre',
        'AlignRight': 'Aligner à droite',
        'VerticalAlignment': 'Alignement vertical',
        'AlignTop': 'Aligner en haut',
        'AlignMiddle': 'Aligner le milieu',
        'AlignBottom': 'Aligner le bas',
        'InsertFunction': 'Insérer une fonction',
        'Delete': 'Effacer',
        'Rename': 'Rebaptiser',
        'Hide': 'Cacher',
        'Unhide': 'Démasquer',
        'NumberFormat': 'Nombre Format',
    }
}
});
let columns: ColumnModel[] = [{ width: 100 }, { width: 130 }, { width: 96 },
    { width: 130 }, { width: 130 }, { width: 96 },
    { width: 100 }, { width: 100 }, { width: 110 }, { width: 100 }, { width:
130 }, { width: 150 }];
let spreadsheet: Spreadsheet = new Spreadsheet({
    // Specifies the locale
    locale: 'fr-CH',
    sheets: [{ ranges: [{ dataSource: defaultData }], columns: columns
    }],
});
spreadsheet.appendTo('#spreadsheet');
```

Internationalization

The Internationalization library is used to globalize number, date, and time values in the spreadsheet component.

The following example demonstrates the Spreadsheet in French [fr-CH] culture. In the below sample we have globalized the Date(Date column), Time(Time column), and Currency(Amount column) formats.

INDEX.TS

```

import { Spreadsheet, SheetModel } from '@syncfusion/ej2-spreadsheet';
import { defaultData } from './datasource.ts';
import { L10n, enableRipple } from '@syncfusion/ej2-base';
import { loadCldr, L10n, setCulture, setCurrencyCode } from
 '@syncfusion/ej2-base';
import * as currencies from './currencies.json';
import * as cagregorian from './ca-gregorian.json';
import * as numbers from './numbers.json';
import * as timeZoneNames from './timeZoneNames.json';
import * as numberingSystems from './numberingSystems.json';
enableRipple(true);
loadCldr(currencies, cagregorian, numbers, timeZoneNames, numberingSystems);
setCulture('fr-CH');
setCurrencyCode('EUR');
L10n.load({
    'fr-CH': {
        'spreadsheet': {
            'File': 'Fichier',

```

```

        'Home': 'Accueil',
        'Insert': 'Insérer',
        'Formulas': 'Formules',
        'Data': 'Les données',
        'View': 'Vue',
        'Cut': 'Coupe',
        'Copy': 'Copie',
        'Paste': 'Pâte',
        'PasteSpecial': 'Pâte spéciale',
        'All': 'Tous les',
        'Values': 'Valeurs',
        'Formats': 'Les formats',
        'Font': 'fonte',
        'FontSize': 'Taille de police',
        'Bold': 'Audacieux',
        'Italic': 'Italique',
        'Underline': 'Souligner',
        'Strikethrough': 'Barré',
        'TextColor': 'Couleur du texte',
        'FillColor': 'La couleur de remplissage',
        'HorizontalAlignment': 'Alignement horizontal',
        'AlignLeft': 'Alignez à gauche',
        'AlignCenter': 'centre',
        'AlignRight': 'Aligner à droite',
        'VerticalAlignment': 'Alignement vertical',
        'AlignTop': 'Aligner en haut',
        'AlignMiddle': 'Aligner le milieu',
        'AlignBottom': 'Aligner le bas',
        'InsertFunction': 'Insérer une fonction',
        'Delete': 'Effacer',
        'Rename': 'Rebaptiser',
        'Hide': 'Cacher',
        'Unhide': 'Démasquer',
        'NumberFormat': 'Nombre Format',
    }
}
});
let columns: ColumnModel[] = [{ width: 100 }, { width: 130 }, { width: 96 },
    { width: 130 }, { width: 130 }, { width: 96 },
    { width: 100 }, { width: 100 }, { width: 110 }, { width: 100 }, { width:
130 }, { width: 150 }];
let spreadsheet: Spreadsheet = new Spreadsheet({
    // Specifies the locale
    locale: 'fr-CH',
    sheets: [{ ranges: [{ dataSource: defaultData }], columns: columns
    }],
    created: (): void => {
        //Applies cell and number formatting to specified range of the
        active sheet
        spreadsheet.cellFormat({ fontWeight: 'bold', textAlign:
'center', verticalAlign: 'middle' }, 'A1:F1');
        spreadsheet.numberFormat('$#,##0.00', 'F2:F11');
    }
});
spreadsheet.appendTo('#spreadsheet');
```

```

Right to left (RTL)

RTL provides an option to switch the text direction and layout of the Spreadsheet component from right to left. It improves the user experiences and accessibility for users who use right-to-left languages (Arabic, Farsi, Urdu, etc.). To enable RTL Spreadsheet, set the [enableRtl](#) to true.

INDEX.TS

```
import { Spreadsheet, SheetModel } from '@syncfusion/ej2-spreadsheet';
import { defaultData } from './datasource.ts';
import { L10n, enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);

Undo redo in EJ2 JavaScript Spreadsheet control

Undo option helps you to undone the last action performed and **Redo** option helps you to do the same action which is reverted in the Spreadsheet. You can use the [allowUndoRedo](#) property to enable or disable undo redo functionality in spreadsheet.

* The default value for **allowUndoRedo** property is **true**.

By default, the **UndoRedo** module is injected internally into Spreadsheet to perform undo redo.

Undo

It reverses the last action you performed with Spreadsheet. Undo can be done by any of the following ways:

- Select the undo item from HOME tab in Ribbon toolbar.
- Use **Ctrl + Z** keyboard shortcut to perform the undo.
- Use the [undo](#) method programmatically.

Redo

It reverses the last undo action you performed with Spreadsheet. Redo can be done by any of the following ways:

- Select the redo item from HOME tab in Ribbon toolbar.
- Use **Ctrl + Y** keyboard shortcut to perform the redo.
- Use the [redo](#) method programmatically.

Update custom actions in UndoRedo collection

You can update your own custom actions in UndoRedo collection, by using the [updateUndoRedoCollection](#) method. And also customize the undo redo operations of your custom action by using **actionComplete** event.

The following code example shows **How to update and customize your own actions for undo redo** functionality in the Spreadsheet control.

INDEX.TS

```

import { Spreadsheet, getRangeIndexes, ColumnModel } from '@syncfusion/ej2-spreadsheet';
import { defaultData } from './datasource.ts';
import { enableRipple, addClass, removeClass } from '@syncfusion/ej2-base';

```

```

let columns: ColumnModel[] = [
    {
        width: 130
    },
    {
        width: 92
    },
    {
        width: 96
    }
];
let spreadsheet: Spreadsheet = new Spreadsheet({
    sheets: [{ ranges: [{ dataSource: defaultData }], columns: columns }],
    actionComplete: (args): void => {
        let actionEvents: any = args;
        if (actionEvents.eventArgs.action == "customCSS") {
            let Element:HTMLElement =
spreadsheet.getCell(actionEvents.eventArgs.rowIdx,actionEvents.eventArgs.col
Idx);

            if (actionEvents.eventArgs.requestType == "undo") {
                removeClass([Element], 'customClass'); // To remove the
custom class in undo action
            }
            else {
                addClass([Element], 'customClass'); // To add the custom class
in redo action
            }
        }
    }
});
//Render the initialized Spreadsheet
spreadsheet.appendTo('#spreadsheet');
document.getElementById("customBtn").addEventListener('click',
updateCollection);
function updateCollection() {
    let cell: string = spreadsheet.getActiveSheet().activeCell;
    let cellIdx: number[] = getRangeIndexes(cell);
    let Element: HTMLElement = spreadsheet.getCell(cellIdx[0], cellIdx[1]);
    if (!Element.classList.contains("customClass")) {
        addClass([Element], 'customClass'); // To add the custom class in
active cell element
        spreadsheet.updateUndoRedoCollection({ eventArgs: { class:
'customClass', rowIdx: cellIdx[0], colIdx: cellIdx[1], action: 'customCSS' }
}); // To update the undo redo collection
    }
}
}

Accessibility in EJ2 JavaScript Spreadsheet control

The Spreadsheet control followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Spreadsheet control is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support | |

| [Section 508](#) Support | |

| Screen Reader Support | |

| Right-To-Left Support | |

| Color Contrast | |

| Mobile Device Support | |

| Keyboard Navigation Support | |

| [Accessibility Checker](#) Validation | |

| [Axe-core](#) Accessibility Validation | |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<div> - All features of the control meet the requirement.</div>

<div> - Some features of the control do not meet the requirement.</div>

<div> - The control does not meet the requirement.</div>

WAI-ARIA attributes

The Spreadsheet control followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Spreadsheet control:

Attributes	Purpose
-----	-----
grid (role)	This role is added to the spreadsheet content table and describes the collection of rows and columns.
gridcell (role)	This role is added to the cell element and describes the rows <td> element.
rowheader (role)	This role is added to the row header and describes the header of the rows.
colheader (role)	This role is added to the column header and describes the header of the columns.
aria-rowindex (attribute)	This attribute describes the table's row index in the spreadsheet.
aria-colindex (attribute)	This attribute describes the table's column index in the spreadsheet.
aria-selected (attribute)	This attribute describes an item's (cell, menu, checkbox, etc.) current selected state in the spreadsheet.
aria-rowcount (attribute)	This attribute describes the total number of rows in the table.
aria-colcount (attribute)	This attribute describes the total number of columns in the table.
aria-busy (attribute)	This attribute describes a currently updated or modified element.
aria-label (attribute)	This attribute describes the accessible name for the interactive elements.
textbox (role)	This role is assigned to the textbox that accepts text input.
menu (role)	This role has been added to the menu and describes the menu items.
aria-expanded (attribute)	This attribute describes the control (for example, dropdown) is expanded or collapsed.
aria-multiline (attribute)	This attribute defines what the Alt + Enter key does in the spreadsheet editor.

Keyboard interaction

The Spreadsheet control followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Spreadsheet control.

Press	To do this
-----	-----
Up arrow	Navigate from the active cell to the previous cell in the same column.

| Down arrow | Navigate from the active cell to the next cell in the same column. |

| Left arrow | Navigate from the active cell to the previous cell in the same row. |

| Right arrow | Navigate from the active cell to the next cell in the same row. |

| Tab | Navigate the active cell to the next cell in the same row. |

| Shift + Tab | Navigate the active cell to the previous cell in the same row. |

| Home | Moves the selection to starting column in worksheet. |

| Ctrl + Home | Move the selection to the first visible cell on a worksheet. |

| Shift + Home | Extend the cell selection to the first column of a worksheet. |

| Ctrl + Shift + Home | Extend the selection of cells to the beginning of the worksheet. |

| Ctrl + End | Move to the last cell on a worksheet, right most last column and last row cell. |

| Page Up | Move page up. |

| Page Down | Move page down. |

| Shift + Page Up | Perform page up by selecting all cells between. |

| Shift + Page Down | Perform page down by selecting all cells between. |

| Ctrl + Up | Navigate to the non-blank cell before the active cell in the same column. |

| Ctrl + Down | Navigate to the last non-blank cell in the same column as the active cell. |

| Ctrl + Left | Navigate to the non-blank cell before the active cell in the same row. |

| Ctrl + Right | Navigate to the last non-blank cell in the same row as the active cell. |

| Shift + Up | Extend the selection of cells to the previous row. |

| Shift + Down | Extend the selection of cells to the next row. |

| Shift + Left | Extend the selection of cells to the previous column. |

| Shift + Right | Extend the selection of cells to the next column. |

| Ctrl + Shift + Up | Extend the cell selection to the previous non-blank cell in the same column as the active cell. |

| Ctrl + Shift + Down | Extend the cell selection to the last non-blank cell in the same column as the active cell. |

| Ctrl + Shift + Left | Extend the cell selection to the previous non-blank cell in the same row as the active cell. |

| Ctrl + Shift + Right | Extend the cell selection to the last non-blank cell in the same row as the active cell. |

| Enter | Navigate the active cell to the next cell in the same column. |

| Shift + Enter | Navigate to the previous cell in the same column from the active cell. |

| Alt + Enter | While editing, add a new line. |

| Enter | Complete the cell editing and select the cell below in the same column. |

- | Shift + Enter | Complete the cell editing and select the cell above in the same column. |
- | Tab | Complete the cell editing and select the next cell in the same row. |
- | Shift + Tab | Complete the cell editing and select the previous cell in the same row. |
- | Alt | Focus on the active ribbon tab. |
- | Left | Move the focus to the previous items in the ribbon content. |
- | Right | Move the focus to the next items in the ribbon content. |
- | Alt + Down | Open the ribbon dropdown menu. |
- | Esc / Alt + Up | Close the ribbon dropdown menu. |

Ensuring accessibility

The Spreadsheet control's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Spreadsheet control is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Spreadsheet control with accessibility tools.

Styles in EJ2 JavaScript Spreadsheet control

To modify the Spreadsheet appearance, you need to override the default CSS of the spreadsheet. Please find the CSS structure that can be used to modify the Spreadsheet appearance. Also, you have an option to create your own custom theme for all the JavaScript controls using our [Theme Studio](#).

Customizing the Spreadsheet

Use the below CSS to customize the Spreadsheet root element.

```
,  
  
.e-spreadsheet {  
font-family: cursive;  
}  
,
```

Header

Customizing the Spreadsheet Ribbon

Use the below CSS to customize the Spreadsheet Ribbon.

```
,  
  
.e-spreadsheet .e-ribbon {  
background-color: #808080;  
}  
,
```

Customizing the Spreadsheet formula bar panel

You can customize the Spreadsheet formula bar panel by using this CSS.

,

```
.e-spreadsheet .e-formula-bar-panel {  
border: none;  
}
```

,

Customizing the Spreadsheet formula bar text

You can customize the Spreadsheet formula bar text by using this CSS.

,

```
.e-spreadsheet .e-formula-bar-panel .e-formula-bar {  
font-weight: bold;  
}
```

,

*Sheet**Customizing the Spreadsheet sheet element*

Using this CSS, you can customize the Spreadsheet sheet element.

,

```
.e-spreadsheet .e-sheet-panel .e-sheet {  
border-color: #000000;  
}
```

,

Customizing the Spreadsheet sheet header

Use the below CSS to customize the Spreadsheet sheet header.

,

```
.e-spreadsheet .e-sheet-panel .e-sheet .e-header-panel {  
font-style: oblique;  
}
```

,

Customizing the Spreadsheet row header

Use the below CSS to customize the Spreadsheet row header.

,

```
.e-spreadsheet .e-row-header .e-header-cell {  
color: #0000FF !important;  
}
```

,

Customizing the Spreadsheet column header

Use the below CSS to customize the Spreadsheet column header.

,

```
.e-spreadsheet .e-column-header .e-header-cell {  
color: #0000FF !important;  
}
```

,

Customizing the Spreadsheet selection element

Customize the Spreadsheet selection element.

,

```
.e-spreadsheet .e-selection {  
border-color: #0000FF;  
}
```

,

Customizing the Spreadsheet active cell element

Customize the Spreadsheet active cell element.

,

```
.e-spreadsheet .e-active-cell {  
border-color: #0000FF;  
}
```

,

Customizing the Spreadsheet cell element

Using this CSS, you can customize the Spreadsheet cell element.

,

```
.e-spreadsheet .e-cell {  
background-color: #0078d7 !important;  
}
```

,

Ribbon Items

Customizing the Spreadsheet sorting icon

Use the below CSS to customize the Spreadsheet sorting icon in the Spreadsheet ribbon. You can use the available Syncfusion [icons](#) based on your theme.

,

```
.e-spreadsheet .e-sort-filter-icon:before {
```

```
background-color: #deecf9;
content: '\e306';
}
`
```

Customizing the filter dialog content

Use the below CSS to customize the Spreadsheet filter dialog content element.

```
`
.e-spreadsheet .e-filter-popup .e-dlg-content {
background-color: #deecf9;
}
`
```

Customizing the filter dialog footer

Spreadsheet filter dialog footer element can be customized by using the below CSS.

```
`
.e-spreadsheet .e-filter-popup .e-footer-content {
background-color: #ccffff;
}
`
```

Customizing the filter dialog input element

Use the below CSS to customize the Spreadsheet filter dialog input element.

```
`
.e-spreadsheet .e-filter-popup .e-input-group input.e-input{
font-family: cursive;
}
`
```

Customizing the filter dialog button element

Use the below CSS to customize the Spreadsheet filter dialog button element.

```
`
.e-spreadsheet .e-filter-popup .e-btn{
font-family: cursive;
}
`
```

Customizing the Excel filter dialog number filters element

Spreadsheet Excel filter dialog number filters element can be customized by using the below CSS.

```
`
```

```
.e-spreadsheet .e-filter-popup .e-contextmenu-wrapper ul{
background-color: #deecf9;
}
`
```

Footer

Customizing the Spreadsheet sheet tab panel

Spreadsheet sheet tab panel can be customized by using the below CSS.

```
.e-spreadsheet .e-sheet-tab-panel {
background: #08fbfb;
}
`
```

Customizing the Spreadsheet sheet tab

Spreadsheet sheet tab element can be customized by using the below CSS.

```
.e-spreadsheet .e-sheet-tab-panel .e-tab-header .e-toolbar-item.e-active .e-tab-wrap .e-tab-text {
font-weight: bold;
}
`
```

Use Cases

Collaborative editing in EJ2 JavaScript Spreadsheet control

The collaborative editing support allows you to work at a spreadsheet collaboratively with other users. Multiple users can access to the the same spreadsheet simultaneously.

Dependencies

The following list of dependencies are required to use the collaborative editing support in spreadsheet.

```
`js
|-- @aspnet/signalr
|-- eventsourcing
|-- request
|-- ws
`
```

* Run the command `npm i @aspnet/signalr` to install `@aspnet/signalr` packages in your application.

Client configuration

To broadcast the data for every action in the spreadsheet, you need to transfer the data to the server through `send` method in `actionComplete` event and receive the same data by using the `dataReceived`

method. In the `dataReceived` method, you need to update the action to the connected clients through `updateAction` method.

The following code example shows `Collaborative Editing` support in the Spreadsheet control.

```
`ts
import { Spreadsheet } from '@syncfusion/ej2-spreadsheet';
import * as signalR from '@aspnet/signalr';
import { data } from './datasource.ts';
// For signalR Hub connection
const connection: signalR.HubConnection = new
signalR.HubConnectionBuilder().withUrl('https://localhost:44385/hubs/spreadsheethub', { // localhost
from AspNetCore service
skipNegotiation: true,
transport: signalR.HttpTransportType.WebSockets
}).build();
//Initialize the SpreadSheet control
let spreadsheet: Spreadsheet = new Spreadsheet({
sheets: [{
ranges: [{ dataSource: data }],
columns: [{ width: 130 }, { width: 110 }, { width: 110 },
{ width: 90 }, { width: 90 }, { width: 90 }, { width: 90 }, { width: 90 }
}],
actionComplete: (args) => {
connection.send('BroadcastData', JSON.stringify(args)); // send the action data to the server
},
});
spreadsheet.appendTo('#spreadsheet');
connection.on('dataReceived', (data: string) => {
let model: CollaborativeEditArgs = JSON.parse(data) as CollaborativeEditArgs;
spreadsheet.updateAction(model); // update the action to the connected clients
});
connection.start().then(() => { // to start the server
console.log('server connected!!!');
}).catch(err => console.log(err));
`
```

Server configuration

To make the communication between the server to the connected clients and from clients to the server, you need to configure the signalR Hubs using the following code.

```
`ts
import * as signalR from '@aspnet/signalr';
// For signalR Hub connection
const connection: signalR.HubConnection = new
signalR.HubConnectionBuilder().withUrl('https://localhost:44385/hubs/spreadsheethub', { // localhost
from AspNetCore service
skipNegotiation: true,
transport: signalR.HttpTransportType.WebSockets
}).build();
`
```

Hub configuration

Initially create a ASP.NET Core project and add the hub file for sending and receiving the data between server and clients.

```
`ts
using Microsoft.AspNetCore.SignalR;
using System.Threading.Tasks;
namespace WebApplication.Hubs
{
public class SpreadsheetHub : Hub
{
public async Task BroadcastData(string data)
{
await Clients.Others.SendAsync("dataReceived", data);
}
}
}
`
```

To configure the SignalR middleware by registering the following service in the `ConfigureServices` method of the `Startup` class.

```
`ts
services.AddSignalR(e =>
{
```

e.MaximumReceiveMessageSize = int.MaxValue; // Option to increase message size for inserting image feature. By default, SignalR send messages up to 32 KB.

```
});
`
```

To set up the SignalR routes by calling MapHub in the `Configure` method of the `Startup` class.

```
`ts
app.UseEndpoints(endpoints =>
{
    endpoints.MapRazorPages();
    endpoints.MapHub<SpreadsheetHub>("/hubs/spreadsheethub");
});
`
```

For hosting the service, you may use the above code snippet or download and run the [local service](#).

Prevent the particular action update for collaborative client

Using the `action` argument from the `actionComplete` event, you can prevent the particular action update for collaborative client.

The following code example shows how to prevent collaborative client from updating the `format` action.

```
`ts
import { Spreadsheet } from '@syncfusion/ej2-spreadsheet';
import * as signalR from '@aspnet/signalr';
import { data } from './datasource.ts';
// For signalR Hub connection
const connection: signalR.HubConnection = new
signalR.HubConnectionBuilder().withUrl('https://localhost:44385/hubs/spreadsheethub', { // localhost
from AspNetCore service
skipNegotiation: true,
transport: signalR.HttpTransportType.WebSockets
}).build();
//Initialize the SpreadSheet control
let spreadsheet: Spreadsheet = new Spreadsheet({
sheets: [{
ranges: [{ dataSource: data }],
columns: [{ width: 130 }, { width: 110 }, { width: 110},
{ width: 90 }, { width: 90 }, {width: 90}, { width: 90 }, {width: 90}]
}],

```

```

actionComplete: (args) => {
  if (args.action !== 'format') { // prevent the format action
    connection.send('BroadcastData', JSON.stringify(args)); // send the action data to the server
  }
},
});
spreadsheet.appendTo('#spreadsheet');
connection.on('dataReceived', (data: string) => {
  let model: CollaborativeEditArgs = JSON.parse(data) as CollaborativeEditArgs;
  spreadsheet.updateAction(model); // update the action to the connected clients
});
connection.start().then(() => { // to start the server
  console.log('server connected!!!');
}).catch(err => console.log(err));
`

```

Perform import action for collaborative clients

Using the `action` argument from the [actionComplete](#) event, you can identify whether the import action is performed or not. If the action is `import`, then you need to send the `response data` to the server and also update the same to the collaborative clients.

The following code example shows how to perform the import functionality for collaborative clients.

```

`ts
import { Spreadsheet, CollaborativeEditArgs } from '@syncfusion/ej2-spreadsheet';
import * as signalR from '@microsoft/signalr';
import { isNullOrUndefined } from "@syncfusion/ej2-base";
// For signalR Hub connection.
const connection: signalR.HubConnection = new
signalR.HubConnectionBuilder().withUrl('https://localhost:44385/hubs/spreadsheethub', {
  skipNegotiation: true,
  transport: signalR.HttpTransportType.WebSockets
}).build();
let spreadsheet: Spreadsheet = new Spreadsheet({
  openUrl: 'https://services.syncfusion.com/js/production/api/spreadsheet/open',
  actionComplete: (args: {action: string, response: any}) => {
    if (args.action === 'import') {

```

```
// Send the action data to the server in args.response at the time of importing an excel file.
connection.send("BroadcastData", JSON.stringify(args.response.data));
}
else {
// Send the action data to the server for other than import actions.
connection.send("BroadcastData", JSON.stringify(args));
}
},
});
spreadsheet.appendTo('#spreadsheet');
connection.on('dataReceived', (data: string) => {
const model: CollaborativeEditArgs = JSON.parse(
data
) as CollaborativeEditArgs;
// Condition to check whether action performed is import.
if (isNullOrUndefined(model['action'])) {
// Load the imported excel file data as JSON to the connected clients.
const jsonData: object = { Workbook: model };
spreadsheet.openFromJson({ file: jsonData });
}
else {
// Update the action details to the connected clients.
spreadsheet.updateAction(model);
}
});
connection
.start()
.then(() => {
console.log('server connected!!!');
})
.catch(err => console.log(err));
,
```

How To

Sort a range by custom list in EJ2 JavaScript Spreadsheet control

You can also define the sorting of cell values based on your own customized personal list. In this article, custom list is achieved using custom sort comparer.

In the following demo, the Trustworthiness column is sorted based on the custom lists Perfect, Sufficient, and Insufficient.

INDEX.TS

```
import { Spreadsheet, CellModel } from '@syncfusion/ej2-spreadsheet';
import { DataManager, DataUtil } from '@syncfusion/ej2-data';
import { tradeData } from './datasource.ts';
let spreadsheet: Spreadsheet = new Spreadsheet({
    sheets: [{ ranges: [{ dataSource: new DataManager(tradeData) }] }],
    dataBound: function () {
        if (spreadsheet.activeSheetIndex === 0) {
            spreadsheet.sort({sortDescriptors: { field: 'F', sortComparer:
mySortComparer }, containsHeader: true}, 'A1:H20');
        }
    },
    sortComplete: function (args) {
        spreadsheet.selectRange(args.range);
        // code here.
    }
});
// custom sort comparer to sort based on the custom list.
let customList: string[] = ['Perfect', 'Sufficient', 'Insufficient'];
function mySortComparer(x: CellModel, y: CellModel): number {
    let comparer: Function = DataUtil.fnSort('Ascending');
    return comparer(x ? customList.indexOf(x.value) : x, y ?
customList.indexOf(y.value) : y);
};
//Render the initialized Spreadsheet
spreadsheet.appendTo('#spreadsheet');
```

INDEX.HTML

Create a object structure in EJ2 JavaScript Spreadsheet control

This topic guides you to construct a JSON structure that can be passed to the [openFromJson](#) method to render the spreadsheet. The JSON structure is an object with the key as **Workbook** and the [properties](#) of the spreadsheet as value.

```
`js
{ Workbook: {} }
`
```

The following properties are the root level properties of the **Workbook** object.

Property	Type	Description
activeSheetIndex	number	Specifies active sheet index in the workbook.
sheets	Sheet[]	Contains a list of sheet properties.
definedNames	DefineName[]	Specifies the name for a range and uses it in the formula for calculation.

The following table defines each property of the **Sheet**.

Property	Type	Description
name	string	Specifies the name of the sheet.
selectedRange	string	Specifies selected range in the sheet.
activeCell	string	Specifies active cell within selectedRange in the sheet.
topLeftCell	string	Specified cell will be positioned at the upper-left corner of the sheet.
showHeaders	boolean	Specifies to show or hide column and row headers in the sheet.
showGridLines	boolean	Specifies to show or hide gridlines in the sheet.
isProtected	boolean	Specifies to protect the cells in the sheet.
state	SheetState	Specifies the sheet visibility state. There must be at least one visible sheet in Spreadsheet.
columns	Column[]	Contains a list of column properties
rows	Row[]	Contains a list of row properties
protectSettings	ProtectSettings	Configures protect and its options.
conditionalFormats	ConditionalFormat[]	Specifies the conditional formatting for the sheet.

The following table defines each property of the **Column**.

Property	Type	Description
width	number	Specifies the width of the column.

| customWidth | boolean | Specifies custom width of the column. |
 | hidden | boolean | To hide or show the column in the sheet. |

The following table defines each property of the **Row**.

Property	Type	Description
height	number	Specifies the height of the row.
customHeight	boolean	Specifies the custom height of the row.
hidden	boolean	To hide or show the row in the sheet.
cells	Cell[]	Contains a list of cell properties

The following table defines each property of the **Cell**.

Property	Type	Description
value	string	Defines the value of the cell which can be text or number.
formula	string	Defines the formula or expression of the cell.
format	string	Specifies the number format code to display the value in specified number format.
hyperlink	string	Specifies the hyperlink of the cell.
wrap	boolean	Wraps the cell text to the next line, if the text width exceeds the column width.
isLocked	boolean	Specifies the cell whether it is locked or not, for allowing edit range in the spreadsheet protect option.
colSpan	number	Specifies the column-wise cell merge count.
rowSpan	number	Specifies the row-wise cell merge count.
style	CellStyle	Specifies the cell style options.
validation	Validation	Specifies the validation of the cell.
image	Image[]	Specifies the image of the cell.

The following table defines each property of the **CellStyle**.

Property	Type	Description
fontFamily	FontFamily	Specifies font family of the cell.
verticalAlign	VerticalAlign	Specifies vertical align of the cell.
textAlign	TextAlign	Specifies text align style of the cell.
textIndent	string	Specifies text indent style of the cell.
color	string	Specifies font color of the cell.
backgroundColor	string	Specifies the background color of the cell.

fontWeight	**FontWeight**	Specifies font weight of the cell.
fontStyle	**FontStyle**	Specifies font style of the cell.
fontSize	string	Specifies font size of the cell.
textDecoration	**TextDecoration**	Specifies text decoration of the cell.
border	string	Specifies border of the cell.
borderTop	string	Specifies top border of the cell.
borderBottom	string	Specifies bottom border of the cell.
borderLeft	string	Specifies left border of the cell.
borderRight	string	Specifies right border of the cell.

```
`js
```

```
type FontFamily = 'Arial' | 'Arial Black' | 'Axettac Demo' | 'Batang' | 'Book Antiqua' | 'Calibri' | 'Courier' |  

  'Courier New' | 'Din Condensed' | 'Georgia' | 'Helvetica' | 'Helvetica New' | 'Roboto' | 'Tahoma' | 'Times  

  New Roman' | 'Verdana';
```

```
type VerticalAlign = 'bottom' | 'middle' | 'top';
```

```
type TextAlign = 'left' | 'center' | 'right';
```

```
type FontWeight = 'bold' | 'normal';
```

```
type FontStyle = 'italic' | 'normal';
```

```
type TextDecoration = 'underline' | 'line-through' | 'underline line-through' | 'none';
```

```
,
```

The following table defines each property of the **Validation**.

Property	Type	Description
-----	-----	-----
type	ValidationType	Specifies Validation Type.
operator	ValidationOperator	Specifies Validation Operator.
value1	string	Specifies Validation Minimum Value.
value2	string	Specifies Validation Maximum Value.
ignoreBlank	boolean	Specifies IgnoreBlank option in Data Validation.
inCellDropDown	boolean	Specifies InCellDropDown option in Data Validation.
isHighlighted	boolean	Specifies to allow Highlight Invalid Data.

```
`js
```

```
type ValidationType = 'WholeNumber' | 'Decimal' | 'Date' | 'TextLength' | 'List' | 'Time';
```

```
type ValidationOperator = 'Between' | 'NotBetween' | 'EqualTo' | 'NotEqualTo' | 'LessThan' |  

  'GreaterThan' | 'GreaterThanOrEqualTo' | 'LessThanOrEqualTo';
```

The following table defines each property of the `Image`.

Property	Type	Description
src	string	Specifies the image source.
id	string	Specifies image element id.
height	number	Specifies the height of the image.
width	number	Specifies the width of the image.
top	number	Specifies the top position of the image.
left	number	Specifies the left position of the image.

The following table defines each property of the `ConditionalFormat`.

Property	Type	Description
type	<code>HighlightCell</code> or <code>TopBottom</code> or <code>DataBar</code> or <code>ColorScale</code> or <code>IconSet</code>	Specifies Conditional formatting Type.
format	<code>Format</code>	Specifies format.
cFColor	<code>CFCOLOR</code>	Specifies Conditional formatting Highlight Color.
value	string	Specifies Conditional formatting value.
range	string	Specifies Conditional formatting range.

```
`js
type HighlightCell = 'GreaterThan' | 'LessThan' | 'Between' | 'EqualTo' | 'ContainsText' | 'DateOccur' |
'Duplicate' | 'Unique';

type TopBottom = 'Top10Items' | 'Bottom10Items' | 'Top10Percentage' | 'Bottom10Percentage' |
'BelowAverage' | 'AboveAverage';

type DataBar = 'BlueDataBar' | 'GreenDataBar' | 'RedDataBar' | 'OrangeDataBar' | 'LightBlueDataBar' |
'PurpleDataBar';

type ColorScale = 'GYRColorScale' | 'RYGColorScale' | 'GWRCColorScale' | 'RWGColorScale' |
'BWRCColorScale' | 'RWBCColorScale' | 'WRCColorScale' | 'RWColorScale' | 'GWColorScale' |
'WGColorScale' | 'GYColorScale' | 'YGColorScale';

type IconSet = 'ThreeArrows' | 'ThreeArrowsGray' | 'FourArrowsGray' | 'FourArrows' | 'FiveArrowsGray' |
'FiveArrows' | 'ThreeTrafficLights1' | 'ThreeTrafficLights2' | 'ThreeSigns' | 'FourTrafficLights' |
'FourRedToBlack' | 'ThreeSymbols' | 'ThreeSymbols2' | 'ThreeFlags' | 'FourRating' | 'FiveQuarters' |
'FiveRating' | 'ThreeTriangles' | 'ThreeStars' | 'FiveBoxes';

type CFColor = 'RedFT' | 'YellowFT' | 'GreenFT' | 'RedF' | 'RedT';
```

The following table defines each property of the `Format`.

Property	Type	Description
format	string	Specifies the number format code to display the value in specified number format.
style	CellStyle	Specifies the cell style options.

The following table defines each property of the `DefinedName`.

Property	Type	Description
name	string	Specifies a name for the defined name, which can be used in the formula.
scope	string	Specifies scope for the defined name.
comment	string	Specifies comment for the defined name.
refersTo	string	Specifies reference for the defined name.

In the following demo, the JSON structure is passed to the `openFromJson` method to render the spreadsheet in the `created` event.

INDEX.TS

```
import { Spreadsheet } from '@syncfusion/ej2-spreadsheet';
import { jsonData } from './datasource.ts';
let spreadsheet: Spreadsheet = new Spreadsheet({
    created: function () {
        spreadsheet.openFromJson({ file: jsonData });
    }
});
spreadsheet.appendTo('#spreadsheet');
```

Print in EJ2 JavaScript Spreadsheet control

You can use the `print` method by importing from `ej2-base` package. Here, the `Select` event in the dropdown and the `dataBound` event are used to print the single/multiple sheets of data. To print the single/multiple sheets, use the dropdown button and select the `Print` (or) `Print All` option. In the following sample, you can be able to print the single/multiple sheets.

INDEX.TS

```

import { createElement, print } from '@syncfusion/ej2-base';
import { Spreadsheet, SheetModel, MenuSelectEventArgs, UsedRangeModel } from
 '@syncfusion/ej2-spreadsheet';
import { budgetData, salaryData } from './datasource.ts';
import { DropDownButton, ItemModel, MenuEventArgs } from "@syncfusion/ej2-
splitbuttons";
//Initialize action items.
let items: ItemModel[] = [
    {
        text: "Print"
    },
    {

```

```

        text: "Print All"
    }
];
// Initialize the DropDownButton component.
let drpDownBtn: DropDownButton = new DropDownButton({
    items: items,
    cssClass: "e-round-corner",
    select: (args: MenuEventArgs) => {
        if (args.item.text === 'Print') {
            printElement.querySelector(".e-sheet-content").innerHTML =
document.querySelector(
                ".e-sheet-content"
            ).innerHTML; // To add the spreadsheet table
            let usedRange: UsedRangeModel =
spreadsheet.getActiveSheet().usedRange;
            let tbody: Element = printElement.querySelector('tbody');
            for (let i: number = tbody.getElementsByClassName('e-row').length; i
>= 0; i--) {
                if (tbody.getElementsByClassName('e-row')[i] &&
parseInt(tbody.getElementsByClassName('e-row')[i].getAttribute('aria-
rowindex')) > usedRange.rowIndex + 1) {
                    tbody.getElementsByClassName('e-row')[i].remove();
                }
            }
            (printElement.querySelector('.e-sheet-
content').children[0].getElementsByClassName('e-virtualtrack')[0] as
HTMLElement).style.height = 'auto';
            print(printElement);
            printElement.querySelector(".e-sheet-content").innerHTML = '';
        }
        if (args.item.text === 'Print All') {
            let sheets: SheetModel[] = spreadsheet.sheets;

Changing the active sheet while importing a file in EJ2 JavaScript Spreadsheet control

You can change the active sheet of imported file by updating [activeSheetIndex](#) property on the [openComplete](#) event.

The following code example shows how to set the active sheet when importing an Excel file.

INDEX.TS

```

import { Spreadsheet } from '@syncfusion/ej2-spreadsheet';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
let spreadsheet: Spreadsheet = new Spreadsheet({
  openUrl:
    'https://services.syncfusion.com/js/production/api/spreadsheet/open',
  saveUrl:
    'https://services.syncfusion.com/js/production/api/spreadsheet/save',
  openComplete: function() {
    if (spreadsheet) {
      spreadsheet.activeSheetIndex = 2;
    }
  }
});
spreadsheet.appendTo('#spreadsheet');

```

INDEX.HTML

Import an excel document using file uploader in EJ2 JavaScript Spreadsheet control

If you explore your machine to select and upload an excel document using the file uploader, you will receive the uploaded document as a raw file in the [success](#) event of the file uploader. In this **success**

event, you should pass the received raw file as an argument to the Spreadsheet's [open](#) method to see the appropriate output.

INDEX.TS

```
import { Spreadsheet } from '@syncfusion/ej2-spreadsheet';
import { Uploader } from '@syncfusion/ej2-inputs';
let spreadsheet: Spreadsheet = new Spreadsheet({
    openUrl:
    'https://services.syncfusion.com/js/production/api/spreadsheet/open',
});
spreadsheet.appendTo('#spreadsheet');
let uploader: Uploader = new Uploader({
    asyncSettings: {
        saveUrl:
            'https://services.syncfusion.com/js/production/api/FileUploader/Save',
        removeUrl:
            'https://services.syncfusion.com/js/production/api/FileUploader/Remove',
    },
    success: onSuccess,
    allowedExtensions: '.csv, .xls, .xlsx',
});
uploader.appendTo('#uploader');
function onSuccess(args): void {
    if (args.operation == 'upload')
        spreadsheet.open({ file: args.file.rawFile });
}
```

Identify the context menu opened in EJ2 JavaScript Spreadsheet control

The Spreadsheet includes several context menus that will open and display depending on the action. When you right-click on a cell, for example, a context menu with options related to the cell element appears.

The class name returned by the [contextMenuBeforeOpen](#) event can be used to identify the context menu that is opened. The context menus and their class names are tabulated below.

Class name	Context menu name
-----	-----
.e-sheet-content	Cell context menu
.e-toolbar-item	Footer context menu
.e-rowhdr-table	Row header context menu
.e-colhdr-table	Column header context menu

The following code example shows how to identify the context menu opened.

INDEX.TS

```

import { Spreadsheet } from '@syncfusion/ej2-spreadsheet';
import { enableRipple, closest } from '@syncfusion/ej2-base';

```

```
import { BeforeOpenCloseMenuEventArgs } from '@syncfusion/ej2-navigations';
enableRipple(true);
let spreadsheet: Spreadsheet = new Spreadsheet({
  contextMenuBeforeOpen: (args: BeforeOpenCloseMenuEventArgs): void => {
    if (closest(args.event.target, '.e-sheet-content')) {
      console.log('Cell Context Menu');
    } else if (closest(args.event.target, '.e-colhdr-table')) {
      console.log('Column Header Context Menu');
    } else if (closest(args.event.target, '.e-rowhdr-table')) {
      console.log('Row Header Context Menu');
    } else if (closest(args.event.target, '.e-toolbar-item')) {
      console.log('Footer Context Menu');
    }
  },
});
spreadsheet.appendTo('#spreadsheet');
```

Save and open Spreadsheet data as a Base64 string in EJ2 JavaScript Spreadsheet control

In the Spreadsheet control, there is currently no direct option to save and open data as a Base64 string. You can achieve this by saving the Spreadsheet data as blob data and then converting that saved blob data to a Base64 string using FileReader.

You can get the Spreadsheet data as blob in the [saveComplete](#) event when you set the `needBlobData` as `true` and `isFullPost` as `false` in the [beforeSave](#) event.

The following code example shows how to save and open the spreadsheet data as base64 string.

INDEX.TS

```
import { Spreadsheet, BeforeSaveEventArgs, SaveCompleteEventArgs } from
'@syncfusion/ej2-spreadsheet';
import { data } from './datasource.ts';
let base64String: string | ArrayBuffer;
let spreadsheet: Spreadsheet = new Spreadsheet({
  openUrl:
'https://services.syncfusion.com/js/production/api/spreadsheet/open',
  sheets: [{
    name: 'Car Sales Report',
    ranges: [{ dataSource: data }],
    columns: [
      { width: 180 }, { width: 130 }, { width: 130 }, { width: 180 },
      { width: 130 }, { width: 120 }
    ]
  }],
  created: (): void => {
    //Applies cell and number formatting to specified range of the active
    sheet
    spreadsheet.cellFormat({ fontWeight: 'bold', textAlign: 'center',
    verticalAlign: 'middle' }, 'A1:F1');
  },
  beforeSave: (args: BeforeSaveEventArgs): void => {
    args.needBlobData = true; // To trigger the saveComplete event.
    args.isFullPost = false; // Get the spreadsheet data as blob data in the
    saveComplete event.
  },
```

```

saveComplete: (args: SaveCompleteEventArgs): void => {
    // Convert blob data to base64 string.
    let reader: FileReader = new FileReader();
    reader.readAsDataURL(args.blobData);
    reader.onloadend = function () {
        base64String = reader.result ? reader.result : '';
    };
}
});
spreadsheet.appendTo('#spreadsheet');
document.getElementById("import")!.onclick = (): void => {
    // Open the file based on saved base64 string.
    fetch(base64String as string)
        .then((response) => response.blob())
        .then((fileBlob) => {
            let file = new File([fileBlob], 'Sample.xlsx');
            spreadsheet.open({ file: file });
        });
}
document.getElementById("export")!.onclick = (): void => {
    spreadsheet.save({
        url:
        'https://services.syncfusion.com/js/production/api/spreadsheet/save',
        fileName: 'Worksheet',
        saveType: 'Xlsx',
    }); // Specifies the save URL, file name, file type need to be saved.
    // Logs base64 string into the console.
    console.log('Base64 String - ', base64String);
}
}

```

Insert a sheet programmatically and make it the active sheet in EJ2 JavaScript Spreadsheet control

A sheet is a collection of cells organized in the form of rows and columns that allows you to store, format, and manipulate the data. Using [insertSheet](#) method, you can insert one or more sheets at the desired index. Then, you can make the inserted sheet as active sheet by focusing the start cell of that sheet using the [goTo](#) method.

The following code example shows how to insert a sheet programmatically and make it the active sheet.

INDEX.TS

```

import { Spreadsheet, SheetModel, ColumnModel } from '@syncfusion/ej2-
spreadsheet';
import { data, employeeData } from './datasource.ts';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
let columns: ColumnModel[] = [
  { width: 180 }, { width: 130 }, { width: 130 },
  { width: 180 }, { width: 130 }, { width: 120 }
];
let sheets: SheetModel[] = [{
  name: 'Car Sales Report',
  ranges: [{ dataSource: data }],

```

```

        columns: columns
    }];
    let spreadsheet: Spreadsheet = new Spreadsheet({
        sheets: sheets,
    });
    spreadsheet.appendTo('#spreadsheet');
    document.getElementById("insertSheet")!.onclick = () => {
        spreadsheet.insertSheet(
            [
                {
                    index: 1,
                    name: 'new_sheet',
                    ranges: [
                        {
                            dataSource: employeeData,
                            startCell: 'A1'
                        },
                    ],
                    columns: columns,
                },
            ],
        );
        // Use the timeout function to wait until the sheet is inserted.
        setTimeout(() => {
            // Method for switching to a new sheet.
            spreadsheet.goTo('new_sheet!A1');
        })
    };
};

```

Get the filtered rows in EJ2 JavaScript Spreadsheet control

Filtering allows you to view specific rows in a spreadsheet while hiding the others. The [allowFiltering](#) property allows you to enable or disable filtering functionality through the UI. You can also use the [allowFiltering](#) property and [applyFilter](#) method combination to filter data via code behind. The filtered rows can be identified by iterating through the row collection on the sheet and using the `isFiltered` property available in each row object.

The following code example shows how to get the filtered rows.

INDEX.TS

```

import { Spreadsheet, ColumnModel, ExtendedRowModel, SheetModel,
UsedRangeModel } from '@syncfusion/ej2-spreadsheet';
import { PredicateModel } from '@syncfusion/ej2-grids';
import { defaultData } from './datasource.ts';
let columns: ColumnModel[] = [
  { width: 180 }, { width: 130 }, { width: 130 }, { width: 180 },
  { width: 130 }, { width: 120 }
]
let spreadsheet: Spreadsheet = new Spreadsheet({
  sheets: [{ ranges: [{ dataSource: defaultData }], columns: columns }],
  created: function () {
    // Applies cell formatting to specified range of the active sheet

```

```

        spreadsheet.cellFormat({ fontWeight: 'bold', textAlign: 'center',
verticalAlign: 'middle' }, 'A1:F1');
        // Construct the predicate model to be updated to the data.
        let predicates: PredicateModel[] = [{
            field: 'C',
            operator: 'equal',
            value: 'Pink',
            matchCase: false
        }];
        // Apply filter to the specified range.
        spreadsheet.applyFilter(predicates, 'A1:C7');
    }
});
spreadsheet.appendTo('#spreadsheet');
document.getElementById("getFilterData").onclick = () => {
    let activeSheet: SheetModel = spreadsheet.getActiveSheet();
    let usedRange: UsedRangeModel = activeSheet.usedRange;
    for (let i: number = 0; i <= usedRange.rowIndex; i++) {
        // Get the filtered row using isFiltered property.
        let filteredRow: Object = (activeSheet.rows[i] as
ExtendedRowModel).isFiltered;
        if (!filteredRow) {
            let rowData: Object = spreadsheet.getRowData(i);
            console.log("Row:", i + 1, "Cells", rowData);
        }
    }
};

```

```

Mobile responsiveness in EJ2 JavaScript Spreadsheet control

The Spreadsheet control rendered in desktop mode will be adaptive in all mobile devices where the layout gets adjusted based on their parent element's dimensions to accommodate any resolution.

You can see the overflowed items of ribbon header, ribbon content, and sheet tab using touch and swipe action. The right navigation arrow is added at the end of the ribbon content through which the user can navigate towards overflowed items. Once you reached the rightmost end of the ribbon content, the right navigation arrow will change to left navigation arrow through which you can navigate to the left of the ribbon content.

The screenshot shows an Excel spreadsheet with a ribbon at the top containing 'File', 'Home', 'Insert', 'Formulas', and 'Data'. The 'Formulas' tab is active, showing a formula bar with 'fx Customer Name'. Below the ribbon is a table with two columns: 'Customer Name' and 'Model'. The table contains 19 rows of data, numbered 1 to 19 in the first column. The last row is highlighted in pink. At the bottom of the table, there is a tab labeled 'Car Sales Report'.

