TreeGrid.Inject(Page);
let treegrid: TreeGrid = new TreeGrid({
 idMapping: 'TaskID',
 parentIdMapping: 'ParentItem',
 pageSettings: { pageSize: 7 },
 allowPaging: true,
 treeColumnIndex: 1,
 columns: [
 { field: 'TaskID', headerText: 'Task ID', textAlign: 'Right', width:
90 },
 { field: 'TaskName', headerText: 'Task Name', width: 180 },
 { field: 'Duration', headerText: 'Duration', width: 80, textAlign:
'Right' },
```

```

 { field: 'Progress', headerText: 'Progress', width: 80, textAlign:
 'Right' }
]
});
treegrid.appendTo('#TreeGrid');
let button: HTMLElement = document.createElement('button');
button.textContent = 'Bind Data';
treegrid.element.parentNode.insertBefore(button, treegrid.element);
button.addEventListener("click", function(e) {
 let fetch = new
Fetch("https://ej2services.syncfusion.com/production/web-
services/api/SelfReferenceData", "GET");
 treegrid.showSpinner();
 fetch.send();
 fetch.onSuccess = function (data: object) {
 treegrid.hideSpinner();
 treegrid.dataSource = data;
 };
});
});

```

## INDEX.HTML

</head>
<body>

 <div id="container">
 <div id="TreeGrid"></div>
 </div>
<script>
var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

\* If you bind the dataSource from this way, then it acts like a local dataSource. So you cannot perform any server side crud actions.

#### *Handling expandStateMapping*

To denotes the expand status of parent row, define the [expandStateMapping](#) property of tree grid.

The `expandStateMapping` property maps the field name in data source, that denotes whether parent record is in expanded or collapsed state and this is useful to renders parent row in expanded or collapsed state based on this mapping property value in data source.

`ts

```

import { DataManager, UrlAdaptor } from '@syncfusion/ej2-data';
import { TreeGridComponent } from '@syncfusion/ej2-treegrid';
import './App.css';

let dataManager: DataManager = new DataManager({
 adaptor: new UrlAdaptor,
 url: "Home/DataSource",
});

let treegrid: TreeGrid = new TreeGrid({
 dataSource: dataManager,
 hasChildMapping : 'isParent',
 idMapping: 'TaskID',
 expandStateMapping: 'IsExpanded',
 parentIdMapping: 'ParentValue',

```

```

height: 400,
treeColumnIndex: 1,
columns: [
{ field: 'TaskID', headerText: 'Task ID', textAlign: 'Right', width: 90 },
{ field: 'TaskName', headerText: 'Task Name', width: 180 },
{ field: 'Duration', headerText: 'Duration', width: 80, textAlign: 'Right' }
]
});
treegrid.appendTo('#TreeGrid');
`

```

The following code example defines `expandStateMapping` property at server end.

```

`ts
public ActionResult ExpandStateMapping()
{
return View();
}

public class TreeData
{
public static List<TreeData> tree = new List<TreeData>();
[System.ComponentModel.DataAnnotations.Key]
public int TaskID { get; set; }
public string TaskName { get; set; }
public int Duration { get; set; }
public int? ParentValue { get; set; }
public bool? isParent { get; set; }
public bool IsExpanded { get; set; }
public TreeData() { }
public static List<TreeData> GetTree()
{
if (tree.Count == 0)
{
int root = 0;
for (var t = 1; t <= 500; t++)

```

```

{
 Random ran = new Random();
 string math = (ran.Next() % 3) == 0 ? "High" : (ran.Next() % 2) == 0 ? "Release Breaker" : "Critical";
 string progr = (ran.Next() % 3) == 0 ? "Started" : (ran.Next() % 2) == 0 ? "Open" : "In Progress";
 root++;
 int rootItem = root;
 tree.Add(new TreeData() { TaskID = rootItem, TaskName = "Parent task " + rootItem.ToString(), isParent
 = true, IsExpanded = false, ParentValue = null, Duration = ran.Next(1, 50) });
 int parent = root;
 for (var d = 0; d < 1; d++)
 {
 root++;
 string value = ((parent + 1) % 3 == 0) ? "Low" : "Critical";
 int par = parent + 1;
 progr = (ran.Next() % 3) == 0 ? "In Progress" : (ran.Next() % 2) == 0 ? "Open" : "Validated";
 int iD = root;
 tree.Add(new TreeData() { TaskID = iD, TaskName = "Child task " + iD.ToString(), isParent = true,
 IsExpanded = false, ParentValue = rootItem, Duration = ran.Next(1, 50) });
 int subparent = root;
 for (var c = 0; c < 500; c++)
 {
 root++;
 string val = ((subparent + c + 1) % 3 == 0) ? "Low" : "Critical";
 int subchild = subparent + c + 1;
 string progress = (ran.Next() % 3) == 0 ? "In Progress" : (ran.Next() % 2) == 0 ? "Open" : "Validated";
 int childID = root ;
 tree.Add(new TreeData() { TaskID = childID, TaskName = "sub Child task " + childID.ToString(), isParent =
 false, IsExpanded = false, ParentValue = subparent, Duration = ran.Next(1, 50) });
 }
 }
}
return tree;
}

```

```
}
,
```

### Custom binding

It is possible to handle data processing externally and bind the result to the TreeGrid. This helps you to provide your own custom data logic. TreeGrid expects an object as the result of the custom logic and the emitted value should be an object with properties result and count.

In this context, we are going to use DataManager with WebApi Adaptor for handling remote interaction, you can choose any HTTP client as per your choice.

```
`ts
```

```
import { TreeGrid, Page } from '@syncfusion/ej2-treegrid';
import { DataManager, WebApiAdaptor, Query } from '@syncfusion/ej2-data';
import { isNullOrUndefined } from '@syncfusion/ej2-base';

TreeGrid.Inject(Page);

let data: DataManager = new DataManager({
 url: 'http://localhost:51473/api/Tasks', // url for fetching the data from server
 adaptor: new WebApiAdaptor,
 crossDomain: true
});

///// filter query for fetching the root level records only and take value should be equal to the
pageSize value of pageSettings

data.executeQuery(new Query().where('ParentId', 'equal', null).take(3).skip(0).requiresCount()).then((e:
any) => {

 let treegrid: TreeGrid = new TreeGrid({
 dataSource: { result: e.result, count: e.count },
 hasChildMapping: 'IsParent',
 idMapping: 'TaskId',
 parentIdMapping: 'ParentId',
 allowPaging: true,
 pageSettings: { pageSize: 3, pageSizeMode: 'Root' },
 dataStateChange: function (state: any) {
 if (state.action.requestType === 'paging') {
 data.executeQuery(new Query().skip(state.skip).take(state.take).requiresCount()).then(function (e: any)
 {
 this.dataSource = { result: e.result, count: e.count };
 });
 }
 }
 });
```

```

 }
 },
 treeColumnIndex: 1,
 columns: [
 { field: 'TaskId', headerText: 'Task ID', isPrimaryKey: true, textAlign: 'Right', width: 120 },
 { field: 'TaskName', headerText: 'Task Name', width: 150 },
 { field: 'StartDate', headerText: 'Start Date', textAlign: 'Right', width: 120, format: { skeleton: 'yMd', type: 'date' } },
 { field: 'Duration', headerText: 'Duration', width: 110, textAlign: 'Right' },
 { field: 'Progress', headerText: 'Progress', width: 110 },
]
});
treegrid.appendTo('#TreeGrid');
});

```

We have a limitation for Custom Binding feature of TreeGrid. This feature works only for Self Referential data binding with `pageSizeMode` as `Root`.

#### Handling child data

Using the custom binding feature you can bind the child data for a parent record as per your custom logic. When a parent record is expanded, [dataStateChange](#) event is triggered in which you can assign your custom data to the `childData` property of the [dataStateChange](#) event arguments.

After assigning the child data, `childDataBind` method should be called from the [dataStateChange](#) event arguments to indicate that the data is bound.

In this context, initially we have assigned only the parent records to the treegrid `dataSource` and fetched the required child records in the [dataStateChange](#) event.

ts

```

import { TreeGrid, Page, Toolbar, Sort } from '@syncfusion/ej2-treegrid';
import { DataManager, WebApiAdaptor, Query } from '@syncfusion/ej2-data';
import { isNullOrUndefined } from '@syncfusion/ej2-base';

TreeGrid.Inject(Page);

let data: DataManager = new DataManager({
 url: 'http://localhost:51473/api/Tasks', // url for fetching the data from server
 adaptor: new WebApiAdaptor,
 crossDomain: true
});

```

```
/// filter query for fetching only the root level records
data.executeQuery(new Query().where('ParentId', 'equal', null).take(3).skip(0).requiresCount()).then((e: any) => {
let treegrid: TreeGrid = new TreeGrid({
 dataSource: { result: e.result, count: e.count },
 hasChildMapping: 'IsParent',
 idMapping: 'TaskId',
 parentIdMapping: 'ParentId',
 allowPaging: true,
 pageSettings: { pageSize: 3, pageSizeMode: 'Root' },
 dataStateChange: function (state: any) {
 if (!NullOrUndefined(state.requestType) && state.requestType === 'expand') {
 /// filter query for fetching the child records of the expanded record
 data.executeQuery(new Query().where('ParentId', 'equal', state.data.TaskId)).then(function (e: any) {
 state.childData = e.result;
 state.childDataBind();
 });
 } else {
 data.executeQuery(new Query().skip(state.skip).take(state.take).requiresCount()).then(function (e: any) {
 {
 this.dataSource = { result: e.result, count: e.count };
 }
 });
 }
 },
 treeColumnIndex: 1,
 columns: [
 { field: 'TaskId', headerText: 'Task ID', isPrimaryKey: true, textAlign: 'Right', width: 120 },
 { field: 'TaskName', headerText: 'Task Name', width: 150 },
 { field: 'StartDate', headerText: 'Start Date', textAlign: 'Right', width: 120, format: { skeleton: 'yMd', type: 'date' } },
 { field: 'Duration', headerText: 'Duration', width: 110, textAlign: 'Right' },
 { field: 'Progress', headerText: 'Progress', width: 110 },
]
});
```

```
treegrid.appendTo('#TreeGrid');
});
```

### Handling Tree Grid actions

For TreeGrid actions such as paging, sorting, etc dataStateChange event will be invoked. You have to query and resolve data using Fetch in this event based on the state arguments.

```
`ts
import { TreeGrid, Page, Toolbar, Sort } from '@syncfusion/ej2-treegrid';
import { DataManager, WebApiAdaptor, Query } from '@syncfusion/ej2-data';
import { isNullOrUndefined } from '@syncfusion/ej2-base';

TreeGrid.Inject(Page);

let data: DataManager = new DataManager({
 url: 'http://localhost:51473/api/Tasks', /// url for fetching the data from server
 adaptor: new WebApiAdaptor,
 crossDomain: true
});

/// filter query for fetching only the root level records
data.executeQuery(new Query().where('ParentId', 'equal', null).take(3).skip(0).requiresCount()).then((e: any) => {
 let treegrid: TreeGrid = new TreeGrid({
 dataSource: { result: e.result, count: e.count },
 hasChildMapping: 'IsParent',
 idMapping: 'TaskId',
 parentIdMapping: 'ParentId',
 allowPaging: true,
 allowSorting: true,
 pageSettings: { pageSize: 3, pageSizeMode: 'Root' },
 dataStateChange: function (state: any) {
 if (!isNullOrUndefined(state.requestType) && state.requestType === 'expand') {
 /// filter query for fetching the child records of the expanded record
 data.executeQuery(new Query().where('ParentId', 'equal', state.data.TaskId)).then(function (e: any) {
 state.childData = e.result;
 state.childDataBind();
 });
 }
 }
 });
```

```

}
if (state.action.requestType === 'paging') {
 data.executeQuery(new Query().skip(state.skip).take(state.take).requiresCount()).then(function (e: any)
 {
 this.dataSource = { result: e.result, count: e.count };
 });
}
if (state.action.requestType === 'sorting') {
 //// sort query for getting the sorted records from server
 data.executeQuery(new Query().sortBy('TaskId',
 'descending').addParams('IdMapping','TaskId').skip(state.skip).take(state.take).requiresCount()).then(fu
 nction (e: any) {
 this.dataSource = { result: e.result, count: e.count };
 });
}
},
treeColumnIndex: 1,
columns: [
 { field: 'TaskId', headerText: 'Task ID', isPrimaryKey: true, textAlign: 'Right', width: 120 },
 { field: 'TaskName', headerText: 'Task Name', width: 150 },
 { field: 'StartDate', headerText: 'Start Date', textAlign: 'Right', width: 120, format: { skeleton: 'yMd', type:
 'date' } },
 { field: 'Duration', headerText: 'Duration', width: 110, textAlign: 'Right' },
 { field: 'Progress', headerText: 'Progress', width: 110 },
]
});
treegrid.appendTo('#TreeGrid');
});
`

```

#### Performing CRUD actions

The [dataSourceChanged](#) event will be triggered for updating the treegrid data. You can perform the save operation based on the event arguments and call the endEdit method to indicate the completion of save operation.

ts

```
import { TreeGrid, Page, Toolbar, Sort, Filter, Edit } from '@syncfusion/ej2-treegrid';
```

```
import { DataManager, WebApiAdaptor, Query } from '@syncfusion/ej2-data';
import { isNullOrUndefined } from '@syncfusion/ej2-base';

TreeGrid.Inject(Page, Toolbar, Sort, Filter, Edit);

let data: DataManager = new DataManager({
 url: 'http://localhost:51473/api/Tasks',
 adaptor: new WebApiAdaptor,
 crossDomain: true
});

data.executeQuery(new Query().where('ParentId', 'equal', null).take(3).skip(0).requiresCount()).then((e: any) => {

 let treegrid: TreeGrid = new TreeGrid({
 dataSource: { result: e.result, count: e.count },
 hasChildMapping: 'IsParent',
 idMapping: 'TaskId',
 parentIdMapping: 'ParentId',
 allowPaging: true,
 toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel'],
 editSettings: { allowEditing: true, allowAdding: true, allowDeleting: true, mode: 'Row' },
 pageSettings: { pageSize: 3, pageSizeMode: 'Root' },
 dataSourceChanged: function (state: any) {
 if (state.action == 'add') {
 state.endEdit();
 }
 else if (state.action == 'edit') {
 state.endEdit();
 }
 else if (state.requestType == 'delete') {
 state.endEdit();
 }
 },
 dataStateChange: function (state: any) {
 if (!isNullOrUndefined(state.requestType) && state.requestType === 'expand') {
 data.executeQuery(new Query().where('ParentId', 'equal', state.data.TaskId)).then(function (e: any) {
```

```

state.childData = e.result;
state.childDataBind();
});
} else {
data.executeQuery(new Query().where('ParentId', 'equal',
null).take(3).skip(0).requiresCount()).then(function (e: any) {
this.dataSource = { result: e.result, count: e.count };
});
}
},
treeColumnIndex: 1,
columns: [
{ field: 'TaskId', headerText: 'Task ID', isPrimaryKey: true, textAlign: 'Right', width: 120 },
{ field: 'TaskName', headerText: 'Task Name', width: 150 },
{ field: 'StartDate', headerText: 'Start Date', textAlign: 'Right', width: 120, format: { skeleton: 'yMd', type:
'date' } },
{ field: 'Duration', headerText: 'Duration', width: 110, textAlign: 'Right' },
{ field: 'Progress', headerText: 'Progress', width: 110 },
]
});
treegrid.appendTo('#TreeGrid');
});

```

#### Calculate aggregates

The footer aggregate values should be calculated and sent along with the **dataSource** property as follows. The aggregate property of the data source should contain the aggregate value assigned to the property named in the **field – type** format. For example, the **Sum** aggregate value for the **Duration** field should be assigned to the property named as **Duration - sum**.

```

、
{
result: [{..}, {..}, {..}, ...],
count: 830,
aggregates: { 'Freight - sum' : 450,'EmployeeID - min': 1 }
}
、

```

### Provide excel filter data source

The [dataStateChange](#) event will be triggered with appropriate arguments when the excel filter requests the filter choice data source. You need to resolve the excel filter data source using the **dataSource** resolver function from the state argument as follows.

```
`ts
import { TreeGrid, Page, Filter } from '@syncfusion/ej2-treegrid';
import { DataManager, WebApiAdaptor, Query } from '@syncfusion/ej2-data';
import { isNullOrUndefined } from '@syncfusion/ej2-base';

TreeGrid.Inject(Page, Filter);

let data: DataManager = new DataManager({
 url: 'http://localhost:51473/api/Tasks', //// url for fetching the data from server
 adaptor: new WebApiAdaptor,
 crossDomain: true
});

///// filter query for fetching the root level records only
data.executeQuery(new Query().where('ParentId', 'equal', null).take(3).skip(0).requiresCount()).then((e: any) => {

 let treegrid: TreeGrid = new TreeGrid({
 dataSource: { result: e.result, count: e.count },
 hasChildMapping: 'IsParent',
 idMapping: 'TaskId',
 parentIdMapping: 'ParentId',
 allowPaging: true,
 allowFiltering: true,
 filterSettings: { type: 'Excel' },
 pageSettings: { pageSize: 3, pageSizeMode: 'Root' },
 dataStateChange: function (state: any) {
 if (state.action && (state.action.requestType === 'filterchoicerequest'
 || state.action.requestType === 'filtersearchbegin')) {
 data.executeQuery(new Query().skip(state.skip).take(state.take).requiresCount()).then(function (e: any) {
 state.dataSource && state.dataSource(e); /// resolve the excel filter dataSource
 });
 }
 }
 });
 else {
```

```

/// take value must be always be equal to the pageSize value of pageSetings
data.executeQuery(new Query().skip(state.skip).take(state.take).requiresCount()).then(function (e: any)
{
this.dataSource = { result: e.result, count: e.count };
});
}
},
treeColumnIndex: 1,
columns: [
{ field: 'TaskId', headerText: 'Task ID', isPrimaryKey: true, textAlign: 'Right', width: 120 },
{ field: 'TaskName', headerText: 'Task Name', width: 150 },
{ field: 'StartDate', headerText: 'Start Date', textAlign: 'Right', width: 120, format: { skeleton: 'yMd', type: 'date' } },
{ field: 'Duration', headerText: 'Duration', width: 110, textAlign: 'Right' },
{ field: 'Progress', headerText: 'Progress', width: 110 },
]
});
treegrid.appendTo('#TreeGrid');
});
`

```

You can refer to our [JavaScript Tree Grid](#) feature tour page for its groundbreaking feature representations. You can also explore our JavaScript Tree Grid example [JavaScript Tree Grid example](#) to know how to present and manipulate data.

#### Local data in EJ2 JavaScript Treegrid control

In Local Data binding, data source for rendering the TreeGrid control is retrieved from the same application locally.

Two types of Data binding are possible with the TreeGrid control.

- Hierarchical Datasource binding
- Self-Referential Data binding (Flat Data)

To bind local data to the treegrid, you can assign a JavaScript object array to the [dataSource](#) property. The local data source can also be provided as an instance of the `DataManager`.

By default, `DataManager` uses `JsonAdaptor` for local data-binding.

#### Hierarchy data source binding

The [childMapping](#) property is used to map the child records in hierarchy data source.

The following code example shows you how to bind the hierarchical local data into the TreeGrid control.

**INDEX.TS**

```
import { TreeGrid, Page } from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(Page);
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 allowPaging: true,
 pageSettings: {pageSize: 7},
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 90,
 textAlign: 'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 180 },
 {
 field: 'startDate', headerText: 'Start Date', width: 90,
 textAlign: 'Right', type: 'date', format: 'yMd'
 },
 { field: 'duration', headerText: 'Duration', width: 80,
 textAlign: 'Right' }
]
});
treeGridObj.appendTo('#TreeGrid');
```

**INDEX.HTML**

```
<!DOCTYPE html><html lang="en"><head>

 <div id="TreeGrid"></div>
 </div>
<script>
var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

\* Remote data binding is not supported for Hierarchy Data.

#### Self-Referential data binding (Flat data)

TreeGrid is rendered from Self-Referential data structures by providing two fields, ID field and parent ID field.

- **ID Field:** This field contains unique values used to identify nodes. Its name is assigned to the [idMapping](#) property.
- **Parent ID Field:** This field contains values that indicate parent nodes. Its name is assigned to the [parentIdMapping](#) property.

#### INDEX.TS

```

import { TreeGrid, Page } from '@syncfusion/ej2-treegrid';
import { projectData } from './datasource.ts';
TreeGrid.Inject(Page);
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: projectData,
 idMapping: 'TaskID',
 parentIdMapping: 'parentID',
 allowPaging: true,
 treeColumnIndex: 1,
 pageSettings: { pageSize: 7 },
 columns: [
 { field: 'TaskID', headerText: 'Task ID', width: 90,
textAlign: 'Right' },
 { field: 'TaskName', headerText: 'Task Name', width: 180 },
 {

```

```

 field: 'StartDate', headerText: 'Start Date', width: 90,
textAlign: 'Right', type: 'date',format: 'yMd'
 },
 { field: 'Duration', headerText: 'Duration', width: 80,
textAlign: 'Right' }
]
});
treeGridObj.appendTo('#TreeGrid');

```

## INDEX.HTML

```

Herewith we have provided list of reserved properties and the purpose we used internally in TreeGrid. We recommend to avoid these reserved properties in your dataSource (To get rid of conflicts).

#### Reserved keywords | Purpose

childRecords | Specifies the childRecords of a parentData

hasChildRecords | Specifies whether the record contains child records

hasFilteredChildRecords | Specifies whether the record contains filtered child records

expanded | Specifies whether the child records are expanded

parentItem | Specifies the parentItem of childRecords

index | Specifies the index of current record

level | Specifies the hierarchy level of record

filterLevel | Specifies the hierarchy level of filtered record

parentIdMapping | Specifies the parentId

uniqueID | Specifies the unique ID of a record

parentUniqueID | Specifies the parent Unique ID of a record

checkboxState | Specifies the checkbox state of a record

isSummaryRow | Specifies the summary of a record

taskData | Specifies the main data

primaryParent | Specifies the Primary data

#### Remote data in EJ2 JavaScript Treegrid control

To bind remote data to TreeGrid component, assign service data as an instance of **DataManager** to the [dataSource](#) property. To interact with remote data source, provide the endpoint [url](#) and define the [hasChildMapping](#) property of treegrid.

The [hasChildMapping](#) property maps the field name in data source, that denotes whether current record holds any child records. This is useful internally to show expand icon while binding child data on demand.

The TreeGrid provides **Load on Demand** support for rendering remote data. The Load on demand is considered in TreeGrid for the following actions.

- Expanding root nodes.

- Navigating pages, with paging enabled in TreeGrid.

When load on demand is enabled, all the root nodes are rendered in collapsed state at initial load.

When load on demand support is enabled in TreeGrid with paging, the current or active page's root node alone will be rendered in collapsed state. On expanding the root node, the child nodes will be loaded from the remote server.

When a root node is expanded, its child nodes are rendered and are cached locally, such that on consecutive expand/collapse actions on root node, the child nodes are loaded from the cache instead from the remote server.

Similarly, if the user navigates to a new page, the root nodes of that specific page, will be rendered with request to the remote server.

Remote Data Binding supports only Self-Referential Data and by default the `pageSizeMode` for Remote Data is `Root` mode. i.e only root node's count will be shown in pager while using Remote Data

### INDEX.TS

```
import { TreeGrid, Page } from '@syncfusion/ej2-treegrid';
import { DataManager, WebApiAdaptor } from '@syncfusion/ej2-data';
let data: DataManager = new DataManager({
 url: 'https://ej2services.syncfusion.com/production/web-
 services/api/SelfReferenceData',
 adaptor: new WebApiAdaptor, crossDomain: true
});
TreeGrid.Inject(Page);
let treegrid: TreeGrid = new TreeGrid({
 dataSource: data,
 hasChildMapping: 'isParent',
 idMapping: 'TaskID',
 parentIdMapping: 'ParentItem',
 height: 260,
 allowPaging: true,
 treeColumnIndex: 1,
 columns: [
 { field: 'TaskID', headerText: 'Task ID', textAlign: 'Right', width:
90 },
 { field: 'TaskName', headerText: 'Task Name', width: 180 },
 { field: 'StartDate', headerText: 'Start Date', textAlign: 'Right',
width: 90, format: { skeleton: 'yMd', type: 'date' } },
 { field: 'Duration', headerText: 'Duration', width: 80, textAlign:
'Right' }
]
});
treegrid.appendTo('#TreeGrid');
```

</body></html>

```

By default, **DataManager** uses **ODataAdaptor** for remote data-binding.

Based on the RESTful web services, set the corresponding adaptor to **DataManager**. Refer [here](#) for more details.

Filtering and searching server-side data operations are not supported in load on demand

### *LoadChildOnDemand*

While binding remote data to Tree Grid component, by default Tree Grid renders parent rows in collapsed state. Tree Grid provides option to load the child records also during the initial rendering itself for remote data binding by setting [loadChildOnDemand](#) as true.

When [loadChildOnDemand](#) is enabled parent records are rendered in expanded state.

The following code example describes the behavior of the loadChildOnDemand feature of Tree Grid.

Also while using **loadChildOnDemand** we need to handle the child records on server end and it is applicable to CRUD operations also.

The following code example describes handling of child records at server end.

```
`ts
public ActionResult UrlDatasource(DataManagerRequest dm)
{
 if (TreeData.tree.Count == 0)
 TreeData.GetTree();
 IEnumerable DataSource = TreeData.tree;
 DataOperations operation = new DataOperations();
 if (dm.Where != null && dm.Where.Count > 0)
 {
 DataSource = operation.PerformFiltering(DataSource, dm.Where, "and"); //perform filtering
 }
 if (dm.Sorted != null && dm.Sorted.Count > 0)
 {
 DataSource = operation.PerformSorting(DataSource, dm.Sorted); //perform sorting
 }
 var count = DataSource.ToList<TreeData>().Count();
 if (dm.Skip != 0)
 {
 DataSource = operation.PerformSkip(DataSource, dm.Skip); //Paging
 }
 if (dm.Take != 0)
 {
 DataSource = operation.PerformTake(DataSource, dm.Take);
 }
 if (dm.Where != null)
```

```

{
DataSource = CollectChildRecords(DataSource, dm); // method to collect child records
}
return dm.RequiresCounts ? Json(new { result = DataSource, count = count }) : Json(DataSource);
}

public IEnumerable CollectChildRecords(IEnumerable datasource, DataManagerRequest dm)
{
DataOperations operation = new DataOperations();
IEnumerable DataSource = TreeData.tree; // use the total DataSource here
string IdMapping = "TaskID"; // define your IdMapping field name here
int[] TaskIds = new int[0];
foreach (var rec in datasource)
{
int taskid = (int)rec.GetType().GetProperty(IdMapping).GetValue(rec);
TaskIds = TaskIds.Concat(new int[] { taskid }).ToArray(); //get the Parentrecord Ids based on
IdMapping Field
}
IEnumerable ChildRecords = null;
foreach (int id in TaskIds)
{
dm.Where[0].value = id;
IEnumerable records = operation.PerformFiltering(DataSource, dm.Where, dm.Where[0].Operator);
//perform filtering to collect the childrecords based on Ids
ChildRecords = ChildRecords == null || (ChildRecords.AsQueryable().Count() == 0) ? records :
((IEnumerable<object>)ChildRecords).Concat((IEnumerable<object>)records); //concat the
childrecords with dataSource
}
if (ChildRecords != null)
{
ChildRecords = CollectChildRecords(ChildRecords, dm); // repeat the operation for inner level child
if (dm.Sorted != null && dm.Sorted.Count > 0) // perform Sorting
{
ChildRecords = operation.PerformSorting(ChildRecords, dm.Sorted);
}
}
}

```

```

datasource = ((IEnumerable<object>)datasource).Concat((IEnumerable<object>)ChildRecords);
//concat the childrecords with dataSource
}

return datasource;
}
`

```

### Offline mode

On remote data binding, all treegrid actions such as paging, loading child on-demand, will be processed on server-side. To avoid postback, set the treegrid to load all data on initialization and make the actions process in client-side. To enable this behavior, use the `offline` property of `DataManager`.