	A	B
1	Customer Name	Model
2	Romona Heaslip	Taurus
3	Clare Batterton	Sparrow
4	Eamon Traise	Grand Cherokee
5	Julius Gorner	GTO
6	Jenna Schoolfield	LX
7	Marylynne Harring	Catera
8	Vilhelmina Leipelt	7 Series
9	Barby Heisler	Corvette
10	Karyn Boik	Regal
11	Jeanette Pamplin	S4
12	Cristi Espinos	TL
13	Issy Humm	Club Wagon
14	Tuesday Fautly	V8 Vantage
15	Rosemaria Thomann	Caravan
16	Lyell Fuentez	Bravada
17	Raynell Layne	Colorado
18	Raye Whines	4Runner
19	Virgina Aharoni	TSX

Stepper

Steps in EJ2 JavaScript Stepper control

The JavaScript Stepper allows you to add steps using the [steps](#) property. Each step can be configured with options such as `iconCss`, `text`, `label`, `cssClass` and more.

Adding steps

You can define the icon and text content for each step using the `iconCss`, `text` and `label` properties.

Defining icon CSS

You can define the CSS class to show the icon for each step using the `iconCss` property.

INDEX.JS

```
var iconOnly = [
  { iconCss: 'sf-icon-cart' },
  { iconCss: 'sf-icon-transport' },
  { iconCss: 'sf-icon-payment' },
  { iconCss: 'sf-icon-success' }
```

```

];
var stepperWithIcon = new ej.navigations.Stepper({
  steps: iconOnly
});
stepperWithIcon.appendTo("#stepper");

```

    font-family: 'Default' !important;
    speak: none;
    font-style: normal;
    font-weight: normal;
    font-variant: normal;
    text-transform: none;
    line-height: inherit;
    -webkit-font-smoothing: antialiased;
    -moz-osx-font-smoothing: grayscale;
}
.sf-icon-cart:before { content: "\e710"; }
.sf-icon-transport:before { content: "\e702"; }
.sf-icon-payment:before { content: "\e706"; }
.sf-icon-success:before { content: "\e715"; }

```

Defining text content

You can define text instead of an icon by setting the `text` property and display label content for a step using the `label` property.

When both label and text are defined, the label takes priority for display based on the `stepType`.

INDEX.JS

```

var textOnly = [
    { text: 'A' },
    { text: 'B' },
    { text: 'C' },
    { text: 'D' }
];
var labelOnly = [
    { label: 'Cart' },
    { label: 'Delivery Address' },
    { label: 'Payment' },
    { label: 'Confirmation' }
];
var textStepper = new ej.navigations.Stepper({
    steps: textOnly,
    stepType: 'indicator'
});
textStepper.appendTo("#stepper");
var labelsStepper = new ej.navigations.Stepper({
    steps: labelOnly
});
labelsStepper.appendTo("#labelStepper");

```

Disabling steps

You can use the `disabled` property to disable a step, preventing user interaction when set to `true`. By default, the value is `false`.

INDEX.JS

```

var stepperIcon = [
  { iconCss: 'sf-icon-cart' },
  { iconCss: 'sf-icon-transport' },
  { iconCss: 'sf-icon-payment', disabled: true },
  { iconCss: 'sf-icon-success' }
];
var stepper = new ej.navigations.Stepper({
  steps: stepperIcon
});
stepper.appendTo("#stepper");

```

```

Setting active step

You can set the active step by specifying its index using the [activeStep](#) property. The default value is 0.

INDEX.JS

```
var iconOnly = [
{ iconCss: 'sf-icon-cart' },
```

```

    { iconCss: 'sf-icon-transport' },
    { iconCss: 'sf-icon-payment' },
    { iconCss: 'sf-icon-success' }
  ];
  var stepperWithIcon = new ej.navigations.Stepper({
    steps: iconOnly,
    activeStep: 1
  });
  stepperWithIcon.appendTo("#stepper");

```

.sf-icon-success:before { content: "\e715"; }

```

Step status

Each step's progress state can be specified using the `status` property. The possible values are `NotStarted`, `InProgress` and `Completed`. By default, the value is `NotStarted`.

INDEX.JS

```

var iconWithLabel = [
    { label: 'Cart', iconCss: 'sf-icon-cart' },
    { label: 'Payment', iconCss: 'sf-icon-payment' },
    { label: 'Ordered', iconCss: 'sf-icon-success' }
];
var stepper = new ej.navigations.Stepper({
    steps: iconWithLabel,
    stepChanged: () => {
        var status = stepper.steps[1].status
        updateStatus(status)
    }
});
stepper.appendTo('#stepperStatus');
function updateStatus(stepStatus) {
    var statusMap = {
        'NotStarted': { text: 'Your payment has not started yet', color:
'#e74d4d' },
        'InProgress': { text: 'Processing your payment', color: 'orange' },
        'Completed': { text: 'Payment successful', color: '#4CAF50' }
    };
    var currentStatus = document.getElementById("paymentStatus");
    if (currentStatus) {
        var { text, color } = statusMap[stepStatus];
        currentStatus.innerText = text;
    }
}

```

```
        currentStatus.style.backgroundColor = color;
    }
}
```

Step validation

You can set the validation state for each step to displaying a success or error icon by using `isValid` property.

To know more about Stepper validation, please refer to the [Validation](#) section.

Step types in EJ2 JavaScript Stepper control

The Stepper control provides support for displaying steps with the following step types.

Default type

In default type, the Stepper displays steps with a combination of both indicators and labels by setting the `stepType` property as `Default`. By default, the Stepper displays steps in the `Default` type.

INDEX.JS

```

.sf-icon-success:before { content: "\e715"; }

```

Label type

In label type, the Stepper displays the steps with only the step labels by setting the [stepType](#) property as **Label**.

When both label and text are defined, the label takes priority in displaying the steps.

INDEX.JS

```

var iconWithLabel = [
  { label: 'Cart', iconCss: 'sf-icon-cart' },
  { label: 'Delivery Address', iconCss: 'sf-icon-transport' },
  { label: 'Payment', iconCss: 'sf-icon-payment' },
  { label: 'Confirmation', iconCss: 'sf-icon-success' }
];
var stepper = new ej.navigations.Stepper({
  steps: iconWithLabel,
  stepType: 'label'
});
stepper.appendTo("#stepper");

```

```

Label positions

You can display the label on the top, bottom, left, or right side of the steps using the [labelPosition](#) property.

The following label positions are supported in Stepper:

Value	Description
Top	Positions the label at the top of each step.
Bottom	Positions the label at the bottom of each step.
Start	Positions the label to the left side of each step.
End	Positions the label to the right side of each step.

INDEX.JS

```
var iconWithLabel = [
  { label: 'Cart', iconCss: 'sf-icon-cart' },
  { label: 'Delivery Address', iconCss: 'sf-icon-transport' },
  { label: 'Payment', iconCss: 'sf-icon-payment' },
  { label: 'Confirmation', iconCss: 'sf-icon-success' }
];
var stepper = new ej.navigations.Stepper({
  steps: iconWithLabel
});
stepper.appendTo("#stepper");
window.updateLabelPosition = function(args) {
  stepper.labelPosition = args.value;
};
```

Indicator type

In indicator type, the Stepper displays steps with only the step indicators by setting the [stepType](#) property as **Indicator**.

INDEX.JS

```

var textOnly = [
    { text: '1' },
    { text: '2' },
    { text: '3' },
    { text: '4' }
];
var defaultStepper = new ej.navigations.Stepper({
    steps: [{}, {}, {}, {}],
    stepType: 'indicator'
});
defaultStepper.appendTo("#stepperDefault");
var textStepper = new ej.navigations.Stepper({
    steps: textOnly,
    stepType: 'indicator'
});
textStepper.appendTo("#stepper");

```

INDEX.HTML

```

Orientations in EJ2 JavaScript Stepper control

The Stepper control supports the display of steps in both horizontal and vertical orientations by using the [orientation](#) property.

Horizontal

In horizontal orientation, the steps are displayed in a side-by-side manner by setting the [orientation](#) property to **Horizontal**. By default, the steps are displayed in the horizontal orientation.

INDEX.JS

```

var iconOnly = [
    { iconCss: 'sf-icon-cart' },
    { iconCss: 'sf-icon-transport' },
    { iconCss: 'sf-icon-payment' },
    { iconCss: 'sf-icon-success' }
];
var horizontalStepper = new ej.navigations.Stepper({
    steps: iconOnly,
    orientation: 'horizontal'
});
horizontalStepper.appendTo("#stepper");

```

Linear flow in EJ2 JavaScript Stepper control

The Stepper control enables users to progress sequentially through each step, ensuring navigation from one step to the next in a linear way by setting the [linear](#) property to **true**. The default value is **false** allowing navigation between any steps and vice versa.

The example demonstrates the functionality of both linear and non-linear flow in the Stepper.

INDEX.JS

```

var iconWithLabel = [
{ label: 'Cart', iconCss: 'sf-icon-cart' },

```

```

{ label: 'Delivery Address', iconCss: 'sf-icon-transport' },
{ label: 'Payment', iconCss: 'sf-icon-payment'},
{ label: 'Confirmation', iconCss: 'sf-icon-success' }
];
var linearStepper = new ej.navigations.Stepper({
  steps: iconWithLabel,
  linear: true
});
linearStepper.appendTo("#stepper");
window.updateLinear = function(args) {
  linearStepper.linear = (/true/).test(args.value) ? true : false;
  linearStepper.reset();
};

```

Steps validation in EJ2 JavaScript Stepper control

The Stepper control allows you to set the validation state for each step, displaying either a success or error icon. You can define the success state of a step by setting the `isValid` property to `true`. If set to `false`, the step will display an error state. By default, the `isValid` property is `null`.

Based on the **stepType**, the validation state icon will be displayed either as an indicator or as part of the step label/text.

INDEX.JS

```
var iconOnly = [
  { iconCss: 'sf-icon-cart', isValid: true },
  { iconCss: 'sf-icon-transport' },
  { iconCss: 'sf-icon-payment', isValid: false },
  { iconCss: 'sf-icon-success' }
];

var iconStepper = new ej.navigations.Stepper({
  steps: iconOnly
});
iconStepper.appendTo("#stepper");
var labelOnly = [
  { label: 'Cart', isValid: true },
  { label: 'Address' },
  { label: 'Payment', isValid: false },
  { label: 'Confirmation' }
];

var labelsStepper = new ej.navigations.Stepper({
  steps: labelOnly
});
labelsStepper.appendTo("#labelStepper");
```

Template in EJ2 JavaScript Stepper control

The Stepper control allows you to customize the default appearance and content of each step, creating a personalized experience for the user. You can use the [template](#) property to set the template content for the steps.

The step model and current step index are passed as `step` and `currentStep` properties in the template context for customization.

INDEX.JS

```
var iconWithLabel = [
```

```

    { label: 'PowerPoint', iconCss: 'sf-icon-powerpoint' },
    { label: 'Presentation', iconCss: 'sf-icon-projector' },
    { label: 'Backup', iconCss: 'sf-icon-onedrive' }
  ];
  var stepper = new ej.navigations.Stepper({
    activeStep: 1,
    steps: iconWithLabel,
    template: '<div class="template-content"><span
class="${step.iconCss}"></span><br><span class="e-
label">${step.label}</span></div>'
  });
  stepper.appendTo('#stepperTemplate');

```

Tooltip in EJ2 JavaScript Stepper control

The Stepper control supports tooltip to show additional information in the steps by setting the [showTooltip](#) property to `true`.

The tooltip appears when the user hovers over the step, providing the information such as the label or text. By default, the `showTooltip` property is `false`.

INDEX.JS

```
var iconWithLabel = [
{ label: 'Cart', iconCss: 'sf-icon-cart' },
```

```

{ label: 'Delivery Address', iconCss: 'sf-icon-transport' },
{ label: 'Payment', iconCss: 'sf-icon-payment' },
{ label: 'Confirmation', iconCss: 'sf-icon-success' }
];
var tooltipStepper = new ej.navigations.Stepper({
  steps: iconWithLabel,
  showTooltip: true
});
tooltipStepper.appendTo("#stepper");

```

Tooltip template

You can use the [tooltipTemplate](#) property to specify a custom template for the tooltips, providing detailed information about the steps.

When hovering over the step, the current step model is passed in the template context, allowing you to include dynamic information about the step.

INDEX.JS

```
var tooltipStep = [
    { text: "Review your cart items", label: 'Cart', iconCss: 'sf-icon-cart' },
    { text: "Enter your delivery address", label: 'Delivery Address', iconCss: 'sf-icon-transport' },
    { text: "Complete your purchase securely", label: 'Payment', iconCss: 'sf-icon-payment' },
    { text: "Verify your order details", label: 'Confirmation', iconCss: 'sf-icon-success' }
];
var stepperTooltip = new ej.navigations.Stepper({
    steps: tooltipStep,
    showTooltip: true,
    tooltipTemplate: '<span class="template-content"><span class="stepper-icon ${value.iconCss}"></span><span class="step-label">${value.text}</span></span>'
});
stepperTooltip.appendTo("#stepper");
```

Animation in EJ2 JavaScript Stepper control

The Stepper progress state can be animated, smoothly transitioning from one step to another. You can customize the animation's **duration** and **delay** by using the [animation](#) property.

You can disable the animation by setting the [enable](#) property to **false**. By default, the value is **true**.

| Fields | Type | Description |

|-----|-----|-----|

| [duration](#) | **number** | Specifies the duration of the animated transition for each step. The default value is **2000** milliseconds. |

| [delay](#) | **number** | Specifies the delay to initiate the animated transition for each step in milliseconds. The default value is **0**. |

The example demonstrates the animation **duration** and **delay** settings for the Stepper.

INDEX.JS

```

var animationStepper = new ej.navigations.Stepper({
  steps: [{}, {}, {}, {} ],
  animation: {enable: true, duration: 2000, delay: 500}
});
animationStepper.appendTo("#stepper");

```

```

Globalization in EJ2 JavaScript Stepper control

Localization

The Localization library allows you to localize the default text content of the Stepper. You can change the static text content used for the **optional** property to other cultures (Arabic, Deutsch, French, etc.) by defining the **locale** value and its translation object.

| Locale key | en-US (default) |

|-----|-----|

| optional | Optional |

In this example, the **French** culture is set to Stepper and the default text is updated with the content defined by the locale key.

INDEX.JS

```

ej.base.L10n.load({
  'fr-BE': {
    'stepper': {
      'optional': "facultatif"
    }
  }
});
var iconWithLabel = [
  { label: 'Cart', iconCss: 'sf-icon-cart' },
  { label: 'Delivery Address', iconCss: 'sf-icon-transport' },
  { label: 'Payment', iconCss: 'sf-icon-payment', optional: true },
  { label: 'Confirmation', iconCss: 'sf-icon-success' }
];
var stepper = new ej.navigations.Stepper({
  steps: iconWithLabel,
  locale: 'fr-BE'
});
stepper.appendTo("#stepper");

```

Accessibility in EJ2 JavaScript Stepper control

Accessibility is achieved in the Stepper control through WAI-ARIA standard and keyboard navigations. The Stepper control can be effectively accessed through assistive technologies such as screen readers.

Keyboard interaction

The Stepper control is interactive with the below keyboard shortcuts.

| **Keyboard shortcuts** | **Actions** |

| --- | --- |

| Up Arrow | Focuses the previous step in a vertical Stepper. |

| Down Arrow | Focuses the next step in a vertical Stepper. |

| Left Arrow | Focuses the previous step in a horizontal Stepper. |

| Right Arrow | Focuses the next step in a horizontal Stepper. |

| Home | Focuses on the first step of the Stepper. |

| End | Focuses on the last step of the Stepper. |

| Enter / Space | Activates the currently focused step. |

ARIA attribute

The following ARIA attributes are used in Stepper control based on its state.

| Properties | Functionality |

| ----- | ----- |

| **aria-label** | Attribute provide a descriptive text that labels the interactive element for accessibility. |

| **aria-current** | Attribute denotes the currently active step in the Stepper. |

| **aria-disabled** | Indicates when the step is disabled and cannot be interacted. |

Events in EJ2 JavaScript Stepper control

This section describes the Stepper events that will be triggered when an appropriate actions are performed. The following events are available in the Stepper control.

created

The Stepper control triggers the [created](#) event when the control rendering is completed.

INDEX.JS

```

var stepper = new ej.navigations.Stepper({
  steps: [{}, {}, {}, {}],
  created: () => {
    //Your required action here
  }
});
stepper.appendTo("#stepper");

```

INDEX.HTML

```

if(ele) {
ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

stepChanged

The Stepper control triggers the [stepChanged](#) event after the active step is changed.

INDEX.JS

```

var stepper = new ej.navigations.Stepper({
  steps: [{}, {}, {}, {}],

```

```

    stepChanged: (args) =>{
        alert("Step changed from "+args.previousStep + " to " + args.activeStep)
    }
});
stepper.appendTo("#stepper");

```

INDEX.HTML

Stock Chart

<!-- markdownlint-disable MD036 -->

Working with data in EJ2 JavaScript Stock chart control

Stock Chart can visualise data bound from local or remote data.

Local Data

You can bind a simple JSON data to the chart using [dataSource](#) property in series.

INDEX.TS

```

import { StockChart } from '@syncfusion/ej2-charts';
import { chartData } from './datasource.ts';
import { DateTime, HiloOpenCloseSeries, CandleSeries } from
 '@syncfusion/ej2-charts';
import { AccumulationDistributionIndicator, AtrIndicator, BollingerBands,
EmaIndicator, MomentumIndicator } from '@syncfusion/ej2-charts';
import { MacdIndicator, RsiIndicator, Trendlines, SmaIndicator,
StochasticIndicator, Export } from '@syncfusion/ej2-charts';
import { TmaIndicator, RangeTooltip, Tooltip, Crosshair}

```

```

    from '@syncfusion/ej2-charts';
    StockChart.Inject(DateTime, HiloOpenCloseSeries, CandleSeries);
    StockChart.Inject(AccumulationDistributionIndicator, AtrIndicator,
    BollingerBands, EmaIndicator, MomentumIndicator);
    StockChart.Inject(MacdIndicator, RsiIndicator, SmaIndicator,
    StochasticIndicator);
    StockChart.Inject(Trendlines, TmaIndicator, RangeTooltip, Tooltip,
    Crosshair, Export);
    let stockChart: StockChart = new StockChart({
        series: [
            {
                dataSource: chartData, type: 'Candle',
                animation: { enable: true },
                bearFillColor: '#2ecd71', bullFillColor: '#e74c3d',
            }
        ],
    });
    stockChart.appendTo("#element");

```

INDEX.HTML

```

Chart dimensions in EJ2 JavaScript Stock chart control

Size for Container

Stock Chart can render to its container size. You can set the size via inline or CSS as demonstrated below.

INDEX.TS

```
import { StockChart } from '@syncfusion/ej2-charts';
import { chartData } from './datasource.ts';
import { DateTime, CandleSeries } from '@syncfusion/ej2-charts';
import { AccumulationDistributionIndicator, AtrIndicator, BollingerBands,
EmaIndicator, MomentumIndicator } from '@syncfusion/ej2-charts';
import { MacdIndicator, RsiIndicator, Trendlines, SmaIndicator,
StochasticIndicator, Export } from '@syncfusion/ej2-charts';
import { TmaIndicator, RangeTooltip, Tooltip, Crosshair}
    from '@syncfusion/ej2-charts';
StockChart.Inject(DateTime, CandleSeries);
StockChart.Inject(AccumulationDistributionIndicator, AtrIndicator,
BollingerBands, EmaIndicator, MomentumIndicator);
StockChart.Inject(MacdIndicator, RsiIndicator, SmaIndicator,
StochasticIndicator);
StockChart.Inject(Trendlines, TmaIndicator, RangeTooltip, Tooltip,
Crosshair, Export);
let stockChart: StockChart = new StockChart({
    series: [
        {
            dataSource: chartData,
            type: 'Candle'
        },
    ]
});
stockChart.appendTo('#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
    <title>Chart dimension</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">

="text/javascript"></script>
</head>
<body>

    <div id="container">
```

```

        <div id="element"></div>
    </div>
</script>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

<!-- markdownlint-disable MD036 -->

Size for Stock Chart

<!-- markdownlint-disable MD036 -->

You can also set size for chart directly through [width](#) and [height](#) properties.

In Pixel

You can set the size of chart in pixel as demonstrated below.

INDEX.TS

```

import { StockChart } from '@syncfusion/ej2-charts';
import { chartData } from './datasource.ts';
import { DateTime, CandleSeries } from '@syncfusion/ej2-charts';
import { AccumulationDistributionIndicator, AtrIndicator, BollingerBands,
EmaIndicator, MomentumIndicator } from '@syncfusion/ej2-charts';
import { MacdIndicator, RsiIndicator, Trendlines, SmaIndicator,
StochasticIndicator, Export } from '@syncfusion/ej2-charts';
import { TmaIndicator, RangeTooltip, Tooltip, Crosshair}
    from '@syncfusion/ej2-charts';
StockChart.Inject(DateTime, CandleSeries);
StockChart.Inject(AccumulationDistributionIndicator, AtrIndicator,
BollingerBands, EmaIndicator, MomentumIndicator);
StockChart.Inject(MacdIndicator, RsiIndicator, SmaIndicator,
StochasticIndicator);
StockChart.Inject(Trendlines, TmaIndicator, RangeTooltip, Tooltip,
Crosshair, Export);
let stockChart: StockChart = new StockChart({
    series: [
        {
            dataSource: chartData,
            type: 'Candle'
        },
    ],
    // Width and height for stock chart in pixel
    width: '650', height: '350'
});
stockChart.appendTo('#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>Chart dimension</title>
    <meta charset="utf-8">

```

```

<meta name="viewport" content="width=device-width, initial-scale=1.0">
<meta name="description" content="Typescript UI Controls">
<meta name="author" content="Syncfusion">
<link href="./index.css" rel="stylesheet">
<link href="./material.css" rel="stylesheet">
<link href="http://cdn.syncfusion.com/ej2/material.css"
rel="stylesheet">

<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="es5-datasource.js" type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="element"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

In Percentage

By setting value in percentage, Stock Chart gets its dimension with respect to its container. For example, when the height is '50%', Stock Chart renders to half of the container height.

INDEX.TS

```

import { StockChart } from '@syncfusion/ej2-charts';
import { chartData } from './datasource.ts';
import { DateTime, CandleSeries } from '@syncfusion/ej2-charts';
import { AccumulationDistributionIndicator, AtrIndicator, BollingerBands,
EmaIndicator, MomentumIndicator } from '@syncfusion/ej2-charts';
import { MacdIndicator, RsiIndicator, Trendlines, SmaIndicator,
StochasticIndicator, Export } from '@syncfusion/ej2-charts';
import { TmaIndicator, RangeTooltip, Tooltip, Crosshair}
    from '@syncfusion/ej2-charts';
StockChart.Inject(DateTime, CandleSeries);
StockChart.Inject(AccumulationDistributionIndicator, AtrIndicator,
BollingerBands, EmaIndicator, MomentumIndicator);
StockChart.Inject(MacdIndicator, RsiIndicator, SmaIndicator,
StochasticIndicator);
StockChart.Inject(Trendlines, TmaIndicator, RangeTooltip, Tooltip,
Crosshair, Export);
let stockChart: StockChart = new StockChart({
    series: [
        {
            dataSource: chartData,

```

```

        type: 'Candle'
    },
],
// Width and height for stock chart in percentage
width: '80%', height: '90%'
});
stockChart.appendTo('#element');
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>Chart dimension</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">

if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Note: When you do not specify the size, it takes **450px** as the height and window size as its width.

<!-- markdownlint-disable MD036 -->

Axis types in EJ2 JavaScript Stock chart control

DateTime axis

DateTime axis uses date time scale and displays the date time values as axis labels in the specified format. To use DateTime axis, set the [valueType](#) of axis to **DateTime**.

INDEX.TS

```

import { StockChart } from '@syncfusion/ej2-charts';
import { chartData } from './datasource.ts';
```

```
import { DateTime, AreaSeries, CandleSeries, HiloOpenCloseSeries,
HiloSeries, LineSeries, SplineSeries } from '@syncfusion/ej2-charts';
import { AccumulationDistributionIndicator, AtrIndicator, BollingerBands,
EmaIndicator, MomentumIndicator } from '@syncfusion/ej2-charts';
import { MacdIndicator, RsiIndicator, Trendlines, SmaIndicator,
StochasticIndicator, Export } from '@syncfusion/ej2-charts';
import { TmaIndicator, RangeTooltip, Tooltip, Crosshair }
  from '@syncfusion/ej2-charts';
StockChart.Inject(DateTime, AreaSeries, CandleSeries, HiloOpenCloseSeries,
HiloSeries, LineSeries, SplineSeries);
StockChart.Inject(AccumulationDistributionIndicator, AtrIndicator,
BollingerBands, EmaIndicator, MomentumIndicator);
StockChart.Inject(MacdIndicator, RsiIndicator, SmaIndicator,
StochasticIndicator);
StockChart.Inject(Trendlines, TmaIndicator, RangeTooltip, Tooltip,
Crosshair, Export);
let stockChart: StockChart = new StockChart({
  primaryXAxis: { valueType: 'DateTime' },
  series: [
    {
      dataSource: chartData,
      type: 'Candle'
    },
  ],
});
stockChart.appendTo('#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="./index.css" rel="stylesheet">
  <link href="http://cdn.syncfusion.com/ej2/material.css"
rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="es5-datasource.js" type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
```

```

</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Note: To use this axis, we need to inject `DateTime` using `StockChart.Inject(DateTime)` method and set the [valueType](#) of axis to `DateTime`.

`DateTimeCategory` axis

`DateTimeCategory` axis in the stock chart is used to display only business days. To use `DateTimeCategory` axis, set the [valueType](#) of axis to `DateTimeCategory`.

INDEX.TS

</body></html>

```

Note: To use this axis, we need to inject `DateTimeCategory` using `StockChart.Inject(DateTimeCategory)` method and set the `valueType` of axis to `DateTimeCategory`.

Logarithmic axis

<!-- markdownlint-disable MD033 -->

Logarithmic axis uses logarithmic scale and it is very useful in visualizing data, when it has numerical values in both lower order of magnitude (eg: 10^{-6}) and higher order of magnitude (eg: 10^6). To use Logarithmic axis, set the `valueType` of axis to `Logarithmic`.

INDEX.TS

```

import { StockChart } from '@syncfusion/ej2-charts';
import { chartData } from './datasource.ts';
import { DateTime, AreaSeries, CandleSeries, HiloOpenCloseSeries, HiloSeries,
LineSeries, Logarithmic } from '@syncfusion/ej2-charts';
import { SplineAreaSeries, SplineSeries } from '@syncfusion/ej2-charts';
import { AccumulationDistributionIndicator, AtrIndicator, BollingerBands,
EmaIndicator, MomentumIndicator } from '@syncfusion/ej2-charts';
import { MacdIndicator, RsiIndicator, Trendlines, SmaIndicator,
StochasticIndicator, Export } from '@syncfusion/ej2-charts';
import { TmaIndicator, RangeTooltip, Tooltip, Crosshair,
IStockChartEventArgs, ChartTheme } from '@syncfusion/ej2-charts';
StockChart.Inject(DateTime, Logarithmic, AreaSeries, CandleSeries,
HiloOpenCloseSeries, HiloSeries, LineSeries, SplineAreaSeries, SplineSeries
);
StockChart.Inject(AccumulationDistributionIndicator, AtrIndicator,
BollingerBands, EmaIndicator, MomentumIndicator);
StockChart.Inject(MacdIndicator, RsiIndicator, SmaIndicator,
StochasticIndicator);
StockChart.Inject(Trendlines, TmaIndicator, RangeTooltip, Tooltip,
Crosshair, Export);

```

```

let stockChart: StockChart = new StockChart({
  primaryXAxis: { valueType: 'DateTime' },
  primaryYAxis: {
    valueType: 'Logarithmic'
  },
  chartArea: { border: { width: 0 } },
  series: [
    {
      dataSource: chartData, type: 'Line' xName: 'date' yName:
'high'
    }
  ],
});
stockChart.appendTo('#element');

```

INDEX.HTML

```

Axis customization in EJ2 JavaScript Stock chart control

Axis Crossing

An axis can be positioned in the Stock Chart area using [crossesAt](#) and [crossesInAxis](#) (`../api/stock-chart/stockChartAxisModel/#crossesinaxis`) properties. The [crossesAt](#) property specifies the values (datetime, numeric, or logarithmic) at which the axis line has to be intersected with the vertical axis or vice-versa, and the [crossesInAxis](#) property specifies the axis name with which the axis line has to be crossed.

Series types in EJ2 JavaScript Stock chart control

Essential JS 2 StockChart supports 6 major types of series namely **Line**, **Spline**, **Hilo**, **HiloOpenClose**, **Hollow Candle** and **Candle**. By using the series dropdown button you can navigate between the above listed series types.

```
<!-- markdownlint-disable MD036 -->
```

Line

To render a line series, use series **type** as **Line** and inject **LineSeries** module using **StockChart.Inject(LineSeries)** method.

Spline

To render a spline series, use series **type** as **Spline** and inject **SplineSeries** module using **StockChart.Inject(SplineSeries)** method.

Hilo

To render a hilo series, use series **type** as **Hilo** and inject **HiloSeries** module using **StockChart.Inject(HiloSeries)** method.

HiloOpenClose

To render a hiloOpenClose series, use series **type** as **HiloOpenClose** and inject **HiloOpenCloseSeries** module using **StockChart.Inject(HiloOpenCloseSeries)** method.

HollowCandle

To render a hollowcandle series, use series **type** as **Candle** and set **enableSolidCandle** as false. Now inject **CandleSeries** module using **StockChart.Inject(CandleSeries)** method.

Candle

To render a candle series, use series **type** as **Candle** and inject **CandleSeries** module using **StockChart.Inject(CandleSeries)** method.

Trend lines in EJ2 JavaScript Stock chart control

Trendlines are used to show the direction and speed of price.

StockChart supports 6 types of trendlines namely

Linear, Exponential, Logarithmic, Polynomial, Power, Moving Average. By using trendline dropdown button you can add or remove the required trendline type.

Linear

A linear trendline is a best fit straight line that is used with simpler data sets. To render a linear trendline, use trendline **type** as **Linear** and inject **Trendlines** module using **StockChart.Inject(Trendlines)**.

Exponential

An exponential trendline is a curved line that is most useful when data values rise or fall at increasingly higher rates. You cannot create an exponential trendline, if your data contains zero or negative values.

To render a exponential trendline, use trendline **type** as **Exponential** and inject

Trendlines module using `StockChart.Inject(Trendlines)`.

Logarithmic

A logarithmic trendline is a best-fit curved line that is most useful when the rate of change in the data increases or decreases quickly and then levels out. A logarithmic trendline can use negative and/or positive values.

To render a logarithmic trendline, use trendline [type](#) as **Logarithmic** and inject

Trendlines module using `StockChart.Inject(Trendlines)`.

Polynomial

A polynomial trendline is a curved line that is used when data fluctuates.

To render a polynomial trendline, use trendline [type](#) as **Polynomial** and inject

Trendlines module using `StockChart.Inject(Trendlines)`.

polynomialOrder used to define the polynomial value.

Power

A power trendline is a curved line that is best used with data sets that compare measurements that increase at a specific rate.

To render a power trendline, use trendline [type](#) as **Power** and inject **Trendlines** module using `StockChart.Inject(Trendlines)`.

Moving Average

A moving average trendline smoothen out fluctuations in data to show a pattern or trend more clearly.

To render a moving average trendline, use trendline [type](#) as **MovingAverage** and inject

Trendlines module using `StockChart.Inject(Trendlines)`.

period property defines the period to find the moving average.

<!-- markdownlint-disable MD036 -->

Technical indicators in EJ2 JavaScript Stock chart control

A technical indicator is a mathematical calculation based on historic price, volume or open interest information that aims to forecast financial market direction.

StockChart supports 10 types of technical indicators namely Accumulation Distribution, ATR, EMA, SMA, TMA, Momentum, MACD, RSI, Stochastic, Bollinger Band. By using indicator dropdown box you can add and remove the required indicators types.

Accumulation Distribution

Accumulation Distribution combines price and volume to show how money may be flowing into or out of stock. To render a Accumulation Distribution Indicator, use indicator [type](#) as AccumulationDistribution and inject

AccumulationDistributionIndicator module using StockChart.Inject(AccumulationDistributionIndicator). To calculate the signal line [volume](#) field is additionally added with [dataSource](#).

Average True Range (ATR)

ATR measures the stock volatility by comparing the current value with the previous value. To render a Average True Range (ATR) Indicator,

use indicator [type](#) as `Atr` and inject `AtrIndicator` module using `StockChart.Inject(AtrIndicator)`.

Exponential Moving Average (EMA)

Moving average Indicators are used to define the direction of the trend. To render a EMA Indicator, use indicator [type](#) as `Ema` and inject `EmaIndicator` module using `StockChart.Inject(EmaIndicator)`.

Momentum

Momentum shows the speed at which the price of the stock is changing. To render a Momentum indicator, use indicator [type](#) as `Momentum` and inject `MomentumIndicator` module using `StockChart.Inject(MomentumIndicator)` method. Momentum indicator will be represented by two lines (upperLine, signalLine). In momentum indicator the upperBand value is always renders at the value 100.

Moving Average Convergence Divergence (MACD)

MACD is based on the difference between two EMA's. To render a MACD Indicator, use indicator [type](#) as `Macd` and inject `MacdIndicator` module using `StockChart.Inject(MacdIndicator)`. MACD indicator will be represented by MACD line, signal line, MACD histogram. MACD histogram is used to differentiate MACD line and signal line.

Relative Strength Index (RSI)

RSI shows how strongly a stock is moving in its current direction. To render a RSI Indicator, use indicator [type](#) as `Rsi` and inject `RsiIndicator` module using `StockChart.Inject(Rsindicator)`. RSI indicator will be represented

by three lines (upperBand, lowerBand, signalLine). The upperBand and lowerBand values are customized by [overBought](#) and [overSold](#) properties of indicator and the signalLine is calculated by RSI formula.

Simple Moving Average (SMA)

Moving average Indicators are used to define the direction of the trend. To render a SMA Indicator, use indicator [type](#) as `Sma` and inject `SmaIndicator` module using `StockChart.Inject(SmaIndicator)`.

Stochastic

It shows how a stock is, when compared to previous state. To render a Stochastic indicator, use indicator [type](#) as `Stochastic` and inject `StochasticIndicator` module using `StockChart.Inject(StochasticIndicator)` method.

stochastic indicator will be represented by four lines (upperLine, lowerLine, periodLine, signalLine). In stochastic indicator the upperBand value and lowerBand value is customized by [overBought](#) and [overSold](#) properties of indicators and the periodLine and signalLine is render based on stochastic formula.

Triangular Moving Average (TMA)

Moving average Indicators are used to define the direction of the trend. To render a TMA Indicator, use indicator [type](#) as `Tma` and inject `TmaIndicator` module using `StockChart.Inject(TmaIndicator)`.

Bollinger Band

A StockChart overlay that shows the upper and lower limits of normal price movements based on the standard deviation of prices. To render a Bollinger Band, use indicator [type](#) as `BollingerBand` and inject `BollingerBands` module using `StockChart.Inject(BollingerBands)` method. Bollinger band will be represented by three lines (upperLine, lowerLine, signalLine).

The default values of the Bollinger Band [period](#) is 14 and [standardDeviations](#) is 2.

Tool tip in EJ2 JavaScript Stock chart control

<!-- markdownlint-disable MD036 -->

StockChart will display details about the points through tooltip, when the mouse is moved over the point.

Default tooltip

By default, tooltip is not visible. Enable the tooltip by setting [enable](#) property to true and by injecting [Tooltip](#) module using `StockChart.Inject(Tooltip)`.

<!-- markdownlint-disable MD013 -->

Format the tooltip

<!-- markdownlint-disable MD013 -->

By default, tooltip shows information of x and y value in points. In addition to that, you can show more information in tooltip. For example the format `${series.name} ${point.x}` shows series name and point x value.

Note: To use crosshair feature, we need to inject `Crosshair` module `StockChart.Inject(Crosshair)` method.

```
<!-- markdownlint-disable MD036 -->
```

Legend in EJ2 JavaScript Stock chart control

```
<!-- markdownlint-disable MD038 -->
```

Legend provides information about the series rendered in the Stock Chart. Legend can be added to a Stock Chart by enabling the [visible](#) option in the [legendSettings](#).

Position and Alignment

By using the [position](#) property, legend can be placed at `Left`, `Right`, `Top`, `Bottom` or `Custom` of the Stock Chart. The legend is positioned at the bottom of the Stock Chart, by default.

INDEX.TS

```

Note: To use legend feature, we need to inject `StockLegend` using `StockChart.Inject(StockLegend)`.

Period selector in EJ2 JavaScript Stock chart control

The period selector allows to select a range with specified periods. By default the period selector is enabled in stock chart.

Periods

Periods is an array of objects that allows users to specify the range of [periods](#). The `interval` property specifies the count value of the button, and the `text` property specifies the text to be displayed on button. The `intervalType` property allows users to customize the intervals of the buttons. The `intervalType` property supports the following interval types:

- Auto
- Years
- Quarter
- Months
- Weeks
- Days
- Hours
- Minutes
- Seconds

Range selector in EJ2 JavaScript Stock chart control

The left and right thumb of RangeNavigator are used to indicate the selected range in the large collection of data. Following are the ways you can select a range.

- By dragging the thumbs.
- By tapping on the labels.
- By setting the start and end through Date Range button.

Following code example shows the [enableSelector](#) property allows users to toggle the visibility of range selector.

Appearance in EJ2 JavaScript Stock chart control

Stock Chart Title

Stock Chart can be given a title using [title](#) property, to show the information about the data plotted.

INDEX.TS

```
import { StockChart } from '@syncfusion/ej2-charts';
import { DateTime, AreaSeries, CandleSeries, HiloOpenCloseSeries,
HiloSeries, LineSeries, SplineSeries } from '@syncfusion/ej2-charts';
import { AccumulationDistributionIndicator, AtrIndicator, BollingerBands,
EmaIndicator, MomentumIndicator } from '@syncfusion/ej2-charts';
import { MacdIndicator, RsiIndicator, Trendlines, SmaIndicator,
StochasticIndicator, Export } from '@syncfusion/ej2-charts';
import { TmaIndicator, RangeTooltip, Tooltip, Crosshair } from
 '@syncfusion/ej2-charts';
StockChart.Inject(DateTime, AreaSeries, CandleSeries, HiloOpenCloseSeries,
HiloSeries, LineSeries, SplineSeries);
```

```

StockChart.Inject(AccumulationDistributionIndicator, AtrIndicator,
BollingerBands, EmaIndicator, MomentumIndicator);
StockChart.Inject(MacdIndicator, RsiIndicator, SmaIndicator,
StochasticIndicator);
StockChart.Inject(Trendlines, TmaIndicator, RangeTooltip, Tooltip,
Crosshair, Export);
import { chartData } from './datasource.ts';
let stockChart: StockChart = new StockChart({
    primaryYAxis: {
        lineStyle: { color: 'transparent' },
        majorTickLines: { color: 'transparent', width: 0 },
    },
    primaryXAxis: { majorGridLines: { color: 'transparent' } },
    series: [
        {
            dataSource: chartData,
            type: 'Candle'
        },
    ],
    title: 'AAPL Stock Price',
    titleStyle: {
        fontFamily: "Arial",
        fontStyle: 'italic',
        fontWeight: 'regular',
        color: "#E27F2D",
        size: '20px'
    }
});
stockChart.appendTo("#element");

```

INDEX.HTML

Accessibility in EJ2 JavaScript Stock chart control

The Stock chart control followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Stock chart control is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support | |

| [Section 508](#) Support | |

| Screen Reader Support | |

| Right-To-Left Support | |

| Color Contrast | |

| Mobile Device Support | |

| Keyboard Navigation Support | |

| [Accessibility Checker](#) Validation | |

```
| Axe-core Accessibility Validation |  |
<style>
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
</style>
<div> - All
features of the control meet the requirement.</div>
<div> - Some features of the control do not meet the requirement.</div>
<div> - The control does not meet the requirement.</div>
```

WAI-ARIA attributes

The Stock chart control followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Stock chart control:

- `img` (role)
- `button` (role)
- `region` (role)
- `aria-label` (attribute)
- `aria-hidden` (attribute)
- `aria-pressed` (attribute)

Keyboard interaction

The Stock chart control followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Stock chart control.

| **Press** | **To do this** |

| --- | --- |

| **Alt + J** | Moves the focus to the Stock chart element. |

| **Tab** | Moves the focus to the next element in the Stock chart. |

| **Shift + Tab** | Moves the focus to the previous element in the Stock chart. |

| **Down Arrow** | Moves the focus to the data point left side from the selected point. |

| **Up Arrow** | Moves the focus to the data point right side from the selected point. |

| **ESC** | Cancel the tooltip for the data point. |

| **Ctrl + P** | Prints the Stock chart. |

Ensuring accessibility

The Stock chart control's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Stock chart control is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Stock chart control with accessibility tools.

Switch

Accessibility in EJ2 JavaScript Switch control

The Switch component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Switch component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support | |

| [Section 508](#) Support | |

| Screen Reader Support | |

| Right-To-Left Support | |

| Color Contrast | |

| Mobile Device Support | |

| Keyboard Navigation Support | |

| [Accessibility Checker](#) Validation | |

| [Axe-core](#) Accessibility Validation | |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

```

}
</style>

<div> - All
features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The
component does not meet the requirement.</div>

```

WAI-ARIA attributes

The Switch component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Switch component:

| Attributes | Purpose |
|---------------|--|
| role | Indicates the switch component. |
| aria-disabled | Indicates that the element is perceivable but disabled, so it is not editable or otherwise operable. |

Keyboard interaction

The Switch component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Switch component.

| Press | To do this |
|-------|--|
| Space | When the switch has focus, pressing the Space key changes the state of the switch. |

Ensuring accessibility

The Switch component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Switch component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Switch component with accessibility tools.

How To

Change size in EJ2 JavaScript Switch control

The different Switch sizes available are default and small. To reduce the size of default Switch to small, set the [cssClass](#) property to `e-small`.

INDEX.TS

```

import { Switch } from '@syncfusion/ej2-buttons';
import { enableRipple } from '@syncfusion/ej2-base';

```

```
enableRipple(true);
//Small Switch.
let switchObj: Switch = new Switch({ cssClass: 'e-small' });
switchObj.appendTo('#switch1');
//Default Switch.
switchObj = new Switch({});
switchObj.appendTo('#switch2');
```

INDEX.HTML

```

Customize the appearance of a switch in EJ2 JavaScript Switch control

You can customize the appearance of the Switch component using the CSS rules. Define your own CSS rules according to your requirement and assign the class name to the [cssClass](#) property.

Customize Switch bar and handle

Switch bar and handle can be customized as per requirement using CSS rules. Switch bar and handle customized using `cssClass` property. In the following sample, the `border-radius` CSS property for the Switch bar (`e-switch-inner`) and handle (`e-switch-handle`) elements was changed border radius circle to square shape.

INDEX.TS

```
import { Switch } from '@syncfusion/ej2-buttons';
// Initialize Switch with square cssClass.
let switchObj: Switch = new Switch({ cssClass: 'square' });
switchObj.appendTo('#switch1');
// Initialize Switch with custom-switch cssClass.
switchObj = new Switch({ cssClass: 'custom-switch', checked: true });
switchObj.appendTo('#switch2');
// Initialize Switch with handle-text cssClass.
switchObj = new Switch({ cssClass: 'handle-text' });
switchObj.appendTo('#switch3');
```

INDEX.HTML

```

Color the Switch

Switch colors can be customized as per the requirement using CSS rules. Switch bar and handle colors customized using `cssClass` property. In the following sample, the Switch bar (`e-switch-inner`) element background and border colors were changed from default colors.

INDEX.TS

```
import { Switch } from '@syncfusion/ej2-buttons';
// Initialize Switch with bar-color cssClass.
let switchObj: Switch = new Switch({ cssClass: 'bar-color' });
switchObj.appendTo('#switch1');
// Initialize Switch with handle-color cssClass.
switchObj = new Switch({ cssClass: 'handle-color', checked: true });
switchObj.appendTo('#switch2');
// Initialize Switch with custom-iOS cssClass.
switchObj = new Switch({ cssClass: 'custom-iOS', checked: true });
switchObj.appendTo('#switch3');
```

INDEX.HTML

```

Enable ripple for switch label in EJ2 JavaScript Switch control

By default, label with ripple effect is not available in Switch. You can achieve this using `rippleMouseHandler`

method.

The following example illustrates how to enable ripple effect for labels in Switch component.

INDEX.TS

```

import { Switch, rippleMouseHandler } from '@syncfusion/ej2-buttons';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
// Initialize Switch component.
let switchObj: Switch = new Switch({ checked: true });
// Render initialized Switch.
switchObj.appendTo('#switch1');
// Function to handle ripple effect for Switch with label.
document.querySelector('.lSize label').addEventListener('mouseup',
rippleHandler);
document.querySelector('.lSize label').addEventListener('mousedown',
rippleHandler);
function rippleHandler(e: MouseEvent): void {
    let rippleSpan: Element =
this.parentElement.nextElementSibling.querySelector('.e-ripple-container');
    if (rippleSpan) {
        rippleMouseHandler(e, rippleSpan);
    }
}

Enable rtl in EJ2 JavaScript Switch control

Switch component has RTL support. This can be achieved by setting [enableRtl](#) as `true`.

The following example illustrates how to enable right-to-left support in Switch component.

INDEX.TS

```

import { Switch } from '@syncfusion/ej2-buttons';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
// Initialize Switch component.
let switchObj: Switch = new Switch({ enableRtl: true });
// Render initialized Switch.
switchObj.appendTo('#element');

```

```
.e-switch-wrapper {
  margin-top: 18px;
}
```

Submit name and value in form in EJ2 JavaScript Switch control

The [name](#) attribute of the Switch is used to group Switches. When the Switches are grouped in form, the checked items [value](#) attribute will post to the server on form submit. The disabled and unchecked Switch values will not be sent to the server on form submit.

In the following code snippet, USB and Wi-Fi in the [checked](#) state, and Bluetooth is in disabled state. Values that are in checked state only be sent on form submit.

INDEX.TS

```
import { Switch, Button } from '@syncfusion/ej2-buttons';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
//Name and Value attribute in form submit.
let switchObj: Switch = new Switch({ name: 'Tethering', value: 'USB',
checked: true });
switchObj.appendTo('#switch1');
switchObj = new Switch({ name: 'Hotspot', value: 'Wi-Fi', checked: true });
switchObj.appendTo('#switch2');
switchObj = new Switch({ name: 'Tethering', value: 'Bluetooth', disabled:
true });
switchObj.appendTo('#switch3');
let button: Button = new Button({ isPrimary: true });
button.appendTo('#btnElement');
```

INDEX.HTML

  position: absolute;  
  top: 45%;  
  left: 45%;  
}  
.e-switch-wrapper {  
  margin-top: 18px;  
}
```

Switch triggers [change](#) event on every state stage to perform custom operations.