### INDEX.TS

```

import { TreeGrid, Page } from '@syncfusion/ej2-treegrid';
import { DataManager, WebApiAdaptor } from '@syncfusion/ej2-data';
let data: DataManager = new DataManager({
 url: 'https://ej2services.syncfusion.com/production/web-
services/api/SelfReferenceData',
 adaptor: new WebApiAdaptor, crossDomain: true, offline: true
});
TreeGrid.Inject(Page);
let treegrid: TreeGrid = new TreeGrid({
 dataSource: data,
 idMapping: 'TaskID',
 parentIdMapping: 'ParentItem',
 height: 260,
 allowPaging: true,
 treeColumnIndex: 1,
 columns: [
 { field: 'TaskID', headerText: 'Task ID', textAlign: 'Right', width:
90 },
 { field: 'TaskName', headerText: 'Task Name', width: 180 },
 { field: 'StartDate', headerText: 'Start Date', textAlign: 'Right',
width: 90, format: { skeleton: 'yMd', type: 'date' } },
 { field: 'Duration', headerText: 'Duration', width: 80, textAlign:
'Right' }
]
});
treegrid.appendTo('#TreeGrid');

```

### INDEX.HTML

 ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

### Custom adaptor

You can create your own adaptor by extending the built-in adaptors. The following demonstrates custom adaptor approach and how to add a serial number for the records by overriding the built-in response processing using the `processResponse` method of the `WebApiAdaptor`.

### INDEX.TS

```

import { TreeGrid } from '@syncfusion/ej2-treegrid';
import { DataManager, WebApiAdaptor } from '@syncfusion/ej2-data';

```

```

class SerialNoAdaptor extends WebApiAdaptor {
 public processResponse(): Object[] {
 let i: number = 0;
 // calling base class processResponse function
 let original: Object[] = super.processResponse.apply(this,
arguments);
 // adding serial number
 original.forEach((item: Object) => item['Sno'] = ++i);
 return original;
 }
}
let data: DataManager = new DataManager({
 url: 'https://ej2services.syncfusion.com/production/web-
services/api/SelfReferenceData',
 adaptor: new SerialNoAdaptor, crossDomain: true, offline: true
});
let treegrid: TreeGrid = new TreeGrid({
 dataSource: data,
 idMapping: 'TaskID',
 parentIdMapping: 'ParentItem',
 height: 260,
 treeColumnIndex: 1,
 columns: [
 { field: 'Sno', width: 120, headerText: 'SNO', textAlign: 'Right' },
 { field: 'TaskName', headerText: 'Task Name', width: 180 },
 { field: 'StartDate', headerText: 'Start Date', textAlign: 'Right',
width: 90, format: { skeleton: 'yMd', type: 'date' } },
 { field: 'Duration', headerText: 'Duration', width: 80, textAlign:
'Reight' }
]
});
treegrid.appendTo('#TreeGrid');

```

## INDEX.HTML

```

#### *Sending additional parameters to the server*

To add a custom parameter to the data request, use the `addParams` method of `Query` class. Assign the `Query` object with additional parameters to the treegrid `query` property.

#### **INDEX.TS**

```

import { TreeGrid, Page } from '@syncfusion/ej2-treegrid';
import { DataManager, Query, WebApiAdaptor } from '@syncfusion/ej2-data';
let data: DataManager = new DataManager({
 url: 'https://ej2services.syncfusion.com/production/web-
services/api/SelfReferenceData',
 adaptor: new WebApiAdaptor, crossDomain: true
});
TreeGrid.Inject(Page);
let treegrid: TreeGrid = new TreeGrid({
 dataSource: data,
 hasChildMapping: 'isParent',
 idMapping: 'TaskID',
 parentIdMapping: 'ParentItem',
 height: 260,
 allowPaging: true,

```

```

 query: new Query().addParams('ej2treegrid', 'true'),
 treeColumnIndex: 1,
 columns: [
 { field: 'TaskID', headerText: 'Task ID', textAlign: 'Right', width:
90 },
 { field: 'TaskName', headerText: 'Task Name', width: 180 },
 { field: 'StartDate', headerText: 'Start Date', textAlign: 'Right',
width: 90, format: { skeleton: 'yMd', type: 'date' } },
 { field: 'Duration', headerText: 'Duration', width: 80, textAlign:
'Reight' }
]
 });
 treegrid.appendTo('#TreeGrid');

```

## INDEX.HTML

```

```

### Handling HTTP error

During server interaction from the treegrid, some server-side exceptions may occur, and you can acquire those error messages or exception details

in client-side using the [actionFailure](#) event.

The argument passed to the [actionFailure](#) event contains the error details returned from the server.

### INDEX.TS

```

import { TreeGrid } from '@syncfusion/ej2-treegrid';
import { DataManager } from '@syncfusion/ej2-data';
let data: DataManager = new DataManager({
 url: 'http://some.com/invalidUrl'
});
let treegrid: TreeGrid = new TreeGrid({
 dataSource: data,
 idMapping: 'TaskID',
 parentIdMapping: 'ParentItem',
 actionFailure: (e) => {
 let span: HTMLElement = document.createElement('span');
 treegrid.element.parentNode.insertBefore(span, treegrid.element);
 span.style.color = '#FF0000'
 span.innerHTML = 'Server exception: 404 Not found';
 },
 treeColumnIndex: 1,
 columns: [
 { field: 'TaskID', headerText: 'Task ID', textAlign: 'Right', width:
90 },
 { field: 'TaskName', headerText: 'Task Name', width: 180 },
 { field: 'StartDate', headerText: 'Start Date', textAlign: 'Right',
width: 90, format: { skeleton: 'yMd', type: 'date' } },
 { field: 'Duration', headerText: 'Duration', width: 80, textAlign:
'Right' }
]
});
treegrid.appendTo('#TreeGrid');

```

### INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>

}
 </script>
 <script src="index.js" type="text/javascript"></script>
</body></html>
```

The [actionFailure](#) event will be triggered not only for the server errors, but also when there is an exception while processing the treegrid actions.

#### *Load on demand with virtualization*

While binding remote data to Tree Grid component, by default Tree Grid renders parent rows in collapsed state. When expanding the root node, the child nodes will be loaded from the remote server.

When using virtualization with remote data binding, it helps you to improve the tree grid performance while loading a large set of data by setting [enableVirtualization](#) as true. The Tree Grid UI virtualization allows it to render only rows and columns visible within the view-port without buffering the entire datasource.

[hasChildMapping](#) property maps the field name in data source, that denotes whether current record holds any child records. This is useful internally to show expand icon while binding child data on demand.

The following code example describes handling of Load on demand at server end.

```
`ts
public ActionResult lazyLoading()
{
 TreeData.tree = new List<TreeData>();
 return View();
}

public ActionResult UrlDatasource(DataManagerRequest dm)

### Load parent rows in expanded state with virtualization

Tree Grid provides an option to load the child records in the initial rendering itself for remote data binding by setting the [loadChildOnDemand](#) as true. When the `loadChildOnDemand` is enabled, parent records are rendered in expanded state.

When using virtualization with `loadChildOnDemand`, it helps you to improve the tree grid performance while loading the child records during the initial rendering for remote data binding by setting [enableVirtualization](#) as true and `loadChildOnDemand` as true.

The following code example describes handling of child records at server end.

```
`ts
public ActionResult loadChildOndemand()
{
 TreeData.tree = new List<TreeData>();
 return View();
}

public ActionResult UrlDatasource(DataManagerRequest dm)
{
 List<TreeData> data = new List<TreeData>();

### Immutable mode in EJ2 JavaScript Treegrid control

The immutable mode optimizes the Tree Grid re-rendering performance by using the object reference and [deep compare](#) concept. When performing the Tree Grid actions, it will only re-render the modified or newly added rows and prevent the re-rendering of the unchanged rows.

To enable this feature, you have to set the [enableImmutableMode](#) property as **true**.

\* This feature uses the primary key value for data comparison. So, you need to provide the [isPrimaryKey](#) column.

```

## Limitations

The following features are not supported in the immutable mode:

- Frozen rows and columns
- Row Template
- Detail Template
- Column reorder
- Virtualization

You can refer to our [JavaScript Tree Grid](#) feature tour page for its groundbreaking feature representations. You can also explore our JavaScript Tree Grid example [JavaScript Tree Grid example](#) to know how to present and manipulate data.

## Columns

Columns in EJ2 JavaScript Treegrid control

The column definitions are used as the [dataSource](#) schema in the TreeGrid. This plays a vital role in rendering column values in the required format.

The treegrid operations such as sorting, filtering and searching etc. are performed based on column definitions. The [field](#) property of the [columns](#)

is necessary to map the data source values in TreeGrid columns.

1. If the column [field](#) is not specified in the dataSource, the column values will be empty.
2. If the [field](#) name contains “dot” operator, it is considered as complex binding.

[treeColumnIndex](#) property denotes the column that is used to expand and collapse child rows.

### Format

To format cell values based on specific culture, use the [columns.format](#) property. The TreeGrid uses [Internalization](#) library to format [number](#) and [date](#)

values.

### INDEX.TS

```

import { TreeGrid } from '@syncfusion/ej2-treegrid';
import { formatData } from './datasource.ts';
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: formatData,
 childMapping: 'subtasks',
 height: 315,
 treeColumnIndex: 1,
 columns: [
 { field: 'orderId', headerText: 'Order ID', textAlign:
'Right', width: 90 },

```

```

 { field: 'orderName', headerText: 'Order Name', textAlign:
'Left', width: 180 },
 { field: 'price', headerText: 'Price', textAlign: 'Right',
width: 90, format: 'c2', type: 'number' },
]
});
treeGridObj.appendTo('#TreeGrid');

```

## INDEX.HTML

</body></html>

```

By default, the [number](#) and [date](#) values are formatted in **en-US** locale.

#### Number formatting

The number or integer values can be formatted using the below format strings.

Format | Description | Remarks

{ type:'date', format:'dd/MM/yyyy' } | 04/07/1996

{ type:'date', format:'dd.MM.yyyy' } | 04.07.1996

{ type:'date', skeleton:'short' } | 7/4/96

{ type:'dateTime', format:'dd/MM/yyyy hh:mm a' } | 04/07/1996 12:00 AM

{ type:'dateTime', format:'MM/dd/yyyy hh:mm:ss a' } | 07/04/1996 12:00:00 AM

#### INDEX.TS

```

import { TreeGrid } from '@syncfusion/ej2-treegrid';
import { formatData } from './datasource.ts';
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: formatData,
 childMapping: 'subtasks',
 height: 315,
 treeColumnIndex: 1,
 columns: [
 { field: 'orderID', headerText: 'Order ID', textAlign:
'Right', width: 90 },
 { field: 'orderName', headerText: 'Order Name', textAlign:
'Left', width: 220 },
 {
 field: 'orderDate', headerText: 'Order Date', textAlign:
'Right', width: 160,
 format: { format: 'dd/MM/yyyy', type: 'date' }
 },
 { field: 'price', headerText: 'Price', textAlign: 'Right',
width: 90, format: 'c2', type: 'number' },
]
});
treeGridObj.appendTo('#TreeGrid');

```

if(ele) {
 ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

### Lock columns

You can lock columns by using [column.lockColumn](#) property. The locked columns will be moved to the first position. Also you can't reorder its position.

In the below example, duration column is locked and its reordering functionality is disabled.

### INDEX.TS

```
import { TreeGrid, Reorder } from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(Reorder);
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 allowReordering: true,
 allowSelection: false,
 height: 315,
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 90,
 textAlign: 'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 180,
 textAlign: 'Left' },
 {
 field: 'startDate', headerText: 'Start Date', width: 90,
 textAlign: 'Right', type: 'date', format: 'yMd'
 },
 { field: 'duration', headerText: 'Duration', width: 80,
 lockColumn: true, customAttributes: {class: 'customcss'}, textAlign: 'Right'
 }
]
});
treeGridObj.appendTo('#TreeGrid');
```

### INDEX.HTML

if(ele) {
 ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

### Column type

Column type can be specified using the [columns.type](#) property. It specifies the type of data the column binds.

If the [format](#) is defined for a column, the column uses [type](#) to select the appropriate format option ([number](#) or [date](#)).

TreeGrid column supports the following types:

- string
- number
- boolean
- date
- datetime

If the [type](#) is not defined, it will be determined from the first record of the [dataSource](#).

*Checkbox column*

To render checkboxes in existing column, you need to set `[columns.showCheckbox]` property as `true`.

It is also possible to select the rows hierarchically using checkboxes in TreeGrid by enabling `[autoCheckHierarchy]` property. When we check on any parent record checkbox then the child record checkboxes will get checked.

**INDEX.TS**

```
import { TreeGrid } from '@syncfusion/ej2-treegrid';
import { data, sampleData } from './datasource.ts';
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 height: 315,
 autoCheckHierarchy: true,
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 90,
 textAlign: 'Right' },
 { field: 'taskName', headerText: 'Task Name', showCheckbox:
 true, width: 180 },
 { field: 'approved', headerText: 'Approved', width: 90 },
 { field: 'duration', headerText: 'Duration', width: 80,
 textAlign: 'Right' }
]
});
treeGridObj.appendTo('#TreeGrid');
```

**INDEX.HTML**

### Controlling Tree Grid actions

You can enable or disable treegrid action for a particular column by setting the [allowFiltering](#), and [allowSorting](#) properties.

### INDEX.TS

```

import { TreeGrid, Filter, Sort } from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(Filter, Sort);
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 height: 270,
 treeColumnIndex: 1,
 allowSorting: true,
 allowFiltering: true,
 columns: [
 {
 field: 'taskID', headerText: 'Task ID', allowSorting:
false, width: 90, textAlign: 'Right'
 },
 { field: 'taskName', headerText: 'Task Name', width: 180 },
]
});

```

```

 field: 'startDate', headerText: 'Start Date',
allowFiltering: false, width: 90, textAlign: 'Right', type: 'date', format:
'yMd'
 },
 { field: 'duration', headerText: 'Duration', width: 80,
textAlign: 'Right' }
]
});
treeGridObj.appendTo('#TreeGrid');

```

## INDEX.HTML

### Show/hide columns by external button

You can show or hide treegrid columns dynamically using external buttons by invoking the [showColumns](#) or [hideColumns](#) method.

### INDEX.TS

```

import { TreeGrid } from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
import { Button } from '@syncfusion/ej2-buttons';
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 height: 270,
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 90,
 textAlign: 'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 180 },
 {
 field: 'startDate', headerText: 'Start Date', width: 90,
 textAlign: 'Right', type: 'date', format: 'yMd'
 },
 { field: 'duration', headerText: 'Duration', width: 80,
 textAlign: 'Right' }
]
});
treeGridObj.appendTo('#TreeGrid');
let show: Button = new Button({ cssClass: 'e-flat' }, '#show');
let hide: Button = new Button({ cssClass: 'e-flat' }, '#hide');
document.getElementById('show').onclick = () => {
 treeGridObj.showColumns(['Task ID', 'Duration']); //show by HeaderText
};
document.getElementById('hide').onclick = () => {
 treeGridObj.hideColumns(['Task ID', 'Duration']); //hide by HeaderText
};

```

```

### ValueAccessor

The [valueAccessor](#) is used to access/manipulate the value of display data. You can achieve custom value formatting by using the [valueAccessor](#).

### INDEX.TS

```
import { TreeGrid } from '@syncfusion/ej2-treegrid';
import { formatData } from './datasource.ts';
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: formatData,
 childMapping: 'subtasks',
 height: 315,
 treeColumnIndex: 1,
 columns: [
 { field: 'orderId', headerText: 'Order ID', textAlign: 'Right',
width: 100 },
 {
 field: 'orderName', headerText: 'Order Name', textAlign:

### Display array type columns

You can bind an array of objects in a column by using the [valueAccessor](#) property.

In this example, the name field has an array of two objects, FirstName and LastName. These two objects are joined and bound to a column using the

[valueAccessor](#).

### INDEX.TS

```

import { TreeGrid } from '@syncfusion/ej2-treegrid';
import { stringData } from './datasource.ts';

```

```

let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: stringData,
 childMapping: 'subtasks',
 height: 315,
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', textAlign: 'Right',
width: 110 },
 { field: 'taskName', headerText: 'Task Name', width: 180 },
 {
 field: 'name', headerText: 'Assignee', textAlign: 'Left',
valueAccessor: orderFormatter, width: 150
 },
 { field: 'duration', headerText: 'Duration', width: 80,
textAlign: 'Right' }
],
 height: 315
});
treeGridObj.appendTo('#TreeGrid');
function orderFormatter(field: string, data: Object, column: Object): string
{
 return data[field].map(function (s: {lastName: string, firstName:
string}): string {
 return s.lastName || s.firstName }).join(' ');
}

```

You can refer to our [JavaScript Tree Grid](#) feature tour page for its groundbreaking feature representations. You can also explore our JavaScript Tree Grid example [JavaScript Tree Grid example](#) to know how to present and manipulate data.

## Headers in EJ2 JavaScript Treegrid control

### Header text

By default, column header title is displayed from column [field](#) value. To override the default header title, you have to define the [headerText](#) value.

### INDEX.TS

```

import { TreeGrid } from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 height: 315,
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 90,
textAlign: 'Right' },

```

```

 { field: 'taskName', headerText: 'Task Name', width: 180,
textAlign: 'Left' },
 {
 field: 'startDate', headerText: 'Start Date', width: 90,
textAlign: 'Right', type: 'date', format: 'yMd'
 },
 { field: 'duration', headerText: 'Duration', width: 80,
textAlign: 'Right' }
]
});
treeGridObj.appendTo('#TreeGrid');

```

## INDEX.HTML

var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

TreeGrid actions such as editing, filtering and sorting etc. will depend upon the column [field](#). If the [field](#) is not specified in the template column, the treegrid actions cannot be performed.

#### Using condition template

You can render the template elements based on condition.

In the following code, checkbox is rendered based on **Approved** field value.

```

<script id="template" type="text/x-template">
<div class="template_checkbox">
 ${if(approved)}
<input type="checkbox" checked> ${else}
<input type="checkbox"> ${/if}
</div>
</script>

```

#### INDEX.TS

```

import { TreeGrid } from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 allowResizing: true,
 height: 315,
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', textAlign: 'Right', width:
90 },
 { field: 'taskName', headerText: 'Task Name', width: 180 },

```

```

 {
 headerText: 'Approved', textAlign: 'Center',
 template: '#template', width: 120
 },
 { field: 'progress', headerText: 'Progress', width: 80, textAlign:
'Right' }
]
});
treeGridObj.appendTo('#TreeGrid');

```

## INDEX.HTML

### Complex data binding in EJ2 JavaScript Treegrid control

You can achieve complex data binding in the treegrid by using the dot(.) operator in the [column.field](#).

#### INDEX.TS

```

import { TreeGrid } from '@syncfusion/ej2-treegrid';
import { complexData } from './datasource.ts';
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: complexData,
 childMapping: 'subtasks',
 height: 315,
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 90,
 textAlign: 'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 180 },
 { field: 'assignee.firstName', headerText: 'Assignee',
 width: 90},
 { field: 'duration', headerText: 'Duration', width: 80,
 textAlign: 'Right' }
]
});
treeGridObj.appendTo('#TreeGrid');

```

#### INDEX.HTML

```

### Auto fit columns in EJ2 JavaScript Treegrid control

The [autoFitColumns](#) method resizes the column to fit the widest cell's content without wrapping. You can autofit a specific column at initial rendering by invoking the [autoFitColumns](#) method in [dataBound](#) event.

### INDEX.TS

```

import { TreeGrid, Resize } from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';

```

```

TreeGrid.Inject(Resize);
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 allowResizing: true,
 dataBound: () => treeGridObj.autoFitColumns(['taskName']),
 height: 315,
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', textAlign: 'Right', width:
90 },
 { field: 'taskName', headerText: 'Task Name', width: 60 },
 {
 field: 'startDate', headerText: 'Start Date', format: 'yMd',
width: 120, textAlign: 'Right'
 },
 { field: 'duration', headerText: 'Duration', width: 120, textAlign:
'Right' },
 { field: 'progress', headerText: 'Progress', width: 120, textAlign:
'Right' }
]
});
treeGridObj.appendTo('#TreeGrid');

```

## INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

</body></html>

```

You can autofit all the columns by invoking the [autoFitColumns](#) method without column names.

#### Column reorder in EJ2 JavaScript Treegrid control

Reordering can be done by drag and drop of a particular column header from one index to another index within the treegrid. To enable reordering, set the [allowReordering](#) to true.

To use reordering, inject the [Reorder](#) module in the treegrid.

#### INDEX.TS

```

import { TreeGrid, Reorder } from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(Reorder);
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 allowReordering: true,
 height: 315,
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', textAlign: 'Right', width:
90 },
 { field: 'taskName', headerText: 'Task Name', width: 180 },
 { field: 'duration', headerText: 'Duration', width: 80, textAlign:
'Right' },
 { field: 'progress', headerText: 'Progress', width: 80, textAlign:
'Right' }
]
});
treeGridObj.appendTo('#TreeGrid');

```

**INDEX.HTML**

```
<!DOCTYPE html><html lang="en"><head>

```

You can disable reordering a particular column by setting the [columns.allowReordering](#) to false.

### Reorder multiple columns

Multiple columns can be reordered at a time by using the [reorderColumns](#) method.

### INDEX.TS

```
import { TreeGrid, Reorder } from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
import { Button } from '@syncfusion/ej2-buttons';
TreeGrid.Inject(Reorder);
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 allowReordering: true,
 height: 285,
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', textAlign: 'Right', width:
90 },
 { field: 'taskName', headerText: 'Task Name', width: 180 },
 { field: 'duration', headerText: 'Duration', width: 80, textAlign:
'Right' },
 { field: 'progress', headerText: 'Progress', width: 80, textAlign:
'Right' }
]
});
treeGridObj.appendTo('#TreeGrid');
let reorderMultipleColsBtn: Button = new Button();
reorderMultipleColsBtn.appendTo('#reorderMultipleCols');
document.getElementById('reorderMultipleCols').addEventListener('click', ()
=> {
 treeGridObj.reorderColumns(['taskID', 'duration'], 'progress');
});
```

### INDEX.HTML

### Column resizing in EJ2 JavaScript Treegrid control

Column width can be resized by clicking and dragging the right edge of the column header. While dragging, the width of the respective column will be resized immediately. Each column can be auto resized by double-clicking the right edge of the column header to fit the width of that column based on the widest cell content. To enable column resize, set the [allowResizing](#) property to true.

To use the column resize, inject **Resize** module in the treegrid.

### INDEX.TS

```

import { TreeGrid, Resize } from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(Resize);

```

```

let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 allowResizing: true,
 height: 315,
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', textAlign: 'Right', width:
90 },
 { field: 'taskName', headerText: 'Task Name', width: 180 },
 { field: 'duration', headerText: 'Duration', width: 80, textAlign:
'Right' },
 { field: 'progress', headerText: 'Progress', width: 80, textAlign:
'Right' }
]
});
treeGridObj.appendTo('#TreeGrid');

```

```

\* You can disable resizing for a particular column by setting the [columns.allowResizing](#) to false.

\* In RTL mode, you can click and drag the left edge of the header cell to resize the column.

#### *Min and max width*

Column resize can be restricted between minimum and maximum width by defining the [columns->minWidth](#) and [columns->maxWidth](#).

In the following sample, minimum and maximum width are defined for **Duration**, and **Task Name** columns.

#### **INDEX.TS**

```

import { TreeGrid, Resize } from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(Resize);
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 allowResizing: true,
 height: 315,
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', textAlign: 'Right', width:
90 },
 { field: 'taskName', headerText: 'Task Name', minWidth: 170,
maxWidth: 250, width: 180 },
 { field: 'duration', headerText: 'Duration', width: 80, minWidth:
50, maxWidth: 150, textAlign: 'Right' },
 { field: 'progress', headerText: 'Progress', width: 80, textAlign:
'Right' }
]
});
treeGridObj.appendTo('#TreeGrid');

```

#### **INDEX.HTML**

 </script>
 <script src="index.js" type="text/javascript"></script>
</body></html>

```

*Resize stacked column*

Stacked columns can be resized by clicking and dragging the right edge of the stacked column header. While dragging, the width of the respective child columns will be resized at the same time. You can disable resize for particular stacked column by setting `allowResizing` as `false` to its columns.

**INDEX.TS**

```
import { TreeGrid, Resize } from '@syncfusion/ej2-treegrid';
import { stackedData } from './datasource.ts';
TreeGrid.Inject(Resize);
let treeGridObj: TreeGrid = new TreeGrid(
 {
 dataSource: stackedData,
 childMapping: 'subtasks',
 allowResizing: true,
 treeColumnIndex: 1,
 height: 260
 columns: [
 {
 headerText: 'Order Details', textAlign: 'Center', columns: [
 { field: 'orderID', headerText: 'Order ID', textAlign:
'Right', width: 90 },
 { field: 'orderName', headerText: 'Order Name',
textAlign: 'Left', width: 170 },
]
 },
 {
 headerText: 'Shipment Details', textAlign: 'Center',
columns: [
 { field: 'shipMentCategory', headerText: 'Shipment
Category', textAlign: 'Left', width: 90 },
 { field: 'shippedDate', headerText: 'Shipped Date',
textAlign: 'Right', width: 90, format: 'yMd' }
]
 }
]
 });
treeGridObj.appendTo('#TreeGrid');
```

**INDEX.HTML**

### Touch interaction

When the right edge of the header cell is tapped, a floating handler will be visible over the right border of the column. To resize the column, tap and drag the floating handler as needed.

The following screenshot represents the column resizing in touch device.

The image shows a touch interaction for column resizing. It displays a grid with a floating handler on the right edge of a header cell, which is used to tap and drag to resize the column.

### Column chooser in EJ2 JavaScript Treegrid control

The column chooser has options to show or hide columns dynamically. It can be enabled by defining the [showColumnChooser](#) as true.

To use the column chooser, inject the **Column Chooser** module in the treegrid.