Tabs

Getting started in EJ2 JavaScript Tab control

The Essential JS 2 for JavaScript (global script) is an ES5 formatted pure JavaScript framework which can be directly used in latest web browsers.

Component Initialization

The Essential JS 2 JavaScript components can be initialized by using either of the following ways.

- Using local script and style references in a HTML page.
- Using CDN link for script and style reference.

Using local script and style references in a HTML page

Step 1: Create an app folder `myapp` for Essential JS 2 JavaScript components.

Step 2: You can get the global scripts and styles from the [Essential Studio JavaScript \(Essential JS 2\)](#) build installed location.

Syntax:

Script: `(installed location)/Syncfusion/Essential Studio/{RELEASEVERSION}/Essential JS 2/{PACKAGENAME}/dist/global/{PACKAGE_NAME}.min.js`

Styles: `(installed location)/Syncfusion/Essential Studio/{RELEASEVERSION}/Essential JS 2/{PACKAGENAME}/styles/material.css`

Example:

Script: `C:/Program Files (x86)/Syncfusion/Essential Studio/15.4.30/Essential JS 2/ej2-navigations/dist/global/ej2-navigations.min.js`

Styles: `C:/Program Files (x86)/Syncfusion/Essential Studio/15.4.30/Essential JS 2/ej2-navigations/styles/material.css`

Step 3: Create a folder `myapp/resources` and copy/paste the global scripts and styles from the above installed location to `myapp/resources` location.

Step 4: Create a HTML page (`index.html`) in `myapp` location and add the Essentials JS 2 script and style references.

```
`html
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<title>Essential JS 2</title>
<!-- Essential JS 2 material theme -->
<link href="resources/material.css" rel="stylesheet" type="text/css"/>
<!-- Essential JS 2 Tab's global script -->
<script src="resources/ej2-navigations.min.js" type="text/javascript"></script>
</head>
<body>
</body>
</html>
`
```

Step 5: Now, add the `Tab` element and initiate the `Essential JS 2 Tab` component in the `index.html` by using following code

Initialize the Tab using JSON items collection

The Tab can be rendered by defining a JSON array. The item is rendered with [header](#) text and [content](#) for each Tab using [items](#) property.

```
`html
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<title>Essential JS 2</title>
<!-- Essential JS 2 material theme -->
<link href="resources/material.css" rel="stylesheet" type="text/css"/>
<!-- Essential JS 2 Tab's global script -->
<script src="resources/ej2-navigations.min.js" type="text/javascript"></script>
</head>
<body>
```

```
<!-- Add the HTML <div> element -->
<div id="element"></div>
<script>
var tabObj = new ej.navigations.Tab({
items: [
{
header: { 'text': 'Twitter' },
content: 'Twitter is an online social networking service that enables users to send and read short 140-
character ' +
'messages called "tweets". Registered users can read and post tweets, but those who are unregistered
can only read ' +
'them. Users access Twitter through the website interface, SMS or mobile device app Twitter Inc. is
based in San ' +
'Francisco and has more than 25 offices around the world. Twitter was created in March 2006 by Jack
Dorsey, ' +
'Evan Williams, Biz Stone, and Noah Glass and launched in July 2006. The service rapidly gained
worldwide popularity, ' +
'with more than 100 million users posting 340 million tweets a day in 2012.The service also handled 1.6
billion ' +
'search queries per day.'
},
{
header: { 'text': 'Facebook' },
content: 'Facebook is an online social networking service headquartered in Menlo Park, California. Its
website was ' +
'launched on February 4, 2004, by Mark Zuckerberg with his Harvard College roommates and fellow
students Eduardo ' +
'Saverin, Andrew McCollum, Dustin Moskovitz and Chris Hughes.The founders had initially limited the
websites' +
'membership to Harvard students, but later expanded it to colleges in the Boston area, the Ivy League,
and Stanford ' +
'University. It gradually added support for students at various other universities and later to high-school
students.'
},
{
header: { 'text': 'WhatsApp' },
```

content: 'WhatsApp Messenger is a proprietary cross-platform instant messaging client for smartphones that operates ' +

'under a subscription business model. It uses the Internet to send text messages, images, video, user location and ' +

'audio media messages to other users using standard cellular mobile numbers. As of February 2016, WhatsApp had a user ' +

'base of up to one billion,[10] making it the most globally popular messaging application. WhatsApp Inc., based in ' +

'Mountain View, California, was acquired by Facebook Inc. on February 19, 2014, for approximately US\$19.3 billion.'

}

]

});

//Render initialized Tab component

tabObj.appendTo('#element');

</script>

</body>

</html>

Step 6: Now, run the `index.html` in web browser, it will render the **Essential JS 2 Tab** component.

Using [CDN link for script and style reference](#)

Step 1: Create an app folder `myapp` for the Essential JS 2 JavaScript components.

Step 2: The Essential JS 2 component's global scripts and styles are already hosted in the below CDN link formats.

Syntax:

Script: `http://cdn.syncfusion.com/ej2/{PACKAGENAME}/dist/global/{PACKAGENAME}.min.js`

Styles: `http://cdn.syncfusion.com/ej2/{PACKAGE_NAME}/styles/material.css`

Example:

Script: <http://cdn.syncfusion.com/ej2/ej2-navigations/dist/global/ej2-navigations.min.js>

Styles: <http://cdn.syncfusion.com/ej2/ej2-navigations/styles/material.css>

Step 3: Create a HTML page (`index.html`) in `myapp` location and add the CDN link references. Now, add the `Tab` element and initiate the `Essential JS 2 Tab` component in the `index.html` by using following code.

INDEX.HTML

```

<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
  <head>

    <title>Essential JS 2</title>
    <!-- Essential JS 2 material theme -->
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet" type="text/css"/>
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
buttons/styles/material.css" rel="stylesheet" type="text/css"/>
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
popups/styles/material.css" rel="stylesheet" type="text/css"/>
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
navigations/styles/material.css" rel="stylesheet" type="text/css"/>
    <!-- Essential JS 2 Tab's global script -->
    <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
    <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
  </head>
  <body>
    <!-- Add the HTML <div> element -->
    <div id="element"></div>
    <script>
      var tabObj = new ej.navigations.Tab({
        items: [
          {
            header: { 'text': 'Twitter' },
            content: 'Twitter is an online social networking
service that enables users to send and read short 140-character ' +
'messages called "tweets". Registered users can read
and post tweets, but those who are unregistered can only read ' +
'them. Users access Twitter through the website
interface, SMS or mobile device app Twitter Inc. is based in San ' +
'Francisco and has more than 25 offices around the
world. Twitter was created in March 2006 by Jack Dorsey, ' +
'Evan Williams, Biz Stone, and Noah Glass and launched
in July 2006. The service rapidly gained worldwide popularity, ' +
'with more than 100 million users posting 340 million
tweets a day in 2012. The service also handled 1.6 billion ' +
'search queries per day.'
          },
          {
            header: { 'text': 'Facebook' },
            content: 'Facebook is an online social networking
service headquartered in Menlo Park, California. Its website was ' +
'launched on February 4, 2004, by Mark Zuckerberg with
his Harvard College roommates and fellow students Eduardo ' +
'Saverin, Andrew McCollum, Dustin Moskovitz and Chris
Hughes. The founders had initially limited the website's ' +
'membership to Harvard students, but later expanded it
to colleges in the Boston area, the Ivy League, and Stanford ' +
'University. It gradually added support for students
at various other universities and later to high-school students.'
          },
        ],
      });
    </script>
  </body>
</html>

```

```

        {
            header: { 'text': 'WhatsApp' },
            content: 'WhatsApp Messenger is a proprietary cross-
platform instant messaging client for smartphones that operates ' +
                'under a subscription business model. It uses the
Internet to send text messages, images, video, user location and ' +
                'audio media messages to other users using standard
cellular mobile numbers. As of February 2016, WhatsApp had a user ' +
                'base of up to one billion, [10] making it the most
globally popular messaging application. WhatsApp Inc., based in ' +
                'Mountain View, California, was acquired by Facebook
Inc. on February 19, 2014, for approximately US* 9.3 billion.'
        }
    }
});
//Render initialized Tab component
tabObj.appendTo('#element');
</script>
</body>
</html>

```

Step 4: Now, run the `index.html` in web browser, it will render the `Essential JS 2 Tab` component.

Initialize the Tab using HTML elements

The Tab component can be rendered based on the given HTML element using `id` as `target`.

Header section must be enclosed with in a wrapper element using `e-tab-header` class and corresponding content must be mapped with `e-content` class.

You need to follow the below structure of HTML elements to render the Tab,

,

`<div id='tabhtmlmarkup'>` --> Root Tab element

`<div class="e-tab-header">` --> Tab header

`<div>` --> Header Item

`</div>`

`</div>`

`<div class="e-content">` --> Tab content

`<div>` --> Content Item

`</div>`

`</div>`

`</div>`

,

- Add the HTML template data with its id attribute and add it in your `index.html` file to initialize the Tab.

Adaptive in EJ2 JavaScript Tab control

The following section explains about rendering Tab when its width exceeds the viewable area or particularly in a given [width](#). The available modes are as follows:

- Scrollable
- Popup

Scrollable

The default overflow mode is Scrollable. Scrollable display mode supports displaying the Tab header items in a single line with horizontal scrolling enabled, when the item overflows to the available space.

- The right and left navigation arrow is added at the start and end of the Tab header through which user can navigate towards overflowed items of the Tab header.
- You can also see the overflowed items using touch and swipe action on the header and content section.
- By default, navigation icon in the left direction is disabled, you can see the overflowed items by moving in the right direction.
- By clicking the arrow or by holding the arrow continuously, you can see the overflowed items.

- In devices the navigation icons are not available. You can touch and swipe to see the overflowed items of the Tab header.

ASP.NET

HyperText Markup Language, commonly referred to as HTML, is the standard markup language used to create web pages. Along with CSS, and JavaScript, HTML is a cornerstone technology, used by most websites to create visually engaging web pages, user interfaces for web applications, and user interfaces for many mobile applications.[1] Web browsers can read HTML files and render them into visible or audible web pages. HTML describes the structure of a website semantically along with cues for presentation, making it a markup language, rather than a programming language.

Header in EJ2 JavaScript Tab control

This section explains about modifying the style of Tab header, and configuring its icons and positions.

Styles

You can customize header styles by adding predefined classes in the Tab root element. The pre-defined CSS class names are as follows:

- **e-fill:** The Selected Tab header background is set as solid fill.
- **e-background:** Tab header has a solid fill background, and the selected header has a highlighted border.

- **e-background e-accent:** Tab header has a solid fill background, and the selected header has a highlighted border with accent color.

If the above custom style classes are not included in the root element, the default style is applied to the Tab items.

Icon positions

You can customize the position of the Tab header icons using the [iconPosition](#) property. This property depends on the header items [iconCss](#) property. By default, Tab header icon is placed on left position. The position values are as follows:

- **Left:** Icon is placed on the left of the Tab header item.
- **Right:** Icon is placed on the right of the Tab header item.
- **Top:** Icon is placed on the top of the Tab header item.
- **Bottom:** Icon is placed on the bottom of the Tab header item.

Localization in EJ2 JavaScript Tab control

Localization library allows to localize the default text content of the Tab to different cultures using the [locale](#) property. In Tab, the close button's tooltip text alone will be localize based on culture. The close button is shown on tab header when enabled [showCloseButton](#) property.

| Locale key | en-US (default) |

|-----|-----|

| closeButtonTitle | Close |

Loading translations

To load translation object in an application use `load` function of `L10n` class.

In the below sample, `French` culture is set to Tab and change the close button's tooltip text.

INDEX.TS

```
import { Tab } from '@syncfusion/ej2-navigations';
import { DropDownList, ChangeEventArgs } from '@syncfusion/ej2-
dropdowns';
import { L10n, setCulture } from '@syncfusion/ej2-base';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);

Orientation in EJ2 JavaScript Tab control

This section explains about modifying the position and modes of Tab header.

It allows placing the header section inside the Tab component at different positions by using the [headerPlacement](#) property. The available positions are as follows:

- **Top:** Tab header items can be arranged horizontally, and their content can be placed after the header.
- **Bottom:** Tab header items can be arranged horizontally, and their content can be placed before the header.
- **Left:** Tab header items can be arranged vertically, and their content can be placed after the header.
- **Right:** Tab header items can be arranged vertically, and their content can be placed before the header.

It is also adaptable to the available space when the tab items exceed the view space. You can customize the modes by using `overflowMode` property. The available modes are as follows:

- Scrollable
- Popup

INDEX.TS

Drag and drop in EJ2 JavaScript Tab control

The Tab component allows you to drag and drop any item by setting [allowDragAndDrop](#) to **true**. Items can be reordered to any place by dragging and dropping them onto the desired location.

- If you need to prevent dragging action for a particular item, the [onDragStart](#) event can be used which will trigger when the item drag is started. If you need to prevent dropping action for a particular item, the [dragged](#) event can be used which will trigger when the drag action is stopped.
- The [dragArea](#) defines the area in which the draggable element movement will be occurring. Outside that area will be restricted for the draggable element movement.
- The [onDragStart](#) event will be triggered before dragging the item from Tab.
- The [dragging](#) event will be triggered when the Tab item is being dragged.
- The [dragged](#) event will be triggered when the Tab item is dropped on the target element successfully.

In the following sample, the [allowDragAndDrop](#) property is enabled.

INDEX.TS

```

import { Tab } from '@syncfusion/ej2-navigations';
let tabObj: Tab = new Tab({
    heightAdjustMode: 'Auto',
    allowDragAndDrop: true,
    dragArea: '#container',
    items: [
        {
            header: { text: 'India' },
            content: 'India officially the Republic of India, is a country in South Asia. It is the seventh-largest country by area, the second-most populous country with over 1.2 billion people, and the most populous democracy in the world. Bounded by the Indian Ocean on the south, the Arabian Sea on the south-west, and the Bay of Bengal on the south-east, it shares land borders with Pakistan to the west; China, Nepal, and Bhutan to the north-east; and Burma and Bangladesh to the east. In the Indian Ocean, India is in the vicinity of Sri Lanka and the Maldives; in addition, India Andaman and Nicobar Islands share a maritime border with Thailand and Indonesia.'
        },
        {

```

```

        header: { text: 'Australia' },
        content: 'Australia, officially the Commonwealth of Australia,
is a country comprising the mainland of the Australian continent, the island
of Tasmania and numerous smaller islands. It is the world sixth-largest
country by total area. Neighboring countries include Indonesia, East Timor
and Papua New Guinea to the north; the Solomon Islands, Vanuatu and New
Caledonia to the north-east; and New Zealand to the south-east.'
    },
    {
        header: { text: 'USA' },
        content: 'The United States of America (USA or U.S.A.), commonly
called the United States (US or U.S.) and America, is a federal republic
consisting of fifty states and a federal district. The 48 contiguous states
and the federal district of Washington, D.C. are in central North America
between Canada and Mexico. The state of Alaska is west of Canada and east of
Russia across the Bering Strait, and the state of Hawaii is in the mid-North
Pacific. The country also has five populated and nine unpopulated
territories in the Pacific and the Caribbean.'
    },
    {
        header: { text: 'France' },
        content: 'France, officially the French Republic is a sovereign
state comprising territory in western Europe and several overseas regions
and territories. The European part of France, called Metropolitan France,
extends from the Mediterranean Sea to the English Channel and the North Sea,
and from the Rhine to the Atlantic Ocean; France covers 640,679 square kilo
metres and as of August 2015 has a population of 67 million, counting all
the overseas departments and territories.'
    }

```

Drag and drop item between tabs

It is possible to drag and drop the tab items between two tabs, by manually saving those dropped items as new tab item data through the `addTab` method of Tab and removing the dragged item through the `removeTab` method of Tab.

In this example, we have used the tab control as an external source, and the item from the tab component is dragged and dropped onto another Tab. Therefore, it is necessary to use the `onDragStart` and `dragged` event of the Tab component, where we can form an event object and save it using the `addTab` method of the Tab and remove the dragged item through `removeTab` method of Tab using the dragged item index.

INDEX.TS

Drag and drop items to external source

It is possible to drag and drop the items to any of the external sources from the Tab, by manually saving those dropped items as new node data through the `addNodes` method of Treeview and removing the dragged item through the `removeTab` method of Tab.

In this example, we have used the tree view control as an external source, and the item from the tab component is dragged and dropped onto the child nodes of the tree view component. Therefore, it is necessary to use the `dragged` event of the Tab component, where we can form an event object and save it using the `addNodes` method of the Treeview and remove the dragged item through the `removeTab` method of Tab using the dragged item index.

Accessibility in EJ2 JavaScript Tab control

The Tab control followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Tab control is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support | |

| [Section 508](#) Support | |

| Screen Reader Support | |

| Right-To-Left Support | |

| Color Contrast | |

| Mobile Device Support | |

| Keyboard Navigation Support | |

| [Accessibility Checker](#) Validation | |

| [Axe-core](#) Accessibility Validation | |

```
<style>
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
</style>

<div> - All
features of the control meet the requirement.</div>

<div> - Some features of the control do not meet the requirement.</div>

<div> - The
control does not meet the requirement.</div>
```

ARIA attributes

Tab control is designed by considering [WAI-ARIA](#) standard. Tab is supported with ARIA Accessibility which is accessible by on-screen readers, and other assistive technology devices. The following list of attributes are added in the Tab.

| Roles and Attributes | Functionalities |

| --- | --- |

| tablist | Attribute is set to the Tab header element that describes actual role of the element. |

| tab | Attribute is set to the Tab items element to indicates an interactive element inside a **tablist** that, when activated, displays its associated **tabpanel**. |

| tabpanel | Attribute is set to the Tab content that describes the role for viewing the active content. |

| aria-orientation | Attribute is set to the Tab header element indicates the Tab header orientation. Default value of this attribute is horizontal. |

| aria-selected | Attribute set to the Tab items to indicates the selection state for Tab items. Active Tab is set to true for this attribute. |

| aria-labelledby | Attribute is set to the Tab content element to indicates the associated Tab header for the content. |

| aria-controls | Attribute is set to the Tab items element to indicates the associated **tabpanel** for the header. |

| aria-haspopup | Attribute is set to the Popup element to indicates the popup mode in the Tab. The default value of this attribute is false. If popup mode is enabled, the attribute value is set to true. |

| aria-disabled | Attribute set to the Tab items to It indicates the disabled state of the Tab. |

Keyboard interaction

By default, keyboard navigation is enabled. This control implements keyboard navigation support by following the WAI-ARIA practices. Once focused on the active Tab element, you can use the following key combination for interacting with the Tab.

Key	Description
Left	Moves focus to the previous Tab. If focus is on the first Tab, the focus will not move to any Tab.
Right	Moves focus to the next Tab. If focus is on the last Tab element, the focus will not move to any Tab.
Enter or Space	Selects the Tab if it is not selected. Opens the popup dropdown icon if it is focussed. Select the Tab item as active when popup item is focussed.
Esc(Escape)	Closes the popup if popup is in opened state.
Down or Up	When the popup is open and focused, it will move to previous/next Tab items of the popup in the vertical direction.
Home	Moves focus to the first Tab.
End	Moves focus to the last Tab.
Shift + F10	If popup mode is enabled, it opens the popup when the Tab is focused.
Delete	Deletes the Tab, if close button is enabled in Tab header.
Tab	To Move focus through the interactive elements.
Shift + Tab	To Move focus through the interactive elements.

Ensuring accessibility

The Tab control accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Tab control is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Tab control with accessibility tools.

Style in EJ2 JavaScript Tab control

The following content provides the exact CSS structure that can be used to modify the control's appearance based on user preference.

Customizing Tab

Use the following CSS to customize the Tab.

```
`css
.e-tab {
border: 5px solid rgb(173, 255, 47);
}
```

Customizing the Tab items

Use the following CSS to customize the header items of Tab.

```
`css
.e-tab .e-tab-header .e-toolbar-items {
background: #9faed8;
border: 2px solid blue;
}
`
```

Use the following CSS to customize the content items of Tab.

```
`css
.e-tab .e-content .e-item {
color: #a78515;
font-size: 14px;
}
`
```

Customizing Tab's header

Use the following CSS to customize the header of Tab control.

```
`css
.e-tab .e-tab-header {
background: #badfba !important;
}
`
```

Customizing Tab's header icon

Use the following CSS to customize the header item icon of Tab control.

```
`css
.e-tab .e-tab-header .e-toolbar-item .e-tab-icon {
color: #badfba !important;
}
`
```

Customizing Tab's content

Use the following CSS to customize the content of Tab control.

```
`css
.e-tab .e-content {
background: #d1f6d1 !important;
}
```

```
}  
,
```

Customizing the hover state of Tab control

Use the following CSS to customize the tab item when hovering.

```
`css  
.e-tab .e-tab-header .e-toolbar-item .e-tab-wrap:hover {  
background: #d1f6d1 !important;  
}  
,
```

Use the following CSS to customize the tab item popup icon when hovering.

```
`css  
.e-tab .e-tab-header .e-hor-nav .e-popup-up-icon:hover,  
.e-tab .e-tab-header .e-hor-nav .e-popup-down-icon:hover {  
background: #d1f6d1 !important;  
}  
,
```

Customizing selected item of Tab control

Use the following CSS to customize the selected tab item.

```
`css  
.e-tab .e-tab-header .e-toolbar-item.e-active {  
background: #d1f4d1;  
}  
,
```

Use the following CSS to customize the selected tab item text and icon.

```
`css  
.e-tab .e-tab-header .e-toolbar-item.e-active .e-tab-text,  
.e-tab .e-tab-header .e-toolbar-item.e-active .e-tab-icon {  
color: green !important;  
}  
,
```

How To

Load content through post in EJ2 JavaScript Tab control

The Tab supports to load external contents through AJAX library. Refer to the following steps.

- Import the Ajax module from ej2-base and initialize with URL path.

- Get the data from Ajax Success event, then initialize the Tab with retrieved external path data.

INDEX.TS

```
import {Tab} from '@syncfusion/ej2-navigations';
import { enableRipple } from '@syncfusion/ej2-base';
import { Ajax } from '@syncfusion/ej2-base';
enableRipple(true);
let ajax: Ajax = new Ajax('./ajax.html', 'GET', true);
ajax.send().then();

Prevent content swipe selection in EJ2 JavaScript Tab control

We can prevent the tab selection on touch swipe action by using the Tab [selecting](#) event. Refer the below sample with preventing swipe selection.

INDEX.TS

```

import { Tab, selectEventArgs } from '@syncfusion/ej2-navigations';
let tabObj: Tab = new Tab({
    selecting: select,
    items: [
        {
            header: { 'text': 'Twitter' },
            content: 'Twitter is an online social networking service that
enables users to send and read short 140-character ' +
'messages called "tweets". Registered users can read and post
tweets, but those who are unregistered can only read ' +
'them. Users access Twitter through the website interface, SMS
or mobile device app Twitter Inc. is based in San ' +
'Francisco and has more than 25 offices around the world.
Twitter was created in March 2006 by Jack Dorsey, ' +
'Evan Williams, Biz Stone, and Noah Glass and launched in July
2006. The service rapidly gained worldwide popularity, ' +
'with more than 100 million users posting 340 million tweets a
day in 2012. The service also handled 1.6 billion ' +
'search queries per day.'
        },
        {
            header: { 'text': 'Facebook' },

Customize selected tab styles in EJ2 JavaScript Tab control

You can customize the Tab style by overriding its header and active tab CSS classes. Define HTML string for adding animation and customizing the Tab header and pass it to [text](#) property. Now you can override the style using custom CSS classes added to the Tab elements.

You can add the custom class into Tab component using [cssClass](#) property which is used to customize the Tab component.

INDEX.TS

```

import {Tab} from '@syncfusion/ej2-navigations';
let tabObj: Tab = new Tab({
  cssClass: "e-tab-custom-class",
  items: [
    {
      header: { 'text': '<div><div class="e-image e-andrew"></div><div class="e-title fade-in">Andrew</div></div>' },
      content: 'Andrew received his BTS commercial in 1974 and a Ph.D. in international marketing from the University of Dallas in 1981. He is fluent in French and Italian and reads German. He joined the company as a sales representative, was promoted to sales manager in January 1992 and to vice president of sales in March 1993. Andrew is a member of the Sales Management Roundtable, the Seattle Chamber of Commerce, and the Pacific Rim Importers Association.'
    },
    {
      header: { 'text': '<div><div class="e-image e-margaret"></div><div class="e-title fade-in">Margaret</div></div>' },
      content: 'Margaret holds a BA in English literature from Concordia College (1958) and an MA from the American Institute of Culinary Arts (1966). She was assigned to the London office temporarily from July through November 1992.'
    },

Create wizard using tab in EJ2 JavaScript Tab control

Tab items can be disabled dynamically by passing the index and boolean value with the [enableTab](#) method and also passing index or HTML element to select an item from the tab using [select](#) method.

In the below Wizard sample, each Tab is integrated with required components to complete the reservation. Each field is provided with validation for all mandatory option to proceed to next tabs. Using Tab item's template property the components are added into content.

```
`ts
```

/ Initializing Tab with header and contents bind to template div for adding other components /

```
tabObj = new Tab({ heightAdjustMode: 'None', height: 390, showCloseButton: false,
```

```
selecting: tabSelected,
```

```
items: [
```

```
{ header: { 'text': 'New Booking' }, content: '#booking' },
```

```
{ header: { 'text': 'Train List' }, content: '#selectTrain', disabled: true },
```

```
{ header: { 'text': 'Add Passenger' }, content: '#details', disabled: true },
```

```
{ header: { 'text': 'Make Payment' }, content: '#confirm', disabled: true }
```

```
]
```

```
});
```

```
tabObj.appendTo('#element');
```

```
,
```

Create the following contents for each tab in the wizard.

1. Search tab:

Created with [DropDownList](#) to select the source, destination and type of ticket. A [DatePicker](#) for choosing the date of journey.

2. Train tab:

Based on the selected start and end point, populated Grid with random list of available seats and train list. Initially define the columns and row selected event for validating, after the source and destination chosen update the [dataSource](#) for the Grid.

3. Passenger tab:

A table with Textbox, Numeric, DropDownList for adding passenger name, age, gender and preferred berth/seat. Add validation on entering passenger details to proceed.

4. Payment tab:

Calculate the ticket cost based on location, passenger count and ticket type. Generate data for Grid with passenger details, train number and ticket cost summary.

You can go back on each tab using buttons available in it and tabs are [disabled](#) to navigate through tab header click actions. Once you end the wizard all the data get cleared and wizard goes back to starting tab.

Load tab with data source in EJ2 JavaScript Tab control

You can bind any data object to Tab items, by mapping it to a [header](#) and [content](#) property.

In the below demo, Data is fetched from an OData service using **DataManager**. The result data is formatted as a JSON object with **header** and **content** fields, which is set to items property of Tab.

INDEX.TS

```
import { Tab } from '@syncfusion/ej2-navigations';
import { DataManager, Query, ODataV4Adaptor, ReturnOption } from
 '@syncfusion/ej2-data';
let itemsData: any = [];
let mapping = { header: 'FirstName', content: 'Notes' };
const SERVICE_URI: string =
 'https://services.odata.org/V4/Northwind/Northwind.svc/Employees';
new DataManager({ url: SERVICE_URI, adaptor: new ODataV4Adaptor,
crossDomain: true})
    .executeQuery(new Query().range(1, 4)).then((e: ReturnOption) => {
        let result: any = e.result;
        for(let i: number = 0; i < result.length; i++) {
            itemsData.push({ header: {text: result[i][mapping.header]}, content:
result[i][mapping.content] });
        }
        let tabObj: Tab = new Tab({
            items: itemsData
        });
        tabObj.appendTo('#element');
    });
```

Add nested tabs in EJ2 JavaScript Tab control

Tab supports to render the nested level of Tabs by using `content` property. You can add the nested Tab element inside the parent Tab `content` property. To render the nested Tab, initialize the component using the id of Tab from a [selected](#) event handler.

INDEX.TS

```

import { Tab, SelectEventArgs } from '@syncfusion/ej2-navigations';
import { enableRipple, isNullOrUndefined as isNOU } from '@syncfusion/ej2-base';
import { usa_cities, france_cities, australia_cities } from './datasource.ts';
enableRipple(true);
let tabObj: Tab = new Tab({
    selected: handleSelectEvent,
    created: handleCreatedEvent,
    items: [
        {
            header: { 'text': 'USA' },
            content: '<div id="usa_tab"></div>'
        },
        {
            header: { 'text': 'France' },
            content: '<div id="france_tab"></div>'
        },
        {
            header: { 'text': 'Australia' },

Add font awesome in EJ2 JavaScript Tab control

We can customize the Tab component items by using font awesome icons and fonts.

- Need to add font awesome CDN reference link in your sample to use font awesome icons.

```
<link rel="stylesheet" href="https://cdnjs.cloudflare.com/ajax/libs/font-awesome/4.7.0/css/font-awesome.min.css"/>
```

You can add the font awesome icons to the Tab component using '[iconCss](#)' property. The following sample illustrates how to use font awesome in tab component.

INDEX.TS

```
import { Tab } from '@syncfusion/ej2-navigations';
let tabObj: Tab = new Tab({
    items: [
        {
            header: { 'text': 'Twitter', 'iconCss': 'fa fa-twitter' },
            content: 'Twitter is an online social networking service that
enables users to send and read short 140-character ' +
'messages called "tweets". Registered users can read and post
tweets, but those who are unregistered can only read ' +
'them. Users access Twitter through the website interface, SMS
or mobile device app Twitter Inc. is based in San ' +
'Francisco and has more than 25 offices around the world.
Twitter was created in March 2006 by Jack Dorsey, ' +
'Evan Williams, Biz Stone, and Noah Glass and launched in July
2006. The service rapidly gained worldwide popularity, ' +
'with more than 100 million users posting 340 million tweets a
day in 2012. The service also handled 1.6 billion ' +
'search queries per day.'
        },
        {
            header: { 'text': 'Facebook', 'iconCss': 'fa fa-facebook' },
            content: 'Facebook is an online social networking service
headquartered in Menlo Park, California. Its website was ' +
'launched on February 4, 2004, by Mark Zuckerberg with his
Harvard College roommates and fellow students Eduardo ' +
'Saverin, Andrew McCollum, Dustin Moskovitz and Chris Hughes. The
founders had initially limited the website's ' +
'membership to Harvard students, but later expanded it to
colleges in the Boston area, the Ivy League, and Stanford ' +
'University. It gradually added support for students at various
other universities and later to high-school students.'
        },
        {
            header: { 'text': 'WhatsApp', 'iconCss': 'fa fa-whatsapp' },
            content: 'WhatsApp Messenger is a proprietary cross-platform
instant messaging client for smartphones that operates ' +
'under a subscription business model. It uses the Internet to
send text messages, images, video, user location and ' +
'audio media messages to other users using standard cellular
mobile numbers. As of February 2016, WhatsApp had a user ' +
'base of up to one billion, [10] making it the most globally
popular messaging application. WhatsApp Inc., based in ' +
'Mountain View, California, was acquired by Facebook Inc. on
February 19, 2014, for approximately US$19.3 billion.'
        }
    ]
});
```

```
tabObj.appendTo('#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Tab</title>
  <meta charset="utf-8">

```

Customization

Use the following CSS to customize the header item icon of Tab control.

```
`css

.e-tab .e-tab-header .e-toolbar-item .e-tab-icon {
color: #badfba !important;
}
`
```

Set state persistence of the tab component in EJ2 JavaScript Tab control

State persistence allows the Tab to retain the current modal value in the browser cookies for state maintenance. This action is handled through the [enablePersistence](#) property which is set to false by

default. When it is set to true, some of the Tab component model values will be retained even after refreshing the page.

The following sample demonstrates how to set state persistence of the Tab component.

INDEX.TS

```
import { Tab } from '@syncfusion/ej2-navigations';
let tabObj: Tab = new Tab({
    enablePersistence: true,
    items: [{
        header: { 'text': 'Twitter' },
        content: 'Twitter is an online social networking service that enables users to send and read short 140-character ' +
            'messages called "tweets". Registered users can read and post tweets, but those who are unregistered can only read ' +
            'them. Users access Twitter through the website interface, SMS or mobile device app Twitter Inc. is based in San ' +
            'Francisco and has more than 25 offices around the world. Twitter was created in March 2006 by Jack Dorsey, ' +
            'Evan Williams, Biz Stone, and Noah Glass and launched in July 2006. The service rapidly gained worldwide popularity, ' +
            'with more than 100 million users posting 340 million tweets a day in 2012. The service also handled 1.6 billion ' +
            'search queries per day.'
    },
    {
        header: { 'text': 'Facebook' },
        content: 'Facebook is an online social networking service headquartered in Menlo Park, California. Its website was ' +
            'launched on February 4, 2004, by Mark Zuckerberg with his Harvard College roommates and fellow students Eduardo ' +
            'Saverin, Andrew McCollum, Dustin Moskovitz and Chris Hughes. The founders had initially limited the website's ' +
            'membership to Harvard students, but later expanded it to colleges in the Boston area, the Ivy League, and Stanford ' +
            'University. It gradually added support for students at various other universities and later to high-school students.'
    },
    {
        header: { 'text': 'WhatsApp' },
        content: 'WhatsApp Messenger is a proprietary cross-platform instant messaging client for smartphones that operates ' +
            'under a subscription business model. It uses the Internet to send text messages, images, video, user location and ' +
            'audio media messages to other users using standard cellular mobile numbers. As of February 2016, WhatsApp had a user ' +

Set custom animation in EJ2 JavaScript Tab control

Tab supports custom animations for both previous and next actions from the provided animation option of **Animation** library. The [animation](#) property also allows you to set [easing](#), [duration](#), and various other [effect](#).

Default animation is given as **SlideLeftIn** for [previous](#) tab animation and **SlideRightIn** for [next](#) tab animation. You can also disable the animation by setting the animation effect as **None**. Also, please use the following CSS to disable indicator animation for animation effect as **None**.

```
`css
```

```
.e-tab .e-tab-header:not(.e-vertical) .e-indicator, .e-tab .e-tab-header.e-vertical .e-indicator {
transition: none;
}
`
```

The sample demonstrates some types of animation that suits Tab. You can check all the animation effects [here](#).

INDEX.TS

```

```

Load tab items dynamically in EJ2 JavaScript Tab control

Tabs can be added dynamically by passing array of items and index value to the [addTab](#) method.

```
`ts
```

```
// New tab title and content inputs are fetched and stored in local variable
```

```
let title: string = document.getElementById('tab-title').value;
```

```
let content: string = document.getElementById('tab-content').value;
```

```
// Required tab item object formed by using textbox inputs
```

```
let item: Object = { header: { text: title }, content: createElement('pre', { innerHTML:
content.replace(/\n/g, '<br>\n') }).outerHTML };
```

```
// Item object and the index argument passed into the addTab method to add a new tab
```

```
tabObj.addTab([item], index);
```

```
,
```

In the following demo, you can add the tab content by clicking the +. This + icon is added on the tab header using [iconCss](#) property. Enter the new Tab heading and content details in the available text boxes, click 'Add Tab' button to pass the details as an array and here last index is calculated to append the new tab at the end.

INDEX.TS

```
import { enableRipple, createElement } from '@syncfusion/ej2-base';
import { Tab, SelectEventArgs } from '@syncfusion/ej2-navigations';
```

```

enableRipple(true);
let totalItems: number = 0;
let tabObj: Tab = new Tab({
    selected: tabSelected,
    items: [
        {
            header: { 'text': 'Tab1' },
            content: '#tab1_content'
        },
        {
            header: { 'iconCss': 'e-add-icon' },
            content: '#form-container'
        }
    ]
});
tabObj.appendTo('#element');

Create collapsible tabs in EJ2 JavaScript Tab control

You can achieve collapse and expand functionality in Tab by adding/removing a custom CSS class in the click event handler for each tab.

- Define a CSS class to set the style property display as none. Here 'collapse' class is added to the content element for hiding it using [created](#) event.
- Bind the [selected](#) event for Tab to collapse the initially selected Tab item and bind custom click handler for the Tab headers.
- In the event handler, add and remove 'collapse' class to hide and show the corresponding Tab content.

INDEX.TS

```

import { enableRipple } from '@syncfusion/ej2-base';

Customize tab content height in EJ2 JavaScript Tab control

You can change the Tab content height by using the [heightAdjustMode](#) property. By default, the Tab content [heightAdjustMode](#) property is set to **Content** value.

- **None:** Each tab content height is set based on the Tab height. This value is used only the tab component having the [height](#) property.
- **Auto:** Each tab content height will take the maximum height of all other tabs content.
- **Content:** Each tab content height is set based on their own content.
- **Fill:** Each tab content height is set based on the full height of Tabs parent element.

INDEX.TS

```

import { Tab } from '@syncfusion/ej2-navigations';

Reorder active tab in EJ2 JavaScript Tab control

We can able to prevent the changing of the active tab item on resizing the browser when overflow mode is popup by using the [reorderActiveTab](#) property. By default, the active Tab should be reordered when we click the tab items from the popup. If we set false to [reorderActiveTab](#) property the active tab item from the popup will not be reordered and an active item is highlighted inside the popup. The following code example depicts to prevent the reorder active tab item inside the popup.

INDEX.TS

```
import { Tab } from '@syncfusion/ej2-navigations';
let tabObj: Tab = new Tab({
  overflowMode: 'Popup',
  heightAdjustMode: 'Auto',
  reorderActiveTab: false,
  items: [
    {
      header: { 'text': 'India' },
      content: 'India officially the Republic of India, is a
country in South Asia. It is the seventh-largest country by area, the
second-most populous country with over 1.2 billion people, and the most
populous democracy in the world. Bounded by the Indian Ocean on the south,
the Arabian Sea on the south-west, and the Bay of Bengal on the south-east,
it shares land borders with Pakistan to the west;China, Nepal, and Bhutan to
the north-east; and Burma and Bangladesh to the east. In the Indian Ocean,
India is in the vicinity of Sri Lanka and the Maldives; in addition, India
Andaman and Nicobar Islands share a maritime border with Thailand and
Indonesia.'
    },
    {
      header: { 'text': 'Canada' },
      content: 'Canada is a North American country stretching from
the U.S. in the south to the Arctic Circle in the north. Major cities
include massive Toronto, west coast film centre Vancouver, French-speaking
Montréal and Québec City, and capital city Ottawa. Canada vast swaths of
wilderness include lake-filled Banff National Park in the Rocky Mountains.
It also home to Niagara Falls, a famous group of massive waterfalls.'

Tab key navigation in EJ2 JavaScript Tab control

The [tabIndex](#) property of a Tab item is used to enable tab key navigation for that particular item. When a positive value is assigned to the [tabIndex](#) property, it allows the user to switch focus to the next or

previous tab item using the Tab or Shift+Tab keys. By default, the user can only switch between tab items using the arrow keys.

If the [tabIndex](#) value is set to 0 for all tab items, the tab will switch based on the order of the elements on the page. This means that if the tab items are listed in a specific order on the page, the user will be able to navigate through them using the Tab key in that same order.

To use the [tabIndex](#) property, you can assign a positive value to the property of each tab item that you want to enable tab key navigation. For example:

INDEX.TS

```
import { Tab } from '@syncfusion/ej2-navigations';
let tabObj: Tab = new Tab({
    heightAdjustMode: 'Auto',
    overflowMode: 'Scrollable',
    items: [
        {

</body></html>
```

With this code, the user will be able to switch between the tab items using the Tab and Shift+Tab keys, in the order specified by the [tabIndex](#) values.

It's important to note that the [tabIndex](#) property only affects the ability to navigate between tab items using the Tab key. The user will still be able to use the arrow keys to switch between tab items, regardless of the value of the [tabIndex](#) property.

TextBox

Groups in EJ2 JavaScript Textbox control

The following section explains you the steps required to create TextBox with **icon** and **floating label**.

TextBox:

- Create a parent div element with the class **e-input-group**

- Place input element with the class `e-input` inside the parent div element.

```
<div class="e-input-group">
<input class="e-input" name='input' type="text" placeholder="Enter Date"/>
</div>
```

Floating label:

- Add the `e-float-input` class to the parent div element.
- Remove the `e-input` class and add `required` attribute to the input element.
- Place the span element with class `e-float-line` after the input element.
- Place the label element with class `e-float-text` after the above created span element. When you focus or filled with value in the TextBox, the label floats above the TextBox.

Creating the Floating label TextBox, you have to set the `required` attribute to the Input element to achieve the floating label functionality which is used for validating the value existence in TextBox. If you want to render the Floating label TextBox without

`required` attribute then refer to the [Floating label without required attribute](#) section.

```
<div class="e-float-input e-input-group">
<input type="text" required/>
<span class="e-float-line"></span>
<label class="e-float-text">Enter Name </label>
</div>
```

And refer to the following sections to add the icons to the TextBox.

With icon and floating label

Create an icon element as a span with the class `e-input-group-icon`, and the user can place the icon in either side of TextBox by adding the created icon element before/after the input.

For the floating label enabled TextBox add the icon element as first or last element inside the TextBox wrapper, and based on the element position it will act as prefix or suffix icon.

INDEX.TS

```
// To get the all input fields and its container.
let inputElement = document.querySelectorAll('.e-input-group .e-input, .e-
float-input.e-input-group input');
// Add 'e-input-focus' class to the input for achive ripple effect when
focus on the input field.
for (let i = 0; i < inputElement.length; i++) {
    inputElement[i].addEventListener("focus", function () {
```

```

        let parentElement = this.parentNode;
        if (parentElement.classList.contains('e-input-in-wrap')) {
            parentElement.parentNode.classList.add('e-input-focus');
        } else {
            this.parentNode.classList.add('e-input-focus');
        }
    });
    inputElement[i].addEventListener("blur", function () {
        let parentElement = this.parentNode;
        if (parentElement.classList.contains('e-input-in-wrap')) {
            parentElement.parentNode.classList.remove('e-input-focus');
        } else {
            this.parentNode.classList.remove('e-input-focus');
        }
    });
}
// Add 'e-input-btn-ripple' class to the icon element for achieve ripple
effect when click on the icon.
var inputIcon = document.querySelectorAll('.e-input-group-icon');
for (let i = 0; i < inputIcon.length; i++) {
    inputIcon[i].addEventListener('mousedown', function () {
        this.classList.add('e-input-btn-ripple');
    });
    inputIcon[i].addEventListener('mouseup', function () {
        let element = this;
        setTimeout(function () {
            element.classList.remove('e-input-btn-ripple');
        }, 500);
    });
}
}

    box-sizing: border-box;
    margin: 0 auto;
    padding: 20px 10px;
    width: 340px;
}
.e-input-group-icon:before {
    font-family: e-icons;
}
.e-input-group .e-input-group-icon.e-input-popup-date { /* csslint allow: adjoining-classes */
    font-size: 16px;
}
.e-input-group.e-small .e-input-group-icon.e-input-popup-date { /* csslint allow: adjoining-classes */
    font-size: 14px;
}
.e-input-group-icon.e-input-popup-date:before { /* csslint allow: adjoining-classes */
    content: "□";
}
.e-input-group-icon.e-input-up:before { /* csslint allow: adjoining-classes */
    content: '\e85e';
}
.e-input-group-icon.e-input-down:before { /* csslint allow: adjoining-classes */
    content: "□";
}
.e-input-group-icon.e-input-plus:before { /* csslint allow: adjoining-classes */
    content: '\e7ba';
}
.e-input-group-icon.e-input-minus:before { /* csslint allow: adjoining-classes */
    content: '\e814';
}
.e-input-group-icon.e-input-date:before { /* csslint allow: adjoining-classes */
    content: "□";
}
```

```
.e-input-group-icon.e-input-left:before { /* csslint allow: adjoining-classes */
  content: '\e904';
}
.e-input-group-icon.e-input-right:before { /* csslint allow: adjoining-classes */
  content: '\e913';
}
.e-input-group-icon.e-input-reload:before { /* csslint allow: adjoining-classes */
  content: '\e837';
}
.e-input-group-icon.e-input-search:before { /* csslint allow: adjoining-classes */
  content: '\e806';
}
#input-container .e-input-group { /* csslint allow: adjoining-classes */
  margin: 30px 0;
}
#input-container .e-float-input { /* csslint allow: adjoining-classes */
  margin: 30px 0;
}
```

To place the icon on left side of the TextBox, create a div element with the class `e-input-in-wrap` as wrapper to the input element and place the floating line, floating text, and right side icon element within it. Add the `e-float-icon-left` class to the TextBox container element.

With clear button and floating label

The clear button is added to the input for clearing the value given in the TextBox. It is shown only when the input field has a value, otherwise not shown.

You can add the clear button to the TextBox by enabling the [showClearButton](#) API in textbox

INDEX.TS

```
import { TextBox } from '@syncfusion/ej2-inputs'
let inputobj: TextBox = new TextBox({
  placeholder: 'First Name',
  floatLabelType: 'Never'
});
inputobj.appendTo('#firstName');
let inputobj1: TextBox = new TextBox({
  placeholder: 'Last Name',
  floatLabelType: 'Auto'
});
inputobj1.appendTo('#lastName');
```

Floating label without required attribute

You can render the **Floating label TextBox** without **required** attribute by manually float the label above of the TextBox using input events.

You can manually float the label above of the TextBox by adding the below list of classes to the floating label element. The classes are:

Class Name | Description

e-label-top | Floats the label above of the TextBox.

e-label-bottom | Label to be placed as placeholder for the TextBox.

INDEX.TS

```
/* To get the Input element */
let inputElement = document.getElementById('inpt1');
/* Update the label position based on Input value */
updateLabelState(inputElement.value,
inputElement.parentElement.querySelector('.e-float-text'));
inputElement.addEventListener("focus", function () {
  let label = this.parentElement.querySelector('.e-float-text');

Multi-line input with floating label

Add the HTML textarea element with the **e-input** class to create default multi-line input.

Add the floating label support to the **multi-line input** by creating the floating label structure as defined in the initial section.

INDEX.TS

```
// To get the all input fields and its container.
let inputElement = document.querySelectorAll('.e-input-group .e-input, .e-
float-input.e-input-group input');
// Add 'e-input-focus' class to the input for achive ripple effect when
focus on the input field.
for (let i = 0; i < inputElement.length; i++) {
    inputElement[i].addEventListener('focus', () => {
        let parentElement = this.parentNode;
        if (parentElement.classList.contains('e-input-in-wrap')) {
            parentElement.parentNode.classList.add('e-input-focus');
        } else {
            this.parentNode.classList.add('e-input-focus');
        }
    });
    inputElement[i].addEventListener('blur', () => {
        let parentElement = this.parentNode;
        if (parentElement.classList.contains('e-input-in-wrap')) {
            parentElement.parentNode.classList.remove('e-input-focus');

Sizing in EJ2 JavaScript Textbox control

You can render the TextBox in two different sizes.

Property | Description

Normal | By default, the TextBox is rendered with normal size.

Small | You need to add `e-small` class to the input element, or else add to the input container.

INDEX.TS

```
// To get the all input fields and its container.
let inputElement = document.querySelectorAll('.e-input-group .e-input, .e-
float-input.e-input-group input');
// Add 'e-input-focus' class to the input for achive ripple effect when
focus on the input field.
for (let i = 0; i < inputElement.length; i++) {
    inputElement[i].addEventListener("focus", function () {
        let parentElement = this.parentNode;
        if (parentElement.classList.contains('e-input-in-wrap')) {
            parentElement.parentNode.classList.add('e-input-focus');
        } else {
            this.parentNode.classList.add('e-input-focus');
        }
    });
    inputElement[i].addEventListener("blur", function () {
        let parentElement = this.parentNode;
        if (parentElement.classList.contains('e-input-in-wrap')) {
            parentElement.parentNode.classList.remove('e-input-focus');
        } else {
            this.parentNode.classList.remove('e-input-focus');
        }
    });
}
// Add 'e-input-btn-ripple' class to the icon element for achive ripple
effect when click on the icon.
var inputIcon = document.querySelectorAll('.e-input-group-icon');
for (let i = 0; i < inputIcon.length; i++) {
    inputIcon[i].addEventListener('mousedown', function () {
        this.classList.add('e-input-btn-ripple');
    });
    inputIcon[i].addEventListener('mouseup', function () {
        let element = this;
        setTimeout(function () {
            element.classList.remove('e-input-btn-ripple');
        }, 500);
    });
}

}
```

Validation in EJ2 JavaScript Textbox control

The TextBox supports three types of validation styles namely **error**, **warning**, and **success**. These states are enabled by adding corresponding classes **.e-error**, **.e-warning**, or **.e-success** to the input parent element.

INDEX.TS

```
// To get the all input fields and its container.
let inputElement = document.querySelectorAll('.e-input-group .e-input, .e-float-input.e-input-group input');
// Add 'e-input-focus' class to the input for achive ripple effect when focus on the input field.

Adding mandatory asterisk to placeholder and float label

You can add a mandatory asterisk(*) to placeholder and float label using **.e-float-input.e-control-wrapper .e-float-text::after** class.

INDEX.TS

```

// To get the all input fields and its container.
let inputElement = document.querySelectorAll('.e-input-group .e-input,.e-
float-input.e-input-group input');
// Add 'e-input-focus' class to the input for achive ripple effect when
focus on the input field.
for (let i = 0; i < inputElement.length; i++) {
  inputElement[i].addEventListener("focus", function () {
    let parentElement = this.parentNode;
    if (parentElement.classList.contains('e-input-in-wrap')) {
      parentElement.parentNode.classList.add('e-input-focus');
    } else {
      this.parentNode.classList.add('e-input-focus');
    }
  });
  inputElement[i].addEventListener("blur", function () {
    let parentElement = this.parentNode;
    if (parentElement.classList.contains('e-input-in-wrap')) {
      parentElement.parentNode.classList.remove('e-input-focus');
    }
  });
}

```

```

    } else {
        this.parentNode.classList.remove('e-input-focus');
    }

    color: red;
}

```

Multiline in EJ2 JavaScript Textbox control

This feature allows the textbox to accept one or more lines of text like address, description, comments, and more.

Create multiline textbox

You can convert the default textbox into the multiline textbox by setting the [multiline](#) API value as true or pass HTML5 textarea as element to the textbox.

The multiline textbox allows you to resize it in vertical direction alone.

INDEX.TS

```

import { TextBox } from '@syncfusion/ej2-inputs';
// Initialize TextBox component
let textareaObject: TextBox = new TextBox({
    placeholder: 'Enter your address',
    value: 'Mr. Dodsworth Dodsworth, System Analyst, Studio 103, The
    Business Center'
});

```

```
// Render initialized TextBox
textareaObject.appendTo('#default');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 Multiline</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Essential JS 2 TextBox Component">
  <meta name="author" content="Syncfusion">

  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container" class="multiline">
    <textarea id="default" name="text"></textarea>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

STYLES.CSS

```
.multiline{
  margin: 30px auto;
  width: 30%;
}
#loader {
  color: #008cff;
  font-family: 'Helvetica Neue', 'calibiri';
  font-size: 14px;
  height: 40px;
  left: 45%;
  position: absolute;
  top: 45%;
  width: 30%;
```

```
}
```

Implementing floating label

You can achieve the floating label behavior in the multiline textbox by setting [floatLabelType](#) as 'Auto'. The placeholder text act as floating label to the multiline textbox. You can provide the placeholder text to the multiline textbox either by using the [placeholder](#) property or placeholder attribute.

INDEX.TS

```
import { TextBox } from '@syncfusion/ej2-inputs';
// Initialize TextBox component with floating type as auto
let floatTypeAuto: TextBox = new TextBox({
    placeholder: 'Enter your address',
    floatLabelType: 'Auto'
});
// Render initialized floating type as auto TextBox
floatTypeAuto.appendTo('#multiline-auto');
// Initialize TextBox component with floating type as always
let floatTypeAlways: TextBox = new TextBox({
    placeholder: 'Enter your address',
    floatLabelType: 'Always'
});
// Render initialized floating type as always TextBox
floatTypeAlways.appendTo('#multiline-always');
// Initialize TextBox component with floating type as never
let floatTypeNever: TextBox = new TextBox({
    placeholder: 'Enter your address',
    floatLabelType: 'Never'
});
// Render initialized floating type as never TextBox
floatTypeNever.appendTo('#multiline-never');
```

INDEX.HTML

```

```

```

</head>
<body>

    <label class="custom-input-label"> Float label type auto </label>
    <div id="container" class="multiline">
        <textarea id="multiline-auto" name="typeAuto"></textarea>
    </div>
    <label class="custom-input-label"> Float label type always </label>
    <div id="container1" class="multiline">
        <textarea id="multiline-always" name="typeAlways"></textarea>
    </div>
    <label class="custom-input-label"> Float label type never </label>
    <div id="container2" class="multiline">
        <textarea id="multiline-never" name="typeNever"></textarea>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

STYLES.CSS

```

.multiline{
    margin: 10px auto;
    width: 30%;
}
.custom-input-label {
    font-size: 14px;
    font-weight: bold;
    margin: 35%;
}
#loader {
    color: #008cff;
    font-family: 'Helvetica Neue','calibiri';
    font-size: 14px;
    height: 40px;
    left: 45%;
    position: absolute;
    top: 45%;
    width: 30%;
}

```

Auto resizing

By default, you can manually resize the multiline textbox. But you can also create an **auto resizing** multiline textbox with both the initial and dynamic value change. It can be done by calculating the height of the textarea in the created event for initial value update and in the input event for dynamic value update of the auto resize multiline textbox, as explained in the following code sample.

INDEX.TS

```

import { TextBox } from '@syncfusion/ej2-inputs';

```

```
// Initialize TextBox component
let autoResize: TextBox = new TextBox({
  placeholder: 'Enter your address',
  floatLabelType: 'Auto',
  value: "Mr. Dodsworth Dodsworth, System Analyst, Studio 103, The
Business Center",
  created: (args: any)=> {
    autoResize.addAttributes({rows: "1"});
    autoResize.element.style.height = "auto";
    autoResize.element.style.height = (autoResize.element.scrollHeight-
7) + "px";
  },
  input: (args: any)=> {
    args.event.currentTarget.style.height = "auto";
    args.event.currentTarget.style.height =
(args.event.currentTarget.scrollHeight)+"px";
  }
});
// Render initialized TextBox
autoResize.appendTo('#default');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 Multiline</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

inputs/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
popups/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
buttons/styles/material.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container" class="multiline">
    <textarea id="default" name="text"></textarea>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
```

```
<script src="index.js" type="text/javascript"></script>
</body></html>
```

STYLES.CSS

```
.multiline{
    margin: 30px auto;
    width: 30%;
}
#loader {
    color: #008cff;
    font-family: 'Helvetica Neue','calibiri';
    font-size: 14px;
    height: 40px;
    left: 45%;
    position: absolute;
    top: 45%;
    width: 30%;
}
```

Disable resizing

By default, the multiline textbox is rendered with resizable. You can disable the resize of the multiline textbox by applying the following CSS styles.

```
`css
textarea.e-input,
.e-float-input textarea,
.e-float-input.e-control-wrapper textarea,
.e-input-group textarea,
.e-input-group.e-control-wrapper textarea {
    resize: none;
}
```

INDEX.TS

```
import { TextBox } from '@syncfusion/ej2-inputs';
// Initialize TextBox component
let disableResize: TextBox = new TextBox({
    placeholder: 'Enter your address',
    floatLabelType: 'Auto'
});
// Render initialized TextBox
disableResize.appendTo('#default');
```

INDEX.HTML

```

    position: absolute;
    top: 45%;
    width: 30%;
}

```

```
}
```

Limit the text length

By default, the text length of the multiline textbox is unlimited. You can limit the text length by setting the `maxLength` attribute using the [addAttributes](#) method.

INDEX.TS

```
import { TextBox } from '@syncfusion/ej2-inputs';
import { Button } from '@syncfusion/ej2-buttons';
// Initialize TextBox component
let maxLength: TextBox = new TextBox({
    placeholder: 'Enter your address',
    floatLabelType: 'Auto'
});
// Render initialized TextBox
maxLength.appendTo('#default');
// Initialize TextBox component
let addAttr: TextBox = new TextBox({
    placeholder: 'Enter your address',
    floatLabelType: 'Auto'
});
// Render initialized TextBox
addAttr.appendTo('#attr');
// Initialize Button component
let button: Button = new Button({
});
// Render initialized Button
button.appendTo('#button');
document.getElementById('button').onclick = (): void => {
    addAttr.addAttributes({maxlength: 15});
}
```

INDEX.HTML

```

}

```

Count characters

You can show the number of characters entered inside the textarea by calculating the character count in the input event of multiline textbox. The character count is updated while entering or deleting any

character inside the textarea. The character count shows how many characters can be entered or left to be entered.

INDEX.TS

```
import { TextBox } from '@syncfusion/ej2-inputs';
// Initialize TextBox component
let countChar: TextBox = new TextBox({
  placeholder: 'Enter your address',
  floatLabelType: 'Auto',
  input: (args: any)=> {
    let word, addresscountRem, addressCount;
    word = args.value;
    addressCount = word.length;
    addresscountRem = document.getElementById('numbercount');
    addresscountRem.textContent = addressCount+"/25";
  }
});
// Render initialized TextBox
countChar.appendTo('#default');
```

INDEX.HTML

}

```

Style appearance in EJ2 JavaScript Textbox control

The [Theme Studio](#) for Essential JS 2 can be used to customize a new theme from an existing theme. It allows modification and preview for primary font and color as well as secondary font and color of the chosen theme. This section covers the instructions and techniques to customize the appearance and styling of the TextBox component beyond the basic requirement provided by the theme studio.

Note: The styling and customization provided in this section will be applied globally for all the Textbox in the page when used as such. To apply the customization only to a specific textbox component, the [cssClass](#) property can be used. [cssClass](#) API adds the custom class attribute to the textbox component, using which the styling can be restricted to the specific component.

INDEX.TS

```

import { TextBox } from '@syncfusion/ej2-inputs';
// Initialize TextBox component
let textbox: TextBox = new TextBox({
    placeholder: 'First Name',
    floatLabelType: 'Auto',
});
textbox.appendTo('#firstname');

```

INDEX.HTML

```

Filled and Outline mode

The Filled and Outline modes can be enabled in the Textbox component by adding the `e-outline` or `e-filled` class to the [cssClass](#) API.

INDEX.TS

```
import { TextBox } from '@syncfusion/ej2-inputs';
// Initialize TextBox component with cssClass 'e-filled'
let filledTextBox: TextBox = new TextBox({
  placeholder: 'Filled',
  cssClass: 'e-filled',
  floatLabelType: 'Auto'
});
filledTextBox.appendTo('#filled');
// Initialize TextBox component with cssClass 'e-outline'
let outlinedTextBox: TextBox = new TextBox({
  placeholder: 'Outlined',
  cssClass: 'e-outline',
  floatLabelType: 'Auto'
});
outlinedTextBox.appendTo('#outlined');
```

}

```

Note: Filled and Outline theme customization are available only with Material theme.

How To

Set the rounded corner in EJ2 JavaScript Textbox control

Render the TextBox with **rounded corner** by adding the **e-corner** class to the input parent element.

This rounded corner visible only in box model input component

INDEX.TS

```

// To get the all input fields and its container.
let inputElement = document.querySelectorAll('.e-input-group .e-input, .e-float-input.e-input-group input');
// Add 'e-input-focus' class to the input for achive ripple effect when focus on the input field.
for (let i = 0; i < inputElement.length; i++) {
    inputElement[i].addEventListener("focus", function () {
        let parentElement = this.parentNode;
        if (parentElement.classList.contains('e-input-in-wrap')) {
            parentElement.parentNode.classList.add('e-input-focus');
        } else {
            this.parentNode.classList.add('e-input-focus');
        }
    });
    inputElement[i].addEventListener("blur", function () {
        let parentElement = this.parentNode;
        if (parentElement.classList.contains('e-input-in-wrap')) {
            parentElement.parentNode.classList.remove('e-input-focus');
        } else {

```

```

        this.parentNode.classList.remove('e-input-focus');
    });
}
// Add 'e-input-btn-ripple' class to the icon element for achive ripple
effect when click on the icon.
var inputIcon = document.querySelectorAll('.e-input-group-icon');
for (let i = 0; i < inputIcon.length; i++) {
    inputIcon[i].addEventListener('mousedown', function () {
        this.classList.add('e-input-btn-ripple');
    });
    inputIcon[i].addEventListener('mouseup', function () {
        let element = this;
        setTimeout(function () {
            element.classList.remove('e-input-btn-ripple');
        }, 500);
    });
}

```

Add textbox programmatically in EJ2 JavaScript Textbox control

- Create a TypeScript file and import the **Input** modules

from **ej2-inputs** library as shown below.

``ts`

`import {Input} from '@syncfusion/ej2-inputs';`

```

- Pass the **HTML Input** element as parameter to the **createInput** method.
- You can also add the **icons** on the input by passing **buttons** property value with the class name **e-input-group-icon** as parameter to the **createInput** method.

### INDEX.TS

```
// To get the all input fields and its container.
let inputElement = document.querySelectorAll('.e-input-group .e-input, .e-float-input.e-input-group input');
// Add 'e-input-focus' class to the input for achieve ripple effect when focus on the input field.
for (let i = 0; i < inputElement.length; i++) {
 inputElement[i].addEventListener("focus", function () {
 this.parentNode.classList.add('e-input-focus')
 });
 inputElement[i].addEventListener("blur", function () {
 this.parentNode.classList.remove('e-input-focus')
 });
}
// Add 'e-input-btn-ripple' class to the icon element for achieve ripple effect when click on the icon.
var inputIcon = document.querySelectorAll('.e-input-group-icon');
for (let i = 0; i < inputIcon.length; i++) {
 inputIcon[i].addEventListener('mousedown', function () {
 this.classList.add('e-input-btn-ripple');
 });
}
```

```

 });
 inputIcon[i].addEventListener('mouseup', function () {
 var element = this;
 setTimeout(function () {
 element.classList.remove('e-input-btn-ripple');
 }, 500);
 });
}
import { Input, InputObject } from '@syncfusion/ej2-inputs';
let inputObj: InputObject;
let element: HTMLInputElement = <HTMLInputElement>
document.createElement('input');
document.getElementById('input-container').appendChild(element);
Input.createInput({
 element: element,
 properties:{
 placeholder:'Enter Name'
 }
});
let element1: HTMLInputElement =
<HTMLInputElement>document.createElement('input');
document.getElementById('input-container').appendChild(element1);
Input.createInput({
 element: element1,
 buttons: ['e-input-group-icon e-input-down'],
 properties:{
 placeholder:'Enter Value'
 }
});

```

 margin: 30px 0;
}
```

### Add floating label to textbox programmatically in EJ2 JavaScript Textbox control

The Floating Label TextBox floats label above the TextBox after focusing, or entering a value in the TextBox.

Floating label supports the types of actions as given below.

| Type | Description |
|------|-------------|
|------|-------------|

|      |                                                                                                 |
|------|-------------------------------------------------------------------------------------------------|
| Auto | The floating label will float above the input after focusing, or entering a value in the input. |
|------|-------------------------------------------------------------------------------------------------|

|        |                                                       |
|--------|-------------------------------------------------------|
| Always | The floating label will always float above the input. |
|--------|-------------------------------------------------------|

|       |                                                                                   |
|-------|-----------------------------------------------------------------------------------|
| Never | By default, never float the label in the input when the placeholder is available. |
|-------|-----------------------------------------------------------------------------------|

- Create a TypeScript file and import the `Input` modules from `ej2-inputs` library as shown below.

```
`ts
```

```
import {Input} from '@syncfusion/ej2-inputs';
```

```
,
```

- Pass the `HTML Input` element and `floatLabelType` property as `Auto` to the `createInput` method.
- Set the `placeholder` value to the input element via `element attribute` or pass the parameter to the `createInput` method.

The watermark label will be updated based on the specified placeholder value of the Floating Label TextBox.

- You can add the icons on the input by passing buttons property value with the

class name `e-input-group-icon` as parameter to the `createInput` method.

## INDEX.TS

```
// To get the all input fields and its container.
let inputElement = document.querySelectorAll('.e-input-group .e-input,.e-
float-input.e-input-group input');
// Add 'e-input-focus' class to the input for achive ripple effect when
focus on the input field.
for (let i = 0; i < inputElement.length; i++) {
 inputElement[i].addEventListener("focus", function () {
 this.parentNode.classList.add('e-input-focus')
 });
 inputElement[i].addEventListener("blur", function () {
 this.parentNode.classList.remove('e-input-focus')
 });
}
// To get the all icon elements on the input field.
var inputIcon = document.querySelectorAll('.e-input-group-icon');
// Add 'e-input-btn-ripple' class to the icon element for achive ripple
effect when click on the icon.
for (let i = 0; i < inputIcon.length; i++) {
 inputIcon[i].addEventListener('mousedown', function () {
 this.classList.add('e-input-btn-ripple');
 });
 inputIcon[i].addEventListener('mouseup', function () {
 var element = this;
 setTimeout(function () {
 element.classList.remove('e-input-btn-ripple');
 }, 500);
 });
}
import { Input, InputObject } from '@syncfusion/ej2-inputs';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
let inputObj: InputObject;
let element: HTMLInputElement =
<HTMLInputElement>document.createElement('input');
document.getElementById('input-container').appendChild(element);
Input.createInput({
 element: element,
 floatLabelType: "Auto",
 properties:{
 placeholder:'Enter Name'
 }
});
let element2: HTMLInputElement =
<HTMLInputElement>document.createElement('input');
document.getElementById('input-container-01').appendChild(element2);
Input.createInput({
 element: element2,
```

```

 floatLabelType: "Always",
 properties:{
 placeholder:'Enter Name'
 }
 });
 let element3: HTMLInputElement =
 <HTMLInputElement>document.createElement('input');
 document.getElementById('input-container-02').appendChild(element3);
 Input.createInput({
 element: element3,
 floatLabelType: "Never",
 properties:{
 placeholder:'Enter Name'
 }
 });
 // Render float label TextBox with icon
 let element4: HTMLInputElement =
 <HTMLInputElement>document.createElement('input');
 document.getElementById('input-container-03').appendChild(element4);
 Input.createInput({
 element: element4,
 floatLabelType: "Auto",
 buttons: ['e-input-group-icon e-input-down'],
 properties:{
 placeholder:'Enter Value'
 }
 });

```

### Change the floating label color of the textbox in EJ2 JavaScript Textbox control

You can change the floating label color of the TextBox for both **success** and **warning** validation states by applying the following CSS styles.

```
`css
/ For Success state /
.e-float-input.e-success label.e-float-text,
.e-float-input.e-success input:focus ~ label.e-float-text,
.e-float-input.e-success input:valid ~ label.e-float-text {
color: #22b24b;
}
```

*/ For Warning state /*

```
.e-float-input.e-warning label.e-float-text,
.e-float-input.e-warning input:focus ~ label.e-float-text,
.e-float-input.e-warning input:valid ~ label.e-float-text {
color: #ffca1c;
}
,
```

## INDEX.TS

```
// To get the all input fields and its container.
let inputElement = document.querySelectorAll('.e-input-group .e-input,.e-
float-input.e-input-group input');
// Add 'e-input-focus' class to the input for achive ripple effect when
focus on the input field.
for (let i = 0; i < inputElement.length; i++) {
 inputElement[i].addEventListener("focus", function () {
 let parentElement = this.parentNode;
 if (parentElement.classList.contains('e-input-in-wrap')) {
 parentElement.parentNode.classList.add('e-input-focus');
 } else {
 this.parentNode.classList.add('e-input-focus');
 }
 });
 inputElement[i].addEventListener("blur", function () {
 let parentElement = this.parentNode;
 if (parentElement.classList.contains('e-input-in-wrap')) {
 parentElement.parentNode.classList.remove('e-input-focus');
 } else {
 this.parentNode.classList.remove('e-input-focus');
 }
 });
}
// Add 'e-input-btn-ripple' class to the icon element for achive ripple
effect when click on the icon.
var inputIcon = document.querySelectorAll('.e-input-group-icon');
for (let i = 0; i < inputIcon.length; i++) {
 inputIcon[i].addEventListener('mousedown', function () {
 this.classList.add('e-input-btn-ripple');
 });
 inputIcon[i].addEventListener('mouseup', function () {
 let element = this;
 setTimeout(function () {
 element.classList.remove('e-input-btn-ripple');
 }, 500);
 });
}
}
```

 margin: 0 auto;
 min-width: 185px;
}
.content-wrapper .row {
 padding: 15px 0;
}

```

Change the color of the textbox based on its value in EJ2 JavaScript Textbox control

You can change the color of the TextBox by validating its value using regular expression in the **keyup** event for predicting the numeric values as demonstrated in the following code sample.

#### INDEX.TS

```
// To get the all input fields and its container.
```

```
let inputElement = document.querySelectorAll('.e-input-group .e-input, .e-
float-input.e-input-group input');
// Add 'e-input-focus' class to the input for achive ripple effect when
focus on the input field.
for (let i = 0; i < inputElement.length; i++) {
 inputElement[i].addEventListener("focus", function () {
 let parentElement = this.parentNode;
 if (parentElement.classList.contains('e-input-in-wrap')) {
 parentElement.parentNode.classList.add('e-input-focus');
 } else {
 this.parentNode.classList.add('e-input-focus');
 }
 });
 inputElement[i].addEventListener("blur", function () {
 let parentElement = this.parentNode;
 if (parentElement.classList.contains('e-input-in-wrap')) {
 parentElement.parentNode.classList.remove('e-input-focus');
 } else {
 this.parentNode.classList.remove('e-input-focus');
 }
 });
}
// To Configure RegExp for predicting Numeric values on keyUp event function
function onKeyUp(e) {
 let str = e.value.match(/^[0-9]+$/);
 if (!(str && str.length > 0) && e.value.length) {
 e.parentElement.classList.add('e-error');
 } else {
 e.parentElement.classList.remove('e-error');
 }
}
```

}
.wrap label { /* csslint allow: adjoining-classes */
 font-weight:bold;
}

```

### Add floating label to read only textbox in EJ2 JavaScript Textbox control

You can achieve floating label for read-only textboxes by adding/removing **e-label-top** and **e-label-bottom** classes to the label element

In this sample, click the update value button to fill the read-only textbox with value and float a label.

#### INDEX.TS

```

function checkFloatingLabel(id) {
 let inputElement= document.getElementById(id);
 let labelElement = inputElement.parentElement.querySelector('.e-float-
text');
 if (inputElement.value !== '') {
 labelElement.classList.remove('e-label-bottom');
 labelElement.classList.add('e-label-top');
 } else {
 labelElement.classList.remove('e-label-top');
 labelElement.classList.add('e-label-bottom');
 }
}
let inputField = document.getElementById('myText');
document.getElementById('valuebtn').onclick = () => {
 (document.getElementsByClassName('myField')[0]).value = '10';
 checkFloatingLabel('myText')
}
document.getElementById('removebtn').addEventListener('click', function()
{
 (document.getElementsByClassName('myField')[0]).value = '';
 checkFloatingLabel('myText')
}))

```

#### INDEX.HTML

```

<!DOCTYPE html>

</body></html>

```

Customize the textbox background color and text color in EJ2 JavaScript Textbox control  
You can customize the textbox styles such as background-color, text-color and border-color by overriding its default styles.

To change the styles of the floating label, you must override the style to the input element.

### INDEX.TS

```

// To get the all input fields and its container.
let inputElement = document.querySelectorAll('.e-input-group .e-input, .e-
float-input.e-input-group input');
// Add 'e-input-focus' class to the input for achive ripple effect when
focus on the input field.
for (let i = 0; i < inputElement.length; i++) {
inputElement[i].addEventListener("focus", function () {
this.parentNode.classList.add('e-input-focus');
});
}

```

```
inputElement[i].addEventListener("blur", function () {
 this.parentNode.classList.remove('e-input-focus');
});
}
```

```

## Migration from css textbox to javascript textbox in EJ2 JavaScript Textbox control

From v16.3.21 version, the textbox is provided as JavaScript control to achieve the floating label textbox with minimal code. You can find the available textbox properties, methods, and events in the [API reference](#).

The following table describes the migration from CSS textbox to JavaScript textbox control.

### Normal textbox

<!-- markdownlint-disable MD038 -->

Rendering mode	CSS textbox	JavaScript textbox control
-----	-----	-----

| Default rendering | `<div class='e-input-group'><br/><input class='e-input' type='text' placeholder='Enter Value' /><br/></div> | <input id='default' /><br/><br/> //To initiate the default textbox control <br/>var inputobj = new ej.inputs.TextBox({<br/>placeholder: 'Enter Value',<br/> floatLabelType: 'Never'<br/>});<br/>inputObj.appendTo('#default'); |`

| Textbox with clear button | `<div class='e-input-group'><br/><input class='e-input' placeholder='Enter Value' required='true'><br/><span class='e-clear-icon'></span><br/></div><br/><br/>Note: You have to write action for clear button. | <input id='clear-input' /><br/><br/> var inputobj = new ej.inputs.TextBox({<br/>placeholder: 'Enter Value',<br/>showClearButton: 'true',<br/> floatLabelType: 'Never'<br/>});<br/>inputObj.appendTo('#clear-input'); |`

| Validation states | `<div class='e-input-group e-error'><br/><input class='e-input' type='text' placeholder='Enter Value' /><br/></div><br/><br/>Note: Textbox control consists of three types of validation rules such as success, warning, and error. | <input id='validation' /><br/><br/> var inputobj = new ej.inputs.TextBox({<br/>placeholder: 'Enter Value',<br/>cssClass: 'e-error',<br/> floatLabelType: 'Never'<br/>});<br/>inputObj.appendTo<br/>('#validation'); |`

#### Floating label textbox

<!-- markdownlint-disable MD038 -->

#### | Rendering mode | CSS textbox | JavaScript textbox control |

| ----- | ----- | ----- |

| Default rendering | `<div class='e-float-input'><br/><input type='text' required /><br/><span class='e-float-line'></span><br/><label class='e-float-text'>Enter Value</label><br/></div> | <input id='default' /><br/><br/> //To initiate the default textbox control with floating option <br/>var inputobj = new ej.inputs.TextBox({<br/>placeholder: 'Enter Value',<br/> floatLabelType: 'Auto'<br/>});<br/>inputObj.appendTo('#default'); |`

| Textbox with clear button | `<div class='e-float-input e-input-group'><br/><input type='text' required value= 'Clear Input' /><br/><span class='e-float-line'></span><br/><label class='e-float-text'>Enter Value</label><br/><span class='e-clear-icon'></span><br/></div><br/><br/>Note: You have to write action for clear button. | <input id='clear-input' /><br/><br/> //To initiate the textbox control with clear button and floating option<br/>var inputobj = new ej.inputs.TextBox({<br/>placeholder: 'Enter Value',<br/>showClearButton: 'true',<br/> floatLabelType: 'Auto'<br/>});<br/>inputObj.appendTo('#clear-input'); |`

| Validation states | `<div class='e-float-input e-error'><br/><input type='text' required /><br/><span class='e-float-line'></span><br/><label class='e-float-text'>Enter Value</label><br/></div><br/><br/> Note: Textbox control consists of three types of validation rules such as success, warning, and error. | <input id='validation' /><br/><br/> //To initiate the textbox control with validation and floating option<br/>var inputobj = new ej.inputs.TextBox({<br/>placeholder: 'Enter Value',<br/>cssClass: 'e-error',<br/> floatLabelType: 'Auto'<br/>});<br/>inputObj.appendTo<br/>('#validation'); |`

## TimePicker

### Time range in EJ2 JavaScript Timepicker control

TimePicker provides an option to select a time value within a specified range by using the [min](#) and [max](#) properties. The min value should always be lesser than the max value.

When the min and max properties are configured and the selected time value is out-of-range or invalid, then the model value will be set to **out of range** time value or **null** respectively with highlighted **error** class to indicates the time is out of range or invalid.

The value property depends on the min/max with respect to [strictMode](#) property.

The following example allows you to select a time value within a range of **9:00 AM** to **11:30 AM**.

#### INDEX.TS

```
import { TimePicker } from '@syncfusion/ej2-calendars';
import { enableRipple } from '@syncfusion/ej2-base';
//enable ripple style
enableRipple(true);
//creates a timepicker with min and max property
let timeObject: TimePicker = new TimePicker({
 //sets the min value
 min: new Date('3/8/2017 9:00 AM'),
 //sets the max value
 max: new Date('3/8/2017 11:30 AM'),
 //sets the value
 value: new Date('3/8/2017 11:00 AM')
});
timeObject.appendTo('#element');
```

#### INDEX.HTML

 <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
 type="text/javascript"></script>
```

```

<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

 <div id="container">
 <input type="text" id="element">
 </div>
<script>
var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

If the value of **min** or **max** property is changed through code behind you have to update the **value** property to set within the range.

#### Time Range customization using two TimePicker components

Here, two TimePicker components are used to select the start and end time. The below sample illustrates the appointment time selection scenario with the start and end time option.

Before the start time selection, the end time TimePicker is in disable state. When the start time is selected, then you will be able to select the end time or else, need to select the entire business hours 9:00 to 18:00 from the Business Hours option. Once the options are checked, both the TimePicker components goes to readonly state.

#### INDEX.TS

```

import { TimePicker, ChangeEventArgs } from '@syncfusion/ej2-calendars';
import { CheckBox, ChangeEventArgs as checkboxChange } from
 '@syncfusion/ej2-buttons';
import { enableRipple } from '@syncfusion/ej2-base';
//enable ripple style
enableRipple(true);
let value: Date;
let isStartTimeChange: Boolean = true;
let startTime: TimePicker = new TimePicker({
 change: onEnableEndTime
});
startTime.appendTo('#start');
let endTime: TimePicker = new TimePicker({
 enabled: false
});
endTime.appendTo('#end');
let checkboxObject: CheckBox = new CheckBox({ label: 'Business Hours',
change: changeTime });
checkboxObject.appendTo('#dayRange');
let endInput: HTMLInputElement =
<HTMLInputElement>document.getElementById('end');
function changeTime(args: checkboxChange): void {
 /*To determine whether we have selected business hours or not*/
 isStartTimeChange = false;
 if (args.checked) {

```

```

 /*Business hours*/
 startTime.value = new Date('9/6/2017 9:00');
 endTime.enabled = true;
 endTime.value = new Date('9/6/2017 18:00');
 startTime.readonly = true;
 endTime.readonly = true;
 } else {
 endTime.value = null;
 startTime.value = null;
 endInput.value = '';
 startTime.readonly = false;
 endTime.readonly = false;
 endTime.enabled = false;
 }
}
function onEnableEndTime(args: ChangeEventArgs): void {
 /*Enables end time if start time is selected*/
 if (isStartTimeChange) {
 endTime.enabled = true;
 endTime.value = null;
 endInput.value = '';
 value = new Date(+args.value);
 value.setMinutes(value.getMinutes() + endTime.step);
 endTime.min = value;
 } else {
 isStartTimeChange = true;
 }
}
}

```

## Time masking in EJ2 JavaScript Timepicker control

TimePicker has `enableMask` property that provides the option to enable the built-in date masking support. Also, you must inject the MaskedDateTime module to enable the masking support.

### INDEX.TS

```

import { TimePicker, MaskedDateTime } from '@syncfusion/ej2-calendars';
TimePicker.Inject(MaskedDateTime);
let timepickerObject: TimePicker = new TimePicker({
 enableMask: true
});
timepickerObject.appendTo('#mask');

```

### INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
 <title>Essential JS 2 DatePicker control</title>
 <meta charset="utf-8">
 <meta name="viewport" content="width=device-width, initial-scale=1.0">
 <meta name="description" content="Typescript UI Controls">
 <meta name="author" content="Syncfusion">

var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

The mask pattern is defined based on the provided time format to the component. If the format is not specified, the mask pattern is formed based on the default format of the current culture.

| **Keys | Actions |**

| --- | --- |

| Up / Down arrows | To increment and decrement the selected portion of the time. |

| Left / Right arrows and Tab | To navigate the selection from one portion to next portion |

The following example demonstrates default and custom format of TimePicker component with mask.

#### INDEX.TS

```

import { TimePicker, MaskedDateTime } from '@syncfusion/ej2-calendars';
TimePicker.Inject(MaskedDateTime);
let timepickerObject: TimePicker = new TimePicker({
 enableMask: true
});
timepickerObject.appendTo('#mask');
let timepickerFormat: TimePicker = new TimePicker({
 enableMask: true,
 format: "h:mm a",

```

```
});
timepickerFormat.appendTo('#format');
```

## INDEX.HTML

 <script>
var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
 </script>
 <script src="index.js" type="text/javascript"></script>
</body></html>
```

### Configure Mask Placeholder

You can change mask placeholder value through property `maskPlaceholder`. By default , it takes the full name of time co-ordinates such as `hour`, `minute` and `second`.

While changing to a culture other than `English`, ensure that locale text for the concerned culture is loaded through load method of L10n class for mask placeholder values like below.

```
`ts
//Load the L10n from ej2-base
import { L10n } from '@syncfusion/ej2-base';
//load the locale object to set the localized mask placeholder value
L10n.load({
 'de': {
 'timepicker': { hour: 'Stunde' ,minute: 'Minute', second:'Sekunde' }
 }
});
`
```

The following example demonstrates default and customized mask placeholder value.

#### **INDEX.TS**

```
import { TimePicker, MaskedDateTime } from '@syncfusion/ej2-calendars';
TimePicker.Inject(MaskedDateTime);
let timepickerObject: TimePicker = new TimePicker({
 enableMask: true
});
timepickerObject.appendTo('#mask');
let timepickerPlaceholder: TimePicker = new TimePicker({
 enableMask: true,
 maskPlaceholder: {hour: 'h', minute: 'm', second: 's'}
});
timepickerPlaceholder.appendTo('#placeholder');
```

#### **INDEX.HTML**

<script src="index.js" type="text/javascript"></script>
</body></html>

```

## Globalization in EJ2 JavaScript Timepicker control

Globalization is the combination of internalization and localization. You can adapt the component to various languages by parsing and formatting the date or number [internationalization](#), and also add culture specific customization and translation to the text [localization](#).

By default, the time format and meridian names are specific to the American English culture. It utilizes the [Essential JavaScript 2 Internationalization](#) package to parse and format the date object based on the culture by using the official [UNICODE CLDR](#) JSON data. It provides the `loadCldr` method to load culture specific CLDR JSON data. To use a different culture other than English, follow the steps below:

- Install the `CLDR-Data` package by using the following command (installs all the CLDR JSON data). To know more about CLDR-Data refer to the [CLDR-Data](#) link.

```
npm install cldr-data --save
```

Once the package is installed, you can find the culture specific JSON data under the location `/node_modules/cldr-data`.

- Import the installed CLDR JSON data into the `app.ts` file. To import JSON data, install the JSON plugin loader. Here, The systemJS JSON plugin loader is used.

,

```
npm install systemjs-plugin-json --save-dev
```

,

- After installation, configure the `system.config.js` configuration settings as given below to map the `systemjs-plugin-json` loader.

```
`ts
System.config({
 paths: {
 'npm:': './node_modules/',
 'syncfusion:': 'npm:@syncfusion/'
 },
 map: {
 app: 'app',
 //Syncfusion packages mapping
 "@syncfusion/ej2-base": "syncfusion:ej2-base/dist/ej2-base.umd.min.js",
 "@syncfusion/ej2-data": "syncfusion:ej2-data/dist/ej2-data.umd.min.js",
 "@syncfusion/ej2-inputs": "syncfusion:ej2-inputs/dist/ej2-inputs.umd.min.js",
 "@syncfusion/ej2-splitbuttons": "syncfusion:ej2-splitbuttons/dist/ej2-splitbuttons.umd.min.js",
 "@syncfusion/ej2-buttons": "syncfusion:ej2-buttons/dist/ej2-buttons.umd.min.js",
 "@syncfusion/ej2-lists": "syncfusion:ej2-lists/dist/ej2-lists.umd.min.js",
 "@syncfusion/ej2-navigations": "syncfusion:ej2-navigations/dist/ej2-navigations.umd.min.js",
 "@syncfusion/ej2-popups": "syncfusion:ej2-popups/dist/ej2-popups.umd.min.js",
 "@syncfusion/ej2-charts": "syncfusion:ej2-charts/dist/ej2-charts.umd.min.js",
 "@syncfusion/ej2-calendars": "syncfusion:ej2-calendars/dist/ej2-calendars.umd.min.js",
 "@syncfusion/ej2-grids": "syncfusion:ej2-grids/dist/ej2-grids.umd.min.js",
 "cldr-data": 'npm:cldr-data',
 "plugin-json": "npm:systemjs-plugin-json/json.js"
 },
```

```

meta: {
 '*.json': { loader: 'plugin-json' }
},
packages: {
 'app': { main: 'app', defaultExtension: 'js' },
 'cldr-data': { main: 'index.js', defaultExtension: 'js' }
}
});
System.import('app');
`

```

- Use the [loadCldr](#) method to load the culture specific CLDR JSON data from the installed location to `app.ts` file.
- TimePicker displayed `Sunday` as the first day of week based on default culture ("en-US"). If you want to display the TimePicker with loaded culture's first day of week, you need to import `weekdata.json` file from the `cldr-data/supplemental` as given in the code example.

```

`ts
import { loadCldr } from '@syncfusion/ej2-base';
declare var require: any;
loadCldr(
 require('cldr-data/supplemental/numberingSystems.json'),
 require('cldr-data/main/de/ca-gregorian.json'),
 require('cldr-data/main/de/numbers.json'),
 require('cldr-data/supplemental/weekdata.json') // To load the culture based first day of week
);
`

```

- Before changing to a culture other than `English`, ensure that the locale text for the concerned culture is loaded through [L10n.load](#) method.

```

`ts
//Load the L10n from ej2-base
import { L10n } from '@syncfusion/ej2-base';
//load the locale object to set the localized placeholder value
L10n.load({
 'de': {

```

```
'timepicker': { placeholder: 'Wählen Sie Zeit' }
}
});
`
```

- Set the culture by using the [locale](#) property. In the following code example, the TimePicker component is initialized in **German** culture with corresponding localized text.

```
`ts
import { TimePicker } from '@syncfusion/ej2-calendars';
//Load the L10n from ej2-base
import { L10n, loadCldr } from '@syncfusion/ej2-base';
import { enableRipple } from '@syncfusion/ej2-base';
//enable ripple style
enableRipple(true);
declare var require: any;
loadCldr(
 require('cldr-data/supplemental/numberingSystems.json'),
 require('cldr-data/main/de/ca-gregorian.json'),
 require('cldr-data/main/de/numbers.json')
);
//load the locale object to set the localized placeholder value
L10n.load({
 'de': {
 'timepicker': { placeholder: 'Wählen Sie Zeit' }
 }
});
// creates the timepicker with German culture.
let timeObject: TimePicker = new TimePicker({
 locale:'de',
 value: new Date()
});
timeObject.appendTo('#element');
```

The following example demonstrates the TimePicker in **German** culture.

**INDEX.TS**

```
import { TimePicker } from '@syncfusion/ej2-calendars';
//Load the L10n from ej2-base
import { loadCldr, L10n } from '@syncfusion/ej2-base';
//load the CLDR data files.
import * as numberingSystems from './numberingSystems.json';
import * as gregorian from './ca-gregorian.json';
import * as numbers from './numbers.json';
import { enableRipple } from '@syncfusion/ej2-base';
//enable ripple style
enableRipple(true);
loadCldr(numberingSystems, gregorian, numbers);
L10n.load({
 'de': {
 'timepicker': { placeholder: 'Wählen Sie Zeit' }
 }
});
// creates the timepicker with German culture.
let timeObject: TimePicker = new TimePicker({
 locale: 'de',
 value: new Date()
});
timeObject.appendTo('#element');
```

**INDEX.HTML**

```

if(ele) {
 ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

### Right-To-Left

The TimePicker supports RTL (right-to-left) functionality for languages like Arabic and Hebrew to displays the text in the right-to-left direction. Use [enableRtl](#) property to set the RTL direction.

The code example demonstrates the TimePicker component in **Arabic** culture. It also explains how to set localized text to the placeholder using [L10n.load](#) method.

```

`ts
import { TimePicker } from '@syncfusion/ej2-calendars';
//Load the L10n from ej2-base
import { L10n, loadCldr } from '@syncfusion/ej2-base';
import { enableRipple } from '@syncfusion/ej2-base';
//enable ripple style
enableRipple(true);
declare var require: any;
loadCldr(
 require('cldr-data/supplemental/numberingSystems.json'),
 require('cldr-data/main/ar/ca-gregorian.json'),
 require('cldr-data/main/ar/numbers.json')
);
//load the locale object to set the localized placeholder value
L10n.load({
 'ar': {
 'timepicker': { placeholder: 'حدد الوقت' }
 }
});
// creates the timepicker with Arabic culture.
let timeObject: TimePicker = new TimePicker({
 //sets the locale
 locale: 'ar',

```

```

value: new Date(),
//sets the enableRtl
enableRtl: true
});
timeObject.appendTo('#element');

```

The following example demonstrates TimePicker in **Arabic** culture with right-to-left direction.

#### INDEX.TS

```

import { loadCldr, L10n } from '@syncfusion/ej2-base';
import { TimePicker } from '@syncfusion/ej2-calendars';
import * as numberingSystems from './numberingSystems.json';
import * as gregorian from './ca-gregorian.json';
import * as numbers from './numbers.json';
import { enableRipple } from '@syncfusion/ej2-base';
//enable ripple style
enableRipple(true);
loadCldr(numberingSystems, gregorian, numbers);
//set the placeholder value
L10n.load({
 'ar': {
 'timepicker': { placeholder: 'حدد الوقت' }
 }
});
// creates the timepicker with Arabic culture.
let timeObject: TimePicker = new TimePicker({
 //sets the locale
 locale: 'ar',
 value: new Date(),
 //sets the enableRtl
 enableRtl: true
});
timeObject.appendTo('#element');

```

```

### Strict mode in EJ2 JavaScript Timepicker control

The [strictMode](#) is an act that allows you to enter only valid time value within the specified min/max range in the textbox. If the time value is invalid, the component value sets to the previous value. If the time value is out of range, the component sets the time value to min/max value.

The following example demonstrates the TimePicker in `strictMode` with min/max range of **10:00 AM** to **4:00 PM**. It allows you to enter

only valid time within the specified range. If you enter the out-of-range value like **8:00 PM**, the value sets to the max time **4:00 PM** as the value **8:00 PM** is greater than max value of **4:00 PM**. If you enter invalid time value like **9:00 tt**, the value sets to the previous value.

#### INDEX.TS

```

import { TimePicker } from '@syncfusion/ej2-calendars';
import { enableRipple } from '@syncfusion/ej2-base';
//enable ripple style
enableRipple(true);
let timeObject: TimePicker = new TimePicker({
 strictMode: true,
 min: new Date('7/18/2017 10:00 AM'),
 max: new Date('7/18/2017 4:00 PM'),
 value: new Date('7/18/2017 8:00 PM'),
});
timeObject.appendTo('#element');

```

</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

By default, the TimePicker act in strictMode **false** state, that allows to enter the invalid or out-of-range time in textbox.

If the time is out-of-range or invalid, then the model value will be set to **out of range** time value or **null** respectively with highlighted **error** class to indicates the time is out of range or invalid.

The following example demonstrates the **strictMode** as **false**. Here, it allows to enter the valid or invalid value in textbox. If you are entering the out-of-range or invalid time value, then the model value will be set to **out of range** time value or **null** respectively with highlighted **error** class to indicates the time is out of range or invalid.

</body></html>

```

If the value of `min` or `max` property is changed through code behind, update the `value` property to set within the range.

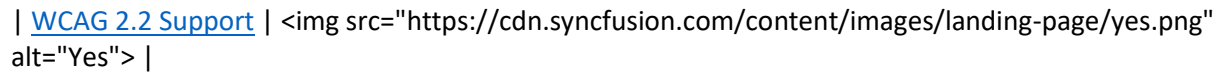

## Accessibility in EJ2 JavaScript Timepicker control

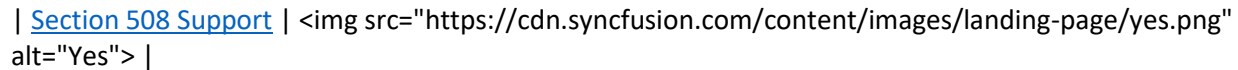

The TimePicker component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

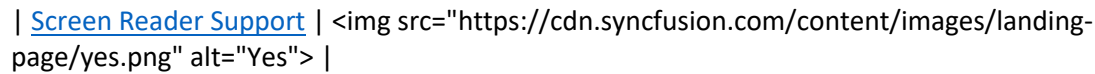

The accessibility compliance for the TimePicker component is outlined below.