**INDEX.TS**

```
import { TreeGrid, Selection, Toolbar, ColumnChooser } from
'@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(Selection, Toolbar, ColumnChooser);
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 showColumnChooser: true,
 treeColumnIndex: 1,
 toolbar: ['ColumnChooser'],
 columns: [
 { field: 'taskID', headerText: 'Task ID', textAlign: 'Right', width:
90 },
 { field: 'taskName', headerText: 'Task Name', width: 240,
showInColumnChooser: false },
 { field: 'startDate', headerText: 'Start Date', width: 110, format:
'yMd' },
 { field: 'endDate', headerText: 'End Date', width: 110, textAlign:
'Right', type: 'date', format: 'yMd' },
 { field: 'duration', headerText: 'Duration', width: 100, textAlign:
'Right' },
 { field: 'progress', headerText: 'Progress', width: 100, textAlign:
'Right' },
 { field: 'priority', headerText: 'Priority', width: 90 }
]
 height: 315
});
treeGridObj.appendTo('#TreeGrid');
```

**INDEX.HTML**

```
<!DOCTYPE html><html lang="en"><head>

<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

 <div id="container">
 <div id="TreeGrid"></div>
 </div>
<script>
var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

You can hide the column names in column chooser by defining the [columns.showInColumnChooser](#) as false.

#### *Open column chooser by external button*

The Column chooser can be displayed on a page through external button by invoking the [openColumnChooser](#) method with X and Y axis positions.

#### **INDEX.TS**

```

import { TreeGrid, Selection, ColumnChooser } from '@syncfusion/ej2-
treegrid';
import { sampleData } from './datasource.ts';
import { Button } from '@syncfusion/ej2-buttons';
TreeGrid.Inject(Selection, ColumnChooser);
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 treeColumnIndex: 1,
 showColumnChooser: true,
 columns: [
 { field: 'taskID', headerText: 'Task ID', textAlign: 'Right', width:
90 },

```

```

 { field: 'taskName', headerText: 'Task Name', width: 240,
showInColumnChooser: false },
 { field: 'startDate', headerText: 'Start Date', width: 110, format:
'yMd' },
 { field: 'endDate', headerText: 'End Date', width: 110, textAlign:
'Right', type: 'date', format: 'yMd' },
 { field: 'duration', headerText: 'Duration', width: 100, textAlign:
'Right' },
 { field: 'progress', headerText: 'Progress', width: 100, textAlign:
'Right' },
 { field: 'priority', headerText: 'Priority', width: 90 }
]
 height: 315
});
treeGridObj.appendTo('#TreeGrid');
let show: Button = new Button({ cssClass: 'e-flat' }, '#show');
document.getElementById('show').onclick = () => {
 treeGridObj.columnChooserModule.openColumnChooser(200, 50); // give X
and Y axis
};

```

### Column menu in EJ2 JavaScript Treegrid control

The column menu has options to integrate features like sorting, filtering, and autofit. It will show a menu with the integrated feature when users click on multiple icon of the column. To enable column menu, you need to define the [showColumnMenu](#) property as true.

By default, column menu is enabled for all columns and you can disable column menu for a particular column by defining the [showColumnMenu](#) as false in [columns](#) property.

To use the column menu, inject the `ColumnMenu` module in the treegrid.

The default items are displayed in following table.

Item	Description
----- -----	
<code>SortAscending</code>	Sort the current column in ascending order.
<code>SortDescending</code>	Sort the current column in descending order.
<code>AutoFit</code>	Auto fit the current column.
<code>AutoFitAll</code>	Auto fit all columns.
<code>Filter</code>	Show the filter option as given in <code>filterSettings.type</code>

### INDEX.TS

```

import {TreeGrid, Sort, Page, Filter, Resize, ColumnMenu} from
'@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(Page, Filter, Sort, Resize, ColumnMenu);
let treegrid: TreeGrid = new TreeGrid(
{

```

```

 dataSource: sampleData,
 childMapping: 'subtasks',
 height: 315,
 allowFiltering: true,
 allowResizing: true,
 filterSettings: { type: 'Menu' },
 allowSorting: true,
 showColumnMenu: true,
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 90, textAlign:
'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 180 },
 {
 field: 'startDate', headerText: 'Start Date', width: 90,
textAlign: 'Right', showColumnMenu: false, type: 'date', format: 'yMd'
 },
 { field: 'duration', headerText: 'Duration', width: 80,
textAlign: 'Right' }
]
 });
 treegrid.appendTo('#TreeGrid');

```

## INDEX.HTML

</body></html>

```

#### Custom column menu item

The custom column menu items can be added to the column menu by defining the [columnMenuItems](#) as a collection of the [MenuItemModel](#).

The action for custom column menu items can be performed using [columnMenuClick](#) event.

In the below example, clear sorting action was performed through [columnMenuItems](#) by using [clearSorting](#) method of the Tree Grid.

#### INDEX.TS

```

import {TreeGrid, ColumnMenu, Sort} from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(ColumnMenu, Sort);
let treegrid: TreeGrid = new TreeGrid(
 {
 dataSource: sampleData,
 childMapping: 'subtasks',
 height: 315,
 showColumnMenu: true,
 allowSorting: true,
 sortSettings: {
 columns: [{ direction: 'Ascending', field: 'taskID' }],
 },
 columnMenuItems: [{ text: 'Clear Sorting', id: 'clearsorting' }],
 columnMenuClick: function (args) {
 if (args.item.id === 'clearsorting') {
 treegrid.clearSorting();
 }
 },
 },

```

```

 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 90, textAlign:
'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 180 },
 {
 field: 'startDate', headerText: 'Start Date', width: 90,
textAlign: 'Right', type: 'date', format: 'yMd'
 },
 { field: 'duration', headerText: 'Duration', width: 80,
textAlign: 'Right' }
]
 });
 treegrid.appendTo('#TreeGrid');

```

## INDEX.HTML

<script src="index.js" type="text/javascript"></script>
</body></html>

```

### Customize menu items for particular columns

It is possible to customize specific items from the column menu for particular [columns](#) using [columnMenuOpen](#) event. `columnMenuOpen` event can be utilized to determine which items to customize in column menu.

The following example shows how to hide the built-in **Filter** menu item when the column menu is opened for the **taskName** column, while allowing it to remain visible for all other columns.

### INDEX.TS

```

import {TreeGrid, ColumnMenu, Sort, Filter} from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
import { ColumnMenuOpenEventArgs, ColumnMenuItemModel } from '@syncfusion/ej2-grids';
TreeGrid.Inject(ColumnMenu, Sort, Filter);
let treegrid: TreeGrid = new TreeGrid(
 {
 dataSource: sampleData,
 childMapping: 'subtasks',
 height: 315,
 showColumnMenu: true,
 allowSorting: true,
 allowFiltering: true,
 filterSettings: { type: 'Menu' },
 treeColumnIndex: 1,
 columnMenuOpen: function (args) {
 for (const item of args.items) {
 if (item.text === 'Filter' && args.column.field ===
'taskName') {
 (item as ColumnMenuItemModel).hide = true;
 } else {
 (item as ColumnMenuItemModel).hide = false;
 }
 }
 },
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 90, textAlign:
'Right' },

```

```

 { field: 'taskName', headerText: 'Task Name', width: 180 },
 {
 field: 'startDate', headerText: 'Start Date', width: 90,
 textAlign: 'Right', type: 'date', format: 'yMd'
 },
 { field: 'duration', headerText: 'Duration', width: 80,
 textAlign: 'Right' }
]
});
treegrid.appendTo('#TreeGrid');

```

```

### Responsive columns in EJ2 JavaScript Treegrid control

You can toggle column visibility based on media queries which are defined

at the [hideAtMedia](#).

The [hideAtMedia](#) accepts valid

[Media Queries](#).

#### INDEX.TS

```

import { TreeGrid } from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 height: 315,
 treeColumnIndex: 1,
 columns: [
 {
 field: 'taskID', headerText: 'Task ID', hideAtMedia:
'(min-width: 700px)', width: 90, textAlign: 'Right'
 }, // column hides when browser screen width less than 700px;
 { field: 'taskName', headerText: 'Task Name', width: 180 },
 {
 field: 'startDate', headerText: 'Start Date',
hideAtMedia: '(max-width: 500px)', width: 90, textAlign: 'Right', type:
'date', format: 'yMd'
 }, // column shows when browser screen width less than or

## Row

Row in EJ2 JavaScript Treegrid control

The row represents record details fetched from data source.

### Customize rows

You can customize the appearance of a row by using the [rowDataBound](#) event.

The [rowDataBound](#) event triggers for every row. In the event handler, you can get the [RowDataBoundEventArgs](#) that contains details of the row.

### INDEX.TS

```
import { TreeGrid, RowDataBoundEventArgs } from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 height: 275,
 treeColumnIndex: 1,
 rowDataBound: rowBound,
 enableHover: false,
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 90,
 textAlign: 'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 180 },
 {
 field: 'startDate', headerText: 'Start Date', width: 90,
 textAlign: 'Right', type: 'date', format: 'yMd'
 },
 { field: 'duration', headerText: 'Duration', width: 80,
 textAlign: 'Right' }
]
});
treeGridObj.appendTo('#TreeGrid');
function rowBound(args: RowDataBoundEventArgs) {
 if (args.data['duration'] == 0) {
 args.row.style.background= '#336c12';
 } else if (args.data['duration'] < 3) {
 args.row.style.background= '#7b2b1d';
 }
}
```

</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

### Styling alternate rows

You can change the treegrid's alternative rows' background color by overriding the `.e-altrow` class.

```

.e-treegrid .e-altrow {
background-color: #fafafa;
}

```

Please refer to the following example.

### INDEX.TS

```
import { TreeGrid, RowDataBoundEventArgs } from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 height: 275,
 treeColumnIndex: 1,
 enableHover: false,
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 90,
textAlign: 'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 180 },
 {
 field: 'startDate', headerText: 'Start Date', width: 90,
textAlign: 'Right', type: 'date', format: 'yMd'
 },
 { field: 'duration', headerText: 'Duration', width: 80,
textAlign: 'Right' }
]
});
treeGridObj.appendTo('#TreeGrid');
```

```

You can refer to our [JavaScript Tree Grid](#) feature tour page for its groundbreaking feature representations. You can also explore our JavaScript Tree Grid example [JavaScript Tree Grid example](#) to know how to present and manipulate data.

#### Indent in EJ2 JavaScript Treegrid control

The Indent and Outdent feature will help to change the hierarchy level of rows in tree grid. The indent action moves the selected row as the last child of its previous row, whereas the outdent action moves the selected row as a sibling to its parent row.

To use the indent and outdent feature, inject the **RowDD** module in the Tree Grid. The tree grid toolbar has the built-in items to execute indent and outdent actions. Define this by using the toolbar property.

#### INDEX.TS

```

import { TreeGrid, RowDD, Toolbar } from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(RowDD, Toolbar);
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 toolbar: ['Indent', 'Outdent'],
 selectedRowIndex: 2,
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', isPrimaryKey: true, width:
90, textAlign: 'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 180 },
 { field: 'priority', headerText: 'Priority', width: 90 },
 { field: 'duration', headerText: 'Duration', width: 80, textAlign:
'Right' }
],
 height: 270

```

```
});
treeGridObj.appendTo('#TreeGrid');
```

## INDEX.HTML

### *Indent/Outdent a row programmatically*

You can change the hierarchy level of record programmatically using [indent](#) and [outdent](#) methods.

### **INDEX.TS**

```

import { TreeGrid, RowDD } from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(RowDD);
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', isPrimaryKey: true, width:
90, textAlign: 'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 180 },
 { field: 'priority', headerText: 'Priority', width: 90 },
 { field: 'duration', headerText: 'Duration', width: 80, textAlign:
'Right' }
],
 height: 270
});
treeGridObj.appendTo('#TreeGrid');
document.getElementById('Indenting').addEventListener('click', Indent);
document.getElementById('Outdenting').addEventListener('click', Outdent);
function Indent() {
 treeGridObj.indent(treeGridObj.getCurrentViewRecords()[2]);
}
function Outdent() {
 treeGridObj.outdent(treeGridObj.getCurrentViewRecords()[2]);
}

```

### Row height in EJ2 JavaScript Treegrid control

You can customize the row height of treegrid rows through the [rowHeight](#) property. The `rowHeight` property is used to change the row height of entire treegrid rows.

In the below example, the `rowHeight` is set as '60px'.

#### INDEX.TS

```

import { TreeGrid } from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',

```

```

height: 275,
rowHeight: 60,
treeColumnIndex: 1,
columns: [
 { field: 'taskID', headerText: 'Task ID', width: 90,
textAlign: 'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 180 },
 {
 field: 'startDate', headerText: 'Start Date', width: 90,
textAlign: 'Right', type: 'date', format: 'yMd'
 },
 { field: 'duration', headerText: 'Duration', width: 80,
textAlign: 'Right' }
]
});
treeGridObj.appendTo('#TreeGrid');

```

## INDEX.HTML

### Customize row height for particular row

Grid row height for particular row can be customized using the [rowDataBound](#) event by setting the **rowHeight** in arguments for each row based on the requirement.

In the below example, the row height for the row with Task ID as '3' is set as '90px' using the **rowDataBound** event.

### INDEX.TS

```

import { TreeGrid, RowDataBoundEventArgs } from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 height: 275,
 rowDataBound: rowBound,
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 90,
textAlign: 'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 180 },
 {
 field: 'startDate', headerText: 'Start Date', width: 90,
textAlign: 'Right', type: 'date', format: 'yMd'
 },
 { field: 'duration', headerText: 'Duration', width: 80,
textAlign: 'Right' }
]
});
treeGridObj.appendTo('#TreeGrid');
function rowBound(args: RowDataBoundEventArgs) {
 if((args.data as TaskDetails).taskID === 3){
 args.rowHeight = 90;
 }
}
interface TaskDetails {

```

```
taskID ?: number;
}
```

### Row template in EJ2 JavaScript Treegrid control

The [rowTemplate](#) has an option to customise the look and behavior of the treegrid rows. The [rowTemplate](#) property accepts either the template string or HTML element ID.

#### INDEX.TS

```

import { TreeGrid } from '@syncfusion/ej2-treegrid';
import { textdata } from './datasource.ts';
let treegrid: TreeGrid = new TreeGrid(
{
 dataSource: textdata,
 childMapping: 'Children',
 treeColumnIndex: 0,
 rowTemplate: '#rowtemplate',
 height: 250,
 width: 'auto',
 rowHeight: 83,
 columns: [
 { field: 'EmpID', headerText: 'Employee ID', width: '150' },
 { field: 'Name', headerText: 'Employee Name', width: '150' },
 { field: 'Address', headerText: 'Employee Details', width:
'350' }
]
});
treegrid.appendTo('#TreeGrid');

```

#### INDEX.HTML

```

```

The [rowTemplate](#) property accepts only the TR element.

#### Row template with formatting

If the [rowTemplate](#) is used, the value cannot be formatted inside the template using the [columns.format](#) property. In that case, a function should be defined globally to format the value and invoke it inside the template.

#### INDEX.TS

```

import { TreeGrid } from '@syncfusion/ej2-treegrid';
import { textdata } from './datasource.ts';
import { Internationalization } from '@syncfusion/ej2-base';
let instance: Internationalization = new Internationalization();
(window as DateFormat).format = (value: Date) => {
 return instance.formatDate(value, { skeleton: 'yMd', type: 'date' });
};
interface DateFormat extends Window {
 format?: Function;
}
let treegrid: TreeGrid = new TreeGrid(
 {
 dataSource: textdata,
 childMapping: 'Children',
 treeColumnIndex: 0,
 rowTemplate: '#rowtemplate',
 height: 250,
 width: 'auto',
 rowHeight: 83,
 columns: [
 { field: 'EmpID', headerText: 'Employee ID', width: '150' },
 { field: 'Address', headerText: 'Employee Details', width:

### Limitations

Row template feature is not compatible with all the features which are available in treegrid and it has limited features support. Here we have listed out the features which are not compatible with row template feature.

- Filtering
- Paging
- Sorting
- Scrolling
- Searching
- Rtl
- Context Menu
- State Persistence

### Detail template in EJ2 JavaScript Treegrid control

The detail template provides additional information about a particular row. By expanding the parent row the child rows are expanded along with their detail template. The [detailTemplate](#) property accepts either the template string or HTML element ID.

To use detail template, inject the DetailRow module in the TreeGrid.

### INDEX.TS

```

import { TreeGrid, DetailRow } from '@syncfusion/ej2-treegrid';
import { textdata } from './datasource.ts';
import { Internationalization } from '@syncfusion/ej2-base';
TreeGrid.Inject(DetailRow);
let instance: Internationalization = new Internationalization();
(window as DateFormat).format = (value: Date) => {
 return instance.formatDate(value, { skeleton: 'yMd', type: 'date' });
};
interface DateFormat extends Window {
 format?: Function;
}
let treegrid: TreeGrid = new TreeGrid(
 {
 dataSource: textdata,
 childMapping: 'Children',
 treeColumnIndex: 0,
 detailTemplate: '#detailtemplate',
 }
);

```

```

 width: 'auto',
 columns: [
 { field: 'Name', headerText: 'First Name', width: '170' },
 { field: 'Designation', headerText: 'Designation', width:
'180' },
 { field: 'EmpID', headerText: 'EmployeeID', width: '110'},
 { field: 'Country', headerText: 'Country' , width: '90'},
]
 });
 treegrid.appendTo('#TreeGrid');

```

## INDEX.HTML

### Row drag and drop in EJ2 JavaScript Treegrid control

The TreeGrid rows can be reordered, dropped to another TreeGrid or custom control by enabling the [allowRowDragAndDrop](#) to true.

To use row drag and drop, inject the **RowDD** module in the TreeGrid.

#### *Drag and drop within Tree Grid*

The TreeGrid row drag and drop allows you to drag and drop TreeGrid rows on the same TreeGrid using drag icon. To enable row drag and drop, set the [allowRowDragAndDrop](#) to true. It provides the way to drop the row above, below or child to the target row with respective to the target row position.

### **INDEX.TS**

```

import { TreeGrid, RowDD } from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(RowDD);
let treegrid: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 treeColumnIndex: 1,
 childMapping: 'subtasks',
 allowRowDragAndDrop: true,
 height: 300,
 selectionSettings: { type: 'Multiple' },
 columns: [
 { field: 'taskID', headerText: 'Task ID', isPrimaryKey: true,
width: 90, textAlign: 'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 180 },
 {

```

```

 field: 'startDate', headerText: 'Start Date', width: 90,
 textAlign: 'Right', type: 'date', format: 'yMd'
 },
 { field: 'duration', headerText: 'Duration', width: 80,
 textAlign: 'Right' }
]
});
treegrid.appendTo('#TreeGrid');

```

## INDEX.HTML

```

</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

\* Selection feature must be enabled for row drag and drop.

\* For multiple row selection, the [type](#) property must be set to `multiple`.

\* The [isPrimaryKey](#) property is necessary to perform row drag and drop operation.

#### *Drag and drop to another Tree Grid*

To drag and drop between two TreeGrid, enable the [allowRowDragAndDrop](#) property and specify the target TreeGrid ID in [targetID](#) property of rowDropSettings.

#### **INDEX.TS**

```

import { TreeGrid, RowDD } from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(RowDD);
let treegrid: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 treeColumnIndex: 1,
 childMapping: 'subtasks',
 allowRowDragAndDrop: true,
 rowDropSettings: { targetID: 'destTree' },
 selectionSettings: { type: 'Multiple' },
 columns: [
 { field: 'taskID', headerText: 'Task ID', isPrimaryKey: true,
width: 90, textAlign: 'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 180 },
 {
 field: 'startDate', headerText: 'Start Date', width: 90,
textAlign: 'Right', type: 'date', format: 'yMd'
 },
 { field: 'duration', headerText: 'Duration', width: 80,
textAlign: 'Right' }
]
});
treegrid.appendTo('#TreeGrid');
let destTree: TreeGrid = new TreeGrid({
 dataSource: [],
 treeColumnIndex: 1,
 childMapping: 'subtasks',
 allowRowDragAndDrop: true,
 rowDropSettings: { targetID: 'TreeGrid' },
 selectionSettings: { type: 'Multiple' },

</body></html>

```

### Drag and drop events

The following events are triggered while drag and drop the treegrid rows.

[rowDragStartHelper](#) - Triggers when click the drag icon or treegrid row and this event is used to customize the drag element based on user criteria.<br/>

[rowDragStart](#) -Triggers when starts to drag the treegrid row. <br/>

[rowDrag](#) - Triggers while dragging the treegrid row. <br/>

[rowDrop](#) - Triggers when a drag element is dropped on the target element. <br/>

### Prevent reordering a row as child to another row

You can prevent the default behavior of dropping rows as children to the target by setting the `cancel` property to `true` in [rowDrop](#) event argument. You can also change the drop position after cancelling using [reorderRows](#) method.

In the below example drop action is cancelled and dropped above to target row.

### INDEX.TS

```

import { TreeGrid, RowDD } from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(RowDD);
let treegrid: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 treeColumnIndex: 1,
 childMapping: 'subtasks',
 allowRowDragAndDrop: true,
 height: 300,
 columns: [
 { field: 'taskID', headerText: 'Task ID', isPrimaryKey: true,
width: 90, textAlign: 'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 180 },
 {
 field: 'startDate', headerText: 'Start Date', width: 90,
 textAlign: 'Right', type: 'date', format: 'yMd'
 },
 { field: 'duration', headerText: 'Duration', width: 80,
 textAlign: 'Right' }
],
 rowDrop : (args) => {

```

```

 if (args.dropPosition == 'middleSegment') {
 args.cancel = true;
 treegrid.reorderRows([args.fromIndex], args.dropIndex, 'above');
 }
 });
 treegrid.appendTo('#TreeGrid');

```

## INDEX.HTML

## Cell

Cell in EJ2 JavaScript Treegrid control

### Customize cell styles

The appearance of cells can be customized by using the [queryCellInfo](#) event.

The [queryCellInfo](#) event triggers for every cell. In that event handler, you can get [QueryCellInfoEventArgs](#) that contains the details of the cell.

### INDEX.TS

```

import { TreeGrid, QueryCellInfoEventArgs } from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 height: 300,
 queryCellInfo: customiseCell,
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 90, textAlign:

 ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

### Custom attributes

You can customize the treegrid cells by adding a CSS class to the [customAttribute](#) property of the column.

```
`css
.e-attr {
background: '#d7f0f4';
}
`ts
{
field: 'taskID', headerText: 'Task ID', width: 90, customAttributes: {class: "e-attr"}, textAlign: 'Right'
}
`
```

In the below example, we have customized the cells of **TaskID** and **StartDate** columns.

### INDEX.TS

```
import { TreeGrid } from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 height: 300,
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 90,
customAttributes: {class: "e-attr"}, textAlign: 'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 160 },
 {
 field: 'startDate', headerText: 'Start Date', width: 90,
customAttributes: {class: "e-attr"}, textAlign: 'Right', type:
'date', format: 'yMd'
 },
 { field: 'duration', headerText: 'Duration', width: 80, textAlign:
'Right' }
]
});
treeGridObj.appendTo('#TreeGrid');
```

```

### Grid lines

The [gridLines](#) have option to display cell border and it can be defined by the [gridLines](#) property.

The available modes of grid lines are:

- | Modes | Actions |
- |-----|-----|
- | Both | Displays both the horizontal and vertical grid lines.|
- | None | No grid lines are displayed.|
- | Horizontal | Displays the horizontal grid lines only.|
- | Vertical | Displays the vertical grid lines only.|
- | Default | Displays grid lines based on the theme.|

### INDEX.TS

```
import { TreeGrid } from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 height: 300,
 gridLines: 'Both',
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 90, textAlign:
'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 160 },
 {
 field: 'startDate', headerText: 'Start Date', width: 90,
 textAlign: 'Right', type: 'date', format: 'yMd'
 },
 { field: 'duration', headerText: 'Duration', width: 80, textAlign:
'Right' }
]
});
treeGridObj.appendTo('#TreeGrid');
```

</body></html>

```

By default, the treegrid renders with **Default** mode.

You can refer to our [JavaScript Tree Grid](#) feature tour page for its groundbreaking feature representations. You can also explore our JavaScript Tree Grid example [JavaScript Tree Grid example](#) to know how to present and manipulate data.

### Content in EJ2 JavaScript Treegrid control

The HTML tags can be displayed in the TreeGrid header and content by enabling the [disableHtmlEncode](#) property.

### INDEX.TS

```

import { TreeGrid } from '@syncfusion/ej2-treegrid';
import { htmlData } from './datasource.ts';
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: htmlData,
 childMapping: 'subtasks',

```

```

 height: 300,
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: ' Task ID ',
 disableHtmlEncode: true, width: 140, textAlign: 'Right' },
 { field: 'taskName', headerText: ' Task Name ',
 disableHtmlEncode: false, width: 180 },
 { field: 'duration', headerText: 'Duration', width: 80, textAlign:
 'Right' },
 { field: 'progress', headerText: 'Progress', width: 80, textAlign:
 'Right' }
]
 });
 treeGridObj.appendTo('#TreeGrid');

```

### Auto wrap in EJ2 JavaScript Treegrid control

The auto wrap allows the cell content of the treegrid to wrap to the next line when it exceeds the boundary of the cell width. The Cell Content wrapping works based on the position of white space between words.

To enable auto wrap, set the [allowTextWrap](#) property to **true**.

You can configure the auto wrap mode by setting the [textWrapSettings.wrapMode](#) property.

There are three types of **wrapMode**. They are:

- **Both:** Both value is set by default. Auto wrap will be enabled for both the content and the header.
- **Header:** Auto wrap will be enabled only for the header.
- **Content:** Auto wrap will be enabled only for the content.

Note: When a column width is not specified, then auto wrap of columns will be adjusted with respect to the treegrid's width.

In the following example, the **textWrapSettings.wrapMode** is set to **Content**.

#### INDEX.TS

```

import { TreeGrid } from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 height: 300,
 allowTextWrap: true,
 textWrapSettings: { wrapMode: 'Content' },
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 90, textAlign:
'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 75 },
 {

```

```

 field: 'startDate', headerText: 'Start Date', width: 90,
 textAlign: 'Right', type: 'date', format: 'yMd'
 },
 { field: 'duration', headerText: 'Duration', width: 80, textAlign:
 'Right' }
]
});
treeGridObj.appendTo('#TreeGrid');

```

## INDEX.HTML

</body></html>

```

### Clip mode in EJ2 JavaScript Treegrid control

The clip mode provides options to display its overflow cell content and it can be defined by the [columns.clipMode](#) property.

There are three types of [clipMode](#). They are:

- **Clip:** Truncates the cell content when it overflows its area.
- **Ellipsis:** Displays ellipsis when the cell content overflows its area.
- **EllipsisWithTooltip:** Displays ellipsis when the cell content overflows its area, also it will display the tooltip while hover on ellipsis is applied.

### INDEX.TS

```

import { TreeGrid } from '@syncfusion/ej2-treegrid';
import { complexData } from './datasource.ts';
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: complexData,
 childMapping: 'subtasks',
 height: 300,
 gridLines: 'Both',
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 90, textAlign:
'Right' },
 { field: 'taskName', headerText: 'Task Name', clipMode: 'Clip',
width: 70 },
 { field: 'assignee.firstName', headerText: 'Assignee', clipMode:
'Ellipsis', width: 30},
 { field: 'priority', headerText: 'Priority', clipMode:
'EllipsisWithTooltip', width: 30 },
 { field: 'duration', headerText: 'Duration', width: 30, textAlign:
'Right' }
]
});
treeGridObj.appendTo('#TreeGrid');

```

### INDEX.HTML

</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

By default, [columns.clipMode](#) value is `Ellipsis`.

## Editing

### Edit in EJ2 JavaScript Treegrid control

The TreeGrid component has options to dynamically insert, delete and update records.