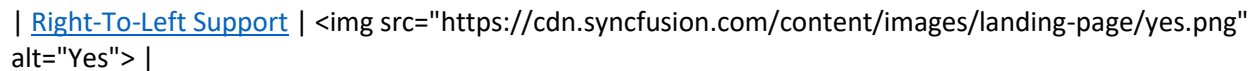

| [Accessibility Criteria](#) | [Compatibility](#) |

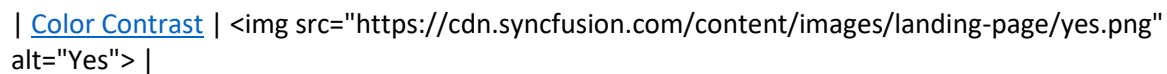

| -- | -- |

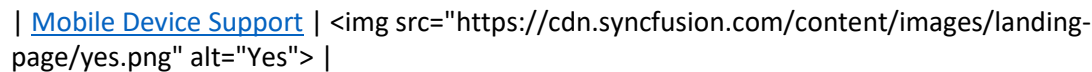

| [WCAG 2.2 Support](#) |  |

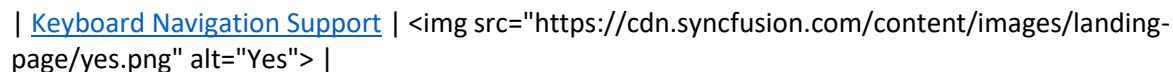

| [Section 508 Support](#) |  |

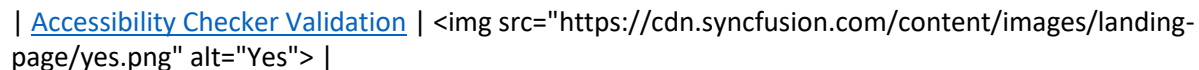

| [Screen Reader Support](#) |  |

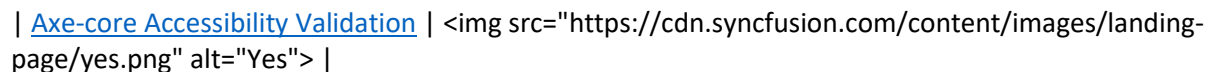

| [Right-To-Left Support](#) |  |

| [Color Contrast](#) |  |

| [Mobile Device Support](#) |  |

| [Keyboard Navigation Support](#) |  |

| [Accessibility Checker Validation](#) |  |

| [Axe-core Accessibility Validation](#) |  |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<div> - All features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

#### WAI-ARIA attributes

The web accessibility makes web applications and its content more accessible to people with disabilities without any barriers. It especially

it tracks the dynamic value changes and DOM changes.

The TimePicker component has covered the [WAI-ARIA](#) specifications with the following list of WAI-ARIA attributes: `aria-haspopup`, `aria-selected`, `aria-disabled`, `aria-activedescendant`, `aria-expanded`, `aria-owns`, and `aria-autocomplete`.

Here in TimePicker, the `combobox` plays the role of input element, and the `listbox` plays the role of popup element.

- **Aria-haspopup:** Provides the information about whether this element display a pop-up window or not.
- **Aria-selected:** Indicates the current selected value of the TimePicker component.
- **Aria-disabled:** Indicates disabled state of the TimePicker component.
- **Aria-expanded:** Indicates the expanded state of the popup.
- **Aria-autocomplete:** Indicates whether user input completion suggestions are provided or not.
- **Aria-owns:** Attribute that creates a parent/child relationship between two DOM element in the accessibility layer.
- **Aria-activedescendent:** Attribute that helps in managing the current active child of the TimePicker component.
- **Role:** Attribute that gives assistive technology information for handling each element in a widget.

### Keyboard Interaction

Keyboard accessibility is one of the most important aspects of web accessibility. Disabled people like blind and those who have motor disabilities or birth defects use keyboard shortcuts more than the mouse.

The TimePicker component has built-in keyboard accessibility support by following the [WAI-ARIA practices](#).

It supports the following list of shortcut keys to interact with the TimePicker control.

| Press | To do this |

| --- | --- |

| Upper Arrow | Navigate and select the previous item. |

| Down Arrow | Navigate and select the next item. |

| Left Arrow | Move the cursor towards arrow key pressed direction. |

| Right Arrow | Move the cursor towards arrow key pressed direction. |

| Home | Navigate and select the first item. |

| End | Navigate and select the last item. |

| Enter | Select the currently focused item and close the popup. |

| Alt + Upper Arrow | Close the popup. |

| Alt + Down Arrow | Open the popup. |

| Esc | Close the popup. |

In the below sample use the `alt+t` keys to focus the TimePicker component.

**INDEX.TS**

```
import { TimePicker } from '@syncfusion/ej2-calendars';
import { enableRipple } from '@syncfusion/ej2-base';
//enable ripple style
enableRipple(true);
// creates the simple timepicker component
let timeObject: TimePicker = new TimePicker({
 placeholder: 'Select Time'
});
timeObject.appendTo('#element');
document.onkeyup = function (e) {
 if (e.altKey && e.keyCode === 84 /* t */) {
 // press alt+t to focus the component by calling public method.
 timeObject.focusIn();
 }
};
```

 ele.style.visibility = "visible";
}
</script>
```

```
<script src="index.js" type="text/javascript"></script>
</body></html>
```

### Ensuring accessibility

The TimePicker component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the TimePicker component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the TimePicker component with accessibility tools.

### Style appearance in EJ2 JavaScript Timepicker control

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

#### Customizing the appearance of TimePicker wrapper element

Use the following CSS to customize the appearance of wrapper element.

,

*/ To specify height and font size /*

```
.e-input-group input.e-input, .e-input-group.e-control-wrapper input.e-input, .e-input-group textarea.e-input, .e-input-group.e-control-wrapper textarea.e-input {
```

```
font-size: 20px;
```

```
height: 40px;
```

```
}
```

,

#### Customizing the TimePicker icon element

Use the following CSS to customize the TimePicker icon element

,

*/ To specify background color and font size /*

```
.e-time-wrapper .e-time-icon.e-icons, *.e-control-wrapper.e-time-wrapper .e-time-icon.e-icons {
```

```
font-size: 20px;
```

```
background-color: beige;
```

```
}
```

,

#### Customizing the TimePicker popup

Use the following CSS to customize the TimePicker popup

,

*/ To specify height /*

```
.e-timepicker.e-popup {
height: 100px;
}
`
```

### Customizing the TimePicker popup content

Use the following CSS to customize the TimePicker popup content

*/ To specify height /*

```
.e-timepicker.e-popup .e-list-parent.e-ul li.e-list-item {
background-color: beige;
font-size: 20px;
}
`
```

### Full screen mode support in mobiles and tablets

The TimePicker component's full-screen mode feature enables users to view the component popup element in full-screen mode on mobile devices with improved visibility and a better user experience. It is important to mention that this feature is exclusively available for mobile and tablet devices in both landscape and portrait orientations. To activate the full screen mode within the TimePicker component, simply set the [fullScreenMode](#) API value to `true`. This action will extend the popup element to occupy the entire screen on mobile devices.

```
`typescript
import { TimePicker } from '@syncfusion/ej2-calendars';
// creates a timepicker with fullScreenMode property
let timeObject: TimePicker = new TimePicker({
// Enable Full Screen Mode
fullScreenMode: true,
});
timeObject.appendTo('#element');
`
```

**Default Sample**

12:00 AM

## How To

### Css customization in EJ2 JavaScript Timepicker control

TimePicker allows you to customize the textbox and popup list appearance to suit your application by using [cssClass](#) property.

The below sample demonstrates customization of text appearance in a textbox, popup button, and popup list along with hover and active

state by using `e-custom-style` class. Following is the list of available classes used to customize the entire TimePicker component.

Class Name	Description
---	---
e-time-wrapper	Applied to TimePicker wrapper element.
e-timepicker	Applied to input element and TimePicker popup element.
e-time-wrapper.e-timepicker	Applied to input element only.
e-input-group-icon.e-time-icon	Applied to popup button.
e-float-text	Applied to floating label text element.
e-popup	Applied to popup element.
e-timepicker.e-popup	Applied to TimePicker popup element only.
e-list-parent	Applied to popup UL element.
e-timepicker.e-list-parent	Applied to TimePicker popup UL element only.
e-list-item	Applied to LI elements.
e-hover	Applied to LI element hovering time.
e-active	Applied to active LI element.

### INDEX.TS

```
import { TimePicker } from '@syncfusion/ej2-calendars';
import { enableRipple } from '@syncfusion/ej2-base';
//enable ripple style
enableRipple(true);
// creates timepicker
let timeObject: TimePicker = new TimePicker({
 placeholder: 'Select Time',
 // define the custom class
 cssClass: 'e-custom-style'
});
timeObject.appendTo('#element');
```

```

### Client side validation using form validator in EJ2 JavaScript Timepicker control

To achieve client side validation in a TimePicker component, use [Essential JavaScript 2 FormValidator](#). It provides an option to customize feedback error messages to the corresponding fields for taking action and resolving the issue.

In the following example, the required field validation is implemented by mapping the name attribute value to the rules property. It validates the TimePicker component and displays the validation message when the textbox value is empty during form post back or focus out.

#### INDEX.TS

```

import { TimePicker } from '@syncfusion/ej2-calendars';
//import the form validator related functions
import { FormValidator, FormValidatorModel } from '@syncfusion/ej2-inputs';
import { enableRipple } from '@syncfusion/ej2-base';
//enable ripple style
enableRipple(true);
let timeObject: TimePicker = new TimePicker({
 placeholder: 'Select Time'
});
timeObject.appendTo('#element');
let options: FormValidatorModel = {

```

```

rules: {
 //must specify the name attribute value in rules section
 'timevalue': { required: true }
},
customPlacement: (inputElement: HTMLElement, errorElement: HTMLElement)
=> {
 //to place the error message in custom position
 //inputElement - target element where the error text will be
 appended
 //errorElement - error text which will be displayed.
 inputElement.parentElement.appendChild(errorElement);
}
};
let formObject: FormValidator = new FormValidator('#form-element', options);

```

## Ej1 api migration in EJ2 JavaScript Timepicker control

This article describes the API migration process of TimePicker component from Essential JS 1 to Essential JS 2.

### Time Selection

<!-- markdownlint-disable MD033 -->

Behavior	API in Essential JS 1	API in Essential JS 2
Setting the value	Property: value valuejavascript\$("#timepicker").ejTimePicker({value: new Date("5/5/2014 12:00 PM")});	Property: valuejavascriptvar timepicker = new ej.calendars.TimePicker({ value: new Date("05/11/2017 2:00 PM")});timepicker.appendTo('#element');

### Time Format

<!-- markdownlint-disable MD033 -->

Behavior	API in Essential JS 1	API in Essential JS 2
Display time format	Property: timeFormat timeFormatjavascript\$("#timepicker").ejTimePicker({timeFormat: 'hh:mm:ss tt'});	Property: formatjavascriptvar timepicker = new ej.calendars.TimePicker({ format: 'hh:mm:ss'});timepicker.appendTo('#element');

### Time Range

<!-- markdownlint-disable MD033 -->

Behavior	API in Essential JS 1	API in Essential JS 2
Minimum time	Property: minTimejavascript\$("#timepicker").ejTimePicker({ minTime: '10:00 AM'});	Property: minjavascriptvar timepicker = new ej.calendars.TimePicker({ min: new Date('5/5/2019 3:00 AM')});timepicker.appendTo('#element');
Maximum time	Property: maxTimejavascript\$("#timepicker").ejTimePicker({ maxTime: '10:00 AM'});	Property: Maxjavascriptvar timepicker = new ej.calendars.TimePicker({ max: new Date('5/5/2019 8:00 AM')});timepicker.appendTo('#element');
Set current time	Method: setCurrentTime()javascript\$("#timepicker").ejTimePicker() ;var timeObj = \$("#timepicker").data("ejTimePicker");console.log(timeObj.setCurrentTime());	Can be achieved byjavascriptvar timepicker = new ej.calendars.TimePicker({ value: new Date()});timepicker.appendTo('#element');

### Disabled Time Ranges

<!-- markdownlint-disable MD033 -->

Behavior	API in Essential JS 1	API in Essential JS 2
Disable time ranges	Property: disableTimeRangesjavascript\$("#timepicker").ejTimePicker({ disableTimeRanges :[{ startTime: '3:00 AM', endTime: '6:00 AM' }, { startTime: '1:00 PM', endTime: '3:00 PM' }, { startTime: '8:00 PM', endTime: '10:00 PM' } ]});	Can be achieved byjavascriptvar timepicker = new ej.calendars.TimePicker({ itemRender: itemRenderHandler});timepicker.appendTo('#element');function itemRenderHandler(args){ if (args.value.getHours() === 4) { args.isDisabled = true; }}

### Customization

<!-- markdownlint-disable MD033 -->

Behavior	API in Essential JS 1	API in Essential JS 2
CSS Class	Property: <code>CssClassjavascript\$("#timepicker").ejTimePicker({ cssClass : 'gradient-lime'});</code>	Property: <code>CssClassjavascriptvar timepicker = new ej.calendars.TimePicker({ cssClass: 'e-custom-style'});timepicker.appendTo('#element');</code>
Popup list customization	Not Applicable	Event: <code>itemRenderjavascriptvar timepicker = new ej.calendars.TimePicker({ itemRender: itemRenderHandler});timepicker.appendTo('#element');</code> <code>function itemRenderHandler(args) { / code block/}</code>
Show/Hide the popup button	Property: <code>showPopupButtonjavascript\$("#timepicker").ejTimePicker({ showPopupButton : false});</code>	Can be achieved by <code>javascriptvar timepicker = new ej.calendars.TimePicker({ focus: onFocus});timepicker.appendTo('#element');</code> <code>function onFocus(args){ timepicker.show();}.e-control-wrapper .e-input-group-icon.e-time-icon { display: none;}</code>
Enable/Disable the rounded corner	Property: <code>showRoundedCornerjavascript\$("#timepicker").ejTimePicker({ showRoundedCorner : true});</code>	Can be achieved by <code>javascriptvar timepicker = new ej.calendars.TimePicker({ cssClass: 'e-custom-style'});timepicker.appendTo('#element');</code> <code>.e-control-wrapper.e-custom-style.e-time-wrapper.e-input-group { border-radius: 4px;}</code>
Enable/Disable the animation	Property: <code>enableAnimationjavascript\$("#timepicker").ejTimePicker({ enableAnimation : true});</code>	Not Applicable
Interval	Property: <code>intervaljavascript\$("#timepicker").ejTimePicker({ interval : 120});</code>	Property: <code>stepjavascriptvar timepicker = new ej.calendars.TimePicker({ step: 120});timepicker.appendTo('#element');</code>
FocusIn event	Event: <code>focusInjavascript\$("#timepicker").ejTimePicker({ focusIn: function (args) { / code block/}});</code>	Event: <code>focusjavascriptvar timepicker = new ej.calendars.TimePicker({ focus: onFocus});timepicker.appendTo('#element');</code> <code>function onFocus(args){ / code block/}</code>
FocusOut event	Event: <code>focusOutjavascript\$("#timepicker").ejTimePicker({ focusIn: function (args) { / code block/}});</code>	Event: <code>blurjavascriptvar timepicker = new ej.calendars.TimePicker({ blur: onBlur});timepicker.appendTo('#element');</code> <code>function onBlur(args) { / code block/}</code>

FocusIn method	Not Applicable	Method: focusIn()javascriptvar timepicker = new ej.calendars.TimePicker({ value : new Date()});timepicker.appendTo('#element');timepicker.focusIn();
FocusOut method	Not Applicable	Event: focusOutjavascriptvar timepicker = new ej.calendars.TimePicker({ value : new Date()});timepicker.appendTo('#element');timepicker.focusOut();
Prevent popup close	Not Applicable	Event: closejavascriptvar timepicker = new ej.calendars.TimePicker({ close: function (args: PreventableEventArgs) { args.cancel = true; }});timepicker.appendTo('#element');timepicker.show();
Prevent popup open	Not Applicable	Event: openjavascriptvar timepicker = new ej.calendars.TimePicker({ open: function (args) { args.cancel = true; }});timepicker.appendTo('#element');timepicker.show();

### Accessibility

<!-- markdownlint-disable MD033 -->

Behavior	API in Essential JS 1	API in Essential JS 2
Enable/Disable the RTL	Property: enableRTLjavascript\$("#timepicker").ejTimePicker({ enableRTL: true});	Property: enableRtljavascriptvar timepicker = new ej.calendars.TimePicker({ enableRtl: true});timepicker.appendTo('#element');

### Persistence

<!-- markdownlint-disable MD033 -->

Behavior	API in Essential JS 1	API in Essential JS 2
Enable/Disable the persistence	Property: enablePersistencejavascript\$("#timepicker").ejTimePicker({ enablePersistence: true});	Property: enablePersistencejavascriptvar timepicker = new ej.calendars.TimePicker({ enablePersistence: true});timepicker.appendTo('#element');

### Validation

<!-- markdownlint-disable MD033 -->

Behavior	API in Essential JS 1	API in Essential JS 2
Validation rules	Property: validationRulesjavascript\$("#timepicker").ejTimePicker({ validationRules : {required : true},});	Can be achieved byjavascriptvar timepicker = new ej.calendars.TimePicker({ placeholder: 'Enter time'});timepicker.appendTo('#element');var options = { rules: { 'timevalue': { required: true } }}var formObject: FormValidator = new FormValidator('#form-element', options);

## Toast

### Config in EJ2 JavaScript Toast control

This section explains the steps required to customize the appearance of the toast using built-in APIs.

### Title and content template

Toast can be created with the notification message. The message contains [title](#) and [content](#) of the toasts. The title and contents are adaptable in any resolution.

The Title or Content property can be given as HTML element/element ID to a string that can be displayed as a toast.

#### INDEX.TS

```
import {Toast} from '@syncfusion/ej2-notifications';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
let toast: Toast = new Toast({
 title: 'Matt sent you a friend request',
 content: 'You have a new friend request yet to accept',
 position: { X: "Center" }
});
toast.appendTo('#element');
toast.show();
document.getElementById('show_toast').onclick = () => {
 toast.show();
}
```

#### INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
 <title>Essential JS 2 Toast</title>
 <meta charset="utf-8">
 <meta name="viewport" content="width=device-width, initial-scale=1.0">
 <meta name="description" content="Typescript Toolbar Controls">
 <meta name="author" content="Syncfusion">
 <link href="index.css" rel="stylesheet">
 <link href="https://cdn.syncfusion.com/ej2/24.1.41/material.css"
rel="stylesheet">

<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

 <div id="container">
 <div class="row"> <button class="e-btn" id="show_toast"> Show
Toast</button> </div>
 <div id="element"></div>

 <div id="result"></div>
 <div id="templateToast" style="display: none;color:red"> System
affected by virus !!! </div>
 </div>
<script>
var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
```

```

}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

### Specifying custom target

By default, the toast can be rendered in the document body. You can change the target position for toast rendering using the [target](#) property. Based on the target, the [position](#) will be updated.

### Close button

By default, the [showCloseButton](#) is not enabled. You can enable it by setting the true value. Before expiring the toast, you can use this button to close or destroy toasts manually.

### Progress bar

By default, the [showProgressBar](#) is not enabled. If it is enabled, it can visually indicate when will the toast gets expired. Based on the [timeOut](#) property, progress bar will appear.

### Progress bar direction

By default, the [progressDirection](#) is set to "Rtl" and it will appear from right to left direction. You can change the progressDirection to "Ltr" to make it appear from left to right direction.

### Newest on top

By default, the newly created toasts will append next with existing toasts. You can change the sequence like inserting before the toast by enabling the [newestOnTop](#).

Here, The following sample demonstrates the combination of the [target](#), [showCloseButton](#), [showProgressBar](#), and [newestOnTop](#) properties in toast.

### INDEX.TS

```

import {Toast} from '@syncfusion/ej2-notifications';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
let toast: Toast = new Toast({
 title: 'File Downloading',
 content: '<div class="progress"></div>',
 showCloseButton: true,
 target: '#toast_target',
 position: { X: "Center" }
 newestOnTop: true,
 showProgressBar: true,
 progressDirection: "Ltr"
});
toast.appendTo('#element');
toast.show();
document.getElementById('show_toast').onclick = () => {
 toast.show();
}

```

### INDEX.HTML

```

<!DOCTYPE html>
<html lang="en">
<head>
 <title>Essential JS 2 Toast</title>

```

```

<meta charset="utf-8" />
<meta name="viewport" content="width=device-width, initial-scale=1.0" />

 if(ele) {
 ele.style.visibility = "visible";
 }
 </script>
 <script src="index.js" type="text/javascript"></script>
</body>
</html>

```

### Width and height

The dimensions of the toast can be set using the [width](#) and [height](#) properties. This will individually set all toasts. You can create different custom dimension toasts.

By default, the toast can be rendered with **300px** width with **auto** height.

In mobile devices, the default width of the toast gets '100%' width of the page.

When you set toast width as '100%', the toast occupies full width and will be displayed at the top or bottom based on the position **Y** property.

Both the width and height properties allow setting pixels/numbers/percentage. The number value is considered as pixels.

### INDEX.TS

```

import {Toast} from '@syncfusion/ej2-notifications';
import { enableRipple } from '@syncfusion/ej2-base';

```

```

import { RadioButton, ChangeEventArgs as CheckBoxChange, CheckBox,
ChangeEventArgs } from '@syncfusion/ej2-buttons';

### Position in EJ2 JavaScript Toast control

The toast position can be updated based on predefined positions or customizable positions. The predefined position combinations are updated in the [X](#) and [Y](#) position properties.

#### Predefined

##### X Positions

- Left
- Center
- Right

##### Y Positions

- Top
- Bottom

In multiple toast display, the new toast position will not be updated on dynamic change of property values until the old toast messages removed.

The toast occupies full width when you set the width to '100%', so the X positions will not affect the changes when the width is '100%'.

#### Custom

Custom [X](#) and [Y](#) positions can be given as pixels/numbers/percentage. The number value is considered as pixels based on the top and left values updated in the toast.

#### INDEX.TS

```
import { Toast } from '@syncfusion/ej2-notifications';
import { DropDownList, ChangeEventArgs } from '@syncfusion/ej2-dropdowns';

### Action buttons in EJ2 JavaScript Toast control

You can include action buttons to the toast control by adding the [buttons](#) property. The collection of Essential JS 2 button models can be bound to the `model` property inside the buttons property. You can also include the click event callback function for each button.

#### INDEX.TS

```

import {Toast} from '@syncfusion/ej2-notifications';
import { enableRipple, closest } from '@syncfusion/ej2-base';
enableRipple(true);
let toast: Toast = new Toast({
 title: 'Anjolie Stokes',
 content: 'Thanks for the update!',
 icon: 'e-laura',
 position: { X: "Right", Y: "Bottom" },
 width: 280,
 height: 120,
 buttons : [{
 model: { content: "Ignore" }, click: btnClick
 }, {
 model: { content: "reply" }
 }]
});
toast.appendTo('#elementToastTime');
toast.show();
document.getElementById('show_toast').onclick = () => {
 toast.show();
}
function btnClick(e: Event) {
 let toastEle = closest(e.target, '.e-toast');
 toast.hide(toastEle);
}

```

### Timeout in EJ2 JavaScript Toast control

The toast can be expired based on the [timeOut](#) property. The toast can live till the time out reaches without user interaction, a time out value is considered as a millisecond.

- The `timeOut` delay can be visually represented using [Progress Bar](#).
- The [extendedTimeOut](#) property determines how long the toast should be displayed after a user hovers over it.

You can terminate the process by using the [showCloseButton](#) property for destroying the toast at any time.

#### INDEX.TS

```
import {Toast} from '@syncfusion/ej2-notifications';
import { enableRipple, closest} from '@syncfusion/ej2-base';
enableRipple(true);
let toast: Toast = new Toast({
 title: 'Anjolie Stokes',
 content: '<p></p>
',
 position: { X: "Right", Y: "Bottom" },
 width: 230,
 height: 250,
 buttons : [{
 model: { content: "Ignore" }
 }, {
 model: { content: "reply" }
 }]
});
toast.appendTo('#elementToastTime');
toast.show();
document.getElementById('show_toast').onclick = () => {
 let value = parseInt(document.getElementById('toast_input_index').value)
 toast.show({timeOut: value});
}

<script>
var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

### Static toast

You can prevent auto hiding in a toast as visible like static by setting zero (0) value in the timeOut Property.

#### INDEX.TS

```

import {Toast} from '@syncfusion/ej2-notifications';
import { enableRipple, closest} from '@syncfusion/ej2-base';
enableRipple(true);
let toast: Toast = new Toast({
 title: 'Matt sent you a friend request',
 content: 'You have a new friend request yet to accept',
 showCloseButton: true,
 position: { X: "Right" },
 timeout: 0
});
toast.appendTo('#element');
toast.show();
document.getElementById('show_toast').onclick = () => {
 toast.show();
}

```

#### INDEX.HTML

```

### Template in EJ2 JavaScript Toast control

The Template property in toast can be defined as **HTML element**, this can be either a **string** or **selector**.

The HTML element tag can be given as a string for the [Template](#) property.

```
`ts
```

```
template: "<div>Toast Content</div>"
```

```
,
```

The Template property allows getting the template content using the query **selector**. Here, the element 'ID' attribute is specified in the template.

```
`ts
```

```
template: "#Template"
```

```
,
```

### INDEX.TS

```

import { Toast, ToastOpenArgs, ToastCloseArgs, ToastBeforeOpenArgs } from
'@syncfusion/ej2-notifications';
import { DropDownList, ChangeEventArgs } from '@syncfusion/ej2-dropdowns';
import { compile, Browser, closest } from '@syncfusion/ej2-base';
let toast: Toast = new Toast({

```

```

template: document.getElementById('template_toast_ele').innerHTML,
position: { X: 'Right', Y: 'Bottom' },
target: document.body,
extendedTimeout: 0,
timeOut: 120000
});
toast.appendTo('#element');
toast.show();
let btnEle: HTMLElement = document.getElementById('toast_mail_remainder');
let snoozeFlag: boolean = false;
document.getElementById('show_toast').onclick = () => {
 toast.show();
}

```

### Animation in EJ2 JavaScript Toast control

The toast control supports custom animations for both shows and hide actions from the provided animation option of the **Animation** library.

The default animation is given as **FadeIn** for showing the toast and **FadeOut** for hiding the toast.

The following sample demonstrates some types of animations that suit toast. You can check all the animation effects here.

### INDEX.TS

```

import {Toast} from '@syncfusion/ej2-notifications';
import { DropDownList } from '@syncfusion/ej2-dropdowns';
import { enableRipple, Effect } from '@syncfusion/ej2-base';
enableRipple(true);
let toast: Toast = new Toast({
 title: 'Matt sent you a friend request',
 content: 'You have a new friend request yet to accept',
 position: { X: 'Right', Y: 'Bottom' },
 animation: { show: { effect: "FadeIn" }, hide: { effect: "FadeOut" } },
});
toast.appendTo('#element');
toast.show();
let listObjExpand: DropDownList = new DropDownList({
 index: 0,
 placeholder: 'Select a animate type',
 change: () => { valueChange(); }
});
listObjExpand.appendTo('#showAnimation');
let listObjCollapse: DropDownList = new DropDownList({
 placeholder: 'Select a animate type',
 change: () => { valueChange1(); }
});
listObjCollapse.appendTo('#hideAnimation');
document.getElementById('show_toast').onclick = () => {
 toast.show();
}

```

```

}
function valueChange(): void {
 toast.animation.show.effect = <Effect>(listObjExpand.value);
}
function valueChange1(): void {
 toast.animation.hide.effect = <Effect>(listObjCollapse.value);
}

```

### Toast services in EJ2 JavaScript Toast control

The Toast component provides a built-in utility function to render the toast with minimal code. The utility function will render the toast without the need of rendering the container element in the DOM where the toast is appended. So that, the toast can now be rendered on the go. The following are the option to render the toast using the utility function.

#### Show Toast with predefined types

The Toast component support 4 types of predefined toast with essential colors for various situations which can be shown using the `ToastUtility.show` by just defining the type of the toast without defining any class names. The following options are used as an argument on calling the utility function for predefined types:

Options	Description
<a href="#">content</a>	Specifies the content that can be displayed on the Toast.
type	Specifies the type of the predefined Toasts. The 4 types of predefined toasts are <b>Information</b> , <b>Success</b> , <b>Error</b> , <b>Warning</b>
<a href="#">timeOut</a>	Specifies the Toast display time duration on the page in milliseconds. Once the time expires, Toast message will be removed. Setting 0 as a time out value displays the Toast on the page until the user closes it manually.

#### INDEX.TS

```

import { ToastUtility, Toast } from '@syncfusion/ej2-notifications';
let toastObj: Toast;
document.getElementById('info_Toast').onclick = function () {
 toastObj = ToastUtility.show('Please read the comments carefully',
 'Information', 20000);
};
document.getElementById('success_Toast').onclick = function () {
 toastObj = ToastUtility.show('Your message has been sent successfully',
 'Success', 20000);
};

```

```
document.getElementById('error_Toast').onclick = function () {
 toastObj = ToastUtility.show('A problem has been occurred while
submitting the data', 'Error', 20000);
};
document.getElementById('warning_Toast').onclick = function () {
 toastObj = ToastUtility.show('There was a problem with your network
connection', 'Warning', 20000);
};
document.getElementById('hide_Toast').onclick = function () {
 toastObj.hide('All');
};
```

## INDEX.HTML

```

```
</body></html>
```

### Show Toast with ToastModel

The utility function can be called using the [ToastModel](#) as argument to show the toast where all the properties in the [ToastModel](#) like any events, position, close icon, action buttons, etc. can be used in the [ToastUtility.show](#).

#### INDEX.TS

```
import { ToastUtility, Toast } from '@syncfusion/ej2-notifications';
let toastObj: Toast;
document.getElementById('show_Toast').onclick = (): void => {
 toastObj = ToastUtility.show({
 title: 'Toast Title',
 content: 'Toast shown using utility function with ToastModel',
 timeout: 20000,
 position: { X: 'Right', Y: 'Bottom' },
 showCloseButton: true,
 click: toastClick,
 buttons: [{
 model: { content: 'Close' }, click: toastClose
 }]
 });
};
function toastClick() {
 console.log('Toast click event triggered');
}
function toastClose() {
 toastObj.hide();
}
```

#### INDEX.HTML

 ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

### Style in EJ2 JavaScript Toast control

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

#### Customizing the toast title

Use the following CSS to customize the default toast's content properties like font-family, font-size and color.

```

`css
/ To change color, font family and font size /
.e-toast-container .e-toast .e-toast-message .e-toast-title {
color: red;
font-size: 18px;
font-weight: bold;
}
`

```

#### Customizing the toast content

Use the following CSS to customize the default toast's content properties like font-family, font-size and color.

```

`css
/ To change color, font family and font size /
.e-toast-container .e-toast .e-toast-message .e-toast-content {
color: aqua;
font-size: 13px;
font-weight: normal;
}
`

```

#### Customizing the toast icon

Use the following CSS to customize the default toast icon color.

```

`css

```

*/ To change icon color /*

```
.e-toast-container .e-toast .e-toast-icon {
color: yellow;
}
`
```

### Customizing the toast background

Use the following CSS to customize the default toast's background color.

```
`css
```

*/ To change background color /*

```
.e-toast-container .e-toast {
background-color: navy;
}
`
```

### Accessibility in EJ2 JavaScript Toast control

The toast component has been designed with [WAI-ARIA](#) specifications in mind by applying the prompt WAI-ARIA roles, states, and properties with the keyboard support. It helps users who use assistive WAI-ARIA accessibility support, which is achieved using attributes.

It provides information about the elements in a document for assistive technology.

The toast component implements the keyboard navigation support by using the following [WAI-ARIA practices](#) and is tested in major screen readers.

The Toast component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Toast component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2 Support](#) |  |

| [Section 508 Support](#) |  |

| [Screen Reader Support](#) |  |

| [Right-To-Left Support](#) |  |

| [Color Contrast](#) |  |

| [Mobile Device Support](#) |  |

```
| Keyboard Navigation Support | |
| Accessibility Checker Validation | |
| Axe-core Accessibility Validation | |
<style>
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
</style>
<div> - All
features of the component meet the requirement.</div>
<div> - Some features of the component do not meet the requirement.</div>
<div> - The component does not meet the requirement.</div>
```

#### WAI-ARIA attributes

<!-- markdownlint-disable MD033 -->

| Class | Description |

| ----- | ----- |

| role | <b>alert:</b> Identifies the element as a container when alert content will be added or updated. |

#### INDEX.TS

```
import {Toast} from '@syncfusion/ej2-notifications';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
let toast: Toast = new Toast({
 title: 'Matt sent you a friend request',
 content: 'You have a new friend request yet to accept',
 timeout: 0
});
toast.appendTo('#element');
toast.show();
```

#### INDEX.HTML

```

rel="stylesheet">

<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

 <div id="container">
 <div class="row"> <button class="e-btn" id="show_toast"> Show
Toast</button> </div>
 <div id="element"></div>

 <div id="result"></div>
 <div id="templateToast" style="display: none;color:red"> System
affected by virus !!! </div>
 </div>
<script>
var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

### Ensuring accessibility

The Toast component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Toast component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Toast component with accessibility tools.

See also

- [Accessibility in Syncfusion components](#)

### How To

#### Prevent duplicate toast display in EJ2 JavaScript Toast control

You can prevent identical same toast displaying in a screen by the event function and terminate the toast displaying process by setting the cancel event property in the [beforeOpen](#) event.

The following sample demonstrates preventing duplicate title toast element displaying with custom code blocks.

#### **INDEX.TS**

```

import {Toast, ToastModel, ToastBeforeOpenArgs} from '@syncfusion/ej2-
notifications';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
let toasts: ToastModel[] = [
 { title: 'Warning !', content: 'There was a problem with your network
connection.' , isOpen: false},
 { title: 'Success !', content: 'Your message has been sent
successfully.' , isOpen: false},
 { title: 'Error !', content: 'A problem has been occurred while
submitting your data.' , isOpen: false },
];
let prevDuplicates: boolean = false;
let toastFlag: number = 0;
let toast: Toast = new Toast({
 position: {
 X: 'Center'
 },
 beforeOpen: onBeforeOpen,
 close: onClose,
 created: onCreate
});
toast.appendTo('#element');
++toastFlag;
document.getElementById('show_toast').onclick = () => {
 toast.show(toasts[toastFlag]);
 ++toastFlag;
 if (toastFlag === (toasts.length)) {
 toastFlag = 0;
 }
}
function onBeforeOpen(e: ToastBeforeOpenArgs): void {
 if (preventDuplicate(e)) {
 e.cancel = true;
 }
}
function preventDuplicate(e: ToastBeforeOpenArgs): boolean {
 for (let i: number = 0; i < toasts.length; i++) {
 if (toasts[i].title === e.options.title && !toasts[i].isOpen) {
 toasts[i].isOpen = true;
 return false;
 }
 }
 return true;
}
function onCreate(): void {
 toast.show(toasts[toastFlag]);
 ++toastFlag;
}
function onClose(e: any): void {
 for (let i: number = 0; i < toasts.length; i++) {
 if (toasts[i].title === e.options.title) {
 toasts[i].isOpen = false;
 }
 }
}
}

```

**INDEX.HTML**

```

<!DOCTYPE html><html lang="en"><head>
 <title>Essential JS 2 Toast</title>
 <meta charset="utf-8">
 <meta name="viewport" content="width=device-width, initial-scale=1.0">

Toast</button> </div>
 <div id="element"></div>

 <div id="result"></div>
 <div id="templateToast" style="display: none;color:red"> System
affected by virus !!! </div>
 </div>
 <script>
var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
 </script>
 <script src="index.js" type="text/javascript"></script>
</body></html>

```

**Restrict the maximum toast to show in EJ2 JavaScript Toast control**

You can restrict the maximum toast count by using the event callback function and terminate the toast displaying process by setting the cancel event property in the [beforeOpen](#) event.

The following sample demonstrates restricting toast displaying up to 3. You can restrict by your own count with custom code blocks.

**INDEX.TS**

```

import {Toast, ToastModel} from '@syncfusion/ej2-notifications';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
let maxCount: number = 3;
let toasts: ToastModel[] = [
 { title: 'Warning !', content: 'There was a problem with your network
connection.' },

```

```

 { title: 'Success !', content: 'Your message has been sent
successfully.' },
 { title: 'Error !', content: 'A problem has been occurred while
submitting your data.' },
 { title: 'Information !', content: 'Please read the comments carefully.'
}
];
let toastFlag: number = 0;
let toast: Toast = new Toast({
 title: 'Sample Toast Title',
 content: 'Sample Toast content'
 position: { X: 'Right', Y: 'Bottom' }
 beforeOpen: onBeforeOpen
});
toast.appendTo('#element');
toast.show(toasts[toastFlag]);
++toastFlag;
document.getElementById('show_toast').onclick = () => {
 toast.show(toasts[toastFlag]);
 ++toastFlag;
 if (toastFlag === (toasts.length)) {
 toastFlag = 0;
 }
}
function onBeforeOpen(e: ToastBeforeOpenArgs): void {
 if (maxCount === toast.element.childElementCount) {
 e.cancel = true;
 } else {
 e.cancel = false;
 }
}
}

```

## INDEX.HTML

```

### Customize progress bar theme and sizing in EJ2 JavaScript Toast control

By default, the progress bar appears based on the theme stylings and dimensions. You can customize the progress bar stylings using custom CSS or event functions.

The following sample demonstrates customizing the progress bar stylings using the [beforeOpen](#) event.

#### INDEX.TS

```

import {Toast, ToastModel} from '@syncfusion/ej2-notifications';
import { DropDownList } from '@syncfusion/ej2-dropdowns';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
let toast: Toast = new Toast({
 title: 'Matt sent you a friend request',
 content: 'You have a new friend request yet to accept',
 showProgressBar: true,
 position: { X: 'Right', Y: 'Bottom' }
 beforeOpen: onBeforeOpen
});
let listObjprogressColor: DropDownList = new DropDownList({
 index: 0,
 placeholder: 'Select a animate type',
 popupHeight: '150px',
 change: () => { valueChange(); }
});
listObjprogressColor.appendTo('#Progress');
toast.appendTo('#element');
toast.show();
document.getElementById('show_toast').onclick = () => {
 toast.show();
}
function valueChange() {
 let progressEles: NodeList = toast.element.querySelectorAll('.e-toast-progress');
 progressEles.forEach((ele: HTMLElement)=> {
 ele.style.backgroundColor = listObjprogressColor.value;
 })
}
function onBeforeOpen(e: ToastBeforeOpenArgs): void {
 let progress = e.element.querySelector('.e-toast-progress');
 progress.style.height = document.getElementById('progressHeight').value + 'px';
}

```

```
progress.style.backgroundColor = listObjprogressColor.value;
}
```

## INDEX.HTML

</body></html>

```

### Play an audio before open the toast in EJ2 JavaScript Toast control

The following sample demonstrates how to play an audio in background while opening the toast by including audio play codes into the beforeOpen event function.

To stop the audio after displaying the toast, use the [open](#) event in toast. For further customization, check the Toast Events [APIs](#).

#### INDEX.TS

```

import {Toast} from '@syncfusion/ej2-notifications';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
let toast: Toast = new Toast({
 title: 'Matt sent you a friend request',
 content: 'You have a new friend request yet to accept',
 position: { X: 'Right', Y: 'Bottom' }
 beforeOpen: onBeforeOpen
});
toast.appendTo('#element');
document.getElementById('show_toast').onclick = () => {
 toast.show();
}
function onBeforeOpen(e: ToastBeforeOpenArgs): void {
 let audio: HTMLAudioElement = new
Audio('https://drive.google.com/uc?export=download&id=1M95VOptolcQ4FQHzNBaLf
0WFQglrtWi7');
 audio.play();
}

```

#### INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
 <title>Essential JS 2 Toast</title>

</body></html>

```

### Show different types of toast in EJ2 JavaScript Toast control

The Essential JS 2 toast has the following predefined styles that can be defined using the [cssClass](#) property for achieving different types of toast:

Class	Description
-----	-----
e-toast-success	Represents a positive toast
e-toast-info	Represents an informative toast
e-toast-warning	Represents a toast with caution
e-toast-danger	Represents a negative toast

### INDEX.TS

```

import {Toast, ToastModel} from '@syncfusion/ej2-notifications';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
let toasts: ToastModel[] = [
 { title: 'Warning !', content: 'There was a problem with your network
connection.', cssClass: 'e-toast-warning' },
 { title: 'Success !', content: 'Your message has been sent successfully.',
cssClass: 'e-toast-success'},
 { title: 'Error !', content: 'A problem has been occurred while submitting
your data.', cssClass: 'e-toast-danger' },
 { title: 'Information !', content: 'Please read the comments carefully.',
cssClass: 'e-toast-info' }
];
let toastFlag: number = 0;
let toast: Toast = new Toast({
 position: { X: 'Right', Y: 'Bottom' }
});
toast.appendTo('#element');
toast.show(toasts[toastFlag]);
++toastFlag;
document.getElementById('show_toast').onclick = () => {
 toast.show(toasts[toastFlag]);
 ++toastFlag;
 if (toastFlag === (toasts.length)) {

```

```

 toastFlag = 0;
 }
}

```

## INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
 <title>Essential JS 2 Toast</title>
 <meta charset="utf-8">
 <meta name="viewport" content="width=device-width, initial-scale=1.0">

var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
 </script>
 <script src="index.js" type="text/javascript"></script>
</body></html>

```

### Show multiple toasts in various positions in EJ2 JavaScript Toast control

By default, the positions of the new toasts are only updated after the visible toasts have been destroyed. If You need to display multiple toasts with different positions, initiate another toasts.

The following sample demonstrates adding multiple toasts in different positions.

## INDEX.TS

```

import {Toast, ToastClickEventArgs } from '@syncfusion/ej2-notifications';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
let toast: Toast = new Toast({
 title: 'Warning !',
 content: 'There was a problem with your network connection.'
 position: { X: 'Right', Y: 'Bottom' }
 click: onClick

```

```

});
toast.appendTo('#element');
toast.show();
let toast1: Toast = new Toast({
 title: 'Success !',
 content: 'Your message has been sent successfully.'
 position: { X: 'Left', Y: 'Bottom' }
 click: onClick
});
toast1.appendTo('#element1');
toast1.show();
document.getElementById('show_toast').onclick = () => {
 toast.show();
}
document.getElementById('show_toast1').onclick = () => {
 toast1.show();
}
function onClick(e: ToastClickEventArgs): void {
 e.clickToClose = true;
}

```

## INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
 <title>Essential JS 2 Toast</title>
 <meta charset="utf-8">
 <meta name="viewport" content="width=device-width, initial-scale=1.0">
 <meta name="description" content="Typescript Toolbar Controls">
 <meta name="author" content="Syncfusion">
 <link href="index.css" rel="stylesheet">
 <link href="https://cdn.syncfusion.com/ej2/24.1.41/material.css"
rel="stylesheet">

<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

 <div id="container">
 <div class="row"> <button class="e-btn" id="show_toast">Show Right
Position Toast</button> </div>
 <div class="row"> <button style="margin-left: 10px;" class="e-btn"
id="show_toast1">Show Left Position Toast</button> </div>
 <div id="element"></div>
 <div id="element1"></div>
 </div>
<script>
var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>

```

```
</body></html>
```

### Close the toast with click tap in EJ2 JavaScript Toast control

By default, the toasts are expired based on the `timeOut` value. You can customize the toast hiding process with click/tap action by setting the event args in the [clicked](#) callback function with [static Toast](#).

#### INDEX.TS

```
import {Toast, ToastClickEventArgs } from '@syncfusion/ej2-notifications';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
let toast: Toast = new Toast({
 title: 'Matt sent you a friend request',
 content: 'You have a new friend request yet to accept',
 timeout: 0,
 position: { X: 'Right', Y: 'Bottom' }
 click: onClick
});
toast.appendTo('#element');
toast.show();
document.getElementById('show_toast').onclick = () => {
 toast.show();
}
function onClick(e: ToastClickEventArgs): void {
 e.clickToClose = true;
}
```

#### INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
 <title>Essential JS 2 Toast</title>
 <meta charset="utf-8">
 <meta name="viewport" content="width=device-width, initial-scale=1.0">
 <meta name="description" content="Typescript Toolbar Controls">
 <meta name="author" content="Syncfusion">
 <link href="index.css" rel="stylesheet">
 <link href="https://cdn.syncfusion.com/ej2/24.1.41/material.css"
rel="stylesheet">

 <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
 <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

 <div id="container">
 <div class="row"> <button class="e-btn" id="show_toast"> Show
Toast</button> </div>
 <div id="element"></div>

 <div id="result"></div>
 <div id="templateToast" style="display: none;color:red"> System
affected by virus !!! </div>
```

```

 </div>
</script>
var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

### Add dynamic template in EJ2 JavaScript Toast control

Toast supports to change templates dynamically with displaying in multiple toasts. You can change the toast properties while calling in the [show](#) method.

#### INDEX.TS

```

import {Toast, ToastClickEventArgs } from '@syncfusion/ej2-notifications';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
let toast: Toast = new Toast({
 position: { X: 'Right', Y: 'Bottom' }
 click: onClick
});
let toastFlag: number = 0;
let toasts = [{ template: '2 Mail has received'},{ template: 'User Guest
Logged in'},{ template: 'Logging in as Guest'},{ template: 'Ticket has
reserved '},{ template: '#templateToast' }];
toast.appendTo('#element');
toast.show(toasts[toastFlag]);
++toastFlag;
document.getElementById('show_toast').onclick = () => {
 toast.show(toasts[toastFlag]);
 ++toastFlag;
 if (toastFlag === (toasts.length)) {
 toastFlag = 0;
 }
}
function onClick(e: ToastClickEventArgs): void {
 e.clickToClose = true;
}

```

#### INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
 <title>Essential JS 2 Toast</title>
 <meta charset="utf-8">
 <meta name="viewport" content="width=device-width, initial-scale=1.0">
 <meta name="description" content="Typescript Toolbar Controls">
 <meta name="author" content="Syncfusion">
 <link href="index.css" rel="stylesheet">
 <link href="https://cdn.syncfusion.com/ej2/24.1.41/material.css"
rel="stylesheet">

```

```

<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

 <div id="container">
 <div class="row"> <button class="e-btn" id="show_toast"> Show
Toast</button> </div>
 <div id="element"></div>

 <div id="result"></div>
 <div id="templateToast" style="display: none;color:red"> System
affected by virus !!! </div>
 </div>
<script>
var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

### Prevent toast close with mobile swipe in EJ2 JavaScript Toast control

You can prevent the toast close with mobile swipe action by setting [beforeClose](#) argument cancel value to true while argument type as a swipe. The following code shows how to prevent toast close with mobile swipe.

The following sample demonstrates preventing toast close with mobile swipe element displaying with custom code blocks.

#### INDEX.TS

```

import {Toast, ToastBeforeCloseArgs} from '@syncfusion/ej2-notifications';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
let toast: Toast = new Toast({
 title: 'Matt sent you a friend request',
 content: 'You have a new friend request yet to accept',
 position: { X: "Center" },
 beforeClose: onBeforeClose,
});
toast.appendTo('#element');
toast.show();
function onBeforeClose (args: ToastBeforeCloseArgs) {
 if (args.type === "swipe") {
 args.cancel = true;
 }
}
document.getElementById('show_toast').onclick = () => {
 toast.show();
}

```

**INDEX.HTML**

```

affected by virus !!! </div>
 </div>
 <script>
var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
 </script>
 <script src="index.js" type="text/javascript"></script>
</body></html>

```

## Toolbar

### Getting started in EJ2 JavaScript Toolbar control

The Essential JS 2 for JavaScript (global script) is an ES5 formatted pure JavaScript framework which can be directly used in latest web browsers.

#### Component Initialization

The Essential JS 2 JavaScript components can be initialized by using either of the following ways.

- Using local script and style references in a HTML page.
- Using CDN link for script and style reference.

#### *Using local script and style references in a HTML page*

**Step 1:** Create an app folder myapp for Essential JS 2 JavaScript components.

**Step 2:** You can get the global scripts and styles from the [Essential Studio JavaScript \(Essential JS 2\)](#) build installed location.

**Syntax:**

Script: **(installed location)/Syncfusion/Essential Studio/{RELEASEVERSION}/Essential JS 2/{PACKAGENAME}/dist/global/{PACKAGE\_NAME}.min.js**

Styles: **(installed location)/Syncfusion/Essential Studio/{RELEASEVERSION}/Essential JS 2/{PACKAGENAME}/styles/material.css**

**Example:**

Script: **C:/Program Files (x86)/Syncfusion/Essential Studio/15.4.30/Essential JS 2/ej2-navigations/dist/global/ej2-navigations.min.js**

Styles: **C:/Program Files (x86)/Syncfusion/Essential Studio/15.4.30/Essential JS 2/ej2-navigations/styles/material.css**

**Step 3:** Create a folder **myapp/resources** and copy/paste the Toolbar and its dependency scripts and styles from the above installed location to **myapp/resources** location.

**Step 4:** Create a HTML page (index.html) in **myapp** location and add the Essentials JS 2 script and style references.

```
`html
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<title>Essential JS 2 Toolbar</title>
<!-- Essential JS 2 Toolbar's dependent material theme -->
<link href="resources/base/styles/material.css" rel="stylesheet" type="text/css" />
<link href="resources/buttons/styles/material.css" rel="stylesheet" type="text/css" />
<link href="resources/popups/styles/material.css" rel="stylesheet" type="text/css" />
<!-- Essential JS 2 Toolbar's material theme -->
<link href="resources/navigations/styles/material.css" rel="stylesheet" type="text/css" />
<!-- Essential JS 2 Toolbar's dependent scripts -->
<script src="resources/scripts/ej2-base.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-buttons.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-popups.min.js" type="text/javascript"></script>
<!-- Essential JS 2 Toolbar's global script -->
```

```
<script src="resources/scripts/ej2-navigations.min.js" type="text/javascript"></script>
</head>
<body>
</body>
</html>
`
```

**Step 5:** Now, add the **Toolbar** element and initiate the **Essential JS 2 Toolbar** component in the **index.html** by using following code

#### Initialize the Toolbar with commands

The Toolbar can be rendered by defining an array of [items](#). An item is rendered with text by defining the default item type as a **Button**. For more information about item configuration, refer to the [Item Configuration](#) section.

```
`html
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<title>Essential JS 2 Toolbar</title>
<!-- Essential JS 2 Toolbar's dependent material theme -->
<link href="resources/base/styles/material.css" rel="stylesheet" type="text/css" />
<link href="resources/buttons/styles/material.css" rel="stylesheet" type="text/css" />
<link href="resources/popups/styles/material.css" rel="stylesheet" type="text/css" />
<!-- Essential JS 2 Toolbar's material theme -->
<link href="resources/navigations/styles/material.css" rel="stylesheet" type="text/css" />
<!-- Essential JS 2 Toolbar's dependent scripts -->
<script src="resources/scripts/ej2-base.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-buttons.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-popups.min.js" type="text/javascript"></script>
<!-- Essential JS 2 Toolbar's global script -->
<script src="resources/scripts/ej2-navigations.min.js" type="text/javascript"></script>
</head>
<body>
<!-- Add the HTML <div> element -->
<div id="element"></div>
<script>
```

```
//Initialize Toolbar component
//Initialize Toolbar component
var toolbar = new ej.navigations.Toolbar({
items: [
{ text: 'Cut' },
{ text: 'Copy' },
{ text: 'Paste' },
{ type: 'Separator'},
{ text: 'Bold' },
{ text: 'Italic' },
{ text: 'Underline' },
]
});
//Render initialized Toolbar component
toolbar.appendTo('#element');
</script>
</body>
</html>
,
```

**Step 6:** Now, run the `index.html` in web browser, it will render the **Essential JS 2 Toolbar** component.

*Using CDN link for script and style reference*

**Step 1:** Create an app folder `myapp` for the Essential JS 2 JavaScript components.

**Step 2:** The Essential JS 2 component's global scripts and styles are already hosted in the below CDN link formats.

**Syntax:**

Script: `http://cdn.syncfusion.com/ej2/{PACKAGENAME}/dist/global/{PACKAGENAME}.min.js`

Styles: `http://cdn.syncfusion.com/ej2/{PACKAGE_NAME}/styles/material.css`

**Example:**

Script: <http://cdn.syncfusion.com/ej2/ej2-navigations/dist/global/ej2-navigations.min.js>

Styles: <http://cdn.syncfusion.com/ej2/ej2-navigations/styles/material.css>

**Step 3:** Create a HTML page (index.html) in myapp location and add the CDN link references. Now, add the **Toolbar** element and initiate the **Essential JS 2 Toolbar** component in the index.html by using following code.

### INDEX.HTML

```
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
 <head>

 <title>Essential JS 2 Toolbar</title>
 <!-- Essential JS 2 Toolbar's dependent material theme -->
 <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet" type="text/css"/>

type="text/javascript"></script>
 <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
 </head>
 <body>
 <!-- Add the HTML <div> element -->
 <div id="element"></div>
 <script>
//Initialize Toolbar component
var toolbar = new ej.navigations.Toolbar({
items: [
 { text: 'Cut' },
 { text: 'Copy' },
 { text: 'Paste' },
 { type: 'Separator' },
 { text: 'Bold' },
 { text: 'Italic' },
 { text: 'Underline' },
]
});
//Render initialized Toolbar component
toolbar.appendTo('#element');
 </script>
 </body>
</html>
```

**Step 4:** Now, run the `index.html` in web browser, it will render the `Essential JS 2 Toolbar` component.

- [Initialize the toolbar using HTML elements](#)

### Item configuration in EJ2 JavaScript Toolbar control

The Toolbar can be rendered by defining an array of [items](#). Items can be constructed with the following built-in command types or item template.

#### Button

**Button** is the default command [type](#), and it can be rendered by using the [text](#) property.

Properties of the button command type:

Property | Description

[text](#) | The text to be displayed for button.

[id](#) | The ID of the button to be rendered. If the ID is not given, auto ID is generated.

[prefixIcon](#) | Defines the class used to specify an icon for the button. The icon is positioned before the text if text is available or the icon alone button is rendered.

[suffixIcon](#) | Defines the class used to specify an icon for the button. The icon is positioned after the text if text is available. If both [prefixIcon](#) and [suffixIcon](#) are specified, only [prefixIcon](#) is considered.

[width](#) | Used to set the [width](#) of the button.

[align](#) | Specifies the location for aligning Toolbar items.

#### Separator

The **Separator** type adds a vertical separation between the Toolbar's single/multiple commands.

#### INDEX.TS

```
import {Toolbar} from '@syncfusion/ej2-navigations';
let toolbar: Toolbar = new Toolbar({
 items: [
 { text: "Cut" },
 { text: "Copy" },
 { type: "Separator" },
 { text: "Paste" },
 { type: "Separator" },
 { text: "Undo" },
 { text: "Redo" }
]
});
toolbar.appendTo('#element');
```

#### INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
 <title>Essential JS 2 Toolbar</title>
 <meta charset="utf-8">
```

```

<meta name="viewport" content="width=device-width, initial-scale=1.0">
<meta name="description" content="Typescript Toolbar Controls">
<meta name="author" content="Syncfusion">
<link href="index.css" rel="stylesheet">
<link href="https://cdn.syncfusion.com/ej2/24.1.41/material.css"
rel="stylesheet">
<link
href="https://ej2.syncfusion.com/angular/demos/src/toolbar/toolbar.component
.css" rel="stylesheet">

<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

 <div id="container">
 <div id="element"></div>

 <div id="result"></div>
 </div>
<script>
var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

If **Separator** is added as the first or the last item, it will not be visible.

### Input

The **Input** type is only applicable for adding **template** elements when the **template** property is defined as an **object**. Input type creates an **input element** internally that acts as the container for Syncfusion input based components.

Note: Set toolbar item **type** property value as **Input** only for Input components.

### NumericTextBox

- The **NumericTextBox** component can be included by importing the **NumericTextBox** module from **ej2-inputs**.
- Initialize the **NumericTextBox** in **template** property, where the Toolbar item type is set as **Input**.
- Related **NumericTextBox** component properties can also be configured as given below.

```
`javascript
```

```
new NumericTextBox({ format: 'c2' })))
```

```
,
```

### DropDownList

- The **DropDownList** component can be included by importing the **DropDownList** module from **ej2-droppdowns**.
- Initialize the **DropDownList** in template property, where the Toolbar item type is set as **Input**.
- Related **DropDownList** component properties can also be configured as given below.

```
`javascript
new DropDownList({ width:100 })
`
```

### CheckBox

- The **CheckBox** component can be included by importing the **CheckBox** module from **ej2-buttons**.
- Initialize the **CheckBox** in template property, where the Toolbar item type is set as **Input**.
- Related **CheckBox** component properties can also be configured as given below.

```
`javascript
new CheckBox({ label: 'Default' })
`
```

### RadioButton

- The **RadioButton** component can be included by importing the **RadioButton** module from **ej2-buttons**.
- Initialize the **RadioButton** in template property, where the Toolbar item type is set as **Input**.
- Related **RadioButton** component properties can also be configured as given below.

```
`javascript
new RadioButton({ label: 'Option 1', name: 'default'})
`
```

The above steps are applicable for all 'Syncfusion' input based components.

E.g.: The following code explains how to add **NumericTextBox**, **DropDownList**, **RadioButton** and **CheckBox** components to the Toolbar.

### INDEX.TS

```
import { Toolbar } from '@syncfusion/ej2-navigations';
import { NumericTextBox } from '@syncfusion/ej2-inputs';
import { DropDownList } from '@syncfusion/ej2-droppdowns';
import { CheckBox, RadioButton } from '@syncfusion/ej2-buttons';
let sportsData: string[] = ['Badminton', 'Cricket', 'Football', 'Golf', 'Tennis'];
let toolbar: Toolbar = new Toolbar({
 items: [
```

```

 { text: "Cut" },
 { text: "Copy" },
 { type: "Separator" },
 { text: "Undo" },
 { text: "Redo" },
 { type: "Separator" },
 { type: 'Input', template: new NumericTextBox({ format: 'c2',
value:1, width:150 }) },
 { type: "Separator" },
 { type: 'Input', template: new DropDownList({ dataSource:
sportsData, width: 120, index: 2 }) },
 { type: "Separator" },
 { type: 'Input', template: new CheckBox({ label: 'Checkbox',
checked: true }) },
 { type: "Separator" },
 { type: 'Input', template: new RadioButton({ label: 'Radio', name:
'default', checked: true }) }
]
});
toolbar.appendTo('#element');
```

## INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
 <title>Essential JS 2 Toolbar</title>
 <meta charset="utf-8">
 <meta name="viewport" content="width=device-width, initial-scale=1.0">

var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
 </script>
 <script src="index.js" type="text/javascript"></script>
```

```
</body></html>
```

### *Enabling tab key navigation in Toolbar*

The [tabIndex](#) property of a Toolbar item is used to enable tab key navigation for the item. By default, the user can switch between items using the arrow keys, but the [tabIndex](#) property allows you to switch between items using the Tab and Shift+Tab keys as well.

To use the [tabIndex](#) property, you need to set it for each Toolbar item that you want to enable tab key navigation. The [tabIndex](#) property should be set to a positive integer value. A value of 0 or a negative value will disable tab key navigation for the item.

For example, to enable tab key navigation for two Toolbar items, you can use the following code:

```
`ts
import {Toolbar} from '@syncfusion/ej2-navigations';
let toolbar: Toolbar = new Toolbar({
 items: [
 { text: "Item 1", tabIndex: 1 },
 { text: "Item 2", tabIndex: 2 }
]
});
`
```

With the above code, the user can switch between the two Toolbar items using the Tab and Shift+Tab keys, in addition to using the arrow keys. The items will be navigated in the order specified by the [tabIndex](#) values.

If you set the [tabIndex](#) value to 0 for all Toolbar items, tab key navigation will be based on the element order rather than the [tabIndex](#) values. For example:

```
`ts
import {Toolbar} from '@syncfusion/ej2-navigations';
let toolbar: Toolbar = new Toolbar({
 items: [
 { text: "Item 1", tabIndex: 0 },
 { text: "Item 2", tabIndex: 0 }
]
});
`
```

In this case, the user can switch between the two Toolbar items using the Tab and Shift+Tab keys, and the items will be navigated in the order in which they appear in the DOM.

Example:

Here is an example of how you can use the [tabIndex](#) property to enable tab key navigation for a Toolbar component:

#### INDEX.TS

```
import {Toolbar} from '@syncfusion/ej2-navigations';
let toolbar: Toolbar = new Toolbar({
 width: 300,
 overflowMode: 'Scrollable',
 items: [
 { type: 'Button', prefixIcon: 'e-cut-icon tb-icons', text: 'Cut',
tabIndex: 0 },
 { type: 'Button', prefixIcon: 'e-copy-icon tb-icons', text: 'Copy',
tabIndex: 0},
 { type: 'Button', prefixIcon: 'e-paste-icon tb-icons',
text: 'Paste',tabIndex: 0},
 { type: 'Separator'},
 { type: 'Button', prefixIcon: 'e-bold-icon tb-icons', text: 'Bold',
tabIndex: 0},
 { type: 'Button', prefixIcon: 'e-underline-icon tb-icons',
text: 'Underline', tabIndex: 0},
 { type: 'Button', prefixIcon: 'e-italic-icon tb-icons', text: 'Italic',
tabIndex: 0},
 { type: 'Button', prefixIcon: 'e-color-icon tb-icons', text: 'Color-
Picker', tabIndex: 0 },
 { type: 'Separator'},
 { type: 'Button', prefixIcon: 'e-ascending-icon tb-icons', text: 'A-Z
Sort', tabIndex: 0 },
 { type: 'Button', prefixIcon: 'e-descending-icon tb-icons', text: 'Z-A
Sort', tabIndex: 0},
 { type: 'Button', prefixIcon: 'e-clear-icon tb-icons', text: 'Clear',
tabIndex: 0}]
 });
toolbar.appendTo('#element');
```

#### INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
 <title>Essential JS 2 Toolbar</title>
 <meta charset="utf-8">
 <meta name="viewport" content="width=device-width, initial-scale=1.0">
 <meta name="description" content="Typescript Toolbar Controls">
 <meta name="author" content="Syncfusion">
 <link href="index.css" rel="stylesheet">
 <link href="https://cdn.syncfusion.com/ej2/24.1.41/material.css"
rel="stylesheet">
 <link
href="https://ej2.syncfusion.com/angular/demos/src/toolbar/toolbar.component
.css" rel="stylesheet">

 <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
 <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
```

```
<body>

 <div id="container">
 <div id="element"></div>

 <div id="result"></div>
 </div>
</script>
<script>
var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

With the above code, the user can switch between the Toolbar items using the Tab and Shift+Tab keys, and the items will be navigated based on the element order.

## Responsive mode in EJ2 JavaScript Toolbar control

This section explains the supported display modes of the Toolbar when the content exceeds the viewing area. Possible modes are:

- Scrollable
- Popup

### Scrollable

The default overflow mode of the Toolbar is **Scrollable**. Scrollable display mode supports display of commands in a single line with horizontal scrolling enabled when commands overflow to available space.

- The right and left navigation arrows are added to the start and end of the Toolbar to navigate to hidden commands.
- You can also see the hidden commands using touch swipe action.
- By default, if navigation icon in the **left** side is disabled, you can see the hidden commands by moving to the **right**.
- By clicking the arrow or by holding the arrow continuously, hidden commands will become visible.
- If device navigation icons are not available, you can touch swipe to see the hidden commands of the Toolbar.

- Once the Toolbar reaches the last or first command, the corresponding navigation icon will be disabled and you can move to the opposite direction.

- You can continuously scroll the Toolbar content by holding the navigation icon.

## INDEX.TS

```
import {Toolbar} from '@syncfusion/ej2-navigations';
let toolbar: Toolbar = new Toolbar({
 width: 600,
 items: [
 { type: 'Button', prefixIcon: 'e-cut-icon tb-icons', text: 'Cut' },
 { type: 'Button', prefixIcon: 'e-copy-icon tb-icons', text: 'Copy' },
 { type: 'Button', prefixIcon: 'e-paste-icon tb-icons', text: 'Paste' },
 { type: 'Separator' },
 { type: 'Button', prefixIcon: 'e-bold-icon tb-icons', text: 'Bold' },
],
});
```

```

 { type: 'Button', prefixIcon: 'e-underline-icon tb-icons',
text:'Underline' },
 { type: 'Button', prefixIcon: 'e-italic-icon tb-icons',
text:'Italic' },
 { type: 'Button', prefixIcon: 'e-color-icon tb-icons',
text:'Color-Picker' },
 { type: 'Separator'},
 { type: 'Button', prefixIcon: 'e-ascending-icon tb-icons',
text:'A-Z Sort' },
 { type: 'Button', prefixIcon: 'e-descending-icon tb-icons',
text:'Z-A Sort' },
 { type: 'Button', prefixIcon: 'e-clear-icon tb-icons',
text:'Clear' }
]
});
toolbar.appendTo('#element');
```

## INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
 <title>Essential JS 2 Toolbar</title>
 <meta charset="utf-8">
 <meta name="viewport" content="width=device-width, initial-scale=1.0">
 <meta name="description" content="Typescript Toolbar Controls">
 <meta name="author" content="Syncfusion">
 <link href="index.css" rel="stylesheet">
 <link href="https://cdn.syncfusion.com/ej2/24.1.41/material.css"
rel="stylesheet">
 <link
href="https://ej2.syncfusion.com/angular/demos/src/toolbar/toolbar.component
.css" rel="stylesheet">

 <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
 <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

 <div id="container">
 <div id="element"></div>

 <div id="result"></div>
 </div>
 <script>
var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
 </script>
 <script src="index.js" type="text/javascript"></script>
</body></html>
```

### Popup

**Popup** is another type of [overflowMode](#) in which the Toolbar container holds the commands that can be placed in the available space. The rest of the overflowing commands that do not fit within the viewing area moves to the overflow popup container.

The commands placed in the popup can be viewed by opening the popup using the drop down icon given at the end of the Toolbar.

If the popup content overflows the height of the page, then the rest of the commands will be hidden.

### Priority of commands

Default popup priority is set as **none**, and when the commands of the Toolbar overflow, the ones listed last will be moved to the popup.

You can customize the priority of commands to be displayed on the Toolbar and popup by using the [overflow](#) property.

Property | Description

Both | Button text is visible in both **Toolbar** and **Popup**.

Overflow | Button text is only visible in **Popup**.

Toolbar | Button text is only visible on the **Toolbar**.

In the following code sample, text is only visible in the popup container and not in the Toolbar container.

### INDEX.TS

```
import {Toolbar} from '@syncfusion/ej2-navigations';
let toolbar: Toolbar = new Toolbar({
 width: 330,
 overflowMode: 'Popup',
 items: [
 { type: 'Button', prefixIcon: 'e-cut-icon tb-icons', text: 'Cut',
 showTextOn: 'Overflow', overflow: 'Show' },
 { type: 'Button', prefixIcon: 'e-copy-icon tb-icons', text: 'Copy',
 showTextOn: 'Overflow', overflow: 'Show' },
 { type: 'Button', prefixIcon: 'e-paste-icon tb-icons', text: 'Paste',
 showTextOn: 'Overflow', overflow: 'Show' },
 { type: 'Separator' },
]
});
```

```

 { type: 'Button', prefixIcon: 'e-bold-icon tb-icons', text: 'Bold',
 showTextOn: 'Overflow', overflow: 'Show' },
 { type: 'Button', prefixIcon: 'e-underline-icon tb-icons',
 text: 'Underline', showTextOn: 'Overflow', overflow: 'Show' },
 { type: 'Button', prefixIcon: 'e-italic-icon tb-icons', text: 'Italic',
 overflow: 'Show', showTextOn: 'Overflow' },
 { type: 'Button', prefixIcon: 'e-color-icon tb-icons', text: 'Color-
 Picker', overflow: 'Hide', showTextOn: 'Overflow' },
 { type: 'Separator' },
 { type: 'Button', prefixIcon: 'e-ascending-icon tb-icons', text: 'A-Z
 Sort', overflow: 'Show', showTextOn: 'Overflow' },
 { type: 'Button', prefixIcon: 'e-descending-icon tb-icons', text: 'Z-A
 Sort', overflow: 'Show', showTextOn: 'Overflow' },
 { type: 'Button', prefixIcon: 'e-clear-icon tb-icons', text: 'Clear',
 overflow: 'Show', showTextOn: 'Overflow' }]
 });
 toolbar.appendTo('#element');

```

## INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
 <title>Essential JS 2 Toolbar</title>

</body></html>

```

## Template configuration in EJ2 JavaScript Toolbar control

The [JavaScript Toolbar](#) can be rendered by item based collection and by HTML elements. To render it based on the given HTML element, use `id` as the `target` property. To render the Toolbar, follow the below structure of the HTML elements:

```
,
<div id='template_toolbar'> --> Root Toolbar Element
<div> --> Toolbar Items Container
<div> --> Toolbar Item Element
</div>
</div>
</div>
,
```

Here, the template ID, `#template_toolbar` is directly appended to the Toolbar.

### INDEX.TS

```
import {Toolbar} from '@syncfusion/ej2-navigations';
let toolbar: Toolbar = new Toolbar();
toolbar.appendTo('#template_toolbar');
```

### INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
 <title>Essential JS 2 Toolbar</title>
 <meta charset="utf-8">
 <meta name="viewport" content="width=device-width, initial-scale=1.0">
 <meta name="description" content="Typescript Toolbar Controls">
 <meta name="author" content="Syncfusion">
 <link href="index.css" rel="stylesheet">
 <link href="https://cdn.syncfusion.com/ej2/24.1.41/material.css"
rel="stylesheet">

 <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
 <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

 <div id="container">
 <div id="template_toolbar">
 <div>
 <div><button class="e-btn e-tbar-btn">Cut</button> </div>
 <div><button class="e-btn e-tbar-btn">Copy</button> </div>
 <div><button class="e-btn e-tbar-btn">Paste</button> </div>
 <div class="e-separator"> </div>
 <div><button class="e-btn e-tbar-btn">Bold</button> </div>
 <div><button class="e-btn e-tbar-btn">Italic</button> </div>
 </div>
 </div>
 </div>
```

```

 </div>
 </div>

 <div id="result"></div>
</div>
<script>
var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

### Popup customization

**Popup** is one of the supported responsive modes of the Toolbar. The Toolbar commands, popup mode priority and button text mode customizations are achieved in the item based rendering through property declaration. For more information on popup mode, refer [here](#)

The above behavior can also be achieved with template rendering by defining **equivalent class** names instead of property declaration.

Equivalent class names listed below are needed to add the Toolbar items' **div** element.

#### Priority

Class	Description
e-popup-text	Button text is only visible in the <b>Popup</b> .
e-toolbar-text	Button text is only visible on the <b>Toolbar</b> .

### INDEX.TS

```

import {Toolbar} from '@syncfusion/ej2-navigations';
let toolbar: Toolbar = new Toolbar({ width: 300 , overflowMode: 'Popup' });
toolbar.appendTo('#template_toolbar');

```

### INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

### Integrate menu component

You can integrate menu component as toolbar item in Toolbar using [template](#) property. Menu can be populated with items as needed.

### INDEX.TS

```

import { Toolbar, Menu, MenuItemModel } from '@syncfusion/ej2-navigations';
let menuTemplate: string = '<ul id="menu">';
let data: MenuItemModel[] = [

```

```

{
 text: 'Appliances',
 items: [
 {
 text: 'Kitchen',
 items: [
 { text: 'Electric Cookers' },
 { text: 'Coffee Makers' },
 { text: 'Blenders' },
],
 },
 {
 text: 'Washing Machine',
 items: [{ text: 'Fully Automatic' }, { text: 'Semi Automatic' }],
 },
 {
 text: 'Air Conditioners',
 items: [
 { text: 'Inverter ACs' },
 { text: 'Split ACs' },
 { text: 'Window ACs' },
],
 },
],
},
{
 text: 'Accessories',
 items: [
 {
 text: 'Mobile',
 items: [
 { text: 'Headphones' },
 { text: 'Memory Cards' },
 { text: 'Power Banks' },
],
 },
 {
 text: 'Computer',
 items: [
 { text: 'Pendrives' },
 { text: 'External Hard Disks' },
 { text: 'Monitors' },
],
 },
],
},
{
 text: 'Fashion',
 items: [

### Accessibility in EJ2 JavaScript Toolbar control

The [JavaScript Toolbar](#) control has been designed, keeping in mind the [WAI-ARIA](#) specifications, and applying the WAI-ARIA roles, states, and properties along with keyboard support for people who use assistive devices. WAI-ARIA accessibility support is achieved through attributes like `aria-label`, and `aria-orientation`. It provides information about elements in a document for assistive technology. The control implements keyboard navigation support by following the [WAI-ARIA practices](#), and has been tested in major screen readers.

The accessibility compliance for the Toolbar control is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support |  |

| [Section 508](#) Support |  |

| Screen Reader Support |  |

| Right-To-Left Support |  |

| Color Contrast |  |

| Mobile Device Support |  |

| Keyboard Navigation Support |  |

| [Accessibility Checker](#) Validation |  |

| [Axe-core](#) Accessibility Validation |  |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<div> - All features of the control meet the requirement.</div>

<div> - Some features of the control do not meet the requirement.</div>

<div> - The control does not meet the requirement.</div>

### ARIA attributes

Toolbar control is designed by considering [WAI-ARIA](#) standard. Toolbar is supported with ARIA Accessibility which is accessible by on-screen readers, and other assistive technology devices. The following list of attributes are added in the Toolbar.

#### | Property | Functionalities |

| --- | --- |

| role="toolbar" | Attribute is set to the ToolBar element describes the actual role of the element. |

| aria-orientation | Attribute is set to the ToolBar element to indicates the ToolBar orientation. Default value is **horizontal**. |

| aria-label | Attribute is set to ToolBar element describes the purpose of the set of toolbar. |

| aria-expanded | Attribute is set to the ToolBar Popup element to indicates the expanded state of the popup. |

| aria-haspopup | Attribute is set to the popup element to indicates the popup mode of the Toolbar. Default value is false. When popup mode is enabled, attribute value has to be changed to **true**. |

| aria-disabled | Attribute set to the ToolBar element to indicates the disabled state of the Toolbar. |

### Keyboard interaction

Keyboard navigation is enabled by default. Possible keys are

Key	Description
Left	Focuses the previous element.
Right	Focuses the next element.

| Enter | When focused on a ToolBar command, clicking the key triggers the click of Toolbar element. When popup drop-down icon is focused, the popup opens. |

| Esc(Escape) | Closes popup. |

| Down | Focuses the next popup element. |

| Up | Focuses the previous popup element. |

| Home | Moves focus to the first Toolbar. |

| End | Moves focus to the last Toolbar. |

| Tab | To Move focus through the interactive elements. |

| Shift + Tab | To Move focus through the interactive elements. |

### Ensuring accessibility

The Toolbar control accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Toolbar control is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Toolbar control with accessibility tools.

### Style in EJ2 JavaScript Toolbar control

The following content provides the exact CSS structure that can be used to modify the control's appearance based on user preference.

#### Customizing Toolbar

Use the following CSS to customize the Toolbar.

```
`css
.e-toolbar {
border: 5px solid rgb(173, 255, 47);
}
```

#### Customizing the Toolbar items

Use the following CSS to customize the items of Toolbar.

```
`css
.e-toolbar .e-toolbar-item {
background: #add8e6;
border: 1px solid #5a70cc;
}
```

Use the following CSS to customize the button in the items of Toolbar.

```
`css
.e-toolbar .e-tbar-btn {
background: #add8e6;
border: 1px solid #5a70cc;
}
`
```

#### Customizing Toolbar's item icon

Use the following CSS to customize the item icon of Toolbar control.

```
`css
.e-toolbar .e-tbar-btn .e-icons {
background: #185655;
color: #d7f9d4;
}
`
```

#### Customizing the hover state of Toolbar control

Use the following CSS to customize the toolbar item when hovering.

```
`css
.e-toolbar .e-tbar-btn:hover {
background: #c0e3a1;
border: 1px solid green;
}
`
```

#### Customizing selected item of Toolbar control

Use the following CSS to customize the selected toolbar item.

```
`css
.e-toolbar .e-tbar-btn:focus {
background: #add8e6;
border: 1px solid #5a70cc;
}
`
```

## How To

Set command customization in EJ2 JavaScript Toolbar control

The [htmlAttributes](#) property of the Toolbar item is used to set the HTML attributes ('ID', 'class', 'style', 'role') for the commands.

When style attributes are added, if the same attributes were already present, they will be replaced. This is not so in the case of `class` attribute. Classes will be added to the element instead of replacing the existing ones.

Single or multiple CSS classes can be added to the Toolbar commands using the Toolbar item [cssClass](#) property.

### INDEX.TS

```
import {Toolbar} from '@syncfusion/ej2-navigations';
let toolbar: Toolbar = new Toolbar({
 width: 300,
 items: [
 { text: "Bold", type: 'Button', htmlAttributes: { 'class':
'custom_bold', 'id': 'itemId' } },
 { text: "Italic", htmlAttributes: { 'class': 'custom_italic' } },
 { text: "Underline", htmlAttributes: { 'class': 'custom_underline' }
 },
 { type: "Separator" },
 { text: "Uppercase", cssClass: "e-txt-casing" }
]
});
toolbar.appendTo('#element');
```

### INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
 <title>Essential JS 2 Toolbar</title>
 <meta charset="utf-8">
 <meta name="viewport" content="width=device-width, initial-scale=1.0">
 <meta name="description" content="Typescript Toolbar Controls">
 <meta name="author" content="Syncfusion">
 <link href="index.css" rel="stylesheet">
 <link href="https://cdn.syncfusion.com/ej2/24.1.41/material.css"
rel="stylesheet">
 <link

.css" rel="stylesheet">

<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

 <div id="container">
 <div id="element"></div>

 <div id="result"></div>
 </div>
<script>
var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
```

```

}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Set tool tip to the commands in EJ2 JavaScript Toolbar control

The [tooltipText](#) property of the Toolbar item is used to set the HTML Tooltip to the commands that can be viewed as hint texts on mouse hover.

To change the [tooltipText](#) to ej2-tooltip component:

- Import the **Tooltip** module from **ej2-popups**, and initialize the Tooltip with the Toolbar target. Refer to the following code example:

### INDEX.TS

```

import { Tooltip } from '@syncfusion/ej2-popups';
import { Toolbar } from '@syncfusion/ej2-navigations';
let toolbar: Toolbar = new Toolbar({
 width: 300,
 items: [
 { text: "Cut", tooltipText: 'Cut' },
 { text: "Copy", tooltipText: 'Copy' },
 { text: "Paste", tooltipText: 'Paste' },
 { text: "Undo", tooltipText: 'Undo' },
 { text: "Redo", tooltipText: 'Redo' }
]
});
toolbar.appendTo('#element');
let tooltip: Tooltip = new Tooltip({
 target: '#element [title]',
});
tooltip.appendTo('#Tooltip');

```

### INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
 <title>Essential JS 2 Toolbar</title>
 <meta charset="utf-8">
 <meta name="viewport" content="width=device-width, initial-scale=1.0">
 <meta name="description" content="Typescript Toolbar Controls">
 <meta name="author" content="Syncfusion">
 <link href="index.css" rel="stylesheet">
 <link href="https://cdn.syncfusion.com/ej2/24.1.41/material.css"
rel="stylesheet">
 <link
href="https://ej2.syncfusion.com/angular/demos/src/toolbar/toolbar.component
.css" rel="stylesheet">

 <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"

 <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>

```

```

</head>
<body>

 <div id="container">
 <div id="Tooltip"><div id="element"></div></div>

 <div id="result"></div>
 </div>
<script>
var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

### Set item wise custom template in EJ2 JavaScript Toolbar control

The Toolbar supports adding template commands using the [template](#) property. Template property can be given as the **HTML element** that is either a **string** or a **query selector**.

#### As a string

The HTML element tag can be given as a string for the template property. Here, the checkbox is rendered as a HTML template.

```
`ts
```

```
template: "<div><input type='checkbox' id='check1' checked=''>Accept</input></div>"
```

```
,
```

#### As a selector

The template property also allows getting template content through query **selector**. Here, checkbox 'ID' attribute is specified in the template.

```
`ts
```

```
template: "#Template"
```

```
,
```

### INDEX.TS

```

import {Toolbar} from '@syncfusion/ej2-navigations';
let toolbar: Toolbar = new Toolbar({
 items: [
 { text: "Cut" },
 { type: "Separator" },
 { text: "Paste" },
 { type: "Separator" },
 { template: "<div><input type='checkbox' id='check1' checked=''>Accept</input></div>" },
 { text: "Undo" },
 { text: "Redo" },
 { template: "#Template" }
]
});

```

```
toolbar.appendTo('#element');
```

## INDEX.HTML

type="text/javascript"></script>
 <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

 <div id="container">
 <div id="element"></div>

 <button id="Template" class="e-btn">Template</button>
 </div>
<script>
var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

### Add font awesome in EJ2 JavaScript Toolbar control

You can customize the Toolbar component items by using third-party icons other than the icons available in the Syncfusion library. In the following example, font awesome icons are used as toolbar items.

- Refer to the third-party reference link. Here, the CDN link of font awesome is referred.

```
<link rel="stylesheet" href="https://cdn.jsdelivr.net/npm/font-awesome/4.7.0/css/font-
awesome.min.css" />
```

- Add the icons to the toolbar component using '[prefixIcon](#)' property

The following sample explains how to use font awesome in the toolbar component.

### INDEX.TS

```
import { Toolbar } from "@syncfusion/ej2-navigations";
let toolbar: Toolbar = new Toolbar({
 items: [
 { prefixIcon: "fa fa-twitter" },
 { prefixIcon: "fa fa-facebook" },
 { prefixIcon: "fa fa-whatsapp" },
 { template: '<button class="e-btn e-tbar-btn"><i class="e-icons fa fa-twitter"></i></button>' }
]
});
toolbar.appendTo("#element");
```

### INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
 <title>Essential JS 2 Toolbar</title>
 <meta charset="utf-8">
 <meta name="viewport" content="width=device-width, initial-scale=1.0">
 <meta name="description" content="Typescript Toolbar Controls">
 <meta name="author" content="Syncfusion">
 <link href="index.css" rel="stylesheet">
 <link href="https://cdn.syncfusion.com/ej2/24.1.41/material.css"
rel="stylesheet">
 <!-- <link
href="https://ej2.syncfusion.com/angular/demos/src/toolbar/toolbar.component
.css" rel="stylesheet" /> -->

 <link rel="stylesheet"
href="https://cdnjs.cloudflare.com/ajax/libs/font-awesome/4.7.0/css/font-
awesome.min.css">

<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

 <div id="container">
 <div id="element"></div>

 <div id="result"></div>
 </div>
<script>
var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

We can also use templates for rendering icons based on the requirements.

#### Customization

The class “e-icons” is used for standardizing the appearance of the icons to fit into toolbar items. If you wish to override the appearance of the icons used, you could do this by using the following set of classes

Use the following CSS to set the color of icons.

```
`css
.e-toolbar .e-icons {
color: #e3165b !important;
}
`
```

Use the following CSS to set the font size of icons.

```
`css
.e-toolbar .e-btn .e-icons.e-btn-icon {
font-size: 14px !important;
}
`
```

#### Add toggle button in EJ2 JavaScript Toolbar control

JavaScript Toolbar supports to add a toggle Button by using the template property. Refer below steps

- By using Toolbar template property, pass required HTML String to render toggle button.

```
`ts
{ template: '<button class="e-btn" id="media_btn"></button>' }
`
```

- Now render the toggle Button into the targeted element in JavaScript Toolbar [created](#) event handler and bind click event for it. On clicking the toggle Button, change the required icon and content based on current active state.

#### INDEX.TS

```
import { Button } from '@syncfusion/ej2-buttons';
import { Toolbar } from '@syncfusion/ej2-navigations';
let undoBtn: any;
let zoomBtn: any;
let mediaBtn: any;
let filterBtn: any;
let visibleBtn: any;
let toolbar: Toolbar = new Toolbar({
 created: create,
 items: [
```

```

 { template: '<button class="e-btn" id="media_btn"></button>' },
 { type: "Separator" },
 { template: '<button class="e-btn" id="zoom_btn"></button>' },
 { type: "Separator" },
 { template: '<button class="e-btn" id="undo_btn"></button>' },
 { type: "Separator" },
 { template: '<button class="e-btn" id="filter_btn"></button>' },
 { type: "Separator" },
 { template: '<button class="e-btn" id="visible_btn"></button>' },
]
});
toolbar.appendTo('#element');
function create() {
 zoomBtn = new Button({ cssClass: `e-flat`, iconCss: 'e-icons e-zoomin-
icon', isToggle: true });
 zoomBtn.appendTo('#zoom_btn');
 mediaBtn = new Button({ cssClass: `e-flat`, iconCss: 'e-icons e-play-
icon', isToggle: true });
 mediaBtn.appendTo('#media_btn');
 undoBtn = new Button({ cssClass: `e-flat`, iconCss: 'e-icons e-undo-
icon', isToggle: true });
 undoBtn.appendTo('#undo_btn');
 filterBtn = new Button({ cssClass: `e-flat`, iconCss: 'e-icons e-filter-
icon', isToggle: true });
 filterBtn.appendTo('#filter_btn');
 visibleBtn = new Button({ cssClass: `e-flat`, iconCss: 'e-icons e-hide-
icon', isToggle: true, content: 'Hide' });
 visibleBtn.appendTo('#visible_btn');
 //Toggle button click event handlers
 zoomBtn.element.onclick = (): void => {
 if (zoomBtn.element.classList.contains('e-active')) {
 zoomBtn.iconCss = 'e-icons e-zoomout-icon';
 } else {
 zoomBtn.iconCss = 'e-icons e-zoomin-icon';
 }
 };
 mediaBtn.element.onclick = (): void => {
 if (mediaBtn.element.classList.contains('e-active')) {
 mediaBtn.iconCss = 'e-icons e-pause-icon';
 } else {
 mediaBtn.iconCss = 'e-icons e-play-icon';
 }
 };
 undoBtn.element.onclick = (): void => {
 if (undoBtn.element.classList.contains('e-active')) {
 undoBtn.iconCss = 'e-icons e-redo-icon';
 } else {
 undoBtn.iconCss = 'e-icons e-undo-icon';
 }
 };
 filterBtn.element.onclick = (): void => {
 if (filterBtn.element.classList.contains('e-active')) {
 filterBtn.iconCss = 'e-icons e-filternone-icon';
 } else {
 filterBtn.iconCss = 'e-icons e-filter-icon';
 }
 };
};

```

```

visibleBtn.element.onclick = (): void => {
 if (visibleBtn.element.classList.contains('e-active')) {
 document.getElementById('content').style.display = 'none';
 visibleBtn.content = 'Show';
 visibleBtn.iconCss = 'e-icons e-show-icon';
 } else {
 document.getElementById('content').style.display = 'block';
 visibleBtn.content = 'Hide';
 visibleBtn.iconCss = 'e-icons e-hide-icon';
 }
};
}

```

### Enable or disable toolbar item in EJ2 JavaScript Toolbar control

The [disabled](#) property of the Toolbar item is used to enable/disable the item by setting false/true value to the property. In the following code example initially paste action will be disabled. On clicking the cut or copy button, the paste button will be enabled.

**INDEX.TS**

```

import { Toolbar } from '@syncfusion/ej2-navigations';
function onClick() {
 toolbarObj.items[2].disabled = false;
}
let toolbarObj: Toolbar = new Toolbar({
 width: 600,
 items: [
 {
 prefixIcon: 'e-cut-icon tb-icons', tooltipText: 'Cut',
click: onClick},
 {
 prefixIcon: 'e-copy-icon tb-icons', tooltipText: 'Copy',
click: onClick},
 {
 prefixIcon: 'e-paste-icon tb-icons', tooltipText: 'Paste',
disabled: true },
 {
 type: 'Separator' },
 {
 prefixIcon: 'e-bold-icon tb-icons', tooltipText: 'Bold' },
 {
 prefixIcon: 'e-underline-icon tb-icons', tooltipText:
'Underline'},
 {
 prefixIcon: 'e-italic-icon tb-icons', tooltipText: 'Italic'
},
 {
 prefixIcon: 'e-color-icon tb-icons', tooltipText: 'Color-
Picker' },
 {
 type: 'Separator' },
 {
 prefixIcon: 'e-alignleft-icon tb-icons', tooltipText:
'Align-Left' },
 {
 prefixIcon: 'e-alignjustify-icon tb-icons', tooltipText:
'Align-Justify'},
 {
 prefixIcon: 'e-alignright-icon tb-icons', tooltipText:
'Align-Right' },
 {
 prefixIcon: 'e-aligncenter-icon tb-icons', tooltipText:
'Align-Center' },
 {
 type: 'Separator' },
 {
 prefixIcon: 'e-bullets-icon tb-icons', tooltipText:
'Bullets'},
 {
 prefixIcon: 'e-numbering-icon tb-icons', tooltipText:
'Numbering' },
 {
 type: 'Separator' },
 {

```

```

 prefixIcon: 'e-ascending-icon tb-icons', tooltipText: 'Sort
A - Z' },
 {
 prefixIcon: 'e-descending-icon tb-icons', tooltipText: 'Sort
Z - A' },
 {
 type: 'Separator' },
 {
 prefixIcon: 'e-upload-icon tb-icons', tooltipText: 'Upload'
 },
 {
 prefixIcon: 'e-download-icon tb-icons', tooltipText:
'Download' },
 {
 type: 'Separator' },
 {
 prefixIcon: 'e-indent-icon tb-icons', tooltipText: 'Text
Indent' },
 {
 prefixIcon: 'e-outdent-icon tb-icons', tooltipText: 'Text
Outdent' },
 {
 type: 'Separator' },
 {
 prefixIcon: 'e-clear-icon tb-icons', tooltipText: 'Clear' },
 {
 prefixIcon: 'e-reload-icon tb-icons', tooltipText: 'Reload'
 },
 {
 prefixIcon: 'e-export-icon tb-icons', tooltipText: 'Export'
 }]
 });
 toolbarObj.appendTo('#element');

```

### How to customize toolbar scroll step in EJ2 JavaScript Toolbar control

Toolbar supports to customize the scrolling distance when you click the left and right side navigation icons. we can customize **ScrollStep** property for scrolling distance. Refer to the following code example.

- By using Toolbar scrollStep property, pass a required value to customize toolbar scrollStep.

### INDEX.TS

```

import { Toolbar, BeforeCreateArgs } from '@syncfusion/ej2-navigations';
let toolbarObj: Toolbar = new Toolbar({
 scrollStep: 50,
 width: 600,
 items: [
 {
 prefixIcon: 'e-cut-icon tb-icons', tooltipText: 'Cut' },
 {
 prefixIcon: 'e-copy-icon tb-icons', tooltipText: 'Copy' },
 {
 prefixIcon: 'e-paste-icon tb-icons', tooltipText: 'Paste' },
 {
 type: 'Separator' },
 {
 prefixIcon: 'e-bold-icon tb-icons', tooltipText: 'Bold' },

'Align-Left' },
 {
 prefixIcon: 'e-alignjustify-icon tb-icons', tooltipText:
'Align-Justify'},
 {

```

```

 prefixIcon: 'e-alignright-icon tb-icons', tooltipText:
'Align-Right' },
 {
 prefixIcon: 'e-aligncenter-icon tb-icons', tooltipText:
'Align-Center' },
 {
 type: 'Separator' },
 {
 prefixIcon: 'e-bullets-icon tb-icons', tooltipText:
'Bullets'},
 {
 prefixIcon: 'e-numbering-icon tb-icons', tooltipText:
'Numbering' },
 {
 type: 'Separator' },
 {
 prefixIcon: 'e-ascending-icon tb-icons', tooltipText: 'Sort
A - Z' },
 {
 prefixIcon: 'e-descending-icon tb-icons', tooltipText: 'Sort
Z - A' },
 {
 type: 'Separator' },
 {
 prefixIcon: 'e-upload-icon tb-icons', tooltipText: 'Upload'
 },
 {
 prefixIcon: 'e-download-icon tb-icons', tooltipText:
'Download' },
 {
 type: 'Separator' },
 {
 prefixIcon: 'e-indent-icon tb-icons', tooltipText: 'Text
Indent' },
 {
 prefixIcon: 'e-outdent-icon tb-icons', tooltipText: 'Text
Outdent' },
 {
 type: 'Separator' },
 {
 prefixIcon: 'e-clear-icon tb-icons', tooltipText: 'Clear' },
 {
 prefixIcon: 'e-reload-icon tb-icons', tooltipText: 'Reload'
 },
 {
 prefixIcon: 'e-export-icon tb-icons', tooltipText: 'Export'
 }
]
});
toolbarObj.appendTo('#element');
function beforeCreate(e: BeforeCreateArgs) {
 e.scrollStep = 50;
};

```

## INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>

<script src="index.js" type="text/javascript"></script>
</body></html>

```

### Add link to toolbar item in EJ2 JavaScript Toolbar control

Toolbar supports to add link by using the template configuration. The Toolbar can be rendered by item based collection and by HTML elements. Template property can be given as the **HTML element** that is either a **string** or a **query selector**.

The template property also allows getting template content through query **selector**. Here, anchor element 'ID' attribute is specified in the template.

```
`ts
```

```
template: "#AnchorTemplate"
```

```
,
```

### INDEX.TS

```

import {Toolbar} from '@syncfusion/ej2-navigations';
let toolbar: Toolbar = new Toolbar({
 items: [
 { text: "Cut" },
 { text: "Copy" },
 { type: "Separator" },
 { text: "Paste" },
]
});

```

```

 { type: "Separator" },
 { template: '#AnchorTemplate' }
]
});
toolbar.appendTo('#element');
```

## INDEX.HTML

## Ej1 api migration in EJ2 JavaScript Toolbar control

This article describes the API migration process of Toolbar component from Essential JS 1 to Essential JS 2.