Editing feature is enabled by using [editSettings](#) property and it requires a primary key column for CRUD operations.

To define the primary key, set [columns.isPrimaryKey](#) to `true` in particular column.

To use CRUD, inject the [Edit](#) module in treegrid.

#### INDEX.TS

```
import { TreeGrid, Edit } from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(Edit);
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true, mode: 'Cell' },
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', isPrimaryKey: true, width:
90, textAlign: 'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 180 },
 { field: 'priority', headerText: 'Priority', width: 90 },
 { field: 'duration', headerText: 'Duration', width: 80, textAlign:
'Right' }
],
 height: 270
});
treeGridObj.appendTo('#TreeGrid');
```

#### INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
 <title>EJ2 Tree Grid</title>
 <meta charset="utf-8">
 <meta name="viewport" content="width=device-width, initial-scale=1.0">
 <meta name="description" content="Typescript Tree Grid Control">
 <meta name="author" content="Syncfusion">
 <link href="index.css" rel="stylesheet">
 <!-- Syncfusion Essential JS 2 Styles -->

```

#### Adding row position

The TreeGrid control provides the support to add the new row in the top, bottom, above selected row, below selected row and child position of tree grid content using [editSettings.newRowPosition](#) property. By default, a new row will be added at the top of the treegrid.

The following examples shows how to set new row position as **Child** in tree grid.

#### INDEX.TS

```

import { TreeGrid, Edit, Toolbar } from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(Edit, Toolbar);
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 toolbar: ['Add', 'Delete', 'Update', 'Cancel'],
 editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true, newRowPosition: 'Child', mode: 'Cell' },
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', isPrimaryKey: true, width:
90, textAlign: 'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 180 },
 {
 field: 'startDate', headerText: 'Start Date', width: 90,
 textAlign: 'Right', editType: 'datepickeredit', type: 'date', format: 'yMd'
 },
 { field: 'duration', headerText: 'Duration', width: 80, textAlign:
'Right' }
],

```

```

 height: 270
 });
 treeGridObj.appendTo('#TreeGrid');

```

## INDEX.HTML

```

### Confirmation messages

#### Delete confirmation

The delete confirm dialog can be shown when deleting a record by defining the [showDeleteConfirmDialog](#) as `true`

## INDEX.TS

```

import { TreeGrid, Edit, Toolbar } from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(Edit, Toolbar);
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 toolbar: ['Add', 'Delete', 'Update', 'Cancel'],

```

```

editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true, showDeleteConfirmDialog: true, mode: 'Cell' },
treeColumnIndex: 1,
columns: [
 { field: 'taskID', headerText: 'Task ID', isPrimaryKey: true, width:
90, textAlign: 'Right'},
 { field: 'taskName', headerText: 'Task Name', width: 180 },
 {
 field: 'startDate', headerText: 'Start Date', width: 90,
 textAlign: 'Right', editType: 'datepickeredit', type: 'date', format: 'yMd'
 },
 { field: 'duration', headerText: 'Duration', width: 80, textAlign:
'Reight' }
],
height: 270
});
treeGridObj.appendTo('#TreeGrid');

```

## INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
 <title>EJ2 Tree Grid</title>
 <meta charset="utf-8">
 <meta name="viewport" content="width=device-width, initial-scale=1.0">

### Disable editing for particular column

You can disable editing for particular columns by using the [columns.allowEditing](#).

In the following demo, editing is disabled for the **Start Date** column.

### INDEX.TS

```

import { TreeGrid, Edit, Toolbar } from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(Edit, Toolbar);
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 toolbar: ['Add', 'Delete', 'Update', 'Cancel'],
 editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true, mode: 'Cell' },
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', isPrimaryKey: true, width:
90, textAlign: 'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 180 },
 {
 field: 'startDate', headerText: 'Start Date', width: 90,
allowEditing: false, textAlign: 'Right', type: 'date', format: 'yMd'
 },
 { field: 'duration', headerText: 'Duration', width: 80, textAlign:
'Right' }
],
 height: 270
});
treeGridObj.appendTo('#TreeGrid');

```

```

#### *Troubleshoot: Editing works only for first row*

The Editing functionalities can be performed based upon the primary key value of the selected row.

If `primaryKey` is not defined in the treegrid, then edit or delete action take places the first row.

You can refer to our [JavaScript Tree Grid](#) feature tour page for its groundbreaking feature representations. You can also explore our JavaScript Tree Grid example [JavaScript Tree Grid example](#) to knows how to present and manipulate data.

Edit types in EJ2 JavaScript Treegrid control

#### *Cell edit type and its params*

The `columns.editType` is used to customize the edit type of the particular column.

You can set the `columns.editType` based on data type of the column.

- `numericedit` - [NumericTextBox](#) component for integers, double, and decimal data types.
- `defaultedit` - [TextBox](#) component for string data type.
- `dropdownedit` - [DropDownList](#) component for list data type.
- `booleanedit` - [CheckBox](#) component for boolean data type.
- `datepickeredit` - [DatePicker](#) component for date data type.
- `datetimepickeredit` - [DateTimePicker](#) component for date time data type.

Also, you can customize model of the `columns.editType` component through the `columns.edit.params`.

The following table describes cell edit type component and their corresponding edit params of the column.

Component | Example

[NumericTextBox](#) | params: { decimals: 2, value: 5 }

[TextBox](#) | -

[DropDownList](#) | params: { value: 'Germany' }

[Checkbox](#) | params: { checked: true }

[DatePicker](#) | params: { format: 'dd.MM.yyyy' }

[DateTimePicker](#) | params: { value: new Date() }

## INDEX.TS

```
import { TreeGrid, Edit, Toolbar } from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(Edit, Toolbar);
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 toolbar: ['Add', 'Delete', 'Update', 'Cancel'],
 editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true, mode: 'Row' },
 treeColumnIndex: 1,
 columns: [
 {
 field: 'taskID', headerText: 'Task ID', isPrimaryKey: true,
textAlign: 'Right', width: 100
 },
 {
 field: 'taskName', headerText: 'Task Name', editType:

 ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

If edit type is not defined in the column, then it will be considered as the **stringedit** type (Textbox component).

#### Cell edit template

The cell edit template is used to add a custom component for a particular column by invoking the following functions:

- **create** - It is used to create the element at the time of initialization.
- **write** - It is used to create the custom component or assign default value at the time of editing.
- **read** - It is used to read the value from the component at the time of save.
- **destroy** - It is used to destroy the component.

#### INDEX.TS

```

import { TreeGrid, Edit, Toolbar, Column } from '@syncfusion/ej2-treegrid';
import { AutoComplete } from '@syncfusion/ej2-dropdowns';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(Edit, Toolbar);
let elem: HTMLElement;
let autoCompleteObj: AutoComplete;
let treeGridObj: TreeGrid = new TreeGrid(

```

```

### Batch editing in EJ2 JavaScript Treegrid control

In Batch edit mode, when you double-click on the Tree Grid cell, then the target cell changed to edit state. You can bulk save (added, changed and deleted data in the single request) to data source by click on the toolbar's **Update** button or by externally invoking the [batchSave](#) method. To enable Batch edit, set the [editSettings.mode](#) as **Batch**.

### INDEX.TS

```

import { TreeGrid, Edit, Toolbar } from '@syncfusion/ej2-treegrid';
import { projectData } from './datasource.ts';
TreeGrid.Inject(Edit, Toolbar);
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: projectData,
 idMapping: 'TaskID',
 parentIdMapping: 'parentID',
 toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel'],
 editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true, mode: 'Batch', newRowPosition: 'Below' },
 treeColumnIndex: 1,
 columns: [
 { field: 'TaskID', headerText: 'Task ID', isPrimaryKey: true, width:
90, textAlign: 'Right' },
 { field: 'TaskName', headerText: 'Task Name', width: 180 },
 {
 field: 'StartDate', headerText: 'Start Date', width: 90,
 editType: 'datepickeredit', textAlign: 'Right', type: 'date', format: 'yMd'
 },
 { field: 'Duration', headerText: 'Duration', width: 80, textAlign:
'Right' }
],
 height: 270
});
treeGridObj.appendTo('#TreeGrid');

```

## Template editing in EJ2 JavaScript Treegrid control

*Dialog template*

The dialog template editing provides an option to customize the default behavior of dialog editing. Using the dialog template, you can render your own editors by defining the [editSettings.mode](#) as **Dialog** and [template](#) as SCRIPT element ID or HTML string which holds the template.

In some cases, you need to add the new field editors in the dialog which are not present in the column model. In that situation, the dialog template will help you to customize the default edit dialog.

In the following sample, treegrid enabled with dialog template editing.

**INDEX.TS**

```

import { TreeGrid, Edit, Toolbar, DialogEditEventArgs, SaveEventArgs } from
'@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
import { DataUtil } from '@syncfusion/ej2-data';
import { DatePicker } from '@syncfusion/ej2-calendars';
import { DropDownList } from '@syncfusion/ej2-dropdowns';
import { CheckBox } from '@syncfusion/ej2-buttons';

```

```

import { NumericTextBox } from '@syncfusion/ej2-inputs';
TreeGrid.Inject(Edit, Toolbar);
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel'],
 editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true, mode: 'Dialog',
 template: '#dialogtemplate' },
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', isPrimaryKey: true, width:
90, textAlign: 'Right'},
 { field: 'taskName', headerText: 'Task Name', width: 180 },
 {
 field: 'startDate', headerText: 'Start Date', width: 90,
textAlign: 'Right', type: 'date', format: 'yMd'
 },
 { field: 'progress', headerText: 'Progress', width: 80, textAlign:
'Right' }
],
 height: 270,
 actionBegin: (args: SaveEventArgs) => {
 if (args.requestType === 'save') {
 // cast string to integer value.
 args.data['progress'] =
parseFloat(args.form.querySelector("#progress").value);
 }
 },
 actionComplete: (args: DialogEditEventArgs) => {
 if ((args.requestType === 'beginEdit' || args.requestType ===
'add')) {
 // Add Validation Rules
 args.form.ej2_instances[0].addRules('progress', {max: 100});
 // EJ2-control Rendering
 let priorityData: {}[] =
DataUtil.distinct(treeGridObj.grid.dataSource, 'priority', true);
 new DropDownList({value: args.rowData.priority, popupHeight:
'200px', floatLabelType: 'Always',
 dataSource: priorityData, fields: {text: 'priority', value:
'priority'}, placeholder: 'Priority'},
args.form.elements.namedItem('priority') as HTMLInputElement);
 new DatePicker({value: args.rowData.startDate, floatLabelType:
'Always', placeholder: 'Start Date'},
args.form.elements.namedItem('startDate') as HTMLInputElement)
 new DatePicker({value: args.rowData.endDate, floatLabelType:
'Always', placeholder: 'End Date'}, args.form.elements.namedItem('endDate')
as HTMLInputElement)
 new CheckBox({ label: 'Approved', checked: args.rowData.approved
}, args.form.elements.namedItem('approved'));
 new NumericTextBox({value: args.rowData.progress, format: 'n',
placeholder: 'Progress', floatLabelType: 'Always' },
args.form.elements.namedItem('progress') as HTMLInputElement);
 // Set initail Focus
 if (args.requestType === 'beginEdit') {
 (args.form.elements.namedItem('taskName') as
HTMLInputElement).focus();
 }
 }
 }
});

```

```

 }
 }
});
treeGridObj.appendTo('#TreeGrid');

```

 ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

The template form editors should have **name** attribute.

#### Template context

The Essential JS2 packages has a built-in template engine. Using the template engine, you can access the row information inside the HTML element and bind the attributes, values, or elements based on this row information.

The following properties will be available at the time of template execution.

Property Name	Usage
---------------	-------

isAdd	A Boolean property; it defines whether the current row should be a new record or not.
-------	---------------------------------------------------------------------------------------

In the following code example, the **OrderID** textbox has been disabled by using the **isAdd** property.

,

// The disabled attributes will be added based on the isAdd property.

```

<input id="taskID" name="taskID" type="text" value=${if(isAdd)} " ${else} ${taskID} ${/if} ${if(isAdd)}"
${else} disabled ${/if}/>

```

,

The following code example illustrates rendering the **taskID** textbox, when a new record is added.

,

```

${if(isAdd)}

```

```

<div class="form-group col-md-6">

```

```

<div class="e-float-input e-control-wrapper">

```

```

<input id="taskID" name="taskID" type="text" value=${if(isAdd)} " ${else} ${taskID} ${/if} ${if(isAdd)}"
${else} disabled ${/if}/>

```

```

```

```

<label class="e-float-text e-label-top" for="OrderID">Task ID</label>

```

```

</div>

```

```

</div>

```

```
$/if}
```

The dialog template syntax supports the ES6 expression string literals, and you can refer to the [Template Engine](#) for more template syntax.

#### Render editors as components

You can convert the form editors to EJ2 controls in the [actionComplete](#) event based on the `requestType` as `beginEdit` or `add`.

The following code example illustrates rendering the drop-down list control in the `actionComplete` event.

```
`ts
actionComplete: (args: DialogEditEventArgs) => {
 if ((args.requestType === 'beginEdit' || args.requestType === 'add')) {
 let priorityData: {}[] = DataUtil.distinct(treeGridObj.grid.dataSource, 'priority', true);
 new DropDownList({value: args.rowData.priority, popupHeight: '200px', floatLabelType: 'Always',
 dataSource: priorityData, fields: {text: 'priority', value: 'priority'}, placeholder: 'Priority'},
 args.form.elements.namedItem('priority') as HTMLInputElement);
 }
}
```

#### Get value from editor

You can read, format, and update the current editor value in the [actionBegin](#) event at the time of setting `requestType` to `save`.

In the following code example, the `progress` value has been formatted and updated.

```
`ts
actionBegin: (args: SaveEventArgs) => {
 if (args.requestType === 'save') {
 // cast string to integer value.
 args.data['progress'] = parseFloat(args.form.querySelector("#progress").value);
 }
}
```

#### Set focus to editor

By default, the first input element in the dialog will be focused while opening the dialog.

If the first input element is in disabled or hidden state, focus the valid input element in the [actionComplete](#) event based on `requestType` as `beginEdit`.

```
`ts
```

```

actionComplete: (args: DialogEditEventArgs) => {
// Set initail Focus
if (args.requestType === 'beginEdit') {
(args.form.elements.namedItem('taskName')as HTMLInputElement).focus();
}
}
,

```

#### Adding validation rules for custom editors

If you have used additional fields that are not present in the column model, then add the validation rules to the [actionComplete](#) event.

```

`ts
actionComplete: (args: DialogEditEventArgs) => {
if ((args.requestType === 'beginEdit' || args.requestType === 'add')) {
// Add Validation Rules
args.form.ej2_instances[0].addRules('progress', {max: 100});
}
}
,

```

#### Command column editing in EJ2 JavaScript Treegrid control

The command column provides an option to add CRUD action buttons in a column. This can be defined by the [column.commands](#) property.

The available built-in command buttons are:

Command Button   Actions
----- -----
Edit   Edit the current row.
Delete   Delete the current row.
Save   Update the edited row.
Cancel   Cancel the edited state.

#### INDEX.TS

```

import { TreeGrid, CommandColumn, Edit } from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(CommandColumn, Edit);
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true, mode: 'Row' },
 treeColumnIndex: 1,

```

```

 columns: [
 { field: 'taskID', headerText: 'Task ID', isPrimaryKey: true, width:
90, textAlign: 'Right'},
 { field: 'taskName', headerText: 'Task Name', width: 180 },
 { field: 'duration', headerText: 'Duration', width: 80, textAlign:
'Right' },
 {
 headerText: 'Manage Records', width: 130,
 commands: [{ type: 'Edit', buttonOption: { iconCss: ' e-icons e-
edit', cssClass: 'e-flat' } },
 { type: 'Delete', buttonOption: { iconCss: 'e-icons e-
delete', cssClass: 'e-flat' } },
 { type: 'Save', buttonOption: { iconCss: 'e-icons e-update',
cssClass: 'e-flat' } },
 { type: 'Cancel', buttonOption: { iconCss: 'e-icons e-
cancel-icon', cssClass: 'e-flat' } }]
 }
],
 height: 270
 });
 treeGridObj.appendTo('#TreeGrid');

```

## INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
 <title>EJ2 Tree Grid</title>

</body></html>

```

## Validation in EJ2 JavaScript Treegrid control

### Column validation

Column validation allows you to validate the edited or added row data and it display errors for invalid fields before saving data.

TreeGrid uses **Form Validator** component for column validation.

You can set validation rules by defining the [columns.validationRules](#).

### INDEX.TS

```

import { TreeGrid, Edit, Toolbar } from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(Edit, Toolbar);
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 toolbar: ['Add', 'Delete', 'Update', 'Cancel'],
 editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true, showDeleteConfirmDialog: true, mode: 'Cell' },
 treeColumnIndex: 1,
 columns: [
 {
 field: 'taskID', headerText: 'Task ID', isPrimaryKey: true,
 textAlign: 'Right',
 validationRules: { required: true, number: true }, width: 100
 },
 {
 field: 'taskName', headerText: 'Task Name', editType:
'stringedit',
 validationRules: { required: true }, width: 170
 },
 {
 field: 'startDate', headerText: 'Start Date', textAlign:
'Right', width: 180,

```

```

 editType: 'datetimepickeredit', edit: { params: { format: 'M/d/y
hh:mm a' } } },
 format: { format: 'M/d/y hh:mm a', type: 'dateTime' },
validationRules: { date: true }
 },
 {
 field: 'approved', headerText: 'Approved', width: 110, editType:
'booleanedit',
 type: 'boolean', displayAsCheckBox: true
 },
 {
 field: 'progress', headerText: 'Progress', textAlign: 'Right',
width: 120,
 editType: 'numericedit', validationRules: { number: true, min: 0
}, edit: { params: { format: 'n' } }
 },
 { field: 'priority', headerText: 'Priority', width: 110, editType:
'dropdownedit', validationRules: { required: true } }
],
 height: 270
});
treeGridObj.appendTo('#TreeGrid');

```

## INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
 <title>EJ2 Tree Grid</title>
 <meta charset="utf-8">
 <meta name="viewport" content="width=device-width, initial-scale=1.0">
 <meta name="description" content="Typescript Tree Grid Control">
 <meta name="author" content="Syncfusion">
 <link href="index.css" rel="stylesheet">
 <!-- Syncfusion Essential JS 2 Styles -->
 <link rel="stylesheet"
href="https://cdn.syncfusion.com/ej2/material.css">
 <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
splitbuttons/styles/material.css" rel="stylesheet">

 <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
 <script src="es5-datasource.js" type="text/javascript"></script>
 <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

 <div id="container">
 <div id="TreeGrid"></div>
 </div>
 <script>
var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
 </script>

```

```
<script src="index.js" type="text/javascript"></script>
</body></html>
```

### Custom validation

You can define your own custom validation rules for the specific columns by using **Form Validator custom rules**.

In the below demo, custom validation applied for **Priority** column.

### INDEX.TS

```
import { TreeGrid, Edit, Toolbar } from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(Edit, Toolbar);
let customFn: (args: { [key: string]: string }) => boolean = (args: { [key:
string]: string }) => {
 return args['value'].length <= 8;
};
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 toolbar: ['Add', 'Delete', 'Update', 'Cancel'],
 editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true, showDeleteConfirmDialog: true, mode: 'Cell' },
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', isPrimaryKey: true, width:
90, textAlign: 'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 180 },
 {
 field: 'startDate', headerText: 'Start Date', width: 90,
 textAlign: 'Right', editType: 'datepickeredit', type: 'date', format: 'yMd'
 },
 { field: 'priority', headerText: 'Priority', width: 80,
 validationRules: { required: true, minLength: [customFn, 'Value should be
within 8 letters'] } }
],
 height: 270
});
treeGridObj.appendTo('#TreeGrid');
```

### INDEX.HTML

```

### Persisting data in server in EJ2 JavaScript Treegrid control

Edited data can be persisted in the database using the RESTful web services.

All the CRUD operations in the treegrid are done through [DataManager](#). The **DataManager** has an option to bind all the CRUD related data in server-side.

For your information, the ODataAdaptor persists data in the server as per OData protocol.

In the following section, we have explained how to perform CRUD operation in server-side using the [UrlAdaptor](#) and **RemoteSave Adaptor**.

#### *URL adaptor*

You can use the [UrlAdaptor](#) of **DataManager** when binding data source from remote data.

In the initial load of treegrid, data are fetched from remote data and bound to the treegrid using **url** property of **DataManager**.

You can map The CRUD operation in treegrid can be mapped to server-side Controller actions using the properties **insertUrl**, **removeUrl**, **updateUrl** and **batchUrl**.

The following code example describes the above behavior.

Also, when using the **UrlAdaptor**, you need to return the data as JSON from the controller action and the JSON object must contain a property as **result** with **dataSource** as its value and one more property **count** with the **dataSource** total records count as its value.

The following code example describes the above behavior.

```

`ts
public ActionResult DataSource(DataManager dm)
{
 var DataSource = TreeData.GetTree();

```

```

DataOperations operation = new DataOperations();
if (dm.Where != null && dm.Where.Count > 0)
{
 DataSource = operation.PerformFiltering(DataSource, dm.Where, "and"); //perform filtering and
 maintain child records on Expand/Collapse operation
}
var count = DataSource.ToList<TreeData>().Count();
if (dm.Skip != 0)
{
 DataSource = operation.PerformSkip(DataSource, dm.Skip); //Paging
}
if (dm.Take != 0)
{
 DataSource = operation.PerformTake(DataSource, dm.Take);
}
return dm.RequiresCounts ? Json(new { result = DataSource, count = count }) : Json(DataSource);
}
`

```

#### *Insert record*

Using the `insertUrl` property, you can specify the controller action mapping URL to perform insert operation on the server-side.

The following code example describes the above behavior and also we have inserted new record based on the `newRowPosition` TreeGrid editSettings as "Below".

```

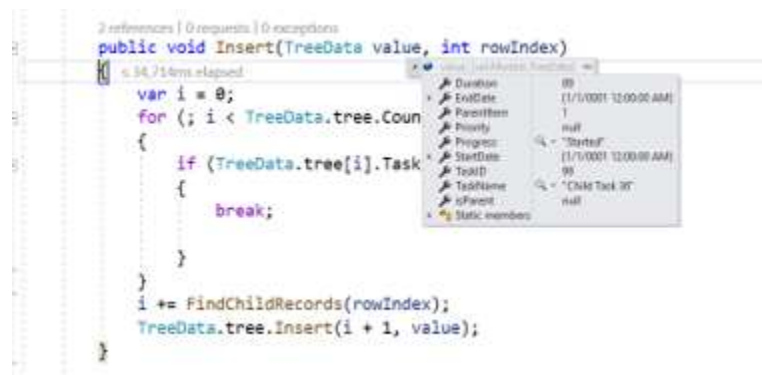

`ts
public void Insert(TreeGridData value, int relationalKey)
{
 var i = 0;
 for (; i < TreeData.tree.Count; i++)
 {
 if (TreeData.tree[i].TaskID == relationalKey)
 {
 break;
 }
 }
}

```

`i += FindChildRecords(relationalKey);` // Inserted new record when newRowPosition API is in "Below".

```
TreeData.tree.Insert(i + 1, value);
}
public int FindChildRecords(int id)
{
 var count = 0;
 for (var i = 0; i < TreeData.tree.Count; i++)
 {
 if (TreeData.tree[i].ParentItem == id)
 {
 count++;
 count += FindChildRecords(TreeData.tree[i].TaskID);
 }
 }
 return count;
}
```

The newly added record details are bound to the `value` parameter and `relationalKey` contains primaryKey value of an selected record helps to find out the position of newly added record. Please refer to the following screenshot.

#### Update record

Using the `updateUrl` property, the controller action mapping URL can be specified to perform save/update operation on the server-side.

The following code example describes the previous behavior.

```
`ts
public ActionResult Update(TreeGridData value)
{

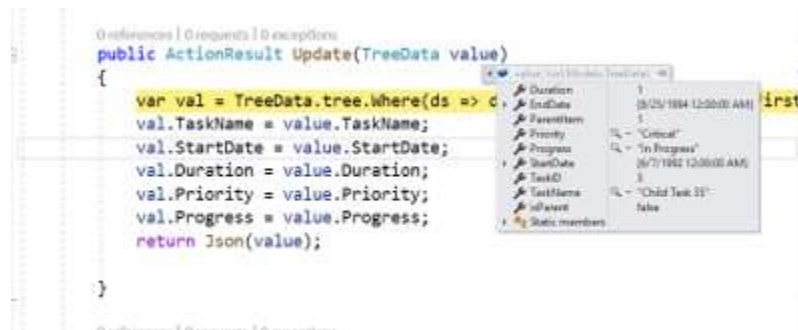

```

```

var val = TreeData.tree.Where(ds => ds.TaskID == value.TaskID).FirstOrDefault();
val.TaskName = value.TaskName;
val.StartDate = value.StartDate;
val.Duration = value.Duration;
val.Priority = value.Priority;
val.Progress = value.Progress;
return Json(value);
}

```

The updated record details are bound to the `value` parameter. Please refer to the following screenshot.

#### Delete record

Using the `removeUrl` and `batchUrl` property, the controller action mapping URL can be specified to perform delete operation on the server-side.

The following code example describes the previous behavior.

```

`ts
public ActionResult Delete(int key)
{
 TreeData.tree.Remove(TreeData.tree.Where(ds => ds.TaskID == key).FirstOrDefault());
}

// Remove method (batchUrl) will be triggered when we delete parent record.
public ActionResult Remove(List<TreeGridData> changed, List<TreeGridData> added,
 List<TreeGridData> deleted)
{
 for (var i = 0; i < deleted.Count; i++)
 {
 TreeData.tree.Remove(TreeData.tree.Where(ds => ds.TaskID == deleted[i].TaskID).FirstOrDefault());
 }
}

```

```

}
,

```

The deleted record primary key value is bound to the **key** parameter. Please refer to the following screenshot.

While delete parent record, the parent and child records is bound to the **deleted** parameter. Please refer to the following screenshot.

#### Remote save adaptor

You may need to perform all Tree Grid Actions in client-side except the CRUD operations, that should be interacted with server-side to persist data. It can be achieved in TreeGrid by using **RemoteSaveAdaptor**.

Datasource must be set to **json** property and set **RemoteSaveAdaptor** to the **adaptor** property. CRUD operations can be mapped to server-side using **updateUrl**, **insertUrl**, **removeUrl** and **batchUrl** properties.

You can use the following code example to use **RemoteSaveAdaptor** in TreeGrid.