### Accessibility

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Localization | **Not Applicable** | **Property:** *locale*   
 <br /> <br /> var toolbar = new ej.navigations.Toolbar({  
 <br /> &#160; locale: 'en-US' <br /> }); <br /> toolbar.appendTo('#ej2Toolbar'); <br /> |

| RTL | **Property:** *enableRTL*   
 <br /> <br /> \$("#toolbar").ejToolbar({ <br /> &#160; enableRTL: true <br /> }); <br /> | **Property:** *enableRtl*   
 <br /> <br /> var toolbar = new ej.navigations.Toolbar({ <br /> &#160; enableRtl: true <br /> }); <br /> toolbar.appendTo('#ej2Toolbar'); <br /> |

## DataSource

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| DataSource | **Property:** *dataSource*   
 <br /> <br /> \$("#toolbar").ejToolbar({ <br /> &#160; dataSource: items <br /> }); <br /> | **Not Applicable** |

| Query | **Property:** *query*   
 <br /> <br /> \$("#toolbar").ejToolbar({ <br /> &#160; query: query <br /> }); <br /> | **Not Applicable** |

| Fields | **Property:** *fields*   
 <br /> <br /> \$("#toolbar").ejToolbar({ <br /> &#160; fields: {} <br /> }); <br /> | **Not Applicable** |

| Group | **Property:** *group*   
 <br /> <br /> \$("#toolbar").ejToolbar({ <br /> &#160; fields: { group: " " } <br /> }); <br /> | **Not Applicable** |

| HtmlAttributes | **Property:** *htmlAttributes*   
 <br /> <br /> \$("#toolbar").ejToolbar({ <br /> &#160; fields: { htmlAttributes: {} } <br /> }); <br /> | **Not Applicable** |

| Id | **Property:** *id*   
 <br /> <br /> \$("#toolbar").ejToolbar({ <br /> &#160; fields: { id: " " } <br /> }); <br /> | **Not Applicable** |

| ImageAttributes | **Property:** *imageAttributes*   
 <br /> <br /> \$("#toolbar").ejToolbar({ <br /> &#160; fields: { imageAttributes: {} } <br /> }); <br /> | **Not Applicable** |

| ImageUrl | **Property:** *imageUrl*   
 <br /> <br /> \$("#toolbar").ejToolbar({ <br /> &#160; fields: { imageUrl: " " } <br /> }); <br /> | **Not Applicable** |

| SpriteCssClass | **Property:** *spriteCssClass*   
 <br /> <br /> \$("#toolbar").ejToolbar({ <br /> &#160; fields: { spriteCssClass: " " } <br /> }); <br /> | **Not Applicable** |

| Text | **Property:** *text*   
 <br /> <br /> \$("#toolbar").ejToolbar({ <br /> &#160; fields: { text: " " } <br /> }); <br /> | **Not Applicable** |

| TooltipText | **Property:** *tooltipText*   
 <br /> <br /> \$("#toolbar").ejToolbar({ <br /> &#160; fields: { tooltipText: " " } <br /> }); <br /> | **Not Applicable** |

| Template | **Property:** *template*   
 <br /> <br /> \$("#toolbar").ejToolbar({ <br /> &#160; fields: { template: " " } <br /> }); <br /> | **Not Applicable** |

## Items

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Default | **Property:** *items*   
 <br /> <br /> \$("#toolbar").ejToolbar({ <br /> &#160; items: [] <br /> }); <br /> | **Property:** *items*   
 <br /> <br /> var toolbar = new ej.navigations.Toolbar({ <br /> &#160; items: [] <br /> }); <br /> toolbar.appendTo('#ej2Toolbar'); <br /> |

| Align | **Not Applicable** | **Property:** *items[0].align* <br /><br /> var toolbar = new ej.navigations.Toolbar({ <br /> items: [{ align: 'center' }] <br /> }); <br /> toolbar.appendTo('#ej2Toolbar'); <br /> |

| Custom Class | **Not Applicable** | **Property:** *items[0].cssClass* <br /><br /> var toolbar = new ej.navigations.Toolbar({ <br /> items: [{ cssClass: 'e-class' }] <br /> }); <br /> toolbar.appendTo('#ej2Toolbar'); <br /> |

| Group Name | **Property:** *items[0].group* <br /><br /> \$("#toolbar").ejToolbar({ <br /> &#160; items: [{ group: " " }] <br /> }); <br /> | **Not Applicable** |

| Html Attributes | **Property:** *items[0].htmlAttributes* <br /><br /> \$("#toolbar").ejToolbar({ <br /> &#160; items: [{ htmlAttributes: {} }] <br /> }); <br /> | **Property:** *items[0].htmlAttributes* <br /><br /> var toolbar = new ej.navigations.Toolbar({ <br /> &#160; items: [{ htmlAttributes: {} }] <br /> }); <br /> toolbar.appendTo('#ej2Toolbar'); <br /> |

| Id | **Property:** *items[0].id* <br /><br /> \$("#toolbar").ejToolbar({ <br /> &#160; items: [{ id: " " }] <br /> }); <br /> | **Property:** *items[0].id* <br /><br /> var toolbar = new ej.navigations.Toolbar({ <br /> &#160; items: [{ id: " " }] <br /> }); <br /> toolbar.appendTo('#ej2Toolbar'); <br /> |

| ImageAttributes | **Property:** *items[0].imageAttributes* <br /><br /> \$("#toolbar").ejToolbar({ <br /> &#160; items: [{ imageAttributes: {} }] <br /> }); <br /> | **Not Applicable** |

| ImageUrl | **Property:** *items[0].imageUrl* <br /><br /> \$("#toolbar").ejToolbar({ <br /> &#160; items: [{ imageUrl: " " }] <br /> }); <br /> | **Not Applicable** |

| Overflow | **Not Applicable** | **Property:** *items[0].overflow* <br /><br /> var toolbar = new ej.navigations.Toolbar({ <br /> &#160; items: [{ overflow: 'popup' }] <br /> }); <br /> toolbar.appendTo('#ej2Toolbar'); <br /> |

| PrefixIcon | **Not Applicable** | **Property:** *items[0].prefixIcon* <br /><br /> var toolbar = new ej.navigations.Toolbar({ <br /> &#160; items: [{ prefixIcon: 'e-icon' }] <br /> }); <br /> toolbar.appendTo('#ej2Toolbar'); <br /> |

| ShowAlwaysInPopup | **Not Applicable** | **Property:** *items[0].showAlwaysInPopup* <br /><br /> var toolbar = new ej.navigations.Toolbar({ <br /> &#160; items: [{ showAlwaysInPopup: true }] <br /> }); <br /> toolbar.appendTo('#ej2Toolbar'); <br /> |

| ShowTextOn | **Not Applicable** | **Property:** *items[0].showTextOn* <br /><br /> var toolbar = new ej.navigations.Toolbar({ <br /> &#160; items: [{ showTextOn: 'popup' }] <br /> }); <br /> toolbar.appendTo('#ej2Toolbar'); <br /> |

| Sprite CssClass | **Property:** *items[0].spriteCssClass* <br /><br /> \$("#toolbar").ejToolbar({ <br /> &#160; items: [{ spriteCssClass: 'e-class' }] <br /> }); <br /> | **Not Applicable** |

| SuffixIcon | **Not Applicable** | **Property:** *items[0].suffixIcon* <br /><br /> var toolbar = new ej.navigations.Toolbar({ <br /> &#160; items: [{ suffixIcon: 'e-icon' }] <br /> }); <br /> toolbar.appendTo('#ej2Toolbar'); <br /> |

| Template | **Property:** *items[0].template* <br /><br /> \$("#toolbar").ejToolbar({ <br /> &#160; items: [{ template: " " }] <br /> }); <br /> | **Property:** *items[0].template* <br /><br /> var toolbar = new ej.navigations.Toolbar({ <br /> &#160; items: [{ template: " " }] <br /> }); <br /> toolbar.appendTo('#ej2Toolbar'); <br /> |

| Text | **Property:** *items[0].text* <br /><br /> \$("#toolbar").ejToolbar({ <br /> &#160; items: [{ text: 'Cut' }] <br /> }); <br /> | **Property:** *items[0].text* <br /><br /> var toolbar = new ej.navigations.Toolbar({ <br /> &#160; items: [{ text: 'Cut' }] <br /> }); <br /> toolbar.appendTo('#ej2Toolbar'); <br /> |

| TooltipText | **Property:** *items[0].tooltipText* <br /><br /> \$("#toolbar").ejToolbar({ <br /> &#160; items: [{ tooltipText: 'Cut' }] <br /> }); <br /> | **Property:** *items[0].tooltipText* <br /><br /> var toolbar = new ej.navigations.Toolbar({ <br /> &#160; items: [{ tooltipText: 'Cut' }] <br /> }); <br /> toolbar.appendTo('#ej2Toolbar'); <br /> |

| Type | **Not Applicable** | **Property:** *items[0].type* <br /><br /> var toolbar = new ej.navigations.Toolbar({ <br /> &#160; items: [{ type: 'Button' }] <br /> }); <br /> toolbar.appendTo('#ej2Toolbar'); <br /> |

| Width | **Not Applicable** | **Property:** *items[0].width* <br /><br /> var toolbar = new ej.navigations.Toolbar({ <br /> &#160; items: [{ width: '50' }] <br /> }); <br /> toolbar.appendTo('#ej2Toolbar'); <br /> |

| Disable Items | **Property:** *disabledItemIndices* <br /><br /> \$("#toolbar").ejToolbar({ <br /> &#160; disabledItemIndices: [] <br /> }); <br /> | **Method:** *enableItems(items, false)* <br /><br /> var toolbar = new ej.navigations.Toolbar(); <br /> toolbar.appendTo('#ej2Toolbar'); <br /> toolbar.enableItems([], false); <br /> |

| Add Items | **Not Applicable** | **Method:** *addItem(items, index)* <br /><br /> var toolbar = new ej.navigations.Toolbar(); <br /> toolbar.appendTo('#ej2Toolbar'); <br /> toolbar.addItem([], 0); <br /> |

| RemoveItem | **Method:** *removeItem(element)* <br /><br /> \$("#toolbar").ejToolbar(); <br /> var toolbar = \$("#toolbar").data("ejToolbar"); <br /> toolbar.removeItem(ele); <br /> | **Method:** *removeItems(args)* <br /><br /> var toolbar = new ej.navigations.Toolbar(); <br /> toolbar.appendTo('#ej2Toolbar'); <br /> toolbar.removeItems(0); <br /> |

| RemoveItemById | **Method:** *removeItemById(id)* <br /><br /> \$("#toolbar").ejToolbar(); <br /> var toolbar = \$("#toolbar").data("ejToolbar"); <br /> toolbar.removeItemById('left'); <br /> | **Not Applicable** |

| Enable Item | **Method:** *enableItem(element)* <br /><br /> \$("#toolbar").ejToolbar(); <br /> var toolbar = \$("#toolbar").data("ejToolbar"); <br /> toolbar.enableItem(ele); <br /> | **Method:** *enableItems(items, true)* <br /><br /> var toolbar = new ej.navigations.Toolbar(); <br /> toolbar.appendTo('#ej2Toolbar'); <br /> toolbar.enableItems(items, true); <br /> |

| EnableItemById | **Method:** *enableItemById(id)* <br /><br /> \$("#toolbar").ejToolbar(); <br /> var toolbar = \$("#toolbar").data("ejToolbar"); <br /> toolbar.enableItemById('left'); <br /> | **Not Applicable** |

| Disable Item | **Method:** *disableItem(element)* <br /><br /> \$("#toolbar").ejToolbar(); <br /> var toolbar = \$("#toolbar").data("ejToolbar"); <br /> toolbar.disableItem(ele); <br /> | **Method:** *enableItems(items, false)* <br /><br /> var toolbar = new ej.navigations.Toolbar(); <br /> toolbar.appendTo('#ej2Toolbar'); <br /> toolbar.enableItems([], false); <br /> |

| DisableItemById | **Method:** *disableItemById(id)* <br /><br /> \$("#toolbar").ejToolbar(); <br /> var toolbar = \$("#toolbar").data("ejToolbar"); <br /> toolbar.disableItemById('left'); <br /> | **Not Applicable** |

| Show Item | **Not Applicable** | **Method:** *hideItem(index, false)* <br /><br /> var toolbar = new ej.navigations.Toolbar(); <br /> toolbar.appendTo('#ej2Toolbar'); <br /> toolbar.hideItem(0, false); <br /> |

| Hide Item | **Not Applicable** | **Method:** *hideItem(index, true)* <br /><br /> var toolbar = new ej.navigations.Toolbar(); <br /> toolbar.appendTo('#ej2Toolbar'); <br /> toolbar.hideItem(0, true); <br /> |

| SelectItem | **Method:** *selectItem(element)* <br /><br /> \$("#toolbar").ejToolbar(); <br /> var toolbar = \$("#toolbar").data("ejToolbar"); <br /> toolbar.selectItem(ele); <br /> | **Not Applicable** |

| SelectItemById | **Method:** *selectItemById(id)* <br /><br /> \$("#toolbar").ejToolbar(); <br /> var toolbar = \$("#toolbar").data("ejToolbar"); <br /> toolbar.selectItemById('left'); <br /> | **Not Applicable** |

| Deselect Item | **Method:** *deselectItem(element)* <br /><br /> \$("#toolbar").ejToolbar(); <br /> var toolbar = \$("#toolbar").data("ejToolbar"); <br /> toolbar.deselectItem(ele); <br /> | **Not Applicable** |

| DeselectItemById | **Method:** *deselectItemById(id)* <br /><br /> \$("#toolbar").ejToolbar(); <br /> var toolbar = \$("#toolbar").data("ejToolbar"); <br /> toolbar.deselectItemById('left'); <br /> | **Not Applicable** |

| Clicked | **Not Applicable** | **Event:** *clicked* <br /><br /> var toolbar = new ej.navigations.Toolbar({ <br /> &#160; clicked: function(e: Event): void { } <br /> }); <br /> toolbar.appendTo('#ej2Toolbar'); <br /> |

| itemHover | **Event:** *itemHover* <br /><br /> \$("#toolbar").ejToolbar({ <br /> &#160; itemHover: function(args) { } <br /> }); <br /> | **Not Applicable** |

| itemLeave | **Event:** *itemLeave* <br /><br /> \$("#toolbar").ejToolbar({ <br /> &#160; itemLeave: function(args) { } <br /> }); <br /> | **Not Applicable** |

### Common

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Custom class | **Property:** *cssClass* <br /><br /> \$("#toolbar").ejToolbar({ <br /> &#160; cssClass: 'customClass' <br /> }); <br /> | **Not Applicable** |

| Enabled | **Property:** *enabled* <br /><br /> \$("#toolbar").ejToolbar({ <br /> &#160; enabled: false <br /> }); <br /> | **Not Applicable** |

| EnableSeparator | **Property:** *enableSeparator* <br /><br /> \$("#toolbar").ejToolbar({ <br /> &#160; enableSeparator: false <br /> }); <br /> | **Not Applicable** |

| Height | **Property:** *height* <br /><br /> \$("#toolbar").ejToolbar({ <br /> &#160; height: 400 <br /> }); <br /> | **Property:** *height* <br /><br /> var toolbar = new ej.navigations.Toolbar({ <br /> &#160; height: 700 <br /> }); <br /> toolbar.appendTo('#ej2Toolbar'); <br /> |

| HtmlAttributes | **Property:** *htmlAttributes* <br /><br /> \$("#toolbar").ejToolbar({ <br /> &#160; htmlAttributes: { } <br /> }); <br /> | **Not Applicable** |

| Hide | **Property:** *hide* <br /><br /> \$("#toolbar").ejToolbar({ <br /> &#160; hide: true <br /> }); <br /> | **Not Applicable** |

| Orientation | **Property:** *orientation* <br /><br /> \$("#toolbar").ejToolbar({ <br /> &#160; orientation: ej.Orientation.Horizontal <br /> }); <br /> | **Not Applicable** |

| OverflowModes | **Property:** *responsiveType* <br /><br /> \$("#toolbar").ejToolbar({ <br /> &#160; responsiveType: 'popup' <br /> }); <br /> | **Property:** *overflowMode* <br /><br /> var toolbar = new ej.navigations.Toolbar({ <br /> &#160; overflowMode: 'Popup' <br /> }); <br /> toolbar.appendTo('#ej2Toolbar'); <br /> |

| Persistence | **Not Applicable** | **Property:** *enablePersistence* <br /><br /> var toolbar = new ej.navigations.Toolbar({ <br /> &#160; enablePersistence: true <br /> }); <br /> toolbar.appendTo('#ej2Toolbar'); <br /> |

| Responsive | **Property:** *isResponsive* <br /><br /> \$("#toolbar").ejToolbar({ <br /> &#160; isResponsive: true <br /> }); <br /> | **Not Applicable** |

| ShowRoundedCorner | **Property:** *showRoundedCorner* <br /><br /> \$("#toolbar").ejToolbar({ <br /> &#160; showRoundedCorner: false <br /> }); <br /> | **Not Applicable** |

| Width | **Property:** *width* <br /><br /> \$("#toolbar").ejToolbar({ <br /> &#160; width: 600 <br /> }); <br /> | **Property:** *width* <br /><br /> var toolbar = new ej.navigations.Toolbar({ <br /> &#160; width: 500 <br /> }); <br /> toolbar.appendTo('#ej2Toolbar'); <br /> |

| Enable | **Method:** *enable()* <br /><br /> \$("#toolbar").ejToolbar(); <br /> var toolbar = \$("#toolbar").data("ejToolbar"); <br /> toolbar.enable(); <br /> | **Method:** *disable(false)* <br /><br /> var toolbar = new ej.navigations.Toolbar(); <br /> toolbar.appendTo('#ej2Toolbar'); <br /> toolbar.disable(false); <br /> |

| Disable | **Method:** *disable()* <br /><br /> \$("#toolbar").ejToolbar(); <br /> var toolbar = \$("#toolbar").data("ejToolbar"); <br /> toolbar.disable(); <br /> | **Method:** *disable(true)* <br /><br /> var toolbar = new ej.navigations.Toolbar(); <br /> toolbar.appendTo('#ej2Toolbar'); <br /> toolbar.disable(true); <br /> |

| Show | **Method:** *show()* <br /><br /> \$("#toolbar").ejToolbar(); <br /> var toolbar = \$("#toolbar").data("ejToolbar"); <br /> toolbar.show(); <br /> | **Not Applicable** |

| Hide | **Method:** *hide()* <br /><br /> \$("#toolbar").ejToolbar(); <br /> var toolbar = \$("#toolbar").data("ejToolbar"); <br /> toolbar.hide(); <br /> | **Not Applicable** |

| Refresh | **Not Applicable** | **Method:** *refresh()* <br /><br /> var toolbar = new ej.navigations.Toolbar(); <br /> toolbar.appendTo('#ej2Toolbar'); <br /> toolbar.refresh(); <br /> |

| Destroy | **Method:** *destroy()* <br /><br /> \$("#toolbar").ejToolbar(); <br /> var toolbar = \$("#toolbar").data("ejToolbar"); <br /> toolbar.destroy(); <br /> | **Method:** *destroy()* <br /><br /> var toolbar = new ej.navigations.Toolbar(); <br /> toolbar.appendTo('#ej2Toolbar'); <br /> toolbar.destroy(); <br /> |

| Click | **Event:** *click* <br /><br /> \$("#toolbar").ejToolbar({ <br /> &#160; click: function(args) {} <br /> }); <br /> | **Not Applicable** |

| BeforeCreate | **Not Applicable** | **Event:** *beforeCreate* <br /><br /> var toolbar = new ej.navigations.Toolbar({ <br /> &#160; beforeCreate: function(e: Event): void {} <br /> }); <br /> toolbar.appendTo('#ej2Toolbar'); <br /> |

| Created | **Event:** *create* <br /><br /> \$("#toolbar").ejToolbar({ <br /> &#160; create: function(args) {} <br /> }); <br /> | **Event:** *created* <br /><br /> var toolbar = new ej.navigations.Toolbar({ <br /> &#160; created: function(e: Event): void {} <br /> }); <br /> toolbar.appendTo('#ej2Toolbar'); <br /> |

| Destroyed | **Event:** *destroy* <br /><br /> \$("#toolbar").ejToolbar({ <br /> &#160; destroy: function(args) {} <br /> }); <br /> | **Event:** *destroyed* <br /><br /> var toolbar = new

```
ej.navigations.Toolbar({
 destroyed: function(e: Event): void { }
 });

toolbar.appendTo('#ej2Toolbar');
 |
```

```
| FocusOut | Event: focusOut

 $(" #toolbar").ejToolbar({
 focusOut:
function(args) { }
 });
 | Not Applicable |
```

```
| overflowOpen | Event: overflowOpen

 $(" #toolbar").ejToolbar({

overflowOpen: function(args) { }
 });
 | Not Applicable |
```

```
| overflowClose | Event: overflowClose

 $(" #toolbar").ejToolbar({

overflowClose: function(args) { }
 });
 | Not Applicable |
```

## Tooltip

### Getting started in EJ2 JavaScript Tooltip control

The Essential JS 2 for JavaScript (global script) is an ES5 formatted pure JavaScript framework which can be directly used in latest web browsers.

#### control Initialization

The Essential JS 2 JavaScript controls can be initialized by using either of the following ways.

- Using local script and style references in a HTML page.
- Using CDN link for script and style reference.

#### *Using local script and style references in a HTML page*

**Step 1:** Create an app folder **myapp** for Essential JS 2 JavaScript controls.

**Step 2:** You can get the global scripts and styles from the [Essential Studio JavaScript \(Essential JS 2\)](#) build installed location.

#### **Syntax:**

Script: **(installed location)/Syncfusion/Essential Studio/{RELEASEVERSION}/Essential JS 2/{PACKAGENAME}/dist/global/{PACKAGE\_NAME}.min.js**

Styles: **(installed location)/Syncfusion/Essential Studio/{RELEASEVERSION}/Essential JS 2/{PACKAGENAME}/styles/material.css**

#### **Example:**

Script: **C:/Program Files (x86)/Syncfusion/Essential Studio/15.4.17/Essential JS 2/ej2-popups/dist/global/ej2-popups.min.js**

Styles: **C:/Program Files (x86)/Syncfusion/Essential Studio/15.4.17/Essential JS 2/ej2-popups/styles/material.css**

**Step 3:** Create a folder **myapp/resources** and copy/paste the global scripts and styles from the above installed location to **myapp/resources** location.

**Step 4:** Create a HTML page (index.html) in **myapp** location and add the Essentials JS 2 script and style references.

```
`html
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<title>Essential JS 2</title>
<!-- Essential JS 2 material theme -->
<link href="resources/material.css" rel="stylesheet" type="text/css"/>
<!-- Essential JS 2 Tooltip's global script -->
<script src="resources/ej2-popups.min.js" type="text/javascript"></script>
</head>
<body>
</body>
</html>
`
```

**Step 5:** Now, add the **Tooltip** element and initiate the **Essential JS 2 Tooltip** control in the **index.html** by using following code

```
`html
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<title>Essential JS 2</title>
<!-- Essential JS 2 material theme -->
<link href="resources/material.css" rel="stylesheet" type="text/css"/>
<!-- Essential JS 2 Tooltip's global script -->
<script src="resources/ej2-popups.min.js" type="text/javascript"></script>
</head>
<body>
<!-- Add the HTML span element -->
<div id='container'>
<div style="margin: 50px;">
Show Tooltip
</div>
</div>
`
```

```
<script>
// Initialize Essential JS 2 JavaScript Tooltip control
var tooltip = new ej.popups.Tooltip({
width: '150px',
height: '40px',
content: 'Tooltip with specific width and height'
});
tooltip.appendTo('#target');
</script>
</body>
</html>
`
```

**Step 6:** Now, run the `index.html` in web browser, it will render the **Essential JS 2 Tooltip** control.

*Using CDN link for script and style reference*

**Step 1:** Create an app folder `myapp` for the Essential JS 2 JavaScript controls.

**Step 2:** The Essential JS 2 control's global scripts and styles are already hosted in the below CDN link formats.

**Syntax:**

Script: `https://cdn.syncfusion.com/ej2/{PACKAGENAME}/dist/global/{PACKAGENAME}.min.js`

Styles: `https://cdn.syncfusion.com/ej2/{PACKAGE_NAME}/styles/material.css`

**Example:**

Script: <https://cdn.syncfusion.com/ej2/ej2-popups/dist/global/ej2-popups.min.js>

Styles: <https://cdn.syncfusion.com/ej2/ej2-popups/styles/material.css>

We can also use [CRG](#) to generate combined control styles.

**Step 3:** Create a HTML page (`index.html`) in `myapp` location and add the CDN link references. Now, add the `Tooltip` element and initiate the **Essential JS 2 Tooltip** control in the `index.html` by using following code.

**INDEX.HTML**

```
<html><head><script
src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
```

```
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type="text/javascript"></script>
</head><body><script>
var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

**Step 4:** Now, run the `index.html` in web browser, it will render the **Essential JS 2 Tooltip** control.

## Setting dimension in EJ2 JavaScript Tooltip control

### Height and width

The Tooltip can either be assigned auto height and width values or specific pixel values. The `width` and `height` properties are used to

set the outer dimension of the Tooltip element. The default value for both the properties is `auto`. It also accepts string and number values in pixels.

The following sample explains how to set dimensions for the Tooltip.

### INDEX.TS

```
import { Tooltip } from '@syncfusion/ej2-popups';
import { Button } from '@syncfusion/ej2-buttons';
let tooltip: Tooltip = new Tooltip({
 width: '180px',
 height: '40px',
 content: 'This tooltip has 180px width and 40px height'
});
tooltip.appendTo('#target');
let button: Button = new Button({
 content: 'Show Tooltip'
});
button.appendTo('#target');
```

### INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
 <title>EJ2 Tooltip</title>
 <meta charset="utf-8">
 <meta name="viewport" content="width=device-width, initial-scale=1.0">
 <meta name="description" content="Typescript UI Controls">
 <meta name="author" content="Syncfusion">
 <link href="index.css" rel="stylesheet">
 <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-base/styles/material.css" rel="stylesheet">
```

```

<link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
popups/styles/material.css" rel="stylesheet">
<link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
buttons/styles/material.css" rel="stylesheet">

<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

 <div id="container">
 <div style="display: inline-block; position: relative; left:
50%;top: 100px;transform: translateX(-50%);">
 Show Tooltip
 </div>
 </div>
<script>
var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

### Scroll mode

When **height** is specified with a certain pixel value and the Tooltip content overflows, the scrolling mode gets enabled.

### INDEX.TS

```

import { Tooltip } from '@syncfusion/ej2-popups';
let tooltipContent: HTMLElement = document.createElement("div");
tooltipContent.id = 'tooltipContent';
tooltipContent.innerHTML = "Environmentally friendly or environment-
friendly, (also referred to as eco-friendly, nature-friendly, and green) are
marketing and sustainability terms referring to goods and services, laws,
guidelines and policies that inflict reduced, minimal, or no harm upon
ecosystems or the environment.";
let tooltip: Tooltip = new Tooltip({
 width: '300px',
 height: '60px',
 content: tooltipContent,
 isSticky: true
});
tooltip.appendTo('#target');

```

### INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
 <title>EJ2 Tooltip</title>
 <meta charset="utf-8">

```

```

<meta name="viewport" content="width=device-width, initial-scale=1.0">
<meta name="description" content="Typescript UI Controls">
<meta name="author" content="Syncfusion">
<link href="index.css" rel="stylesheet">
<link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">
<link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
popups/styles/material.css" rel="stylesheet">

<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

 <div id="container">
 <p>A green home is a type of house designed to be

 <u>environmentally friendly</u>
 and sustainable. And also focuses on the efficient use of
"energy, water, and building materials." As green homes
 have become more prevalent we have also seen the emergence of
green affordable housing.
 </p>
 </div>
<script>
var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

The scrolling mode can best be seen when the sticky mode of the Tooltip is enabled. To enable sticky mode, set the `isSticky` property to true.

### Content in EJ2 JavaScript Tooltip control

A text or a piece of information assigned to the Tooltip's `content` property will be displayed as the main text stream of the Tooltip.

It can be a string or a template content. If the `content` property is not provided with any specific value, then it takes the value

assigned to the `title` attribute of the target element on which the Tooltip was initialized. The content can also dynamically be

assigned to the Tooltip via AJAX.

### Template content

Any text or image can be added to the Tooltip, by default. To customize the Tooltip layout or to create your own visualized element on the

Tooltip, template can be used.

Refer to the following code example to add formatted HTML content to the Tooltip.

#### INDEX.TS

```
import { Tooltip } from '@syncfusion/ej2-popups';
let tooltipContent: HTMLElement = document.createElement("div");
tooltipContent.innerHTML = "<p>Environmentally friendly or
environment-friendly, <i>(also referred to as eco-friendly,
nature-friendly, and green)</i> are marketing and sustainability terms
referring to goods and services, laws, guidelines and policies that inflict
reduced, minimal, or no harm upon ecosystems or the environment.</p>";
let tooltip: Tooltip = new Tooltip({
 content: tooltipContent
});
tooltip.appendTo('#target');
```

#### INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
 <title>EJ2 Tooltip</title>
 <meta charset="utf-8">
 <meta name="viewport" content="width=device-width, initial-scale=1.0">

 green affordable housing.
 </p>
 </div>
 <script>
 var ele = document.getElementById('container');
 if(ele) {
 ele.style.visibility = "visible";
 }
 </script>
 <script src="index.js" type="text/javascript"></script>
```

```
</body></html>
```

### Dynamic content via AJAX

The Tooltip content can be dynamically loaded by making use of the AJAX call. The AJAX request is usually made within the `beforeRender`

event of the Tooltip, and then the Tooltip's `content` is assigned the value retrieved on it's success.

**Note:** The Tooltip **target** property includes a unique identifier used to associate Tooltips with specific elements on a webpage or application interface. When setting the Tooltip **target** value as a GUID (Globally Unique Identifier), it's important to note that the GUID must start with a combination of **letters** before the numeric portion of the GUID. For example, **target: '# + 'tooltip'+ '96ad88bd-294c-47c3-999b-a9daa3285a05'.**

### INDEX.TS

```
import { Tooltip, TooltipEventArgs } from '@syncfusion/ej2-popups';
import { Ajax } from '@syncfusion/ej2-base';
let tooltip: Tooltip = new Tooltip({
 content: 'Loading...',
 target: '.target',
 position: 'RightCenter',
 beforeRender: onBeforeRender
});
tooltip.appendTo('#targetContainer');
function onBeforeRender(args: TooltipEventArgs): void {
 let ajax: Ajax = new Ajax('./tooltipdata.json', 'GET', true);
 ajax.send().then(
 (result: any) => {
 result = JSON.parse(result);
 for (let i: number = 0; i < result.length; i++) {
 if (result[i].Id === args.target.getAttribute('data-
content')) {
 this.content = "<div class='contentWrap'><div>" +
result[i].Sports + "</div></div>";
 }
 }
 this.dataBind();
 },
 (reason: any) => {
 this.content = reason;
 this.dataBind();
 }
);
}
```

### INDEX.HTML

```

### Position in EJ2 JavaScript Tooltip control

Tooltips can be attached to 12 static locations around the target. On initializing the Tooltip, you can set the position property with any one of the following values:

- TopLeft
- TopCenter
- TopRight
- BottomLeft
- BottomCenter
- BottomRight
- LeftTop
- LeftCenter

- LeftBottom
- RightTop
- RightCenter
- RightBottom

By default, Tooltip is placed at the **TopCenter** of the target element.

#### INDEX.TS

```
import { Tooltip } from '@syncfusion/ej2-popups';
import { DropDownList } from '@syncfusion/ej2-dropdowns';
import { Button } from '@syncfusion/ej2-buttons';
let button: Button = new Button({content: 'Show Tooltip'});
button.appendTo('#tooltip');
let tooltip: Tooltip = new Tooltip({
 position: 'TopCenter',
 content: 'Tooltip Content'
});
tooltip.appendTo('#tooltip');
let dropDownListObject: DropDownList = new DropDownList({
 change: dropChange
});
dropDownListObject.appendTo('#positions');
function dropChange() {
 tooltip.close();
 tooltip.position = this.value;
}
```

#### INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>

var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

### Tip pointer positioning

The Tooltip pointer can be attached or detached from the Tooltip by using the `showTipPointer` property. Pointer positions can be adjusted using the `tipPointerPosition` property that can be assigned to one of the following values:

- Auto
- Start
- Middle
- End

The following code example illustrates how to set the pointer to the start position of the Tooltip.

#### INDEX.TS

```

import { Tooltip } from '@syncfusion/ej2-popups';
import { Button } from '@syncfusion/ej2-buttons';
let button: Button = new Button({content: 'Show Tooltip'});
button.appendTo('#target');
let tooltip: Tooltip = new Tooltip({
 tipPointerPosition: "Start"
});
tooltip.appendTo('#target');

```

#### INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
 <title>EJ2 Tooltip</title>
 <meta charset="utf-8">
 <meta name="viewport" content="width=device-width, initial-scale=1.0">
 <meta name="description" content="Typescript UI Controls">

popups/styles/material.css" rel="stylesheet">
 <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
buttons/styles/material.css" rel="stylesheet">

 <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
 <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

 <div id="container">
 <div id="target" title="Tooltip content">
 Show tooltip
 </div>
 </div>
 <script>
var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
 </script>
 <script src="index.js" type="text/javascript"></script>
</body></html>

```

By default, tip pointers are auto adjusted so that the arrow does not point outside the target element.

### Dynamic positioning

The Tooltip and its tip pointer can be positioned dynamically based on the target's location. This can be achieved by using the **refresh**

method, which auto adjusts the Tooltip over the target.

### INDEX.TS

```

import { Tooltip } from '@syncfusion/ej2-popups';
import { Draggable } from '@syncfusion/ej2-base';
let tooltip: Tooltip;
tooltip = new Tooltip({
 content: 'Drag me !!!',
 target: '#demoSmart',
 animation: { open: { effect: 'None' }, close: { effect: 'None' } }
}, '#targetContainer');
let ele: HTMLElement = document.getElementById('demoSmart');
let drag: Draggable = new Draggable(ele, {

```

```

clone: false,
dragArea: '#targetContainer',
drag: (args: any) => {
 tooltip.refresh(args.element);
},
dragStart: (args: any) => {
 tooltip.open(args.element);
},
dragStop: (args: any) => {
 tooltip.close();
}
});

```

## INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
 <title>EJ2 Tooltip</title>
 <meta charset="utf-8">
 <meta name="viewport" content="width=device-width, initial-scale=1.0">
 <meta name="description" content="Typescript UI Controls">
 <meta name="author" content="Syncfusion">
 <link href="index.css" rel="stylesheet">
 <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">
 <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
popups/styles/material.css" rel="stylesheet">

 <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
 <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

 <div id="container">
 <div id="targetContainer">
 <div id="demoSmart">
 </div>
 </div>
 </div>
 </div>
 <script>
var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
 </script>
 <script src="index.js" type="text/javascript"></script>
</body></html>

```

## Mouse trailing

Tooltips can be positioned relative to the mouse pointer. This behavior can be enabled or disabled by using the `mouseTrail` property. By default, it is set to `false`.

## INDEX.TS

```
import { Tooltip } from '@syncfusion/ej2-popups';
let tooltip: Tooltip = new Tooltip({
 mouseTrail: true,
 content: 'Tooltip content'
});
tooltip.appendTo('#target');
```

## INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
 <title>EJ2 Tooltip</title>
 <meta charset="utf-8">
 <meta name="viewport" content="width=device-width, initial-scale=1.0">
 <meta name="description" content="Typescript UI Controls">
 <meta name="author" content="Syncfusion">
 <link href="index.css" rel="stylesheet">
 <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">
 <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
popups/styles/material.css" rel="stylesheet">

 <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
 <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

 <div id="container">
 <div id="target">
 Show tooltip
 </div>
 </div>
 <script>
var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
 </script>
 <script src="index.js" type="text/javascript"></script>
</body></html>
```

When mouse trailing option is enabled, the tip pointer position gets auto adjusted based on the target, and

other position values like start, end, and middle are not applied (to prevent the pointer from moving out of target).

### Setting offset values

Offset values are set to specify the distance between the target and tooltip element. `offsetX` and `offsetY` properties are used to specify the offset left and top values.

- `offsetX` specifies the distance between the target and Tooltip element in X axis.

- **offsetY** specifies the distance between the target and Tooltip element in Y axis.

The following code example illustrates how to set offset values.

#### INDEX.TS

```
import { Tooltip } from '@syncfusion/ej2-popups';
let tooltip: Tooltip = new Tooltip({
 offsetX: 30,
 offsetY: 30,
 mouseTrail: true,
 showTipPointer: false,
 content: 'Tooltip content'
});
tooltip.appendTo('#target');
```

#### INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
 <title>EJ2 Tooltip</title>
 <meta charset="utf-8">
 <meta name="viewport" content="width=device-width, initial-scale=1.0">
 <meta name="description" content="Typescript UI Controls">
 <meta name="author" content="Syncfusion">
 <link href="index.css" rel="stylesheet">
 <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">
 <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
popups/styles/material.css" rel="stylesheet">

 <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
 <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

 <div id="container">
 <div id="target">
 Show tooltip
 </div>
 </div>
 <script>
var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
 </script>
 <script src="index.js" type="text/javascript"></script>
</body></html>
```

By default, collision is handled automatically and therefore when collision is detected the Tooltip fits horizontally and flips vertically.

## Open mode in EJ2 JavaScript Tooltip control

You can decide the mode on which the Tooltip is to be opened on a page, i.e., on hovering, focusing, or clicking on the target elements.

On mobile devices, Tooltips appear when you tap and hold the element, even if the `opensOn` option is assigned with `Hover`.

Tooltips are also displayed as long as you continue to tap and hold the element. On lift, it disappears in the next 1.5 seconds.

If there is another action before that time ends, then the Tooltip disappears.

The `opensOn` property can take either a single or a combination of multiple values, separated by space from the following options. The table below explains how the Tooltip opens on both desktop and mobile based on the value(s) assigned to the `opensOn` property. By default, it takes `auto` value.

Values	Desktop	Mobile
<code>Auto</code>	Tooltip appears when you hover over the target or when the target element receives the focus.	Tooltip opens on tap and hold of the target element.
<code>Hover</code>	Tooltip appears when you hover over the target.	Tooltip opens on tap and hold of the target element.
<code>Click</code>	Tooltip appears when you click a target element.	Tooltip appears when you single tap the target element.
<code>Focus</code>	Tooltip appears when you focus (say through tab key) on a target element.	Tooltip appears with a single tap on the target element.
<code>Custom</code>	Tooltip is not triggered by any default action. So, you have to bind your own events and use either <code>open</code> or <code>close</code> public methods. Same as Desktop.	

To open the Tooltip for multiple actions, say while hovering over or clicking on a target element, the `opensOn` property can be assigned

with multiple values, separated by space as `Hover Click`.

`auto` value cannot be used with any combination for multiple values.

The following code example shows how to set the open mode for Tooltips.

### INDEX.TS

```
import { Tooltip } from '@syncfusion/ej2-popups';
import { Button } from '@syncfusion/ej2-buttons';
let hoverTooltip: Tooltip = new Tooltip({
 opensOn: 'Hover',
 content: 'Tooltip from hover'
});
hoverTooltip.appendTo('#tooltiphover');
let button: Button = new Button();
button.appendTo('#tooltiphover');
let clickTooltip: Tooltip = new Tooltip({
 opensOn: 'Click',
```

```

 content: 'Tooltip from click'
 });
 clickTooltip.appendTo('#tooltipclick');
 button.appendTo('#tooltipclick');
 let focusTooltip: Tooltip = new Tooltip({
 opensOn: 'Focus',
 content: 'Tooltip from focus'
 });
 focusTooltip.appendTo('#tooltipfocus');
 let customTooltip: Tooltip = new Tooltip({
 opensOn: 'Custom',
 content: 'Tooltip from custom mode'
 });
 customTooltip.appendTo('#tooltipcustom');
 button.appendTo('#tooltipopen');
 document.getElementById('tooltipopen').addEventListener("click", function ()
 {
 if (this.getAttribute("data-tooltip-id")) {
 customTooltip.close();
 } else {
 customTooltip.open(this);
 }
 });

```

 <td style="padding:25px">

```

```

 <div id="tooltiphover" class="blocks">
 Hover Me !(Default)
 </div>
 </td>
 <td style="padding:25px">
 <div id="tooltipclick" class="blocks">
 Click Me !
 </div>
 </td>
</tr>
<tr>
 <td style="padding:25px">
 <div class="">

 <input id="tooltipfocus" type="text"
placeholder="Focus and blur">

 </div>
 </td>
 <td style="padding:25px">
 <div id="tooltipcustom">
 <div>
 <input id="tooltipopen" type="button"
value="Click to open tooltip manually">
 </div>
 </div>
 </td>
</tr>
</tbody>
</table>
</div>
<script>
var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

### Custom open mode

Other than the above specified options, the **custom** mode makes the Tooltip appear on screen for user-defined custom actions such as

right-click, double-click, and so on. Here, the tooltip is not triggered by any default action, and you have to bind your own events and use either **open** or **close** public methods to show or hide the Tooltips.

The following code example shows how to define custom open mode for the Tooltip.

### INDEX.TS

```

import { Tooltip } from '@syncfusion/ej2-popups';
let tooltip: Tooltip = new Tooltip({
 opensOn: 'custom',
 content: 'Tooltip from custom mode'
});

```

```

});
tooltip.appendTo('#box');
document.getElementById('box').addEventListener("dblclick", function () {
 if (this.getAttribute("data-tooltip-id")) {
 tooltip.close();
 } else {
 tooltip.open(this);
 }
});

```

## INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
 <title>EJ2 Tooltip</title>
 <meta charset="utf-8">
 <meta name="viewport" content="width=device-width, initial-scale=1.0">
 <meta name="description" content="Typescript UI Controls">
 <meta name="author" content="Syncfusion">
 <link href="index.css" rel="stylesheet">
 <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">
 <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
popups/styles/material.css" rel="stylesheet">

 <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"

 <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

 <div id="container">
 <div id="box">
 Double-click to open Tooltip.
 </div>
 </div>
 <script>
var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
 </script>
 <script src="index.js" type="text/javascript"></script>
</body></html>

```

## Sticky mode

With this mode set to **true**, Tooltips can be made to show up on the screen as long as the close icon is pressed. In this mode, close icon is attached to the Tooltip located at the top right corner. This mode can be enabled or disabled using the **isSticky** property.

## INDEX.TS

```

import { Tooltip } from '@syncfusion/ej2-popups';
let tooltip: Tooltip = new Tooltip({

```

```
isSticky: true,
content: 'Click close icon to close me'
});
tooltip.appendTo('#target');
```

## INDEX.HTML

```

}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

## Open/Close Tooltip with delay

The Tooltips can be opened or closed after some delay by using the `openDelay` and `closeDelay` properties.

## INDEX.TS

```
import { Tooltip } from '@syncfusion/ej2-popups';
let tooltip: Tooltip = new Tooltip({
 openDelay: 1000,
 closeDelay: 1000,
 content: 'Tooltip with delay'
});
tooltip.appendTo('#target');
```

**INDEX.HTML**

```

}
 </script>
 <script src="index.js" type="text/javascript"></script>
</body></html>

```

**Animation in EJ2 JavaScript Tooltip control**

To animate the Tooltip, a set of specific animation effects are available, and it can be controlled using the **animation** property. The animation property also allows you to set delay, duration, and various other effects of your choice.

**AnimationModel** is derived from base to apply the chosen animation effect, duration, etc. on Tooltips.

By default, Tooltip entrance occurs over 150 ms using the **ease-out** timing function. It exits also at 150 ms, but uses **ease-in** timing function.

**INDEX.TS**

```

import { Tooltip } from '@syncfusion/ej2-popups';
let tooltip: Tooltip = new Tooltip({
 content: 'Tooltip content',
 animation: {
 open: { effect: 'ZoomIn', duration: 1000, delay: 0 },
 close: { effect: 'ZoomOut', duration: 500, delay: 0 }
 }
});

```

```
tooltip.appendTo('#target');
```

## INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
 <title>EJ2 Tooltip</title>
 <meta charset="utf-8">
 <meta name="viewport" content="width=device-width, initial-scale=1.0">
 <meta name="description" content="Typescript UI Controls">
 <meta name="author" content="Syncfusion">
 <link href="index.css" rel="stylesheet">
 <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">
 <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
popups/styles/material.css" rel="stylesheet">

 <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
 <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

 <div id="container">
 <div id="target">
 Show tooltip
 </div>
 </div>
 <script>
var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
 </script>
 <script src="index.js" type="text/javascript"></script>
</body></html>
```

The default animation effect for the Tooltip is set to **FadeIn** for its open action, and **FadeOut** for its close action. The default **duration** is set to 150 ms and **delay** is set to 0.

### Animation effects

The animation effects that are applicable to Tooltips are:

- FadeIn
- FadeOut
- FadeZoomIn
- FadeZoomOut
- FlipXDownIn
- FlipXDownOut
- FlipXUpIn
- FlipXUpOut
- FlipYLeftIn

- FlipYLeftOut
- FlipYRightIn
- FlipYRightOut
- ZoomIn
- ZoomOut
- None

When the **effect** is specified as **none**, no effect will be applied to the Tooltip, and animation is considered to be set to **off**.

Some of the above animation effects suits the Tooltip better when its tip pointer is hidden.

This can be achieved by setting the **showTipPointer** to false.

#### Animating via open/close methods

Animations can also be applied on Tooltips dynamically through **open** and **close** methods. These methods accept the animation model as an

optional parameter. If you pass **TooltipAnimationSettings**, animation takes this model; otherwise, it takes the values from the **animation** property. It is also possible to pass different animations for Tooltips on each target.

Refer to the code snippet below to apply animations using public methods.

#### INDEX.TS

```
import { Tooltip, TooltipAnimationSettings } from '@syncfusion/ej2-popups';
let tooltip: Tooltip = new Tooltip({
 content: 'Tooltip content',
 opensOn: 'custom'
});
tooltip.appendTo('#target');
document.getElementById('target').addEventListener("click", function () {
 if (this.getAttribute("data-tooltip-id")) {
 let closeAnimation: TooltipAnimationSettings = { effect: 'FadeOut',
duration: 1000 }
 tooltip.close(closeAnimation);
 } else {
 let openAnimation: TooltipAnimationSettings = { effect: 'FadeIn',
duration: 1000 }
 tooltip.open(this, openAnimation);
 }
});
```

#### INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
 <title>EJ2 Tooltip</title>
 <meta charset="utf-8">
 <meta name="viewport" content="width=device-width, initial-scale=1.0">
 <meta name="description" content="Typescript UI Controls">
 <meta name="author" content="Syncfusion">

var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

### Apply transition

The transition effect can be applied on Tooltips by using the `beforeRender` event as given in the following work-around code example.

#### INDEX.TS

```

import { Tooltip, TooltipEventArgs } from '@syncfusion/ej2-popups';
let tooltip: Tooltip = new Tooltip({
 target: '.circletool',
 closeDelay: 1000,
 animation: { open: { effect: 'ZoomIn', duration: 500 }, close: { effect:
'ZoomOut', duration: 500 } },
 beforeRender: onBeforeRender,
 afterClose: onAfterClose
});
function onBeforeRender(args: TooltipEventArgs): void {
 if (args.element) {
 // here prevent animation while apply transition
 this.animation = { open: { effect: 'None' } };
 args.element.style.display = 'block';
 args.element.style.transitionProperty = 'left,top';
 args.element.style.transitionDuration = '1000ms';
 }
}
function onAfterClose(args: TooltipEventArgs): void {
 // restore the animation effects
 this.animation = { open: { effect: 'ZoomIn', duration: 500 }, close: {
effect: 'ZoomOut', duration: 500 } };
}
tooltip.appendTo('#box');

```

**INDEX.HTML**

```

</body></html>

```

**Customization in EJ2 JavaScript Tooltip control**

The Tooltip can be customized by using the `cssClass` property, which accepts custom CSS class names that define specific user-defined

styles and themes to be applied on the Tooltip element.

### Tip pointer customization

Styling the tip pointer's size, background, and border colors can be done using the `cssClass` property, as given below.

#### INDEX.TS

```
import { Tooltip } from '@syncfusion/ej2-popups';
let tooltip: Tooltip = new Tooltip({
 cssClass: 'customtip'
});
tooltip.appendTo('#target');
```

#### INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
 <title>EJ2 Tooltip</title>
 <meta charset="utf-8">
 <meta name="viewport" content="width=device-width, initial-scale=1.0">
 <meta name="description" content="Typescript UI Controls">
 <meta name="author" content="Syncfusion">
 <link href="index.css" rel="stylesheet">
 <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">
 <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
popups/styles/material.css" rel="stylesheet">

 <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
 <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

 <div id="container">
 <div id="target" title="Tooltip arrow customized">
 Show tooltip
 </div>
 </div>
 <script>
var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
 </script>
 <script src="index.js" type="text/javascript"></script>
</body></html>
```

### Tooltip customization

The complete look and feel of the Tooltip can be customized by changing its background color, opacity, content font, etc. The following code example shows the way to achieve it.

#### INDEX.TS

```
import { Tooltip } from '@syncfusion/ej2-popups';
```

```
let tooltip: Tooltip = new Tooltip({
 cssClass: 'customtooltip'
});
tooltip.appendTo('#target');
```

## INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
 <title>EJ2 Tooltip</title>
 <meta charset="utf-8">
 <meta name="viewport" content="width=device-width, initial-scale=1.0">

popups/styles/material.css" rel="stylesheet">

 <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
 <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

 <div id="container">
 <div id="target" title="Tooltip customized">
 Show tooltip
 </div>
 </div>
 <script>
var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
 </script>
 <script src="index.js" type="text/javascript"></script>
</body></html>
```

## Style in EJ2 JavaScript Tooltip control

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

### Customizing the tooltip

Use the following CSS to customize the tooltip.

```
.e-tooltip-wrap {
border-radius: 4px;
opacity: 1;
```

```
}
,
```

### Customizing the tooltip popup

Use the following CSS to customize the tooltip popup properties.

```
,
```

```
.e-tooltip-wrap.e-popup {
background-color: #fff;
border: 2px solid #000;
}
,
```

### Customizing the tooltip content

Use the following CSS to customize the tooltip content.

```
,
```

```
.e-tooltip-wrap .e-tip-content {
color: red;
font-size: 12px;
line-height: 20px;
}
,
```

### Customizing the tooltip arrow tip

Use the following CSS to customize the tooltip arrow tip.

```
,
```

*/ To customize the arrow tip at bottom /*

```
.e-tooltip-wrap .e-arrow-tip.e-tip-bottom {
height: 12px;
left: 50%;
top: 100%;
width: 24px;
}

/ To customize the arrow tip at top /
```

*/ To customize the arrow tip at top /*

```
.e-tooltip-wrap .e-arrow-tip.e-tip-top {
height: 12px;
left: 50%;
top: -9px;
}
```

```
width: 24px;
}
/ To customize the arrow tip at left /
.e-tooltip-wrap .e-arrow-tip.e-tip-left {
height: 24px;
left: -9px;
top: 48%;
width: 12px;
}
/ To customize the arrow tip at right /
.e-tooltip-wrap .e-arrow-tip.e-tip-right {
height: 24px;
left: 100%;
top: 50%;
width: 12px;
}
,
```

#### Customizing the tooltip inner tip

Use the following CSS to customize the tooltip inner tip.

```
,
.e-tooltip-wrap .e-arrow-tip-inner.e-tip-bottom {
color: #fff;
font-size: 25.9px;
}
,
```

#### Customizing the tooltip outer tip

Use the following CSS to customize the tooltip outer tip.

```
,
/ To customize the arrow tip at bottom /
.e-tooltip-wrap .e-arrow-tip-outer.e-tip-bottom {
border-left: 12px solid transparent;
border-right: 14px solid transparent;
border-top: 12px solid #000;
}
,
```

```

/ To customize the arrow tip at top /
.e-tooltip-wrap .e-arrow-tip-outer.e-tip-top {
border-bottom: 12px solid #000;
border-left: 12px solid transparent;
border-right: 12px solid transparent;
}

/ To customize the arrow tip at left /
.e-tooltip-wrap .e-arrow-tip-outer.e-tip-left {
border-bottom: 12px solid transparent;
border-right: 12px solid #000;
border-top: 12px solid transparent;
}

/ To customize the arrow tip at right /
.e-tooltip-wrap .e-arrow-tip-outer.e-tip-right {
border-bottom: 12px solid transparent;
border-left: 12px solid #000;
border-top: 12px solid transparent;
}
,

```

### Accessibility in EJ2 JavaScript Tooltip component

The Tooltip component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Tooltip component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support |  |

| [Section 508](#) Support |  |

| Screen Reader Support |  |

| Right-To-Left Support |  |

| Color Contrast |  |

| Mobile Device Support |  |

| Keyboard Navigation Support |  |

| [Accessibility Checker](#) Validation |  |

| [Axe-core](#) Accessibility Validation |  |

<style>

```
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
```

</style>

<div> - All features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

#### WAI-ARIA attributes

The Tooltip component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Tooltip component.

| Attributes | Description |

| --- | --- |

| role="tooltip" | The element that serves as the container for the tooltip has the ARIA role of **tooltip**. |

| aria-describedby | This attribute is added to the target element on which the Tooltip gets opened, when focusing or hovering over it. It usually holds the randomly generated Id value of the Tooltip element. <br /> <br />In case, the target element already holds an **aria-describedby** attribute with Id value of some other component, then the Tooltip Id value can be additionally appended to the existing **aria-describedby** attribute separated by a space as shown in the example below.<br /><br /> **For example:** <br /> aria-describedby = "my-text my-tooltip" <br /> **my-text** is the Id of some other component.<br /> **my-tooltip** is the id of Tooltip component. <br /><br /> When the Tooltip is closed, the **aria-describedby** attribute is removed from the target. |

| aria-hidden | This attribute is assigned to the Tooltip element whose default value is true. <br /><br /> When **true**, it denotes that the Tooltip element is in a hidden or a closed state. When the Tooltip appears on the screen, it's value changes to **false**. |

## Keyboard interaction

The Tooltip component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Tooltip component.

Keys	Description
Esc	Closes or dismisses the Tooltip.
Tab	A form control receiving focus (say through tab key), opens the Tooltip, and on focus out closes it.

1. When the Tooltip is being displayed on the target element, focus continues to stay on it.
2. If the Tooltip opens on mouse entering into the target element space, then it should be dismissed only when the mouse leaves that target.
3. If the Tooltip opens on the target element that receives focus, then it should be closed only when the focus moves out of that target element.

Likewise, if the Tooltip opens on a click, then it should be closed only on another click action.

## Ensuring accessibility

The Tooltip component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Tooltip component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Tooltip component with accessibility tools.

## Ej1 api migration in EJ2 JavaScript Tooltip control

This article describes the API migration process of Tooltip component from Essential JS 1 to Essential JS 2

Behavior | API in Essential JS 1 | API in Essential JS 2

--- | --- | ---

Position | **Property:** *position* `<ej-tooltip position: {target: {horizontal: "center", vertical: "top"}, stem: {horizontal: "center", vertical: "bottom"}}>` | **Property:** *position* `let tooltip: Tooltip = new ej.popups.Tooltip({position: 'TopCenter'}); tooltip.appendTo('#test');`

Animation | **Property:** *animation* `<ej-tooltip animation: {effect: "slide", speed: 1000}>` | **Property:** *animation* `let tooltip: Tooltip = new ej.popups.Tooltip({position: 'TopCenter', animation: {open: {effect: 'FadeIn', duration: 150, delay: 0}, close: {effect: 'FadeOut', duration: 150, delay: 0}}}); tooltip.appendTo('#test');`

Close Time Out | **Property:** *autoCloseTimeout* `<ej-tooltip autoCloseTimeout: 5000>` | **Property:** *closeDelay, openDelay* `let tooltip: Tooltip = new`

```

ej.popups.Tooltip({
 position : 'TopCenter',
 closeDelay : 500
 });

tooltip.appendTo('#test'); |

| Sticky Mode | Property : closeMode
 $(("#test").ejTooltip
({
closeMode : "sticky"

}); | Property: isSticky
 let tooltip: Tooltip = new ej.popups.Tooltip({
 position :
'TopCenter',
 isSticky : true
 });
 tooltip.appendTo('#test'); |

| Offset from target | Property : tip.adjust.xValue/ tip.adjust.yValue
 $(("#test").ejTooltip
 { {

 tip :
 size : { width : 25, height : 12},
 adjust : {xValue : 5, yValue: 6}
}
 }; |
Property: offsetX/ offsetY
 let tooltip: Tooltip = new ej.popups.Tooltip({
position :
'TopCenter',
 offsetX : 10,
offsetY : 10
});
tooltip.appendTo('#test'); |

| Mouse trail on target | Not Applicable | Property: mouseTrail
 let tooltip: Tooltip = new
ej.popups.Tooltip({
mouseTrail: true,
});
tooltip.appendTo('#test'); |

| Open mode of tooltip | Not Applicable | Property: opensOn
 let tooltip: Tooltip = new
ej.popups.Tooltip({
opensOn: 'Click',
});
tooltip.appendTo('#test'); |

| Enable/disable the tip of tooltip | Not Applicable | Property: showTipPointer
 let tooltip:
Tooltip = new ej.popups.Tooltip({
 showTipPointer: false,
});
tooltip.appendTo('#test'); |

| Hide | Method: hide()
 var tooltip = $(("#test").ejTooltip({

}
tooltip.open(args.element);
},
dragStop: (args: any) => {
tooltip.close();
}
});
 |
```

## How To

Show tooltip on disabled elements and disable tooltip in EJ2 JavaScript Tooltip control

By default, tooltips will not be displayed on disabled elements. However, you can enable this behavior by using the following steps:

1. Add a disabled element like the **button** element into a div whose display style is set to **inline-block**.
2. Set the pointer event as **none** for the disabled element (button) through CSS.
3. Initialize the tooltip for outer div element that holds the disabled button element.

## INDEX.TS

```
import { Tooltip } from '@syncfusion/ej2-popups';
import { Button, Switch } from '@syncfusion/ej2-buttons';
let tooltipObj_1: Tooltip = new Tooltip({
 content: 'Tooltip from disabled element'
});
tooltipObj_1.appendTo('#box');
//Initialize Button component
let buttonObj_1: Button = new Button({
 disabled: true
});
//Render initialized Button component
buttonObj_1.appendTo('#disabledbutton');
//Initialize Button component
let button: Button = new Button();
//Render initialized Button component
button.appendTo('#tooltip');
//Initialize Tooltip component
let tooltipObj_2: Tooltip = new Tooltip({
 //Set tooltip content
 content: 'Lets go green & Save Earth !!!'
});
//Render initialized Tooltip component
tooltipObj_2.appendTo('#tooltip');
let switchObj: Switch = new Switch({
 value: 'USB tethering',
 checked: true,
 change: (args) => {
 if ((document.getElementById('checked') as HTMLInputElement).checked) {
 let tooltipObj_2: Tooltip = new Tooltip({
 //Set tooltip content
 content: "Lets go green & Save Earth !!!"
 });
 }
 }
});
```

```

 });
 //Render initialized Tooltip component
 tooltipObj_2.appendTo('#tooltip');
 } else {
 tooltipObj_2.destroy();
 }
}
});
switchObj.appendTo('#checked');

```

### Dynamic tooltip content with html in EJ2 JavaScript Tooltip control

The Tooltip component loads HTML tags using the [content](#) template.

The HTML tags such as `<div>`, `<span>`, **bold**, *italic*, underline, etc., can be used. Style attributes can also be applied with HTML tags.

Here, Bold, Italic, Underline, and Anchor tags are used.

When using HTML elements as content to **Tooltip** make the content element `display: none`, then from the [beforeRender](#) event we can make the element visible again using below code.

```
`ts
```

```
document.getElementById('content').style.display = 'block';
```

### INDEX.TS

```
import { Tooltip } from '@syncfusion/ej2-popups';
import { Button } from '@syncfusion/ej2-buttons';
//Define an array of JSON data
let title: Tooltip = new Tooltip({
 cssClass: 'e-tooltip-css',
 position: 'BottomCenter',
 opensOn: 'Hover',
 beforeRender: onBeforeRender,
 content: document.getElementById('tooltip')
});
title.appendTo('#Title');
let btn: Button = new Button();
btn.appendTo('#Title');
function onBeforeRender() {
 if (document.getElementById('tooltip')) {
 document.getElementById('tooltip').style.display = 'block';
 }
}
```

### INDEX.HTML

```

### Custom tooltip with dynamic html in EJ2 JavaScript Tooltip control

Tooltip loads HTML pages via HTML tags such as iframe, video, and map using the [content](#) property, which supports both string and HTML tags.

To load an `iframe` element in tooltip, set the required iframe in the `content` of tooltip while initializing the tooltip component. Refer to the following code.

```
`ts
```

```
content: '<iframe src="https://www.syncfusion.com/products/essential-js2"></iframe>
```

```
,
```

Use the following steps to render `ej2-map` in tooltip:

1. Initialize the map component and create an element. After initialization, append the map object to the element.
2. Set the rendered map element to the content of tooltip component. Refer to the following sample.

### INDEX.TS

```

import { Tooltip } from '@syncfusion/ej2-popups';
import { Button } from '@syncfusion/ej2-buttons';
//Render iframe button
let iframeContent: Button = new Button({ cssClass: 'e-outline', isPrimary:
true });

```

```

iframeContent.appendTo('#iframeContent');
//Render iframe tooltip
let TooltipContent: Tooltip = new Tooltip({
 cssClass: 'e-tooltip-css',
 content: '<iframe
src="https://ej2.syncfusion.com/showcase/typescript/expensetracker/#/dashboa
rd" id="tooltipFrame"></iframe>',
 position: 'BottomCenter',
 opensOn: 'Click',
 width: '350',
 height: '250'
});
TooltipContent.appendTo('#iframeContent');

```

### Tooltip open or display modes in EJ2 JavaScript Tooltip control

The open mode property of tooltip can be defined on a target that is hovering, focusing, or clicking.

Tooltip component have the following types of open mode:

- Auto
- Hover
- Click
- Focus
- Custom

#### Auto

Tooltip appears when you hover over the target or when the target element receives the focus.

#### Hover

Tooltip appears when you hover over the target.

#### Click

Tooltip appears when you click a target element.

#### Focus

Tooltip appears when you focus (say through tab key) on a target element.

#### Custom

Tooltip is not triggered by any default action. So, bind your own events and use either open or close public methods.

### **INDEX.TS**

```
import { Tooltip } from '@syncfusion/ej2-popups';
import { Button } from '@syncfusion/ej2-buttons';
//Render button components
let tooltiphover: Button = new Button({ cssClass: 'e-outline', isPrimary:
true });
tooltiphover.appendTo('#tooltiphover');
let tooltipclick: Button = new Button({ cssClass: 'e-outline', isPrimary:
true });
tooltipclick.appendTo('#tooltipclick');
let tooltipcustom: Button = new Button({ cssClass: 'e-outline', isPrimary:
true });
tooltipcustom.appendTo('#tooltipcustom');

```

### Fancy tooltip customization in EJ2 JavaScript Tooltip control

The arrow of the tooltip can be customized as needed by customizing CSS in the sample-side. The EJ2 tooltip component is achieved through CSS3 format and positioned the tip arrow according to the tooltip positions like **TopCenter**, **BottomLeft**, **RightTop**, and more.

Here, the tip arrow is customized as Curved tooltip and Bubble tooltip.

#### Curved tip

The content for the tip pointer arrow has been added. To customize the curved tip arrow, override the following CSS class of tip arrow.

```
`ts
```

```
let tooltip: Tooltip = new Tooltip({
 cssClass: 'curvetips e-tooltip-css',
 content: 'Tooltip arrow customized',
});
tooltip.appendTo('#target');
```

```
`ts
.e-arrow-tip-outer.e-tip-bottom,
.e-arrow-tip-outer.e-tip-top {
 border-left: none !important;
 border-right: none !important;
 border-top: none !important;
}
.e-arrow-tip.e-tip-top {
 transform: rotate(170deg);
}
```

#### Bubble tip

The two **divs** (inner div and outer div) have been added to achieve the bubble tip arrow. To customize the bubble tip arrow, override the following CSS class of tip arrow.

```
`ts
let bubble: Tooltip = new Tooltip({
 cssClass: 'bubbletip e-tooltip-css',
 position: 'TopRight',
 content: 'Tooltip arrow customized as balloon tip'
});
bubble.appendTo('#bubbletip');
```

```
`ts
.e-arrow-tip-outer.e-tip-bottom, .e-arrow-tip-outer.e-tip-top
{
 border-radius: 50px;
 height: 10px;
 width: 10px;
```

```

}
.e-arrow-tip-inner.e-tip-bottom, .e-arrow-tip-inner.e-tip-top
{
border-radius: 50px;
height: 10px;
width: 10px;
}
`

```

These tip arrow customizations have been achieved through CSS changes in the sample level. The tooltip position can be changed by using the radio button click event.

The arrow tip pointer can also be disabled by using the [showTipPointer](#) property in a tooltip.

### INDEX.TS

```

import { Tooltip } from '@syncfusion/ej2-popups';
import { RadioButton, ChangeArgs, Button } from '@syncfusion/ej2-buttons';
let tooltip: Tooltip = new Tooltip({
 cssClass: 'curvetips e-tooltip-css',
 content: 'Tooltip arrow customized',
});
tooltip.appendTo('#target');
let curvebutton: Button = new Button();
curvebutton.appendTo('#target');
let tipbutton: Button = new Button();
tipbutton.appendTo('#tooltip');
let bubblebutton: Button = new Button();
bubblebutton.appendTo('#bubbletip');
let radiobutton: RadioButton = new RadioButton({ label: 'TopCenter', name:
'default', value: 'TopCenter', checked: true, change: onChange});
// Render initialized radio button
radiobutton.appendTo('#element1');
let radiobutton = new RadioButton({ label: 'BottomLeft', name: 'default',
value: 'BottomLeft', change: onChange});
radiobutton.appendTo('#element2');
let tippointer: Tooltip = new Tooltip({
 cssClass: 'pointertip e-tooltip-css',
 mouseTrail: true,
 content: 'Disabled tooltip pointer',
 showTipPointer: false
});
tippointer.appendTo('#tooltip');
let bubble: Tooltip = new Tooltip({
 cssClass: 'bubbletip e-tooltip-css',
 position: 'TopRight',
 content: 'Tooltip arrow customized as balloon tip'
});
bubble.appendTo('#bubbletip');
let radiobutton: RadioButton = new RadioButton({ label: 'BottomLeft', name:
'position', value: 'BottomLeft', change: onChange});
// Render initialized radio button
radiobutton.appendTo('#radiol');

```

```

let radiobutton = new RadioButton({ label: 'TopRight', name: 'position',
value: 'TopRight', checked: true, change: onChanged});
radiobutton.appendTo('#radio2');
function onChange(args: ChangeArgs): void {
 tooltip.position = args.value as any;
 tooltip.dataBind();
}
function onChanged(args: ChangeArgs): void {
 bubble.position = args.value as any;
 if(bubble.position == 'BottomLeft'){
 bubble.offsetY = -30;
 } else {
 bubble.offsetY = 0;
 }
 bubble.dataBind();
}
}

```

### Display tooltip on svg and canvas elements in EJ2 JavaScript Tooltip control

Tooltip can be displayed on both SVG and Canvas elements. You can directly attach the `<svg>` or `<canvas>` elements to show tooltips on data visualization elements.

#### SVG

Create the SVG square element and refer to the following code snippet to render the tooltip on SVG square.

```
`ts
```

```

let square: Tooltip = new Tooltip({
 cssClass: 'e-tooltip-css',
 content: 'SVG Square',
 target: '#square'
});
square.appendTo('#box');
`

```

*Canvas*

Create the canvas circle element and refer to the following code snippet to render the tooltip on Canvas circle.

```
`ts
```

```
let circle: Tooltip = new Tooltip({
 cssClass: 'e-tooltip-css',
 content: 'Canvas Circle',
 target: '#circle'
});
circle.appendTo('#box');
```

**INDEX.TS**

```
import { Tooltip } from '@syncfusion/ej2-popups';
import { Button } from '@syncfusion/ej2-buttons';
//Render tooltip component
let square: Tooltip = new Tooltip({
 cssClass: 'e-tooltip-css',
 content: 'SVG Square',
 target: '#square'
});
square.appendTo('#box');
let ellipse: Tooltip = new Tooltip({
 cssClass: 'e-tooltip-css',
 content: 'SVG Ellipse',
 target: '#ellipse'
});
ellipse.appendTo('#box');
let polyline: Tooltip = new Tooltip({
 cssClass: 'e-tooltip-css',
 content: 'SVG Polyline',
 target: '#polyline'
});
polyline.appendTo('#box');
let circle: Tooltip = new Tooltip({
 cssClass: 'e-tooltip-css',
 content: 'Canvas Circle',
 target: '#circle'
});
circle.appendTo('#box');
let triangle: Tooltip = new Tooltip({
 cssClass: 'e-tooltip-css',
 content: 'Canvas Triangle',
 target: '#triangle'
});
triangle.appendTo('#box');
let canvas: HTMLCanvasElement = document.getElementById('triangle') as
HTMLCanvasElement;
let context;
if (canvas.getContext) {
```

```

 context = canvas.getContext('2d');
 context.beginPath();
 context.moveTo(0, 50);
 context.lineTo(100, 50);
 context.lineTo(50, 0);
 context.fillStyle = "#FDA600";
 context.fill();
}
canvas = document.getElementById('circle') as HTMLCanvasElement;
context = canvas.getContext('2d');
let centerX: number = canvas.width / 2;
let centerY: number = canvas.height / 2;
let radius: number = 30;
context.beginPath();
context.arc(centerX, centerY, radius, 0, 2 * Math.PI, false);
context.fillStyle = '#0450C2';
context.fill();

```

40,80 80,80 80,120 120,120 120,160"
style="fill:#ffffff;stroke:#0450C2;stroke-width:4"></polyline>
 </svg>
 </div>
 <div class="circletool" id="circleShape"
style="top:16%;left:72%">
 <canvas id="circle" class="shape" width="60"
height="60"></canvas>
 </div>
 <div class="circletool" id="triShape" style="top:73%;left:76%">
 <canvas id="triangle" class="shape" width="100"
height="50"></canvas>
 </div>
 </div>
</div>
<script>
var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

### Dynamic tooltip content in EJ2 JavaScript Tooltip control

The tooltip content can be changed dynamically using the [AJAX](#) request.

The AJAX request should be made within the [beforeRender](#) event of the tooltip. On every success, the corresponding retrieved data will be set to the [content](#) property of the tooltip.

When you hover over the icons, its respective data will be retrieved dynamically and then assigned to the tooltip's content.

Refer to the following code snippet to change the tooltip content dynamically.

```

`ts
function onBeforeRender(args: TooltipEventArgs): void {
 this.content = 'Loading...';
 this.dataBind();
 let ajax: Ajax = new Ajax('./tooltip.json', 'GET', true);
 ajax.send().then(
 (result: any) => {
 result = JSON.parse(result);
 for (let i: number = 0; i < result.length; i++) {
 if (result[i].Id == args.target.id) {

```

```

/ tslint:disable /
this.content = result[i].Sports;
/ tslint:enable /
}
}
this.dataBind();
},
(reason: any) => {
this.content = reason.message;
this.dataBind();
});
}
`

```

## INDEX.TS

```

import { Tooltip, TooltipEventArgs } from '@syncfusion/ej2-popups';
import { Ajax } from '@syncfusion/ej2-base';
let tooltip: Tooltip = new Tooltip({
 content: 'Loading...',
 target: '.circletool',
 showTipPointer: false,
 beforeRender: onBeforeRender
});
tooltip.appendTo('#box');
function onBeforeRender(args: TooltipEventArgs): void {
 this.content = 'Loading...';
 this.dataBind();
 let ajax: Ajax = new Ajax('./tooltip.json', 'GET', true);
 ajax.send().then(
 (result: any) => {
 result = JSON.parse(result);
 for (let i: number = 0; i < result.length; i++) {
 if (result[i].Id == args.target.id) {
 /* tslint:disable */
 this.content = result[i].Name;
 /* tslint:enable */
 }
 }
 this.dataBind();
 },
 (reason: any) => {
 this.content = reason.message;
 this.dataBind();
 }
);
}

```

## INDEX.HTML

```

</body></html>

```

### Create and show tooltip on multiple targets in EJ2 JavaScript Tooltip control

Tooltip can be created and shown on multiple targets within a container by defining the specific target elements to the target property. So, the tooltip is initialized only on matched targets within a container.

In this case, the tooltip content is assigned from the title attribute of the target element.

`ts

```
import { Tooltip } from '@syncfusion/ej2-popups';

let tooltip: Tooltip = new Tooltip({
 position: 'RightCenter'
});

tooltip.appendTo('#uname'); // Here we have appended the target to the element.
```

## INDEX.TS

```
import { Tooltip } from '@syncfusion/ej2-popups';
import { Button } from '@syncfusion/ej2-buttons';
import { InputObject } from '@syncfusion/ej2-inputs';
let button1: Button = new Button();
button1.appendTo('#sample');
let button2: Button = new Button();
button2.appendTo('#clear');
let tooltip1: Tooltip = new Tooltip({
 position: 'RightCenter'
});
tooltip1.appendTo('#uname');
let tooltip2: Tooltip = new Tooltip({
 position: 'RightCenter'
});
tooltip2.appendTo('#mail');
let tooltip3: Tooltip = new Tooltip({
 position: 'RightCenter'
});
tooltip3.appendTo('#pwd');
let tooltip4: Tooltip = new Tooltip({
 position: 'RightCenter'
});
tooltip4.appendTo('#cpwd');
document.getElementById('sample').addEventListener('click', function() {
 let name = document.getElementById('uname').value;
 let pwd = document.getElementById('pwd').value;
 let cpwd = document.getElementById('cpwd').value;
 if(name.length > 0 & name.length < 4){
 document.getElementById('uname').title = 'Required Minimum 4
Characters';
 document.getElementById('uname').style.backgroundColor = 'red';
 let target = document.getElementById('uname');
 tooltip1.open(target);
 } else {
 document.getElementById('uname').style.backgroundColor = 'white';
 }
 if(pwd !== '' && pwd.length < 8){
 document.getElementById('pwd').title = 'Required Minimum 8 Characters';
 document.getElementById('pwd').style.backgroundColor = 'red';
 let pdwtargt = document.getElementById('pwd');
 tooltip3.open(pdwtargt);
 } else {
 document.getElementById('pwd').style.backgroundColor = 'white';
 }
 if(name.length >= 4 && pwd !== '' && pwd.length >= 8 && pwd == cpwd){
```

```

 alert('Form Submitted');
 } else {
 alert('Details are not Valid');
 }
})
document.getElementById('clear').addEventListener('click', function(){
 document.getElementById('uname').style.backgroundColor = 'white';
 document.getElementById('pwd').style.backgroundColor = 'white';
 let target = document.getElementById('uname');
 tooltip1.close(target);
 document.getElementById('uname').title = 'Please enter your name';
 let pwdtarget = document.getElementById('pwd');
 tooltip3.close(pwdtarget);
});

```

## INDEX.HTML

## TreeGrid

### Getting started in EJ2 JavaScript Treegrid control

This section explains the steps required to create a simple Essential JS 2 TreeGrid and demonstrates the basic usage of the TreeGrid control in a JavaScript application.

### Dependencies

Following is the list of dependencies to use the TreeGrid with all features.

```
`javascript
```

```

|-- @syncfusion/ej2-treegrid
|-- @syncfusion/ej2-treegrid
|-- @syncfusion/ej2-base
|-- @syncfusion/ej2-data
|-- @syncfusion/ej2-buttons
|-- @syncfusion/ej2-popups
|-- @syncfusion/ej2-navigations
|-- @syncfusion/ej2-dropdowns
|-- @syncfusion/ej2-lists
|-- @syncfusion/ej2-inputs
|-- @syncfusion/ej2-splitbuttons

```

```
|-- @syncfusion/ej2-calendars
|-- @syncfusion/ej2-excel-export
|-- @syncfusion/ej2-pdf-export
|-- @syncfusion/ej2-file-utils
|-- @syncfusion/ej2-compression
\
```

### Setup for local environment

Refer to the following steps to setup your local environment.

**Step 1:** Create a root folder `myapp` for your application.

**Step 2:** Create `myapp/resources` folder to store local scripts and styles files.

**Step 3:** Create `myapp/index.js` and `myapp/index.html` files for initializing Essential JS 2 TreeGrid control.

### Adding Syncfusion resources

The Essential JS 2 TreeGrid control can be initialized by using either of the following ways.

- Using local script and style.
- Using CDN link for script and style.

### Using local script and style

You can get the global scripts and styles from the [Essential Studio JavaScript \(Essential JS 2\)](#) build installed location.

After installing the Essential JS 2 product build, copy the TreeGrid and its dependencies scripts and style file into the `resources/scripts` and `resources/styles` folder.

Refer to the following code to find location TreeGrid's script and style file.

### Syntax:

Script: `(installed location)/Syncfusion/Essential Studio/{RELEASEVERSION}/Essential JS 2/{PACKAGENAME}/dist/global/{PACKAGE_NAME}.min.js`

Styles: `(installed location)/Syncfusion/Essential Studio/{RELEASEVERSION}/Essential JS 2/{PACKAGENAME}/styles/material.css`

### Example:

Script: `C:/Program Files (x86)/Syncfusion/Essential Studio/16.4.40/Essential JS 2/ej2-treegrid/dist/global/ej2-treegrid.min.js`

Styles: `C:/Program Files (x86)/Syncfusion/Essential Studio/16.4.40/Essential JS 2/ej2-treegrid/styles/material.css`

After copying the files, refer the TreeGrid's scripts and styles into the `index.html` file.

The following HTML code example shows the minimal dependency of TreeGrid.

```
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<title>Essential JS 2 TreeGrid</title>
<!-- Essential JS 2 TreeGrid's dependent material theme -->
<link href="resources/base/styles/material.css" rel="stylesheet" type="text/css"/>
<link href="resources/popups/styles/material.css" rel="stylesheet" type="text/css"/>
<!-- Essential JS 2 material theme -->
<link href="resources/treegrid/styles/material.css" rel="stylesheet" type="text/css"/>
<!-- Essential JS 2 TreeGrid's dependent scripts -->
<script src="resources/scripts/ej2-base.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-data.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-popups.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-grids.min.js" type="text/javascript"></script>
<!-- Essential JS 2 TreeGrid's global script -->
<script src="resources/scripts/ej2-treegrid.min.js" type="text/javascript"></script>
</head>
<body>
</body>
</html>
```

#### *Using CDN link for script and style*

Using CDN link, you can directly refer the TreeGrid control's script and style into the `index.html`.

Refer to the TreeGrid's CDN links as follows.

#### **Syntax:**

Script: `http://cdn.syncfusion.com/ej2/{PACKAGENAME}/dist/global/{PACKAGENAME}.min.js`

Styles: `http://cdn.syncfusion.com/ej2/{PACKAGE_NAME}/styles/material.css`

#### **Example:**

Script: <http://cdn.syncfusion.com/ej2/ej2-treegrid/dist/global/ej2-treegrid.min.js>

Styles: <http://cdn.syncfusion.com/ej2/ej2-treegrid/styles/material.css>

The following HTML code example shows the minimal dependency of TreeGrid.

```
`html
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<title>Essential JS 2 TreeGrid</title>
<!-- Essential JS 2 TreeGrid's dependent material theme -->
<link href="http://cdn.syncfusion.com/ej2/ej2-base/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-popups/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-grids/styles/material.css" rel="stylesheet"
type="text/css"/>
<!-- Essential JS 2 material theme -->
<link href="http://cdn.syncfusion.com/ej2/ej2-treegrid/styles/material.css" rel="stylesheet"
type="text/css"/>
<!-- Essential JS 2 TreeGrid's dependent script -->
<script src="http://cdn.syncfusion.com/ej2/ej2-base/dist/global/ej2-base.min.js"
type="text/javascript"></script>
<script src="http://cdn.syncfusion.com/ej2/ej2-data/dist/global/ej2-data.min.js"
type="text/javascript"></script>
<script src="http://cdn.syncfusion.com/ej2/ej2-popups/dist/global/ej2-popups.min.js"
type="text/javascript"></script>
<script src="http://cdn.syncfusion.com/ej2/ej2-grids/dist/global/ej2-grids.min.js"
type="text/javascript"></script>
<!-- Essential JS 2 TreeGrid's global script -->
<script src="http://cdn.syncfusion.com/ej2/ej2-treegrid/dist/global/ej2-treegrid.min.js"
type="text/javascript"></script>
</head>
<body>
</body>
</html>
`
```

### Adding TreeGrid control

Now, you can start adding TreeGrid control in the application. For getting started, add a `div` element for TreeGrid control in `index.html`. Then refer the `index.js` file into the `index.html` file.

In this document context, the `ej2.min.js` is used, which includes all the Essential JS 2 components and its dependent scripts.

```
`html
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<title>Essential JS 2 TreeGrid</title>
<!-- Essential JS 2 TreeGrid's dependent material theme -->
<link href="http://cdn.syncfusion.com/ej2/ej2-base/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-popups/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-grids/styles/material.css" rel="stylesheet"
type="text/css"/>
<!-- Essential JS 2 material theme -->
<link href="http://cdn.syncfusion.com/ej2/ej2-treegrid/styles/material.css" rel="stylesheet"
type="text/css"/>
<!-- Essential JS 2 all script -->
<script src="http://cdn.syncfusion.com/ej2/dist/ej2.min.js" type="text/javascript"></script>
</head>
<body>
<!-- Add the HTML <div> element for TreeGrid -->
<div id="TreeGrid"></div>
<script src="index.js" type="text/javascript"></script>
</body>
</html>
`
```

Place the following TreeGrid code in the `index.js`.

```
`javascript
var treeGridObj = ej.treegrid.TreeGrid();
treeGridObj.appendTo('#TreeGrid');
`
```

### Defining Row Data

Data for the TreeGrid control is bind by using the `dataSource` property. It accepts either an array of JavaScript object or `DataManager` instance.

```
`html
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<title>Essential JS 2 TreeGrid</title>
<!-- Essential JS 2 TreeGrid's dependent material theme -->
<link href="http://cdn.syncfusion.com/ej2/ej2-base/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-popups/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="http://cdn.syncfusion.com/ej2/ej2-grids/styles/material.css" rel="stylesheet"
type="text/css"/>
<!-- Essential JS 2 material theme -->
<link href="http://cdn.syncfusion.com/ej2/ej2-treegrid/styles/material.css" rel="stylesheet"
type="text/css"/>
<!-- Essential JS 2 all script -->
<script src="http://cdn.syncfusion.com/ej2/dist/ej2.min.js" type="text/javascript"></script>
</head>
<body>
<!-- Add the HTML <div> element for TreeGrid -->
<div id="TreeGrid"></div>
<script src="index.js" type="text/javascript"></script>
</body>
</html>
`
```

Place the following TreeGrid code in the `index.js`.

```
`javascript
var sampleData = [
{
taskID: 1,
taskName: 'Planning',
startDate: new Date('02/03/2017'),
```

```

duration: 5,
subtasks: [
{ taskID: 2, taskName: 'Plan timeline', startDate: new Date('02/03/2017'), duration: 5 },
{ taskID: 3, taskName: 'Plan budget', startDate: new Date('02/03/2017'), duration: 5},
{ taskID: 4, taskName: 'Allocate resources', startDate: new Date('02/03/2017'), duration: 5},
{ taskID: 5, taskName: 'Planning complete', startDate: new Date('02/07/2017'), duration: 0}
]
});
var treeGridObj = ej.treegrid.TreeGrid({dataSource: sampleData});
treeGridObj.appendTo('#TreeGrid');
`

```

### Defining Columns

The TreeGrid has an option to define the columns as an array. In these columns, the following properties are used to customize the columns.

- The `field` has been added to map with a property name in an array of JavaScript objects.
- The `headerText` has been added to change the title of columns.
- The `textAlign` has been added to change the alignment of columns. By default, columns will be left aligned. To change the columns to right align, define `textAlign` to `Right`.
- Also, the another useful property, `format` has been used. Using this, you can format number and date values to standard or custom formats. Here, it is defined for the conversion of numeric values to currency.

Tree Column which is used to expand or collapse child rows is defined by using [treeColumnIndex](#) property.

```

`javascript
var sampleData = [
{
taskID: 1,
taskName: 'Planning',
startDate: new Date('02/03/2017'),
duration: 5,
subtasks: [
{ taskID: 2, taskName: 'Plan timeline', startDate: new Date('02/03/2017'), duration: 5 },
{ taskID: 3, taskName: 'Plan budget', startDate: new Date('02/03/2017'), duration: 5},
{ taskID: 4, taskName: 'Allocate resources', startDate: new Date('02/03/2017'), duration: 5},
{ taskID: 5, taskName: 'Planning complete', startDate: new Date('02/07/2017'), duration: 0}
]
}
]
`

```

```

]
});
var treeGridObj = ej.treegrid.TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 70, textAlign: 'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 200, textAlign: 'Left' },
 {
 field: 'startDate', headerText: 'Start Date', width: 90, textAlign: 'Right', type: 'date', format: 'yMd'
 },
 { field: 'duration', headerText: 'Duration', width: 80, textAlign: 'Right' }
],
 height: 380
});
treeGridObj.appendTo('#TreeGrid');

```

In the above code example, the hierarchical data binding is represented in which the [childMapping](#) property denotes the hierarchy relationship; whereas in self-referencing data binding [idMapping](#) and [parentIdMapping](#) denotes the hierarchy relationship.

### Module injection

To create a treegrid with additional features, inject the required modules. The following modules are used to extend TreeGrid's basic functionality.

- **Page**: Inject this module to use paging feature.
- **Sort**: Inject this module to use sorting feature.
- **Filter**: Inject this module to use filtering feature.
- **ExcelExport**: Inject this module to use Excel export feature.
- **PdfExport**: Inject this module to use PDF export feature.

These modules should be injected into the TreeGrid using the `ej.treegrid.TreeGrid.Inject` method.

Additional feature modules are available [here](#).

### Enable paging

The paging feature enables users to view the TreeGrid record in a paged view. It can be enabled by setting the [allowPaging](#) property to true. Inject the [Page](#)

module as follows. If the [Page](#) module is not injected, the pager will not be rendered in the TreeGrid. The pager can be customized using the [pageSettings](#) property.

In root-level paging mode, paging is based on the root-level rows only, i.e., it ignores the child row count and it can be enabled by using the [pageSettings.pageSizeMode](#) property.

### INDEX.JS

```
ej.treegrid.TreeGrid.Inject(ej.treegrid.Page);
var treeGridObj = new ej.treegrid.TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 treeColumnIndex: 1,
 allowPaging: true,
 pageSettings: { pageSize: 7 },
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 90,
 textAlign: 'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 180,
 textAlign: 'Left' },
 {
 field: 'startDate', headerText: 'Start Date', width: 90,
 textAlign: 'Right', type: 'date', format: 'yMd'
 },
 { field: 'duration', headerText: 'Duration', width: 80,
 textAlign: 'Right' }
]
});
treeGridObj.appendTo('#TreeGrid');
```

### INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>

</body></html>

```

### Enable sorting

The sorting feature enables you to order the records. It can be enabled by setting the [allowSorting](#) property to true. Inject the [Sort](#)

module as follows. If the [Sort](#) module is not injected, you cannot sort when a header is clicked. Sorting feature can be customized using the [sortSettings](#) property.

### INDEX.JS

```

ej.treegrid.TreeGrid.Inject(ej.treegrid.Page, ej.treegrid.Sort);
var treeGridObj = new ej.treegrid.TreeGrid({
 dataSource: sortData,
 childMapping: 'subtasks',
 treeColumnIndex: 1,
 allowSorting: true,
 sortSettings: { columns: [{ field: 'Category', direction: 'Ascending' },
 { field: 'orderName', direction: 'Ascending' }] },
 allowPaging: true,
 columns: [
 { field: 'orderName', headerText: 'Order Name', width: 170
 },
 { field: 'Category', headerText: 'Category', width: 150 },
 { field: 'orderDate', headerText: 'Order Date', width: 130,
 textAlign: 'Right', format: 'yMd', type: 'date' },

```

```

 { field: 'price', headerText: 'Price', width: 100, format:
 'C0', textAlign: 'Right' }
],
 height: 260
});
treeGridObj.appendTo('#TreeGrid');

```

## INDEX.HTML

```

var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

### Enable filtering

The filtering feature enables you to view the reduced amount of records based on the filter criteria. It can be enabled by setting the [allowFiltering](#) property to true. The [Filter] module has to be injected as follows.

If the [Filter] module is not injected, filter bar will not be rendered in the TreeGrid. Filtering feature can be customized using the [filterSettings](#) property.

By default, filtered records are shown along with its parent records. This behavior can be changed by using the [filterSettings-hierarchyMode](#) property.

### INDEX.JS

```
ej.treegrid.TreeGrid.Inject(ej.treegrid.Page, ej.treegrid.Sort,
ej.grid.Filter);
var treeGridObj = new ej.treegrid.TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 treeColumnIndex: 1,
 allowFiltering: true,
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 90,
 textAlign: 'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 180,
 textAlign: 'Left' },
 {
 field: 'startDate', headerText: 'Start Date', width: 90,
 textAlign: 'Right', type: 'date', format: 'yMd'
 },
 { field: 'duration', headerText: 'Duration', width: 80,
 textAlign: 'Right' }
],
 pageSettings: {pageSize: 11},
 allowPaging: true,
 allowSorting: true
});
treeGridObj.appendTo('#TreeGrid');
```

}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

### Run the application

Now, run the `index.html` in the web browser, it will render the Essential JS 2 TreeGrid control.

Output will be displayed as follows.

### INDEX.JS

```

ej.treegrid.TreeGrid.Inject(ej.treegrid.Page, ej.treegrid.Sort,
ej.grid.Filter);
var treeGridObj = new ej.treegrid.TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 treeColumnIndex: 1,
 allowFiltering: true,
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 90,
textAlign: 'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 180,
textAlign: 'Left' },
 {
 field: 'startDate', headerText: 'Start Date', width: 90,
textAlign: 'Right', type: 'date', format: 'yMd'
 },
 { field: 'duration', headerText: 'Duration', width: 80,
textAlign: 'Right' }
],
 pageSettings: {pageSize: 11},
 allowPaging: true,
 allowSorting: true
});
treeGridObj.appendTo('#TreeGrid');

```

## INDEX.HTML

```

```

### Deploy the application

The Essential JS 2 TreeGrid control features are segregated into individual feature-wise modules. The [Essential Studio JavaScript \(Essential JS 2\)](#) build and [CDN](#) scripts contains code for all features used in the TreeGrid. So, do not to use the [CDN](#) scripts in production. It is strongly recommended to generate script files to use in production using our **Custom Resource Generator(CRG)** for Essential JS 2. CRG allows you to generate the bundled script for the currently enabled features in TreeGrid.

You can refer to our [JavaScript Tree Grid](#) feature tour page for its groundbreaking feature representations. You can also explore our JavaScript Tree Grid example [JavaScript Tree Grid example](#) to knows how to present and manipulate data.

### Module in EJ2 JavaScript Treegrid control

The following feature modules should be injected to extend the TreeGrid's functionality.

Module	Description
----- -----	
<a href="#">PageService</a>	Inject this module to use paging feature.
<a href="#">SortService</a>	Inject this module to use sorting feature.
<a href="#">FilterService</a>	Inject this module to use filtering feature.
<a href="#">EditService</a>	Inject this module to use editing feature.
<a href="#">AggregateService</a>	Inject this module to use aggregate feature.
<a href="#">ColumnChooserService</a>	Inject this module to use column chooser feature.

- | [ColumnMenuService](#) | Inject this module to use column menu feature. |
- | [CommandColumnService](#) | Inject this module to use command column feature. |
- | [ContextMenuService](#) | Inject this module to use context menu feature.
- | [ResizeService](#) | Inject this module to use resize feature. |
- | [ReorderService](#) | Inject this module to use reorder feature. |
- | [PrintService](#) | Inject this module to use to use print feature and this is a default injected module. |
- | [ToolbarService](#) | Inject this module to use toolbar feature. |
- | [ExcelExportService](#) | Inject this module to use Excel export feature. |
- | [PdfExportService](#) | Inject this module to use PDF export feature. |

These modules should be injected into the TreeGrid using the `ej.treegrid..TreeGrid.Inject` method.

You can refer to our [JavaScript Tree Grid](#) feature tour page for its groundbreaking feature representations. You can also explore our JavaScript Tree Grid example [JavaScript Tree Grid example](#) to know how to present and manipulate data.

## Data Binding

### Data binding in EJ2 JavaScript Treegrid control

The TreeGrid uses `DataManager`, which supports both RESTful JSON data services binding and local JavaScript object array binding. The `dataSource` property can be assigned either with the instance of `DataManager` or JavaScript object array collection.

It supports two kinds of data binding method:

- Local data
- Remote data

### Binding with ajax

You can use TreeGrid `dataSource` property to bind the data source to TreeGrid from external Fetch request. In the below code we have fetched the data source from the server with the help of Ajax request and provided that to `dataSource` property by using `onSuccess` event of the Fetch.

### INDEX.TS

```
import { TreeGrid, Page } from '@syncfusion/ej2-treegrid';
import { Fetch } from '@syncfusion/ej2-base';