The following code example describes how to fetch the data from **ViewBag** in angular.

```

,

```

```

<script type="text/javascript">

```

```

window.griddata = '@Html.Raw(Json.Encode(ViewBag.dataSource))';

```

```

</script>

```

```

,

```

The following code example describes the CRUD operations handled at server-side.

```

`ts

```

```

public ActionResult Index(DataManager dm)

```

```

{

```

```

var data = TreeData.GetTree();

```

```

ViewBag.dataSource = data;

```

```
return View();
}
public void Insert(TreeData value, int relationalKey)
{
 var i = 0;
 for (; i < TreeData.tree.Count; i++)
 {
 if (TreeData.tree[i].TaskID == relationalKey)
 {
 break;
 }
 }
 i += FindChildRecords(relationalKey); // Inserted new record when newRowPosition API is in "Below".
 TreeData.tree.Insert(i + 1, value);
}
public ActionResult Update(TreeData value)
{
 var val = TreeData.tree.Where(ds => ds.TaskID == value.TaskID).FirstOrDefault();
 val.TaskName = value.TaskName;
 val.StartDate = value.StartDate;
 val.Duration = value.Duration;
 val.Priority = value.Priority;
 val.Progress = value.Progress;
 return Json(value);
}
public ActionResult Delete(int key)
{
 TreeData.tree.Remove(TreeData.tree.Where(ds => ds.TaskID == key).FirstOrDefault());
}
// Remove method (batchUrl) will be triggered when we delete parent record.
public ActionResult Remove(List<TreeGridData> changed, List<TreeGridData> added,
List<TreeGridData> deleted)
{

```

```

for (var i = 0; i < deleted.Count; i++)
{
 TreeData.tree.Remove(TreeData.tree.Where(ds => ds.TaskID == deleted[i].TaskID).FirstOrDefault());
}
}
,

```

### Sorting in EJ2 JavaScript Treegrid control

Sorting enables you to sort data in the **Ascending** or **Descending** order.

To sort a column, click the column header.

To sort multiple columns, press and hold the CTRL key and click the column header. You can clear sorting of any one of the multi-sorted columns by pressing and holding the SHIFT key and clicking the specific column header.

To enable sorting in the TreeGrid, set the [allowSorting](#) to true. Sorting options can be configured through the [sortSettings](#).

To sort, inject the [Sort](#) module in the treegrid.

#### INDEX.TS

```

import { TreeGrid, Sort } from '@syncfusion/ej2-treegrid';
import { sortData } from './datasource.ts';
TreeGrid.Inject(Sort);
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sortData,
 childMapping: 'subtasks',
 allowSorting: true,
 height: 315,
 columns: [
 { field: 'Category', headerText: 'Category', width: 140 },
 { field: 'orderName', headerText: 'Order Name', width: 200 },
 { field: 'orderDate', headerText: 'Order Date', width: 150,
 textAlign: 'Right', format: 'yMd', type: 'date' },
 { field: 'units', headerText: 'Units', width: 90, textAlign: 'Right' }
]
});
treeGridObj.appendTo('#TreeGrid');

```

#### INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

</head>
<body>

 <div id="container">
 <div id="TreeGrid"></div>
 </div>
<script>
var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

\* TreeGrid columns are sorted in the **Ascending** order. If you click the already sorted column, the sort direction toggles.

\* You can apply and clear sorting by invoking [sortByColumn](#) and [clearSorting](#) methods.

\* To disable sorting for a particular column, set the [columns.allowSorting](#) to false.

#### Initial sort

To sort at initial rendering, set the [field](#) and [direction](#) in the **sortSettings.columns**.

**INDEX.TS**

```
import { TreeGrid, Sort } from '@syncfusion/ej2-treegrid';
import { sortData } from './datasource.ts';
TreeGrid.Inject(Sort);
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sortData,
 childMapping: 'subtasks',
 allowSorting: true,
 height: 315,
 treeColumnIndex: 1,
 sortSettings: { columns: [{ field: 'Category', direction: 'Ascending' },
 { field: 'orderName', direction: 'Ascending' }] },
 columns: [
 { field: 'Category', headerText: 'Category', width: 140 },
 { field: 'orderName', headerText: 'Order Name', width: 200 },
 { field: 'orderDate', headerText: 'Order Date', width: 120,
 textAlign: 'Right', format: 'yMd', type: 'date' },
 { field: 'units', headerText: 'Units', width: 90, textAlign: 'Right' }
]
});
treeGridObj.appendTo('#TreeGrid');
```

**INDEX.HTML**

```

### Sorting events

During the sort action, the treegrid component triggers two events. The [actionBegin](#) event triggers before the sort action starts, and the [actionComplete](#) event triggers after the sort action is completed. Using these events you can perform the needed actions.

### INDEX.TS

```

import { TreeGrid, Sort } from '@syncfusion/ej2-treegrid';
import { sortData } from './datasource.ts';
TreeGrid.Inject(Sort);
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sortData,
 childMapping: 'subtasks',
 allowSorting: true,
 height: 315,
 treeColumnIndex: 1,
 columns: [
 { field: 'Category', headerText: 'Category', width: 140 },
 { field: 'orderName', headerText: 'Order Name', width: 200 },
 { field: 'orderDate', headerText: 'Order Date', width: 120,
 textAlign: 'Right', format: 'yMd', type: 'date' },
 { field: 'units', headerText: 'Units', width: 90, textAlign: 'Right'
 }
],
 actionBegin: actionHandler,
 actionComplete: actionHandler
});
treeGridObj.appendTo('#TreeGrid');
function actionHandler(args: SortEventArgs) {
 alert(args.requestType + ' ' + args.type); //custom Action
}

```

```
}

```

**INDEX.HTML**

```
<!DOCTYPE html><html lang="en"><head>

</head>
<body>

 <div id="container">
 <div id="TreeGrid"></div>
 </div>
<script>
var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}

```

```

</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

The `args.requestType` is the current action name. For example, in sorting the `args.requestType` value is 'sorting'.

<!-- Custom sort comparer

You can customize the default sort action for a column by defining the [column.sortComparer](#) property. The sort comparer function has the same functionality like [Array.sort](#) sort comparer.

In the following example, custom sort comparer function was defined in the `Category` column.

### INDEX.TS

```

import { TreeGrid, Sort } from '@syncfusion/ej2-treegrid';
import { sortData } from './datasource.ts';
TreeGrid.Inject(Sort);
// The custom function
let sortComparer: (reference: string, comparer: string) => number =
(reference: string,
comparer: string) => {
 if (reference < comparer) {
 return -1;
 }
 if (reference > comparer) {
 return 1;
 }
 return 0;
};
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sortData,
 childMapping: 'subtasks',
 allowSorting: true,
 height: 315,
 treeColumnIndex: 1,
 columns: [
 { field: 'Category', headerText: 'Category', width: 140 },
 { field: 'orderName', headerText: 'Order Name', width: 200 },
 { field: 'orderDate', headerText: 'Order Date', width: 120,
textAlign: 'Right', format: 'yMd', type: 'date' },
 { field: 'units', headerText: 'Units', width: 90, textAlign: 'Right' }
]
});
treeGridObj.appendTo('#TreeGrid');

```

### INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
 <title>EJ2 Grid</title>

</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

The sort comparer function will work only for the local data. -->

### Touch interaction

When you tap the treegrid header on touchscreen devices, the selected column header is sorted. A

popup is displayed for multi-column sorting. To sort multiple columns, tap the popup, and then tap the desired treegrid headers.

The following screenshot shows treegrid touch sorting.

 Touch Sorting" style="width:320px;height: 620px">

You can refer to our [JavaScript Tree Grid](#) feature tour page for its groundbreaking feature representations. You can also explore our JavaScript Tree Grid example [JavaScript Tree Grid example](#) to know how to present and manipulate data.

### Filtering

#### Filtering in EJ2 JavaScript Treegrid control

Filtering allows you to view specific or related records based on filter criteria. To enable filtering in the TreeGrid, set the [allowFiltering](#) to true. Filtering options can be configured through [filterSettings](#).

To use filter, inject the `Filter` module in the treegrid.

#### INDEX.TS

```
import { TreeGrid, Filter } from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(Filter);
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 height: 275,
 allowFiltering: true,
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 75, textAlign:
'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 180, textAlign:
'Left' },
 {
 field: 'startDate', headerText: 'Start Date', width: 90,
textAlign: 'Right', type: 'date', format: 'yMd'
 },
 { field: 'duration', headerText: 'Duration', width: 80, textAlign:
'Right' }
]
});
treeGridObj.appendTo('#TreeGrid');
```

```

\* You can apply and clear filtering by using [filterByColumn](#) and [clearFiltering](#) methods.

\* To disable filtering for a particular column, set

[columns.allowFiltering](#) to false.

*Filter hierarchy modes*

TreeGrid provides support for a set of filtering modes with [filterSettings.filterHierarchyMode](#) property.

The below are the type of filter mode available in TreeGrid.

- **Parent** : This is the default filter hierarchy mode in TreeGrid. The filtered records are displayed with its parent records, if the filtered records not have any parent record then the filtered records only displayed.
- **Child** : The filtered records are displayed with its child record, if the filtered records not have any child record then the filtered records only displayed.
- **Both** : The filtered records are displayed with its both parent and child record, if the filtered records not have any parent and child record then the filtered records only displayed.
- **None** : The filtered records are only displayed.

**INDEX.TS**

```
import { TreeGrid, Filter } from '@syncfusion/ej2-treegrid';
import { DropDownList, ChangeEventArgs } from '@syncfusion/ej2-dropdowns';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(Filter);
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 height: 225,
 allowFiltering: true,
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 75, textAlign:
'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 180, textAlign:
'Left' },
 {
 field: 'startDate', headerText: 'Start Date', width: 90,
 textAlign: 'Right', type: 'date', format: 'yMd'
 },
 { field: 'duration', headerText: 'Duration', width: 80, textAlign:
'Right' }
]
});
treeGridObj.appendTo('#TreeGrid');
let dropDownMode: DropDownList = new DropDownList({
 dataSource: [
 { id: 'Parent', mode: 'Parent' },
 { id: 'Child', mode: 'Child' },
 { id: 'Both', mode: 'Both' },
 { id: 'None', mode: 'None' },
],
 fields: { text: 'mode', value: 'id' },
 value: 'Parent',
 change: (e: ChangeEventArgs) => {
 let mode: any = <string>e.value;
 treeGridObj.filterSettings.hierarchyMode = mode;
 treeGridObj.clearFiltering();
 }
});
```

```
dropDownMode.appendTo('#mode');
```

<script src="index.js" type="text/javascript"></script>
</body></html>

```

### Filter operators

The filter operator for a column can be defined in the `filterSettings.columns.operator` property.

The available operators and its supported data types are:

Operator	Description	Supported Types
----------	-------------	-----------------

startswith | Checks whether the value begins with the specified value. |String

endswith | Checks whether the value ends with the specified value. |String

contains | Checks whether the value contains the specified value. |String

equal | Checks whether the value is equal to the specified value. |String &#124; Number &#124; Boolean &#124; Date

notequal | Checks for values not equal to the specified value. |String &#124; Number &#124; Boolean &#124; Date

greaterthan | Checks whether the value is greater than the specified value. |Number &#124; Date

greaterthanorequal | Checks whether a value is greater than or equal to the specified value. |Number &#124; Date

lessthan | Checks whether the value is less than the specified value. |Number &#124; Date

lessthanorequal | Checks whether the value is less than or equal to the specified value. |Number &#124; Date

By default, the `filterSettings.columns.operator` value is `equal`.

#### *Diacritics*

By default, treegrid ignores diacritic characters while filtering. To include diacritic characters, set the `filterSettings.ignoreAccent` as `true`.

In the following sample, type **aero** in **Name** column to filter diacritic characters.

#### **INDEX.TS**

```
import { TreeGrid, Filter } from '@syncfusion/ej2-treegrid';
import { diacritics } from './datasource.ts';
TreeGrid.Inject(Filter);
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: diacritics,
 childMapping: 'Children',
 height: 275,
 allowFiltering: true,
 filterSettings: { ignoreAccent: true },
 treeColumnIndex: 0,
 columns: [
 { field: 'EmpID', headerText: 'Employee ID', width: 95 },
 { field: 'Name', headerText: 'Name', width: 110 },
 { field: 'DOB', headerText: 'DOB', width: 90, textAlign: 'Right',
format: 'yMd' },
 { field: 'Country', width: 65 }
]
});
treeGridObj.appendTo('#TreeGrid');
```

</body></html>

```

You can refer to our [JavaScript Tree Grid](#) feature tour page for its groundbreaking feature representations. You can also explore our JavaScript Tree Grid example [JavaScript Tree Grid example](#) to know how to present and manipulate data.

### Filter bar in EJ2 JavaScript Treegrid control

By setting the [allowFiltering](#) to true, the filter bar row will render next to the header, which allows you to filter data. You can filter the records with different expressions depending upon the column type.

#### Filter bar expressions:

You can enter the following filter expressions (operators) manually in the filter bar.

Expression	Example	Description	Column Type
=	=value	equal	Number
!=	!=value	notequal	Number
>	>value	greaterthan	Number
<	<value	lessthan	Number
=	>=value	greaterthanorequal	Number
<=	<=value	lessthanorequal	Number
/	/value	startswith	String
%	%value	endswith	String
N/A	N/A	Equal	Date
N/A	N/A	Equal	Boolean

#### INDEX.TS

```
import { TreeGrid, Filter } from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(Filter);
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 height: 275,
 allowFiltering: true,
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 75, textAlign:
'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 180, textAlign:
'Left' },
 {
 field: 'startDate', headerText: 'Start Date', width: 90,
 textAlign: 'Right', type: 'date', format: 'yMd'
 },
 { field: 'duration', headerText: 'Duration', width: 80, textAlign:
'Right' }
]
});
treeGridObj.appendTo('#TreeGrid');
```

```

*Filter bar template with custom component*

The [filterBarTemplate](#) is used to add custom components to a particular column, and does the following functions:

- **create:** Creates custom components.
- **write:** Wires events for custom components.

In the following sample, the dropdown is used as a custom component in the Duration column.

**INDEX.TS**

```
import { TreeGrid, Filter, Column } from '@syncfusion/ej2-treegrid';
import { DropDownList, ChangeEventArgs } from '@syncfusion/ej2-dropdowns';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(Filter);
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 height: 275,
 allowFiltering: true,
 filterSettings: { type: 'FilterBar', hierarchyMode: 'Parent', mode:
'Immediate' },
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 75, textAlign:
'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 180, textAlign:
'Left' },
 {
 field: 'startDate', headerText: 'Start Date', width: 90,
 textAlign: 'Right', type: 'date', format: 'yMd'
 },
 { field: 'duration', headerText: 'Duration', width: 80, textAlign:
'Right',
 filterBarTemplate: {
 create: (args: { element: Element, column: Column }) => {
 let dd: HTMLInputElement =
document.createElement('input');
 dd.id = 'duration';
 return dd;

```

### Change default filter bar operator

You can change the default filter operator by extending [filterModule.filterOperators](#) property in [dataBound](#) event.

In the following sample, we have changed the default operator for string typed columns as **contains** from **startsWith**.

### INDEX.TS

```
import { TreeGrid, Filter, Column } from '@syncfusion/ej2-treegrid';
import { DropDownList, ChangeEventArgs } from '@syncfusion/ej2-dropdowns';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(Filter);
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 dataBound: dataBound,
 allowFiltering: true,
 filterSettings: { type: 'FilterBar', hierarchyMode: 'Parent', mode:
'Immediate' },
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 75, textAlign:
'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 180, textAlign:
'Left' },
 {
 field: 'startDate', headerText: 'Start Date', width: 90,
 textAlign: 'Right', type: 'date', format: 'yMd'
 },
 { field: 'duration', headerText: 'Duration', width: 80, textAlign:
'Right' }
]
});
treeGridObj.appendTo('#TreeGrid');
function dataBound(): void {
 Object.assign(treeGridObj.grid.filterModule.filterOperators, {
 startsWith: 'contains' });
}
```

### Filter menu in EJ2 JavaScript Treegrid control

You can enable filter menu by setting the [filterSettings.type](#) as **Menu**. The filter menu UI will be rendered based on its column type, which allows you to filter data.

You can filter the records with different operators.

#### INDEX.TS

```
import { TreeGrid, Filter } from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(Filter);
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 height: 275,
 allowFiltering: true,
 filterSettings: {type: 'Menu'},
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 75, textAlign:
'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 120, textAlign:
'Left' },
 {
 field: 'startDate', headerText: 'Start Date', width: 90,
 textAlign: 'Right', type: 'date', format: 'yMd'
 }
]
});
treeGridObj.appendTo('#TreeGrid');
```

#### INDEX.HTML

```

\* [allowFiltering](#) must be set as true to enable filter menu.

\* Setting [columns.allowFiltering](#) as false will prevent filter menu rendering for a particular column.

#### *Custom component in filter menu*

The [column.filter.ui](#) is used to add custom filter components to a particular column. To implement custom filter ui, define the following functions:

- **create**: Creates custom component.
- **write**: Wire events for custom component.
- **read**: Read the filter value from custom component.

In the following sample, dropdown is used as custom component in the duration column.

#### **INDEX.TS**

```

import { TreeGrid, Filter } from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
import { DataManager } from '@syncfusion/ej2-data';
import { DropDownList } from '@syncfusion/ej2-dropdowns';
import { createElement } from '@syncfusion/ej2-base';
TreeGrid.Inject(Filter);

```

```

let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 height: 275,
 allowFiltering: true,
 filterSettings: {type: 'Menu'},
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 75, textAlign:
'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 120,
textAlign: 'Left' },
 { field: 'duration', headerText: 'Duration', width: 80,
textAlign: 'Right', filter: {
 ui: {
 create: (args: { target: Element, column: Object }) => {
 let flValInput: HTMLElement = createElement('input',
{ className: 'flm-input' });
 args.target.appendChild(flValInput);
 let dataSource: string[] = ['All', '1', '3', '4',
'5', '6', '8', '9'];
 this.dropDownFilter = new DropDownList({
 dataSource: dataSource,
 value: 'All', popupHeight: '200px'
 });
 this.dropDownFilter.appendTo(flValInput);
 },
 write: (args: {
 column: Object, target: Element, parent: any,
 filteredValue: number | string
 }) => {
 this.dropDownFilter.value = args.filteredValue;
 },
 read: (args: { target: Element, column: any, operator:
string, fltrObj: Filter }) => {
 args.fltrObj.filterByColumn(args.column.field,
args.operator, parseInt(this.dropDownFilter.value));
 }
 }
 }
]
});
treeGridObj.appendTo('#TreeGrid');

```

```

### *Enable different filter dialog for a column*

You can use both **Menu** and **Excel** filter in a same TreeGrid. To do so, set the [column.filter.type](#) as **Menu** or **Excel**.

In the following sample menu filter is enabled by default and excel filter is enabled for the Task Name column using the [column.filter.type](#).

### **INDEX.TS**

```
import { TreeGrid, Filter } from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(Filter);
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 height: 273,
 allowFiltering: true,
 filterSettings: { type: 'Menu' },
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 75, textAlign:
'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 150, textAlign:
'Left', filter: { type: 'Excel' } },
 { field: 'duration', headerText: 'Duration', width: 90, textAlign:
'Right' },
 { field: 'progress', headerText: 'Progress', width: 90, textAlign:
'Right' }
]
});
treeGridObj.appendTo('#TreeGrid');
```

### Excel like filter in EJ2 JavaScript Treegrid control

You can enable Excel like filter by defining [filterSettings.type](#) as **Excel**. The excel menu contains an option such as Sorting, Clear filter, Sub menu for advanced filtering.

#### INDEX.TS

```

import { TreeGrid, Filter } from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(Filter);
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 height: 273,
 allowFiltering: true,
 filterSettings: { type: 'Excel' },
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 75, textAlign:
'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 150, textAlign:
'Left' },
 { field: 'duration', headerText: 'Duration', width: 90, textAlign:
'Right' },
 { field: 'progress', headerText: 'Progress', width: 90, textAlign:
'Right' }
]
});
treeGridObj.appendTo('#TreeGrid');

```

**INDEX.HTML**

```
<!DOCTYPE html><html lang="en"><head>

```

*Change default excel filter operator*

You can change the default excel-filter operator by changing the column operator as `contains` from `startsWith` in the [actionBegin](#) event

**INDEX.TS**

```
import { TreeGrid, Filter, Column } from '@syncfusion/ej2-treegrid';
import { DropDownList, ChangeEventArgs } from '@syncfusion/ej2-dropdowns';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(Filter);
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 actionBegin: actionBegin,
 allowFiltering: true,
 filterSettings: { type: 'Excel' },
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 75, textAlign:
'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 180, textAlign:
'Left' },
 {
 field: 'startDate', headerText: 'Start Date', width: 90,
 textAlign: 'Right', type: 'date', format: 'yMd'
 },
 { field: 'duration', headerText: 'Duration', width: 80, textAlign:
'Right' }
]
});
treeGridObj.appendTo('#TreeGrid');
function actionBegin(e) {
 if(e.requestType === 'filtersearchbegin' && e.column.type === "string")
 {
 e.operator = 'contains';
 }
}
```

**INDEX.HTML**

```

## Searching in EJ2 JavaScript Treegrid control

You can search records in a TreeGrid, by using the [search](#) method with search key as a parameter. This also provides an option to integrate search text box in treegrid's toolbar by adding [search](#) item to the [toolbar](#).

To search records, inject the [Filter](#) module in the treegrid.

### INDEX.TS

```

import { TreeGrid, Filter, Toolbar } from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(Filter, Toolbar);
let treeGridObj: TreeGrid = new TreeGrid({

```

```

 dataSource: sampleData,
 childMapping: 'subtasks',
 toolbar: ['Search'],
 height: 270,
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 90,
textAlign: 'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 180 },
 { field: 'duration', headerText: 'Duration', width: 80,
textAlign: 'Right' },
 { field: 'progress', headerText: 'progress', width: 80,
textAlign: 'Right' }
]
});
treeGridObj.appendTo('#TreeGrid');

```

 ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

By default, treegrid searches all the bound column values. To customize this behavior define the [searchSettings.fields](#) property.

### Search operators

The search operator can be defined in the [searchSettings.operator](#) property to configure specific searching.

The following operators are supported in searching:

#### Operator | Description

startsWith | Checks whether a value begins with the specified value.

endsWith | Checks whether a value ends with the specified value.

contains | Checks whether a value contains the specified value.

equal | Checks whether a value is equal to the specified value.

notEqual | Checks for values not equal to the specified value.

By default, the [searchSettings.operator](#) value is **contains**.

### Search by external button

To search treegrid records from an external button, invoke the [search](#) method.

#### INDEX.TS

```
import { TreeGrid, Filter } from '@syncfusion/ej2-treegrid';
import { Button } from '@syncfusion/ej2-buttons';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(Filter);
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 height: 220,
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 90,
 textAlign: 'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 180 },
 { field: 'duration', headerText: 'Duration', width: 80,
 textAlign: 'Right' },
 { field: 'progress', headerText: 'progress', width: 80,
 textAlign: 'Right' }
]
});
treeGridObj.appendTo('#TreeGrid');
let searchBtn: Button = new Button();
searchBtn.appendTo('#search');
document.getElementById('search').addEventListener('click', () => {
 let searchText: string =
 (<HTMLInputElement>document.getElementsByClassName('searchtext')[0]).value;
 treeGridObj.search(searchText);
});
```

### Search specific columns

By default, treegrid searches all visible columns. You can search specific columns by defining the specific column's field names in the [searchSettings.fields](#) property.

### INDEX.TS

```
import { TreeGrid, Filter, Toolbar } from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(Filter, Toolbar);
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 toolbar: ['Search'],
 searchSettings: { fields: ['taskName', 'duration'] },
 height: 270,
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 90,
 textAlign: 'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 180 },
 { field: 'duration', headerText: 'Duration', width: 80,
 textAlign: 'Right' },
 { field: 'progress', headerText: 'progress', width: 80,
 textAlign: 'Right' }
]
});
treeGridObj.appendTo('#TreeGrid');
```

## Selection

### Selection in EJ2 JavaScript Treegrid control

Selection provides an option to highlight a row or a cell. It can be done through simple mouse down or arrow keys. To disable selection in TreeGrid, set the [allowSelection](#) to false.

The treegrid supports two types of selection that can be set by using the [selectionSettings.type](#). They are:

- **Single:** The `Single` value is set by default, and it only allows selection of a single row or a cell.
- **Multiple:** Allows you to select multiple rows or cells.

To perform the multi-selection, press and hold CTRL key and click the desired rows or cells. To select range of rows or cells, press and hold the SHIFT key and click the rows or cells.

## INDEX.TS

```
import { TreeGrid, Selection } from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 selectionSettings: { type: 'Multiple' },
 height: 270,
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 90,
textAlign: 'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 180 },
 { field: 'duration', headerText: 'Duration', width: 80,
textAlign: 'Right' },
 { field: 'progress', headerText: 'progress', width: 80,
textAlign: 'Right' }
]
});
treeGridObj.appendTo('#TreeGrid');
```

}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

### Selection mode

TreeGrid supports three types of selection mode which can be set by using

[selectionSettings.mode](#). They are:

- **Row** - The **row** value is set by default. Allows you to select rows only.
- **Cell** - Allows you to select cells only.
- **Both** - Allows you to select rows and cells at the same time.

### INDEX.TS

```

import { TreeGrid, Selection } from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 selectionSettings: { mode: 'Both' },
 height: 315,
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 90, textAlign:
'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 150 },

*Touch interaction*

When you tap a treegrid row on touchscreen device, the tapped row is selected.

It also shows a popup for multi-row selection.

To select multiple rows or cells, tap the popup and then tap the desired rows or cells.

Multi-selection requires the selection [type](#) to be **multiple**.

The following screenshot represents a treegrid touch selection in the device.

 Touch interaction" style="width:320px;height: 620px">

### Get selected row indexes

You can get the selected row indexes by using the [getSelectedRowIndexes](#) method.

### INDEX.TS

```
import { TreeGrid } from '@syncfusion/ej2-treegrid';
```

```

import { RowSelectEventArgs } from '@syncfusion/ej2-grids';
import { sampleData } from './datasource.ts';
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 height: 270,
 treeColumnIndex: 1,
 selectionSettings: {type: 'Multiple'},
 rowSelected: rowSelected
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 90, textAlign:
'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 150 },
 { field: 'duration', headerText: 'Duration', width: 80, textAlign:
'Right' },
 { field: 'progress', headerText: 'progress', width: 80, textAlign:
'Right' }
]
});
treeGridObj.appendTo('#TreeGrid');
function rowSelected(args: RowSelectEventArgs) {
 let selectedrowindex: number[] = treeGridObj.getSelectedRowIndexes();
 // get the selected row indexes.
 alert(selectedrowindex); // to alert the selected row indexes.
 let selectedrecords: Object[] = treeGridObj.getSelectedRecords(); //
 get the selected records.
}

```

### Multiple selection based on condition

You can select multiple treegrid rows based on condition by using the [selectRows](#) method.

In the following code, the rows which contains `taskID` value as `3` and `5` are selected at initial rendering.

### INDEX.TS

```

import { TreeGrid, Row, Column } from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 height: 270,
 treeColumnIndex: 1,
 selectionSettings: {type: 'Multiple'},
 dataBound: ()=>{
 let rowIndexes : number[]=[];
 treeGridObj.grid.dataSource.forEach((data,index)=>{
 if (data.taskID === 3 || data.taskID === 5){
 rowIndexes.push(index);
 }
 });
 treeGridObj.selectRows(rowIndexes);
 },
 columns: [

```

```

 { field: 'taskID', headerText: 'Task ID', width: 90, textAlign:
 'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 150 },
 { field: 'duration', headerText: 'Duration', width: 80, textAlign:
 'Right' },
 { field: 'progress', headerText: 'progress', width: 80, textAlign:
 'Right' }
]
});
treeGridObj.appendTo('#TreeGrid');

```

## INDEX.HTML

```

### Toggle selection

The Toggle selection allows to perform selection and unselection of the particular row or cell. To [enable toggle](#) selection, set enableToggle property of the selectionSettings as true. If you click on the selected row or cell then it will be unselected and vice versa.

### INDEX.TS

```

import { TreeGrid } from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 height: 270,
 treeColumnIndex: 1,
 selectionSettings: {enableToggle: true},
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 90, textAlign:
'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 180 },
 { field: 'duration', headerText: 'Duration', width: 80,
textAlign: 'Right' },
 { field: 'progress', headerText: 'progress', width: 80,
textAlign: 'Right' }
]
});
treeGridObj.appendTo('#TreeGrid');

```

```

If multi selection is enabled, then first click on any selected row (without pressing Ctrl key), it will clear the multi selection and in second click on the same row, it will be unselected.

### Cell selection in EJ2 JavaScript Treegrid control

Cell Selection can be done through simple Mouse down or Arrow keys(up, down, left and right).

TreeGrid supports two types of cell selection mode which can be set by using

[selectionSettings.cellSelectionMode](#). They are:

- **Flow** - The **Flow** value is set by default.

Select range of cells between the start index and end index which includes in between cells of rows.

- **Box** - Select range of cells within the start and end column indexes which includes in between cells of rows within the range.

### INDEX.TS

```
import { TreeGrid, Selection } from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 selectionSettings: { cellSelectionMode: 'Box', type: 'Multiple', mode:
'Cell' },
 height: 315,
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 90, textAlign:
'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 150 },
 { field: 'duration', headerText: 'Duration', width: 80,
textAlign: 'Right' },
 { field: 'progress', headerText: 'progress', width: 80,
textAlign: 'Right' }
]
});
treeGridObj.appendTo('#TreeGrid');
```

### Check box selection in EJ2 JavaScript Treegrid control

Checkbox selection provides an option to select multiple treegrid records with help of checkbox in each row.

To render the checkbox in each treegrid row, you need to use checkbox column with type as **checkbox** using the column [type](#) property.

### INDEX.TS

```

import { TreeGrid } from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 height: 315,
 treeColumnIndex: 2,
 columns: [
 { type: 'checkbox', width: 60 },
 { field: 'taskID', headerText: 'Task ID', width: 90, textAlign:
'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 150 },
 { field: 'duration', headerText: 'Duration', width: 80,
textAlign: 'Right' },
 { field: 'progress', headerText: 'progress', width: 80,
textAlign: 'Right' }
]
});

```

```

]
 });
 treeGridObj.appendTo('#TreeGrid');

```

```

\* By default, selection is allowed by clicking a treegrid row or checkbox in that row. To allow selection only through checkbox, you can set the

[selectionSettings.checkboxOnly](#) property to true.

\* Selection can be persisted in all the operations using the [selectionSettings.persistSelection](#) property. For persisting selection on the treegrid, any one of the columns should be defined as a primary key using the [columns.isPrimaryKey](#) property.

#### Checkbox selection mode

In checkbox selection, selection can also be done by clicking on rows. This selection provides two types of Checkbox Selection mode which can be set by using the following API, [selectionSettings.checkboxMode](#). The modes are

- **Default:** This is the default value of the checkboxMode. In this mode, user can select multiple rows by clicking rows one by one.
- **ResetOnRowClick:** In ResetOnRowClick mode, when user clicks on a row it will reset previously selected row. Also you can perform multiple-selection in this mode by press and hold CTRL key and click the desired rows. To select range of rows, press and hold the SHIFT key and click the rows.

#### INDEX.TS

```

import { TreeGrid } from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 height: 270,
 treeColumnIndex: 2,
 selectionSettings: {checkboxMode: 'ResetOnRowClick'},
 columns: [
 { type: 'checkbox', width: 60 },
 { field: 'taskID', headerText: 'Task ID', width: 90, textAlign:
'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 180 },
 { field: 'duration', headerText: 'Duration', width: 80,
textAlign: 'Right' },
 { field: 'progress', headerText: 'progress', width: 80,
textAlign: 'Right' }
]

</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Checkbox Selection feature is intended for row selection only; it is not compatible with cell selection mode.

### Paging in EJ2 JavaScript Treegrid control

Paging provides an option to display TreeGrid data in page segments. To enable paging, set the [allowPaging](#) to true. When paging is enabled, pager component renders at the bottom of the treegrid.

Paging options can be configured through the [pageSettings](#).

To use paging, inject the [Page](#) module in the treegrid.

#### INDEX.TS

```
import { TreeGrid, Page } from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(Page);
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 allowPaging: true,
 pageSettings: {pageSize: 7},
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 90, textAlign:
'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 160 },
 {
 field: 'startDate', headerText: 'Start Date', width: 90,
 textAlign: 'Right', type: 'date', format: 'yMd'
 },
 { field: 'duration', headerText: 'Duration', width: 80, textAlign:
'Right' }
]
});
treeGridObj.appendTo('#TreeGrid');
```

#### INDEX.HTML

</body></html>

```

You can achieve better performance by using treegrid paging to fetch only a pre-defined number of records from the data source.

### Page Size Mode

Two behaviors are available in TreeGrid paging to display certain number of records in a current page. Following are the two types of [pageSizeMode](#).

- **All** : This is the default mode. The number of records in a page is based on [pageSize](#) property.
- **Root** : The number of root nodes or the 0th level records to be displayed per page is based on [pageSize](#) property.

With [pageSizeMode](#) property as **Root**, only the root level or the 0th level records are considered in records count.

### INDEX.TS

```
import { TreeGrid, Page } from '@syncfusion/ej2-treegrid';
```

```
import { sampleData } from './datasource.ts';
TreeGrid.Inject(Page);
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 allowPaging: true,
 height: 265,
 pageSettings: {pageSize: 2, pageSizeMode: 'Root'},
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 90, textAlign:
'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 160 },
 {
 field: 'startDate', headerText: 'Start Date', width: 90,
 textAlign: 'Right', type: 'date', format: 'yMd'
 },
 { field: 'duration', headerText: 'Duration', width: 80, textAlign:
'Right' }
]
});
treeGridObj.appendTo('#TreeGrid');
```

## INDEX.HTML

 ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

### Template

You can use custom elements inside the pager instead of default elements.

The custom elements can be defined by using the [template](#) property.

Inside this template, you can access the [currentPage](#), [pageSize](#), [pageCount](#), [totalPage](#) and [totalRecordCount](#) values.

### INDEX.TS

```

import { TreeGrid, Page, PageEventArgs } from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
import { NumericTextBox } from '@syncfusion/ej2-inputs';
TreeGrid.Inject(Page);
let flag: boolean = true;
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 allowPaging: true,
 pageSettings: { pageSize: 6, template: '#template' },

### How to render Pager at the Top of the TreeGrid

By default, Pager will be rendered at the bottom of the TreeGrid. You can also render the Pager at the top of the TreeGrid by using the `dataBound` event.

#### INDEX.TS

```
import { TreeGrid, Page } from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(Page);
let initialGridLoad: boolean = true;
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 allowPaging: true,
 pageSettings: {pageSize: 7, pageSizes: true},
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 90, textAlign:
'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 160 },
 {
 field: 'startDate', headerText: 'Start Date', width: 90,
 textAlign: 'Right', type: 'date', format: 'yMd'
 },
 { field: 'duration', headerText: 'Duration', width: 80, textAlign:
'Right' }
]
});
treeGridObj.appendTo('#TreeGrid');
treeGridObj.dataBound = () =>{
 if (initialGridLoad) {
 initialGridLoad = false;
 var pager = document.getElementsByClassName('e-gridpager');
 var topElement;
 if (treeGridObj.toolbar) {
 topElement = document.getElementsByClassName('e-toolbar');
```

```

 } else {
 topElement = document.getElementsByClassName('e-gridheader');
 }
 topElement[0].before(pager[0]);
}
};

```

```

During the paging action, the pager component triggers the below three events.

- \* The **created** event triggers when Pager is created.
- \* The **click** event triggers when the numeric items in the pager is clicked.
- \* The **dropDownChanged** event triggers when pageSize DropDownList value is selected.

You can refer to our [JavaScript Tree Grid](#) feature tour page for its groundbreaking feature representations. You can also explore our JavaScript Tree Grid example [JavaScript Tree Grid example](#) to know how to present and manipulate data.

### Scrolling in EJ2 JavaScript Treegrid control

The scrollbar will be displayed in the treegrid when content exceeds the element [width](#) or [height](#). The vertical and horizontal scrollbars will be displayed based on the following criteria:

- The vertical scrollbar appears when the total height of rows present in the treegrid exceeds its element height.
- The horizontal scrollbar appears when the sum of columns width exceeds the treegrid element width.
- The [height](#) and [width](#) are used to set the treegrid height and width, respectively.

The default value for [height](#) and [width](#) is **auto**.

#### Set width and height

To specify the [width](#) and [height](#) of the scroller in the pixel, set the pixel value to a number.

#### INDEX.TS

```

import { TreeGrid } from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 height: 315,
 width: 400,
 childMapping: 'subtasks',
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 90,
textAlign: 'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 180 },
 {
 field: 'startDate', headerText: 'Start Date', width:
120, textAlign: 'Right', type: 'date', format: 'yMd'
 },
],

```

```

 { field: 'duration', headerText: 'Duration', width: 110,
 textAlign: 'Right' }
]
});
treeGridObj.appendTo('#TreeGrid');

```

## INDEX.HTML

<script src="index.js" type="text/javascript"></script>
</body></html>

```

### Responsive with parent container

Specify the [width](#) and [height](#) as **100%** to make the treegrid element fill its parent container.

Setting the [height](#) to **100%** requires the treegrid parent element to have explicit height.

### INDEX.TS

```

import { TreeGrid } from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 height: '100%',
 width: '100%',
 childMapping: 'subtasks',
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 90,
textAlign: 'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 180 },
 {
 field: 'startDate', headerText: 'Start Date', width: 90,
textAlign: 'Right', type: 'date', format: 'yMd'
 },
 { field: 'duration', headerText: 'Duration', width: 80,
textAlign: 'Right' }
]
});
treeGridObj.appendTo('#TreeGrid');

```

### INDEX.HTML

```

## Frozen in EJ2 JavaScript Treegrid control

### Frozen rows and columns

Frozen rows and columns provides an option to make rows and columns always visible in the top and left side of the tree grid while scrolling.

To use frozen rows and columns support, inject the **Freeze** module in the tree grid.

In this demo, the [frozenColumns](#) is set as '2' and the [frozenRows](#)

is set as '3'. Hence, the left two columns and top three rows are frozen.

### INDEX.TS

```
import { TreeGrid, Freeze } from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(Freeze);
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 height: 317,
 childMapping: 'subtasks',
 allowSelection: false,
 frozenRows: 3,
 frozenColumns: 2,
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', textAlign:
'Right', width: 100 },
 { field: 'taskName', headerText: 'Task Name', width: 230 },
 { field: 'startDate', headerText: 'Start Date', width: 120,
textAlign: 'Right',
 type: 'date', format: { type: 'dateTime', format:
'dd/MM/yyyy' } },
 { field: 'endDate', headerText: 'End Date', width: 120,
textAlign: 'Right',
 type: 'date', format: { type: 'dateTime', format:
'dd/MM/yyyy' } },
 { field: 'duration', headerText: 'Duration', textAlign:
'Right', width: 110 },
 { field: 'progress', headerText: 'Progress', textAlign:
'Right', width: 120 },
 { field: 'priority', headerText: 'Priority', textAlign:
'Left', width: 120 },
 { field: 'approved', headerText: 'Approved', width: 110,
textAlign: 'Left' }
]
});
treeGridObj.appendTo('#TreeGrid');
```

### INDEX.HTML

```

</body></html>

```

### Freeze particular columns

You can use [isFrozen](#) property to freeze selected columns in tree grid.

In this demo, the columns with field name `taskName` and `startDate` is frozen using the `isFrozen` property.

### INDEX.TS

```

import { TreeGrid, Freeze } from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(Freeze);
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,

```

```

 height: 317,
 childMapping: 'subtasks',
 allowSelection: false,
 columns: [
 { field: 'taskID', headerText: 'Task ID', textAlign:
'Right', width: 90 },
 { field: 'taskName', headerText: 'Task Name', width: 230,
isFrozen: true },
 { field: 'startDate', headerText: 'Start Date', isFrozen:
true, width: 120, textAlign: 'Right',

```

### Freeze direction

You can freeze the tree grid columns on the left or right side by using the [column.freeze](#) property and the remaining columns will be movable. The tree grid will automatically move the columns to the left or right position based on the [column.freeze](#) value.

Types of the [column.freeze](#) directions:

- **Left:** Allows you to freeze the columns at the left.
- **Right:** Allows you to freeze the columns at the right.

In this demo, the **Task Name** column is frozen at the left and the **Priority** column is frozen at the right side of the content table.

### INDEX.TS

```

import { TreeGrid, Freeze } from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(Freeze);
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 height: 317,
 treeColumnIndex: 1,
 childMapping: 'subtasks',
 allowSelection: false,
 columns: [

```

```

 { field: 'taskID', headerText: 'Task ID', textAlign:
'Right', width: 90 },
 { field: 'taskName', headerText: 'Task Name', width: 230,
freeze: 'Left' },

\* Freeze Direction is not compatible with the [isFrozen](#) and [frozenColumns](#) properties.

#### *Limitations of frozen tree grid*

The following features are not supported in frozen rows and columns:

- Row Template
- Detail Template
- Cell Editing

Freeze Direction feature has the below limitations, along with the above mentioned limitations.

- Infinite scroll cache mode
- Freeze direction in the stacked header is not compatible with column reordering.

You can refer to our [JavaScript Tree Grid](#) feature tour page for its groundbreaking feature representations. You can also explore our JavaScript tree grid example [JavaScript Tree Grid example](#) to know how to present and manipulate data.

#### Virtual scroll in EJ2 JavaScript Treegrid control

TreeGrid allows you to load large amount of data without performance degradation.

To use virtualization, you need to inject `VirtualScroll` module in treegrid.

#### Row virtualization

Row virtualization allows you to load and render rows only in the content viewport. It is an alternative way of paging in which the rows will be appended while scrolling vertically. To setup the row virtualization, you need to define

[enableVirtualization](#) as true and content height by [height](#) property.

The number of records displayed in the TreeGrid is determined implicitly by height of the content area and a buffer records will be maintained in the TreeGrid content in addition to the original set of rows.

Expand and Collapse state of any child record will be persisted.

### INDEX.TS

```
import { VirtualScroll, TreeGrid } from '@syncfusion/ej2-treegrid';
import { virtualData, dataSource } from './datasource.ts';
TreeGrid.Inject(VirtualScroll);
dataSource();
let treegrid: TreeGrid = new TreeGrid(
 {
 dataSource: virtualData,
 enableVirtualization: true,
 treeColumnIndex: 1,
 childMapping: 'Crew',
 height: 317,
 columns: [
 { field: 'TaskID', headerText: 'Player Jersey', width: 140,
 textAlign: 'Right' },
 { field: 'FIELD1', headerText: 'Player Name', width: 140 },
 { field: 'FIELD2', headerText: 'Year', width: 120,
 textAlign: 'Right' },
 { field: 'FIELD3', headerText: 'Stint', width: 120,
 textAlign: 'Right' },
 { field: 'FIELD4', headerText: 'TMID', width: 120,
 textAlign: 'Right' }
]
 });
treegrid.appendTo('#TreeGrid');
```

```

### Column virtualization

Column virtualization allows you to virtualize columns. It will render column only in the current view port and all other columns are rendered on demand during horizontal scrolling.

To setup the column virtualization, set the

[enableVirtualization](#) and

[enableColumnVirtualization](#) properties as `true`.

### INDEX.TS

```

import { VirtualScroll, TreeGrid } from '@syncfusion/ej2-treegrid';
import { virtualData, dataSource } from './datasource.ts';
TreeGrid.Inject(VirtualScroll);
dataSource();
let treegrid: TreeGrid = new TreeGrid({

}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Column's [width](#) is required for column virtualization. If column's width is not defined then tree grid will consider its value as **200px**.

#### Limitations for virtualization

- Due to the element height limitation in browsers, the maximum number of records loaded by the treegrid is limited by the browser capability.
- Cell selection will not be persisted in row.
- The page size provided must be two times larger than the number of visible rows in the grid. If the page size is failed to meet this condition then the size will be determined by TreeGrid.
- The virtual height of the treegrid content is calculated using the row height and total number of records in the data source and hence features which changes row height such as text wrapping are not supported. If you want to increase the row height to accommodate the content then you can specify the row height as below to ensure all the table rows are in same height.

```

.e-treegrid .e-row {
height: 2em;
}

```

- Programmatic selection using the **selectRows** method is not supported in virtual scrolling.
- Virtual scrolling is not compatible with Batch editing, clipboard functionality and detail template.
- When virtualization is active in a tree grid, the editCell method is unusable for records outside the currently visible viewport.

You can refer to our [JavaScript Tree Grid](#) feature tour page for its groundbreaking feature representations. You can also explore our JavaScript Tree Grid example [JavaScript Tree Grid example](#) to know how to present and manipulate data.

#### Infinite scroll in EJ2 JavaScript Treegrid control

Infinite scrolling is used to load a huge amount of data without degrading the Tree Grid performance. This feature works like the lazy loading concept, which means the buffer data is loaded only when the scrollbar reaches the end of the scroller.

To use Infinite scrolling, set **enableInfiniteScrolling** property as true and inject the **InfiniteScroll** module in the treegrid.

\* In this feature, Tree Grid will not make a new data request when you visit the same page again.

**INDEX.TS**

```
import { InfiniteScroll, TreeGrid } from '@syncfusion/ej2-treegrid';
import { virtualData, dataSource } from './datasource.ts';
TreeGrid.Inject(InfiniteScroll);
dataSource();
let treegrid: TreeGrid = new TreeGrid(
 {
 dataSource: virtualData,
 enableInfiniteScrolling: true,
 treeColumnIndex: 1,
 childMapping: 'Crew',
 pageSettings: { pageSize: 30 },
 height: 317,
 columns: [
 { field: 'TaskID', headerText: 'Player Jersey', width: 140,
textAlign: 'Right' },
 { field: 'FIELD1', headerText: 'Player Name', width: 140 },
 { field: 'FIELD2', headerText: 'Year', width: 120,
textAlign: 'Right' },
 { field: 'FIELD3', headerText: 'Stint', width: 120,
textAlign: 'Right' },
 { field: 'FIELD4', headerText: 'TMID', width: 120,
textAlign: 'Right' }
]
 });
treegrid.appendTo('#TreeGrid');
```

### InitialBlocks

You can define the initial loading pages count by using `infiniteScrollSettings.initialBlocks` property. By default, this feature loads three pages in initial rendering.

In the below demo, we have changed this property value to load five page records instead of three.

### INDEX.TS

```

import { InfiniteScroll, TreeGrid } from '@syncfusion/ej2-treegrid';
import { virtualData, dataSource } from './datasource.ts';
TreeGrid.Inject(InfiniteScroll);
dataSource();
let treegrid: TreeGrid = new TreeGrid(
 {
 dataSource: virtualData,
 enableInfiniteScrolling: true,
 infiniteScrollSettings: { initialBlocks: 5 },
 treeColumnIndex: 1,
 childMapping: 'Crew',
 pageSettings: { pageSize: 30 },
 height: 317,
 columns: [
 { field: 'TaskID', headerText: 'Player Jersey', width: 140,
textAlign: 'Right' },
 { field: 'FIELD1', headerText: 'Player Name', width: 140 },
 { field: 'FIELD2', headerText: 'Year', width: 120,
textAlign: 'Right' },

```

```

 { field: 'FIELD3', headerText: 'Stint', width: 120,
textAlign: 'Right' },
 { field: 'FIELD4', headerText: 'TMID', width: 120,
textAlign: 'Right' }
]
 });
 treegrid.appendTo('#TreeGrid');

```

<script src="index.js" type="text/javascript"></script>
</body></html>
```

### Cache Mode

Cache is used to store the loaded rows object in the Tree Grid instance which can be reused for creating the row elements whenever you scroll to already visited page. Also, this mode maintains row elements based on the `infiniteScrollSettings.maxBlocks` count value, once this limit exceeds then it will remove row elements from DOM for new rows.

To enable the cache mode in Infinite scrolling, set `infiniteScrollSettings.enableCache` property as true.

### INDEX.TS

```
import { InfiniteScroll, TreeGrid } from '@syncfusion/ej2-treegrid';
import { virtualData, dataSource } from './datasource.ts';
TreeGrid.Inject(InfiniteScroll);
dataSource();
let treegrid: TreeGrid = new TreeGrid(
 {
 dataSource: virtualData,
 enableInfiniteScrolling: true,
 infiniteScrollSettings: { enableCache: true },
 treeColumnIndex: 1,
 childMapping: 'Crew',
 pageSettings: { pageSize: 30 },
 height: 317,
 columns: [
 { field: 'TaskID', headerText: 'Player Jersey', width: 140,
 textAlign: 'Right' },
 { field: 'FIELD1', headerText: 'Player Name', width: 140 },
 { field: 'FIELD2', headerText: 'Year', width: 120,
 textAlign: 'Right' },
 { field: 'FIELD3', headerText: 'Stint', width: 120,
 textAlign: 'Right' },
 { field: 'FIELD4', headerText: 'TMID', width: 120,
 textAlign: 'Right' }
]
 });
treegrid.appendTo('#TreeGrid');
```

```

### Limitations for Infinite Scrolling

- Due to the element height limitation in browsers, the maximum number of records loaded by the tree grid is limited due to the browser capability.
- Initial loading rows total height must be greater than the viewport height.
- Cell selection will not be persisted in cache mode.

- Infinite scrolling is not compatible with batch editing, cell editing, detail template and hierarchy features.
- The aggregated information and total group items are displayed based on the current view items. To get these information regardless of the view items, refer to the
- Programmatic selection using the [selectRows](#) and [selectRow](#) method is not supported in infinite scrolling.

You can refer to our [JavaScript Tree Grid](#) feature tour page for its groundbreaking feature representations. You can also explore our JavaScript Tree Grid example [JavaScript Tree Grid example](#) to know how to present and manipulate data.

## Aggregates

### Aggregates in EJ2 JavaScript Treegrid control

Aggregate values are displayed in the TreeGrid footer and in parent row footer for child row aggregate values. It can be configured through `aggregates` property.

[field](#) and [type](#) are the minimum properties required to represent an aggregate column.

To use the aggregate feature, you have to inject the `Aggregate` module.

By default, the aggregate value can be displayed in the treegrid footer, and footer of child rows. To show the aggregate value in one of the cells, use the [footerTemplate](#).

### Built-in aggregate types

The aggregate type should be specified in the [type](#) property to configure an aggregate column.

The built-in aggregates are,

- Sum
- Average
- Min
- Max
- Count
- Truecount
- Falsecount

\* Multiple aggregates can be used for an aggregate column by setting the [type](#) property with an array of aggregate types.

\* Multiple types for a column is supported only when one of the aggregate templates is used.

### Child aggregate

Aggregate value is calculated for child rows, and it is displayed in the parent row footer. Use the [childSummary](#) property to render the child rows aggregate value.

### INDEX.TS

```
import { TreeGrid, Aggregate } from '@syncfusion/ej2-treegrid';
import { summaryRowData } from './datasource.ts';
TreeGrid.Inject(Aggregate);
let treeGridObj: TreeGrid = new TreeGrid(
 {
 dataSource: summaryRowData,
```

```

 childMapping: 'children',
 treeColumnIndex: 0,
 height: 260,
 columns: [
 { field: 'FreightID', headerText: 'Freight ID', width: 130 },
 { field: 'FreightName', width: 195, headerText: 'Freight Name'
 },
 { field: 'UnitWeight', headerText: 'Weight Per Unit', type:
'number', width: 130, textAlign: 'Right' },
 { field: 'TotalUnits', headerText: 'Total Units', type:
'number', width: 125, textAlign: 'Right' }
],
 aggregates: [{
 showChildSummary: true,
 columns: [
 {
 type: 'Max',
 field: 'UnitWeight',
 columnName: 'UnitWeight',
 footerTemplate: 'Maximum: ${Max}'
 },
 {
 type: 'Min',
 field: 'TotalUnits',
 columnName: 'TotalUnits',
 footerTemplate: 'Minimum: ${Min}'
 }
]
 }]
 });
treeGridObj.appendTo('#TreeGrid');

```

```

You can refer to our [JavaScript Tree Grid](#) feature tour page for its groundbreaking feature representations. You can also explore our JavaScript Tree Grid example [JavaScript Tree Grid example](#) to know how to present and manipulate data.

#### Footer aggregate in EJ2 JavaScript Treegrid control

Footer aggregate value is calculated for all the rows, and it is displayed in the footer cells. Use the [footerTemplate](#) property to render the aggregate value in footer cells.

#### INDEX.TS

```

import { TreeGrid, Aggregate } from '@syncfusion/ej2-treegrid';
import { summaryRowData } from './datasource.ts';
TreeGrid.Inject(Aggregate);
let treeGridObj: TreeGrid = new TreeGrid(
 {
 dataSource: summaryRowData,
 childMapping: 'children',
 treeColumnIndex: 0,
 height: 260,
 columns: [
 { field: 'FreightID', headerText: 'Freight ID', width: 130 },
 { field: 'FreightName', width: 195, headerText: 'Freight Name' }
]
 },

```

```

 { field: 'UnitWeight', headerText: 'Weight Per Unit', type:
'number', width: 130, textAlign: 'Right' },
 { field: 'TotalUnits', headerText: 'Total Units', type:
'number', width: 125, textAlign: 'Right' }
],
 aggregates: [{
 showChildSummary: false,
 columns: [
 {
 type: 'Max',
 field: 'UnitWeight',
 columnName: 'UnitWeight',
 footerTemplate: 'Maximum: ${Max}'
 },
 {
 type: 'Min',
 field: 'TotalUnits',
 columnName: 'TotalUnits',
 footerTemplate: 'Minimum: ${Min}'
 }
]
 }]
 });
treeGridObj.appendTo('#TreeGrid');

```

## INDEX.HTML

```

```

### Custom aggregate in EJ2 JavaScript Treegrid control

To calculate the aggregate value with your own aggregate functions, use the custom aggregate option.

To use custom aggregation, specify the [type](#) as `Custom`, and provide the custom aggregate function in the [customAggregate](#) property.

#### INDEX.TS

```

import { TreeGrid, Aggregate } from '@syncfusion/ej2-treegrid';
import { summaryData } from './datasource.ts';
import { getObject, CustomSummaryType } from '@syncfusion/ej2-grids';
let customAggregateFn: CustomSummaryType = (data: Object): number => {
 let sampleData: Object[] = getObject('result', data);
 let countLength: number; countLength = 0;
 sampleData.filter((item: Object) => {
 let data: string = getObject('category', item);
 if (data === 'Frozen seafood') {
 countLength++;
 }
 }));
 return countLength;
};
TreeGrid.Inject(Aggregate);
let treeGridObj: TreeGrid = new TreeGrid(
 {
 dataSource: summaryData,
 childMapping: 'subtasks',
 width: 'auto',
 height: 245,
 treeColumnIndex: 1,
 columns: [
 { field: 'category', headerText: 'Category', width: 200 },
 { field: 'units', headerText: 'Total Units', width: 130, type:
'number', textAlign: 'Right' },
 { field: 'unitPrice', headerText: 'Unit Price($)', width: 110,
type: 'number', format: 'C2', textAlign: 'Right' },
 { field: 'price', headerText: 'Price($)', width: 110, textAlign:
'Right', type: 'number', format: 'C' },
],
 aggregates: [{
 showChildSummary: false,
 columns: [{
 type: 'Custom',
 customAggregate: customAggregateFn,
 columnName: 'category',
 footerTemplate: 'Count of Frozen seafood : ${Custom}'
 }]
 }]
 }
);

```

```

 }}
 });
 treeGridObj.appendTo('#TreeGrid');

```

## INDEX.HTML

```

if(ele) {

```

```

 ele.style.visibility = "visible";
 }
 </script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

To access the custom aggregate value inside the template, use the key as **Custom**.

### Print in EJ2 JavaScript Treegrid control

To print the TreeGrid, use the [print](#) method from treegrid instance. The print option can be displayed on the [toolbar](#) by adding the **print** toolbar item.

#### INDEX.TS

```

import { TreeGrid, Toolbar } from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(Toolbar);
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 toolbar: ['Print'],
 height: 265,
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 90, textAlign:
'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 180,
textAlign: 'Left' },
 {
 field: 'startDate', headerText: 'Start Date', width: 90,
textAlign: 'Right', type: 'date', format: 'yMd'
 },
 { field: 'duration', headerText: 'Duration', width: 80,
textAlign: 'Right' }
]
});
treeGridObj.appendTo('#TreeGrid');

```

 <div id="container">
 <div id="TreeGrid"></div>
 </div>
<script>
var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

### Page setup

Some of the print options cannot be configured through JavaScript code. So, you have to customize the layout, paper size, and margin options using the browser page setup dialog. Please refer to the following links to know more about the browser page setup:

- [Chrome](#)
- [Firefox](#)
- [Safari](#)
- [IE](#)

### Print using an external button

To print the treegrid from an external button, invoke the [print](#) method.

**INDEX.TS**

```
import { TreeGrid } from '@syncfusion/ej2-treegrid';
import { Button } from '@syncfusion/ej2-buttons';
import { sampleData } from './datasource.ts';
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 height: 265,
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 90, textAlign:
'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 180,
textAlign: 'Left' },
 {
 field: 'startDate', headerText: 'Start Date', width: 90,
textAlign: 'Right', type: 'date', format: 'yMd'
 },
 { field: 'duration', headerText: 'Duration', width: 80,
textAlign: 'Right' }
]
});
treeGridObj.appendTo('#TreeGrid');
let printBtn: Button = new Button();
printBtn.appendTo('#print');
document.getElementById('print').addEventListener('click', () => {
 treeGridObj.print();
});
```

**INDEX.HTML**

```

### Print the visible page

By default, the treegrid prints all the pages. To print the current page alone, set the [printMode](#) to **CurrentPage**.

### INDEX.TS

```

import { TreeGrid, Toolbar, Page } from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(Toolbar, Page);
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 toolbar: ['Print'],
 printMode: 'CurrentPage',
 allowPaging: true,
 pageSettings: { pageSize: 8 },
 height: 220,
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 90, textAlign:
'Right' },

```

```

 { field: 'taskName', headerText: 'Task Name', width: 180,
textAlign: 'Left' },
 {
 field: 'startDate', headerText: 'Start Date', width: 90,
textAlign: 'Right', type: 'date', format: 'yMd'
 },
 { field: 'duration', headerText: 'Duration', width: 80,
textAlign: 'Right' }
]
});
treeGridObj.appendTo('#TreeGrid');

```

```

### Print large number of columns

By default, the browser uses A4 as page size option to print pages and to adapt the size of the page the browser print preview will auto-hide the overflowed contents. Hence treegrid with large number of columns will cut off to adapt the print page.

To show large number of columns when printing, adjust the scale option from print option panel based on your content size.

### Show or Hide columns while Printing

You can show a hidden column or hide a visible column while printing the treegrid using [toolbarClick](#) and [printComplete](#) events.

In the `toolbarClick` event, based on `args.item.text` as `Print`. We can show or hide columns by setting `column.visible` property to `true` or `false` respectively.

In the `printComplete` event, We have reversed the state back to the previous state.

In the below example, we have `Duration` as a hidden column in the treegrid. While printing, we have changed `Duration` to visible column and `StartDate` as hidden column.

### INDEX.TS

```

import { TreeGrid, Toolbar } from '@syncfusion/ej2-treegrid';
import { Column } from '@syncfusion/ej2-grids';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(Toolbar);

```

```

let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 toolbar: ['Print'],
 toolbarClick: function(args) {
 if (args.item.text === 'Print') {
 let cols: Column[] = this.grid.columns;
 for (var i = 0; i < cols.length; i++) {
 if (cols[i].field === "duration") {
 cols[i].visible = true;
 }
 else if (cols[i].field === "startDate") {
 cols[i].visible = false;
 }
 }
 }
 },
 printComplete: function(args) {
 let cols: Column[] = this.grid.columns;
 for (var i = 0; i < cols.length; i++) {
 if (cols[i].field === "duration") {
 cols[i].visible = false;
 }
 else if (cols[i].field === "StartDate") {
 cols[i].visible = true;
 }
 }
 }
 height: 265,
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 90, textAlign:
'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 180,
textAlign: 'Left' },
 {
 field: 'startDate', headerText: 'Start Date', width: 90,
textAlign: 'Right', type: 'date', format: 'yMd'
 },
 { field: 'duration', headerText: 'Duration', visible: false,
width: 80, textAlign: 'Right' }
]
});
treeGridObj.appendTo('#TreeGrid');

```

```

### Limitations of Printing Large Data

When treegrid contains large number of data, printing all the data at once is not a best option for the browser performance. Because to render all the DOM elements in one page will produce performance issues in the browser. It leads to browser slow down or browser hang.

If printing of all the data is still needed, we suggest to Export the treegrid to **Excel** or **CSV** or **Pdf** and then print it from another non-web based application.

You can refer to our [JavaScript Tree Grid](#) feature tour page for its groundbreaking feature representations. You can also explore our JavaScript Tree Grid example [JavaScript Tree Grid example](#) to know how to present and manipulate data.

## State Persistence

### State persistence in EJ2 JavaScript Treegrid control

State persistence refers to the TreeGrid's state maintained in the browser's [localStorage](#) even if the browser is refreshed or if you move to the next page within the browser.

State persistence stores treegrid's model object in the local storage when the [enablePersistence](#) is defined as true.

You can refer to our [JavaScript Tree Grid](#) feature tour page for its groundbreaking feature representations. You can also explore our JavaScript Tree Grid example [JavaScript Tree Grid example](#) to know how to present and manipulate data.

### Get or set local storage value in EJ2 JavaScript Treegrid control

If the [enablePersistence](#) property is set to true, the treegrid property value is saved in the window.localStorage for reference. You can get/set the localStorage value by using the `getItem/setItem` method in the `window.localStorage`.

```
`ts
```

```
//get the TreeGrid model.
```

```
let value: string = window.localStorage.getItem('treegridTreeGrid'); // "treegridTreeGrid" is component name + component id.
```

```
let model: Object = JSON.parse(model);
```

```
`
```

```
`ts
```

```
//set the TreeGrid model.
```

```
window.localStorage.setItem('treegridTreeGrid', JSON.stringify(model)); // "treegridTreeGrid" is component name + component id.
```

```
`
```

## Tool Bar

### Tool bar in EJ2 JavaScript Treegrid control

The TreeGrid provides ToolBar support to handle treegrid actions. The [toolbar](#) property accepts either the collection of built-in toolbar items and [ItemModel](#) objects for custom toolbar items or HTML element ID for toolbar template.

To use ToolBar, inject `Toolbar` module in the treegrid.

You can refer to our [JavaScript Tree Grid](#) feature tour page for its groundbreaking feature representations. You can also explore our JavaScript Tree Grid example [JavaScript Tree Grid example](#) to know how to present and manipulate data.

## Tool bar items in EJ2 JavaScript Treegrid control

### Built-in toolbar items

Built-in toolbar items execute standard actions of the treegrid, and it can be added by defining the [toolbar](#) as a collection of built-in items. It renders the button with icon and text.

The following table shows built-in toolbar items and its actions.

Built-in Toolbar Items   Actions	
----- -----	
ExpandAll	Expands all the rows.
CollapseAll	Collapses all the rows.
Add	Adds a new record.
Edit	Edits the selected record.
Update	Updates the edited record.
Delete	Deletes the selected record.
Cancel	Cancel the edit state.
Search	Searches the records by the given key.
Print	Prints the treegrid.
ExcelExport	Exports the treegrid to Excel.
PdfExport	Exports the treegrid to PDF.
WordExport	Exports the treegrid to Word.
Indent	Indents the record to one level of hierarchy.
Outdent	Outdents the record to one level of hierarchy.

### INDEX.TS

```
import { TreeGrid, Toolbar, Filter } from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(Toolbar, Filter);
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 toolbar: ['Print', 'Search'],
 height: 265,
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 90, textAlign:
'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 180,
textAlign: 'Left' },
 {
 field: 'startDate', headerText: 'Start Date', width: 90,
textAlign: 'Right', type: 'date', format: 'yMd'
 },

### Custom tool bar in EJ2 JavaScript Treegrid control

Custom toolbar items can be added by defining the [toolbar](#) as a collection of [ItemModels](#).

Actions for this customized toolbar items are defined in the [toolbarClick](#) event.

By default, Custom toolbar items are in position **Left**. You can change the position by using the [align](#) property. In the below sample, we have applied position **Right** for the **Quick Filter** toolbar item.

#### INDEX.TS

```
import { TreeGrid, Toolbar, Filter } from '@syncfusion/ej2-treegrid';
import { ClickEventArgs } from '@syncfusion/ej2-navigations';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(Toolbar, Filter);
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 toolbar: [{text: 'Quick Filter', tooltipText: 'Quick Filter', id:
'toolbarfilter', align:'Right'}],
 toolbarClick: (args: ClickEventArgs) => {
 if (args.item.id === 'toolbarfilter') {
 treeGridObj.filterByColumn('taskName', 'startswith', 'Testing');
 }
 },
 allowFiltering: true,
 height: 220,
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 90, textAlign:
'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 180,
textAlign: 'Left' },
 {
 field: 'startDate', headerText: 'Start Date', width: 90,
textAlign: 'Right', type: 'date', format: 'yMd'
 },
 { field: 'duration', headerText: 'Duration', width: 80,
textAlign: 'Right' }
]
});
treeGridObj.appendTo('#TreeGrid');

```

\* The [toolbar](#) has options to define both built-in and custom toolbar items.

\* If a toolbar item does not match the built-in items, it will be treated as a custom toolbar item.

*Built-in and custom items in toolbar*

TreeGrid have an option to use both built-in and custom toolbar items at same time.

In the below example, **ExpandAll**, **CollapseAll** are built-in toolbar items and **Click** is custom toolbar item.

**INDEX.TS**

```
import { TreeGrid, Edit, Toolbar } from '@syncfusion/ej2-treegrid';
import { EmitType } from '@syncfusion/ej2-base';
import { ClickEventArgs } from '@syncfusion/ej2-navigations';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(Edit, Toolbar);
let clickHandler: EmitType<ClickEventArgs> = (args: ClickEventArgs) => {
 if (args.item.text === 'Click') {
 alert("Custom toolbar click...");
 }
};
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 toolbar: ['ExpandAll', 'CollapseAll', { text: 'Click', tooltipText:
'Click', prefixIcon: 'e-time', id: 'Click' }],
 toolbarClick: clickHandler,
 editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true },
 height: 270,
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', isPrimaryKey: true,
width: 90, textAlign: 'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 180,
textAlign: 'Left' },
 {
 field: 'startDate', headerText: 'Start Date', width: 90,
textAlign: 'Right', type: 'date', format: 'yMd'
 },
 { field: 'duration', headerText: 'Duration', width: 80,
textAlign: 'Right' }
]
});
treeGridObj.appendTo('#TreeGrid');
```

## Pdf Export

### Pdf export in EJ2 JavaScript Treegrid control

PDF export allows exporting TreeGrid data to PDF document. You need to use the

[pdfExport](#) method for exporting. To enable PDF export in the treegrid, set the [allowPdfExport](#) as true.

To use PDF export, inject the PdfExport module in treegrid.

### INDEX.TS

```

import { TreeGrid, Page, Toolbar, PdfExport } from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(Page, Toolbar, PdfExport);
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 allowPdfExport: true,
 allowPaging: true,
 height: 220,
 pageSettings: { pageSize: 7 },
 toolbar: ['PdfExport'],
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 90, textAlign: 'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 180, textAlign: 'Left' },
 {
 field: 'startDate', headerText: 'Start Date', width: 90, textAlign: 'Right', type: 'date', format: 'yMd'
 },
 { field: 'duration', headerText: 'Duration', width: 80, textAlign: 'Right' }
]
});
treeGridObj.appendTo('#TreeGrid');
treeGridObj.toolbarClick = (args: Object) => {
 if (args['item'].text === 'PDF Export') {
 treeGridObj.pdfExport();
 }
}

```

```

You can refer to our [JavaScript Tree Grid](#) feature tour page for its groundbreaking feature representations. You can also explore our JavaScript Tree Grid example [JavaScript Tree Grid example](#) to know how to present and manipulate data.

### Pdf export options in EJ2 JavaScript Treegrid control

#### *Export hidden columns*

PDF export provides an option to export hidden columns of TreeGrid by defining the `includeHiddenColumn` as `true`.

#### **INDEX.TS**

```

import { TreeGrid, Page, Toolbar, PdfExport, PdfExportProperties } from
'@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(Page, Toolbar, PdfExport);
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 allowPdfExport: true,
 allowPaging: true,
 height: 220,
 pageSettings: { pageSize: 7 },

```

```

 toolbar: ['PdfExport'],
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 90, textAlign:
'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 180,
textAlign: 'Left' },
 {
 field: 'startDate', headerText: 'Start Date', width: 90,
textAlign: 'Right', type: 'date', format: 'yMd'
 },
 { field: 'duration', headerText: 'Duration', visible: false,
width: 80, textAlign: 'Right' }
]
 });
treeGridObj.appendTo('#TreeGrid');
treeGridObj.toolbarClick = (args: Object) => {
 if (args['item'].text === 'PDF Export') {
 let exportProperties: PdfExportProperties = {
 includeHiddenColumn: true
 };
 treeGridObj.pdfExport(exportProperties);
 }
}

```

```

#### Show or hide columns on exported PDF

You can show a hidden column or hide a visible column while exporting the treegrid using [toolbarClick](#) and [pdfExportComplete](#) events.

In the `toolbarClick` event, based on `args.item.text` as `PDF Export`. We can show or hide columns by setting `column.visible` property to `true` or `false` respectively.

In the `pdfExportComplete` event, We have reversed the state back to the previous state.

In the below example, we have `Duration` as a hidden column in the treegrid. While exporting, we have changed `Duration` to visible column and `StartDate` as hidden column.

#### INDEX.TS

```

import { TreeGrid, Page, Toolbar, PdfExport, PdfExportProperties } from
'@syncfusion/ej2-treegrid';
import { Column } from '@syncfusion/ej2-grids';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(Page, Toolbar, PdfExport);
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 allowPdfExport: true,
 allowPaging: true,
 height: 220,
 pageSettings: {pageSize: 7},
 toolbar: ['PdfExport'],
 treeColumnIndex: 1,
 columns: [

```

```

 { field: 'taskID', headerText: 'Task ID', width: 90, textAlign:
'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 180,
textAlign: 'Left' },
 {
 field: 'startDate', headerText: 'Start Date', width: 90,
textAlign: 'Right', type: 'date', format: 'yMd'
 },
 { field: 'duration', headerText: 'Duration', visible: false,
width: 80, textAlign: 'Right' }
]
});
treeGridObj.appendTo('#TreeGrid');
treeGridObj.toolbarClick = (args: Object) => {
if (args['item'].text === 'PDF Export') {
 let cols: Column[] = treeGridObj.grid.columns;
 cols[2].visible = false;
 cols[3].visible = true;
 treeGridObj.pdfExport();
}
}
treeGridObj.pdfExportComplete = () => {
 let cols: Column[] = treeGridObj.grid.columns;
 cols[3].visible = false;
 cols[2].visible = true;
}
}

```

#### *How to change page size*

Page size can be customized for the exported document using the `exportProperties`.

Supported page sizes are:

- Letter
- Note
- Legal
- A0
- A1
- A2
- A3
- A5
- A6
- A7
- A8
- A9
- B0
- B1
- B2
- B3
- B4
- B5
- Archa
- Archb
- Archc
- Archd
- Arche
- Flsa
- HalfLetter
- Letter11x17
- Ledger

**INDEX.TS**

```
import { TreeGrid, Page, Toolbar, PdfExport, PdfExportProperties } from

```

### *To customize PDF export*

PDF export provides an option to customize mapping of treegrid to exported PDF document.

### *File name for exported document*

You can assign the file name for the exported document by defining `fileName` property in `PdfExportProperties`.

### **INDEX.TS**

```

import { TreeGrid, Page, Toolbar, PdfExport, PdfExportProperties } from
'@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(Page, Toolbar, PdfExport);
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,

```

```

 childMapping: 'subtasks',
 allowPdfExport: true,
 allowPaging: true,
 height: 220,
 pageSettings: {pageSize: 7},
 toolbar: ['PdfExport'],
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 90, textAlign:
'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 180,
textAlign: 'Left' },
 {
 field: 'startDate', headerText: 'Start Date', width: 90,
textAlign: 'Right', type: 'date', format: 'yMd'
 },
 { field: 'duration', headerText: 'Duration', width: 80,
textAlign: 'Right' }
]
 });
treeGridObj.appendTo('#TreeGrid');
treeGridObj.toolbarClick = (args: Object) => {
 if (args['item'].text === 'PDF Export') {
 let exportProperties: PdfExportProperties = {
 fileName: "new.xlsx"
 };
 treeGridObj.pdfExport(exportProperties);
 }
}

```

}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

### Font customization

#### Default fonts for PDF exporting

By default, treegrid uses Helvetica font in the exported document. You can change the default font by using `pdfExportProperties.theme` property. The available default fonts are,

- Helvetica
- TimesRoman
- Courier
- Symbol
- ZapfDingbats

The code example for changing default font,

```
`ts
```

```
import { PdfStandardFont, PdfFontFamily, PdfFontStyle } from '@syncfusion/ej2-pdf-export';
```

```
...
```

```
let pdfExportProperties: PdfExportProperties = {
```

```
theme: {
```

```

header: {font: new PdfStandardFont(PdfFontFamily.TimesRoman, 11, PdfFontStyle.Bold),
record: { font: new PdfStandardFont(PdfFontFamily.TimesRoman, 10) }
}
};
`

```

#### Add custom font for PDF exporting

You can change the default font of TreeGrid header, content and caption cells in the exported document by using `pdfExportProperties.theme` property.

In the following example, we have used Advent Pro font to export the treegrid with Hungarian fonts.

#### INDEX.TS

```

import { TreeGrid, Page, Toolbar, PdfExport, PdfExportProperties } from
'@syncfusion/ej2-treegrid';
import { sampleData, adventProFont } from './datasource.ts';
import { PdfTrueTypeFont } from '@syncfusion/ej2-pdf-export';
TreeGrid.Inject(Page, Toolbar, PdfExport);
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 allowPdfExport: true,
 allowPaging: true,
 height: 220,
 pageSettings: {pageSize: 7},
 toolbar: ['PdfExport'],
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 90, textAlign:
'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 180,
textAlign: 'Left' },
 {
 field: 'startDate', headerText: 'Start Date', width: 90,
textAlign: 'Right', type: 'date', format: 'yMd'
 },
 { field: 'duration', headerText: 'Duration', width: 80,
textAlign: 'Right' }
]
});
treeGridObj.appendTo('#TreeGrid');
treeGridObj.toolbarClick = (args: Object) => {
 if (args['item'].text === 'PDF Export') {
 let exportProperties: PdfExportProperties = {
 theme: {
 header: {font: new PdfTrueTypeFont(adventProFont, 12) },
 record: { font: new PdfTrueTypeFont(adventProFont, 9) }
 }
 };
 treeGridObj.pdfExport(exportProperties);
 }
}
}

```

**INDEX.HTML**

```

type="text/javascript"></script>
 <script src="es5-datasource.js" type="text/javascript"></script>
 <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

 <div id="container">
 <div id="TreeGrid"></div>
 </div>
 <script>
var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
 </script>
 <script src="index.js" type="text/javascript"></script>
</body></html>
```

**PdfTrueTypeFont** accepts base 64 format of the Custom Font.

Pdf cell style customization in EJ2 JavaScript Treegrid control

#### *Conditional cell formatting*

TreeGrid cells in the exported PDF can be customized or formatted using [pdfQueryCellInfo](#) event. In this event, we can format the treegrid cells of exported PDF document based on the column cell value.

In the below sample, we have set the background color for **Duration** column in the exported document by **args.cell** and **backgroundColor** property.

#### **INDEX.TS**

```
import { TreeGrid, Page, Toolbar, PdfExport, PdfExportProperties,
RowDataBoundEventArgs, PdfQueryCellInfoEventArgs } from '@syncfusion/ej2-
treegrid';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(Page, Toolbar, PdfExport);
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 allowPdfExport: true,
 allowPaging: true,
 height: 220,
 pageSettings: {pageSize: 7},
 toolbar: ['PdfExport'],
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 90, textAlign:
'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 180,
textAlign: 'Left' },
 {
 field: 'startDate', headerText: 'Start Date', width: 90,
textAlign: 'Right', type: 'date', format: 'yMd'
 },
 { field: 'duration', headerText: 'Duration', width: 80,
textAlign: 'Right' }
]
});
treeGridObj.appendTo('#TreeGrid');
treeGridObj.toolbarClick = (args: Object) => {
 if (args['item'].text === 'PDF Export') {
 treeGridObj.pdfExport();
 }
}
treeGridObj.pdfQueryCellInfo = (args: PdfQueryCellInfoEventArgs) => {
 if (args.column.field === 'duration') {
 if (+args.value === 0 || args.value === '') {
 args.style = {backgroundColor: '#3366cc'};
 }
 else if (args.value < 3) {
 args.style = {backgroundColor: '#7b2b1d'};
 }
 }
}
```

```
treeGridObj.queryCellInfo = (args: RowDataBoundEventArgs) => {
 if (args.data['duration'] == 0 && args.column.field === 'duration') {
 args.cell.style.background= '#336c12';
 } else if (args.data['duration'] < 3 && args.column.field ===
'duration') {
 args.cell.style.background= '#7b2b1d';
 }
}
```

<body>

 <div id="container">
```

```

 <div id="TreeGrid"></div>
 </div>
</script>
<script>
var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

### Theme

PDF export provides an option to include theme for exported PDF document.

To apply theme in exported PDF, define the **theme** in **exportProperties**.

### INDEX.TS

```

import { TreeGrid, Page, Toolbar, PdfExportProperties, PdfExport } from
'@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(Page, Toolbar, PdfExport);
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 allowPdfExport: true,
 allowPaging: true,
 height: 220,
 pageSettings: { pageSize: 7 },
 toolbar: ['PdfExport'],
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 90, textAlign:
'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 180,
textAlign: 'Left' },
 {
 field: 'startDate', headerText: 'Start Date', width: 90,
textAlign: 'Right', type: 'date', format: 'yMd'
 },
 { field: 'duration', headerText: 'Duration', width: 80,
textAlign: 'Right' }
]
});
treeGridObj.appendTo('#TreeGrid');
treeGridObj.toolbarClick = (args: Object) => {
 if (args['item'].text === 'PDF Export') {
 let exportProperties: PdfExportProperties = {
 theme: {
 header: {
 fontColor: '#64FA50', fontName: 'Calibri', fontSize: 17,
bold: true, border: { color: '#64FA50', lineStyle: 'Thin' }
 },
 record: {
 fontColor: '#64FA50', fontName: 'Calibri', fontSize: 17,
bold: true

```

```

 }
 }
};
treeGridObj.pdfExport (exportProperties);
}
}

```

## INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

 <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

 <div id="container">
 <div id="TreeGrid"></div>
 </div>

```

```

<script>
var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

By default, material theme is applied to exported PDF document.

### Adding header and footer in EJ2 JavaScript Treegrid control

You can customize text, page number, line, page size and changing orientation in header and footer.

#### *How to write a text in header or footer*

You can add text either in Header or Footer of exported PDF document.

```
`ts
```

```

let exportProperties: PdfExportProperties = {
 header: {
 fromTop: 0,
 height: 130,
 contents: [
 {
 type: 'Text',
 value: "Task Details",
 position: { x: 0, y: 50 },
 style: { textBrushColor: '#000000', fontSize: 13 }
 },
]
 }
},
`

```

#### *How to draw a line in header or footer*

you can add line either in Header or Footer of the exported PDF document.

Supported line styles:

- dash
- dot
- dashdot
- dashdotdot
- solid

```
`ts
```

```
let exportProperties: PdfExportProperties = {
 header: {
 fromTop: 0,
 height: 130,
 contents: [
 {
 type: 'Line',
 style: { penColor: '#000080', penSize: 2, dashStyle: 'Solid' },
 points: { x1: 0, y1: 4, x2: 685, y2: 4 }
 }
]
 }
},
```

#### *Add page number in header or footer*

you can add page number either in Header or Footer of exported PDF document.

Supported page number types:

- LowerLatin - a, b, c,
- UpperLatin - A, B, C,
- LowerRoman - i, ii, iii,
- UpperRoman - I, II, III,
- Number - 1,2,3.

`ts

```
let exportProperties: PdfExportProperties = {
 header: {
 fromTop: 0,
 height: 130,
 contents: [
 {
 type: 'PageNumber',
 pageNumberType: 'Arabic',
 format: 'Page { $current } of { $total }', //optional
 position: { x: 0, y: 25 },
 style: { textBrushColor: '#ffff80', fontSize: 15, hAlign: 'Center' }
```

```

}
]
}
}
`

```

#### *Insert an image in header or footer*

Image (Base64 string) can be added in the exported document in header/footer using the `exportProperties`.

```

`ts
let exportProperties: PdfExportProperties = {
 header: {
 fromTop: 0,
 height: 130,
 contents: [
 {
 type: 'Image',
 src: image,
 position: { x: 40, y: 10 },
 size: { height: 100, width: 250 },
 }
]
 }
}
`

```

The below code illustrates the pdf export customization.

#### **INDEX.TS**

```

import { TreeGrid, Page, Toolbar, PdfExport, PdfExportProperties } from
 '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
import { image } from './image.ts';
TreeGrid.Inject(Page, Toolbar, PdfExport);
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 allowPdfExport: true,
 allowPaging: true,
 height: 220,
 pageSettings: { pageSize: 7 },
 toolbar: ['PdfExport'],

```

```

 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 90, textAlign:
'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 180,
textAlign: 'Left' },
 {
 field: 'startDate', headerText: 'Start Date', width: 90,
textAlign: 'Right', type: 'date', format: 'yMd'
 },
 { field: 'duration', headerText: 'Duration', width: 80,
textAlign: 'Right' }
]
 });
treeGridObj.appendTo('#TreeGrid');
treeGridObj.toolbarClick = (args: Object) => {
 if (args['item'].text === 'PDF Export') {
 let pdfExportProperties: PdfExportProperties = {
 header: {
 fromTop: 0,
 height: 130,
 contents: [
 {
 type: 'Image',
 src: image,
 position: { x: 40, y: 10 },
 size: { height: 100, width: 250 },
 }
]
 },
 footer: {
 fromBottom: 160,
 height: 150,
 contents: [
 {
 type: 'PageNumber',
 pageNumberType: 'Arabic',
 format: 'Page {$current} of {$total}',
 position: { x: 0, y: 25 },
 style: { textBrushColor: '#ffff80', fontSize: 15 }
 }
]
 }
 };
 treeGridObj.pdfExport(pdfExportProperties);
 }
}

```

## INDEX.HTML

```

### Exporting Tree Grid in Server

The Tree Grid have an option to export the data to PDF in server side using tree grid server export library.

### *Server dependencies*

The Server side export functionality is shipped in the Syncfusion.EJ2.TreeGridExport package, which is available in Essential Studio and [nuget.org](https://www.nuget.org). The following list of dependencies is required for tree grid server side PDF exporting action.

- Syncfusion.EJ2
- Syncfusion.EJ2.TreeGridExport

### *Server configuration*

The following code snippet shows server configuration using ASP.NET MVC Controller Action.

To Export the tree grid in server side, You need to call the [serverPdfExport](#) method for passing the tree grid properties to server exporting action.

```
`ts
public IActionResult ServerSideExporting()
{
 var order = TreeData.GetDefaultData();
 ViewBag.dataSource = order;
 return View();
}

public IActionResult PdfExport(string treeGridModel)
{
 if (treeGridModel == null)
 {
 return View();
 }

 TreeGridExcelExport exp = new TreeGridExcelExport();
 Syncfusion.EJ2.TreeGrid.TreeGrid gridProperty = ConvertTreeGridObject(treeGridModel);
 return exp.ExportToPdf<TreeData>(gridProperty, TreeData.GetDefaultData());
}

private Syncfusion.EJ2.TreeGrid.TreeGrid ConvertTreeGridObject(string gridProperty)
{
 Syncfusion.EJ2.TreeGrid.TreeGrid TreeGridModel =
 (Syncfusion.EJ2.TreeGrid.TreeGrid)Newtonsoft.Json.JsonConvert.DeserializeObject(gridProperty,
 typeof(Syncfusion.EJ2.TreeGrid.TreeGrid));

 TreeGridColumnModel cols =
 (TreeGridColumnModel)Newtonsoft.Json.JsonConvert.DeserializeObject(gridProperty,
 typeof(TreeGridColumnModel));
}
```

```
TreeGridModel.Columns = cols.columns;
return TreeGridModel;
}
public class TreeGridColumnModel
{
public List<TreeGridColumn> columns { get; set; }
}
`
`ts
import { TreeGrid, Toolbar } from '@syncfusion/ej2-treegrid';
import { DataManager, UrlAdaptor } from '@syncfusion/ej2-data';
TreeGrid.Inject(Toolbar);
let data: DataManager = new DataManager({
url: "Home/DataSource",
adaptor: new UrlAdaptor
});
let treegrid: TreeGrid = new TreeGrid({
dataSource: data,
parentIdMapping: 'ParentItem',
hasChildMapping: 'isParent',
toolbar: ['PdfExport'],
columns: [
{ field: 'TaskID', headerText: 'Task ID', textAlign: 'Right', width: 90 },
{ field: 'TaskName', headerText: 'Task Name', width: 180 },
{ field: 'StartDate', headerText: 'Start Date', textAlign: 'Right', width: 90, format: { skeleton: 'yMd', type: 'date' } },
{ field: 'Duration', headerText: 'Duration', width: 80, textAlign: 'Right' }
],
height: 265
});
treegrid.appendTo('#TreeGrid');
treegrid.toolbarClick = (args: Object) => {
if (args['item'].id === 'TreeGridgridcontrolpdfexport') {
```

```

treegrid.serverPdfExport("Home/PdfExport");
}
}
`

```

*Rotate a header text to a certain degree in the exported tree grid on the server side*

The Tree Grid has support to customize the column header styles such as changing text orientation, the font color, and so on in the exported PDF file. To achieve this requirement, define the `BeginCellLayout` event of the `PdfExportProperties` with an event handler to perform the required action.

The `PdfHeaderCellRendering` will be triggered when creating a column header for the pdf document to be exported. Collect the column header details in this event and handle the custom in the `BeginCellLayout` event handler.

In the following demo, the `DrawString` method from the `Graphics` is used to rotate the header text of the column header inside the `BeginCellLayout` event handler.

**Note:** A PDF exporting is not supported to rotate the column header on the client side.

```

`ts
public IActionResult PdfExport(string treeGridModel)
{
 if (treeGridModel == null)
 {
 return View();
 }

 TreeGridPdfExport exp = new TreeGridPdfExport();
 TreeGrid gridProperty = ConvertTreeGridObject(treeGridModel);
 gridProperty.PdfHeaderCellRendering = PdfHeaderQueryCellInfo;
 PdfGrid grid = new PdfGrid();

 Syncfusion.EJ2.TreeGridExport.PdfExportProperties pdfExportProperties = new
 Syncfusion.EJ2.TreeGridExport.PdfExportProperties();
 pdfExportProperties.IsRepeatHeader = true;
 exp.BeginCellLayout = new PdfGridBeginCellLayoutEventHandler(BeginCellEvent);
 System.Collections.IEnumerable data = Syncfusion.EJ2.Base.Dat.DataTableToJson(ViewBag.dataSource);
 var result = exp.PdfExport<dynamic>(gridProperty, data, pdfExportProperties);
 return View();
}

public void BeginCellEvent(object sender, PdfGridBeginCellLayoutEventArgs args)
{

```

```

PdfGrid grid = (PdfGrid)sender;
var brush = new PdfSolidBrush(new PdfColor(Color.DimGray));
args.Graphics.Save();
args.Graphics.TranslateTransform(args.Bounds.X + 50, args.Bounds.Height + 40); // give the value for
bounds x and Y by the user
args.Graphics.RotateTransform(-60); // give the rotate degree value by the user
// Draw the text at particular bounds.
args.Graphics.DrawString(headerValues[args.CellIndex], new PdfStandardFont(PdfFontFamily.Helvetica,
10), brush, new PointF(0, 0));
if (args.IsHeaderRow)
{
grid.Headers[0].Cells[args.CellIndex].Value = string.Empty;
}
args.Graphics.Restore();
}
private void PdfHeaderQueryCellInfo(object pdf)
{
Syncfusion.EJ2.TreeGridExport.PdfHeaderCellEventArgs name =
(Syncfusion.EJ2.TreeGridExport.PdfHeaderCellEventArgs)pdf;
PdfGrid grid = new PdfGrid();
headerValues.Add(name.Column.HeaderText);
var longestString = headerValues.Where(s => s.Length == headerValues.Max(m => m.Length)).First();
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 6);
SizeF size = font.MeasureString(longestString);
name.Headers[0].Height = size.Width * 2;
}
,

```

## Excel Export

### Excel export in EJ2 JavaScript Treegrid control

The excel export allows exporting TreeGrid data to Excel document. You need to use the [excelExport](#) method for exporting. To enable Excel export in the treegrid, set the [allowExcelExport](#) as true.

To use excel export, You need to inject the `ExcelExport` module in treegrid.

### INDEX.TS

```

import { TreeGrid, Toolbar, ExcelExport, Page } from '@syncfusion/ej2-
treegrid';
import { sampleData } from '../datasource.ts';

```

```

TreeGrid.Inject(Toolbar, ExcelExport, Page);
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 allowExcelExport: true,
 allowPaging: true,
 height: 220,
 pageSettings: {pageSize: 7},
 toolbar: ['ExcelExport'],
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 90, textAlign:
'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 180,
textAlign: 'Left' },
 {
 field: 'startDate', headerText: 'Start Date', width: 90,
textAlign: 'Right', type: 'date', format: 'yMd'
 },
 { field: 'duration', headerText: 'Duration', width: 80,
textAlign: 'Right' }
]
});
treeGridObj.toolbarClick = (args: Object) => {
 if (args['item'].text === 'Excel Export') {
 treeGridObj.excelExport();
 }
}
treeGridObj.appendTo('#TreeGrid');

```

## INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
 <title>EJ2 Grid</title>
 <meta charset="utf-8">
 <meta name="viewport" content="width=device-width, initial-scale=1.0">

<script>
var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

### Persist collapsed state

You can persist the collapsed state in the exported document by defining `isCollapsedStatePersist` property as true in `TreeGridExcelExportProperties` parameter of [excelExport](#) method.

### INDEX.TS

```

import { TreeGrid, Toolbar, ExcelExport, TreeGridExcelExportProperties, Page
} from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(Toolbar, ExcelExport, Page);
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 allowExcelExport: true,
 allowPaging: true,
 height: 220,
 pageSettings: { pageSize: 7 },
 toolbar: ['ExcelExport'],
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 90, textAlign:
'Right' },

```

```

 { field: 'taskName', headerText: 'Task Name', width: 180,
textAlign: 'Left' },
 {
 field: 'startDate', headerText: 'Start Date', width: 90,
textAlign: 'Right', type: 'date', format: 'yMd'
 },
 { field: 'duration', headerText: 'Duration', width: 80,
textAlign: 'Right' }
]
});
treeGridObj.toolbarClick = (args: Object) => {
 if (args['item'].text === 'Excel Export') {
 let excelExportProperties: TreeGridExcelExportProperties = {
 isCollapsedStatePersist: true
 };
 treeGridObj.excelExport(excelExportProperties);
 }
}
treeGridObj.appendTo('#TreeGrid');

```

## INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

<script>
var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

### Custom data source

The excel export provides an option to define datasource dynamically before exporting. To export data dynamically, define the `dataSource` in `exportProperties`.

### INDEX.TS

```

import { TreeGrid, Toolbar, ExcelExport, ExcelExportProperties, Page } from
'@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(Toolbar, ExcelExport, Page);
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 allowExcelExport: true,
 allowPaging: true,

Excel export options in EJ2 JavaScript Treegrid control

*To customize excel export*

The excel export provides an option to customize mapping of the treegrid to excel document.

[Export hidden columns](#)

The excel export provides an option to export hidden columns of treegrid by defining `includeHiddenColumn` as `true`.

## INDEX.TS

```

import { TreeGrid, Toolbar, ExcelExport, Page, ExcelExportProperties } from
 '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(Toolbar, ExcelExport, Page);
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 allowExcelExport: true,
 allowPaging: true,
 height: 220,
 pageSettings: { pageSize: 7 },
 toolbar: ['ExcelExport'],
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 90, textAlign:
 'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 180,
 textAlign: 'Left' },
 {
 field: 'startDate', headerText: 'Start Date', width: 90,
 textAlign: 'Right', type: 'date', format: 'yMd'
 },
 { field: 'duration', headerText: 'Duration', visible: false,
 width: 80, textAlign: 'Right' }
]
});
treeGridObj.toolbarClick = (args: Object) => {
 if (args['item'].text === 'Excel Export') {
 let excelExportProperties: ExcelExportProperties = {
 includeHiddenColumn: true
 };
 }
};

```

```

 treeGridObj.excelExport(excelExportProperties);
 }
}
treeGridObj.appendTo('#TreeGrid');

```

```

#### Show or hide columns on exported excel

You can show a hidden column or hide a visible column while printing the treegrid using [toolbarClick](#) and [excelExportComplete](#) events.

In the `toolbarClick` event, based on `args.item.text` as `Excel Export`. We can show or hide columns by setting `column.visible` property to `true` or `false` respectively.

In the `excelExportComplete` event, We have reversed the state back to the previous state.

In the below example, we have `Duration` as a hidden column in the treegrid. While exporting, we have changed `Duration` to visible column and `StartDate` as hidden column.

#### INDEX.TS

```

import { TreeGrid, Page, Toolbar, ExcelExport, ExcelExportProperties } from
 '@syncfusion/ej2-treegrid';
import { Column } from '@syncfusion/ej2-grids';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(Page, Toolbar, ExcelExport);
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 allowExcelExport: true,
 allowPaging: true,
 height: 220,
 pageSettings: { pageSize: 7 },
 toolbar: ['ExcelExport'],
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 90, textAlign:
 'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 180,
 textAlign: 'Left' },
 {
 field: 'startDate', headerText: 'Start Date', width: 90,
 textAlign: 'Right', type: 'date', format: 'yMd'
 },
 { field: 'duration', headerText: 'Duration', visible: false,
 width: 80, textAlign: 'Right' }
]
});
treeGridObj.toolbarClick = (args: Object) => {
 if (args['item'].text === 'Excel Export') {
 let cols: Column[] = treeGridObj.grid.columns;
 cols[2].visible = false;
 cols[3].visible = true;
 treeGridObj.excelExport();
 }
}

```

```
treeGridObj.excelExportComplete = () => {
 let cols: Column[] = treeGridObj.grid.columns;
 cols[3].visible = false;
 cols[2].visible = true;
}
treeGridObj.appendTo('#TreeGrid');
```

Excel cell style customization in EJ2 JavaScript Treegrid control

### Conditional cell formatting

TreeGrid cells in the exported Excel can be customized or formatted using [excelQueryCellInfo](#) event. In this event, we can format the treegrid cells of exported PDF document based on the column cell value.

In the below sample, we have set the background color for **Duration** column in the exported excel by **args.cell** and **backgroundColor** property.

### INDEX.TS

```
import { TreeGrid, Page, Toolbar, ExcelExport, ExcelExportProperties,
RowDataBoundEventArgs, ExcelQueryCellInfoEventArgs } from '@syncfusion/ej2-
treegrid';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(Page, Toolbar, ExcelExport);
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 allowExcelExport: true,
 allowPaging: true,
 height: 220,
 pageSettings: { pageSize: 7 },
 toolbar: ['ExcelExport'],
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 90, textAlign:
'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 180,
textAlign: 'Left' },
 {
 field: 'startDate', headerText: 'Start Date', width: 90,
textAlign: 'Right', type: 'date', format: 'yMd'
 },
 { field: 'duration', headerText: 'Duration', width: 80,
textAlign: 'Right' }
]
});
treeGridObj.toolbarClick = (args: Object) => {
 if (args['item'].text === 'Excel Export') {
 treeGridObj.excelExport();
 }
}
treeGridObj.excelQueryCellInfo = (args: ExcelQueryCellInfoEventArgs) => {
 if (args.column.field === 'duration') {
 if (args.value === 0 || args.value === "") {
 args.style = { backgroundColor: '#336c12' };
 }
 else if (args.value < 3) {
 args.style = { backgroundColor: '#7b2b1d' };
 }
 }
}
treeGridObj.queryCellInfo = (args: RowDataBoundEventArgs) => {
 if (args.data['duration'] === 0 && args.column.field === 'duration') {
 args.cell.style.backgroundColor= '#336c12';
 }
}
```

```
 } else if (args.data['duration'] < 3 && args.column.field ===
'duration') {
 args.cell.style.background= '#7b2b1d';
 }
}
treeGridObj.appendTo('#TreeGrid');
```

</body></html>
```

By default, material theme is applied to exported excel document.

### Adding header and footer in EJ2 JavaScript Treegrid control

The excel export provides an option to include header and footer content for exported excel document.

#### INDEX.TS

```
import { TreeGrid, Toolbar, ExcelExport, ExcelExportProperties, Page } from
 '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(Toolbar, ExcelExport, Page);
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 allowExcelExport: true,
 allowPaging: true,
 height: 220,
 pageSettings: { pageSize: 7 },
 toolbar: ['ExcelExport'],
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 90, textAlign:
'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 180,
textAlign: 'Left' },
 {
 field: 'startDate', headerText: 'Start Date', width: 90,
textAlign: 'Right', type: 'date', format: 'yMd'
 },
 { field: 'duration', headerText: 'Duration', width: 80,
textAlign: 'Right' }
]
});
treeGridObj.toolbarClick = (args: Object) => {
 if (args['item'].text === 'Excel Export') {
 let excelExportProperties: ExcelExportProperties = {
 header: {
 headerRows: 7,
 rows: [
 { cells: [{ colSpan: 4, value: "Northwind Traders",

### Exporting Tree Grid in Server

The Tree Grid have an option to export the data to Excel in server side using tree grid server export library.

#### Server dependencies

The Server side export functionality is shipped in the Syncfusion.EJ2.TreeGridExport package, which is available in Essential Studio and [nuget.org](https://nuget.org). The following list of dependencies is required for tree grid server side Excel exporting action.

- Syncfusion.EJ2
- Syncfusion.EJ2.TreeGridExport

#### Server configuration

The following code snippet shows server configuration using ASP.NET MVC Controller Action.

To Export the tree grid in server side, You need to call the [serverExcelExport](#) method for passing the tree grid properties to server exporting action.

```

`ts
public IActionResult ServerSideExporting()
{
 var order = TreeData.GetDefaultData();
 ViewBag.dataSource = order;
 return View();
}

```

```

public IActionResult ExcelExport(string treeGridModel)
{
 if (treeGridModel == null)
 {
 return View();
 }
 TreeGridExcelExport exp = new TreeGridExcelExport();
 Syncfusion.EJ2.TreeGrid.TreeGrid gridProperty = ConvertTreeGridObject(treeGridModel);
 return exp.ExportToExcel<TreeData>(gridProperty, TreeData.GetDefaultData());
}

private Syncfusion.EJ2.TreeGrid.TreeGrid ConvertTreeGridObject(string gridProperty)
{
 Syncfusion.EJ2.TreeGrid.TreeGrid TreeGridModel =
 (Syncfusion.EJ2.TreeGrid.TreeGrid)Newtonsoft.Json.JsonConvert.DeserializeObject(gridProperty,
 typeof(Syncfusion.EJ2.TreeGrid.TreeGrid));

 TreeGridColumnModel cols =
 (TreeGridColumnModel)Newtonsoft.Json.JsonConvert.DeserializeObject(gridProperty,
 typeof(TreeGridColumnModel));

 TreeGridModel.Columns = cols.columns;
 return TreeGridModel;
}

public class TreeGridColumnModel
{
 public List<TreeGridColumn> columns { get; set; }
}
`typescript
import { TreeGrid, Toolbar } from '@syncfusion/ej2-treegrid';
import { DataManager, UrlAdaptor } from '@syncfusion/ej2-data';
TreeGrid.Inject(Toolbar);
let data: DataManager = new DataManager({
 url: "Home/DataSource",
 adaptor: new UrlAdaptor
});

```

```

let treegrid: TreeGrid = new TreeGrid({
 dataSource: data,
 parentIdMapping: 'ParentItem',
 hasChildMapping: 'isParent',
 toolbar: ['ExcelExport'],
 columns: [
 { field: 'TaskID', headerText: 'Task ID', textAlign: 'Right', width: 90 },
 { field: 'TaskName', headerText: 'Task Name', width: 180 },
 { field: 'StartDate', headerText: 'Start Date', textAlign: 'Right', width: 90, format: { skeleton: 'yMd', type: 'date' } },
 { field: 'Duration', headerText: 'Duration', width: 80, textAlign: 'Right' }
],
 height: 265
});
treegrid.appendTo('#TreeGrid');
treegrid.toolbarClick = (args: Object) => {
 if (args['item'].id === 'TreeGridgridcontrolexcelexport') {
 treegrid.serverExcelExport("Home/ExcelExport");
 }
}

```

#### *CSV Export in server side*

You can export the tree grid to CSV format by using the [serverCsvExport](#) method which will pass the tree grid properties to server.

In the below demo, we have invoked the above method inside the [toolbarClick](#) event. In server side, we have deserialized the tree grid properties and passed to the [ExportToCsv](#) method which will export the properties to CSV format.

```

`ts
public IActionResult ServerSideExporting()
{
 var order = TreeData.GetDefaultData();
 ViewBag.dataSource = order;
 return View();
}

public IActionResult CsvExport(string treeGridModel)

```

```

{
if (treeGridModel == null)
{
return View();
}
TreeGridExcelExport exp = new TreeGridExcelExport();
Syncfusion.EJ2.TreeGrid.TreeGrid gridProperty = ConvertTreeGridObject(treeGridModel);
return exp.ExportToCsv<TreeData>(gridProperty, TreeData.GetDefaultData());
}

private Syncfusion.EJ2.TreeGrid.TreeGrid ConvertTreeGridObject(string gridProperty)
{
Syncfusion.EJ2.TreeGrid.TreeGrid TreeGridModel =
(Syncfusion.EJ2.TreeGrid.TreeGrid)Newtonsoft.Json.JsonConvert.DeserializeObject(gridProperty,
typeof(Syncfusion.EJ2.TreeGrid.TreeGrid));

TreeGridColumnModel cols =
(TreeGridColumnModel)Newtonsoft.Json.JsonConvert.DeserializeObject(gridProperty,
typeof(TreeGridColumnModel));

TreeGridModel.Columns = cols.columns;
return TreeGridModel;
}

public class TreeGridColumnModel
{
public List<TreeGridColumn> columns { get; set; }
}
`ts
import { TreeGrid, Toolbar } from '@syncfusion/ej2-treegrid';
import { DataManager, UrlAdaptor } from '@syncfusion/ej2-data';
TreeGrid.Inject(Toolbar);
let data: DataManager = new DataManager({
url: "Home/DataSource",
adaptor: new UrlAdaptor
});
let treegrid: TreeGrid = new TreeGrid({

```

```

dataSource: data,
parentIdMapping: 'ParentItem',
hasChildMapping: 'isParent',
toolbar: ['CsvExport'],
columns: [
{ field: 'TaskID', headerText: 'Task ID', textAlign: 'Right', width: 90 },
{ field: 'TaskName', headerText: 'Task Name', width: 180 },
{ field: 'StartDate', headerText: 'Start Date', textAlign: 'Right', width: 90, format: { skeleton: 'yMd', type: 'date' } },
{ field: 'Duration', headerText: 'Duration', width: 80, textAlign: 'Right' }
],
height: 265
});
treegrid.appendTo('#TreeGrid');
treegrid.toolbarClick = (args: Object) => {
if (args['item'].id === 'TreeGridgridcontrolcsvexport') {
treegrid.serverCsvExport("Home/CsvExport");
}
}
,

```

*Rotate a header text to a certain degree in the exported tree grid on the server side*

The Tree Grid has support to customize the column header styles such as changing text orientation, the font color, and so on in the exported Excel file. To achieve this requirement, use the `ExcelHeaderCellRendering` event of the tree grid.

The `ExcelHeaderCellRendering` will be triggered when creating a column header for the excel document to be exported in the server side. Customize the column header in this event.

In the following demo, using the `HeaderCellRotate` method of the `TreeGridExcelExport` class in the `ExcelHeaderCellRendering` event, you can rotate the header text of the column header in the excel exported document.

```

`ts
public IActionResult ExcelExport(string treeGridModel)
{
if (treeGridModel == null)
{
return View();
}
}

```

```

}
TreeGridExcelExport exp = new TreeGridExcelExport();
Syncfusion.EJ2.TreeGrid.TreeGrid gridProperty = ConvertTreeGridObject(treeGridModel);
gridProperty.ExcelHeaderCellRendering = ExcelHeaderQueryCellInfo;
return (ActionResult)exp.ExcelExport<TreeGridItems>(gridProperty, TreeGridItems.GetDefaultData());
}
private void ExcelHeaderQueryCellInfo(object excel)
{
 Syncfusion.EJ2.TreeGridExport.ExcelHeaderCellEventArgs name =
 (Syncfusion.EJ2.TreeGridExport.ExcelHeaderCellEventArgs)excel;
 List<string> headerValues = new List<string>();
 headerValues.Add(name.Column.HeaderText);
 var longestString = headerValues.Where(s => s.Length == headerValues.Max(m => m.Length)).First();
 TreeGridExcelExport exp = new TreeGridExcelExport();
 var size = exp.ExcelTextSize(name.Style.Font.FontName, (float)name.Style.Font.Size, longestString);
 name.Cell.RowHeight = size.Width;
 exp.HeaderCellRotate(name, 45); // Give the rotate degree value by the user.
 name.Style.Borders.LineStyle = Syncfusion.XlsIO.ExcelLineStyle.None;
}

```

## Global local in EJ2 JavaScript Treegrid control

### Localization

The [Localization](#) library allows you to localize default text content of the TreeGrid. The treegrid component has static text on some features (like toolbar area text, filter menu text, pager information text, etc.) that can be changed to other cultures (Arabic, Deutsch, French, etc.) by defining the

[locale](#) value and translation object.

The following list of properties and its values are used in the treegrid.

Locale keywords | Text

EmptyRecord | No records to display

True | true

False | false

ExpandAll | Expand All

CollapseAll | Collapse All

RowIndent | Indent

RowOutdent | Outdent

InvalidFilterMessage | Invalid Filter Data

FilterbarTitle | \s filter bar cell

Add | Add

Edit | Edit

Cancel | Cancel

Update | Update

Delete | Delete

Print | Print

Pdfexport | PDF Export

Excelexport | Excel Export

Wordexport | Word Export

Csvexport | CSV Export

Search | Search

Save | Save

EditOperationAlert | No records selected for edit operation

DeleteOperationAlert | No records selected for delete operation

SaveButton | Save

OKButton | OK

CancelButton | Cancel

EditFormTitle | Details of

AddFormTitle | Add New Record

ConfirmDelete | Are you sure you want to Delete Record?

SearchColumns | search columns

Matches | No Matches Found

FilterButton | Filter

ClearButton | Clear

StartsWith | Starts With

EndsWith | Ends With

Contains | Contains

Equal | Equal

NotEqual | Not Equal

LessThan | Less Than

LessThanOrEqualTo | Less Than Or Equal  
GreaterThan | Greater Than  
GreaterThanOrEqualTo | Greater Than Or Equal  
ChooseDate | Choose a Date  
EnterValue | Enter the value  
autoFitAll | Auto Fit all columns  
autoFit | Auto Fit this column  
Export | Export  
FirstPage | First Page  
LastPage | Last Page  
PreviousPage | Previous Page  
NextPage | Next Page  
SortAscending | Sort Ascending  
SortDescending | Sort Descending  
EditRecord | Edit Record  
DeleteRecord | Delete Record  
Above | Above  
Below | Below  
AddRow | Add Row  
FilterMenu | Filter  
SelectAll | Select All  
Blanks | Blanks  
FilterTrue | True  
FilterFalse | False  
NoResult | No Matches Found  
ClearFilter | Clear Filter  
NumberFilter | Number Filters  
TextFilter | Text Filters  
DateFilter | Date Filters  
MatchCase | Match Case  
Between | Between  
CustomFilter | Custom Filter  
CustomFilterPlaceholder | Enter the value

CustomFilterDatePlaceholder | Choose a date

AND | AND

OR | OR

ShowRowsWhere | Show rows where:

currentPageInfo | {0} of {1} pages

totalItemsInfo | ({0} items)

firstPageTooltip | Go to first page

lastPageTooltip | Go to last page

nextPageTooltip | Go to next page

previousPageTooltip | Go to previous page

nextPagerTooltip | Go to next pager

previousPagerTooltip | Go to previous pager

pagerDropDown | Items per page

pagerAllDropDown | Items

All | All

### *Loading translations*

To load translation object in an application, use [load](#) function of the `L10n` class.

The following example demonstrates the TreeGrid in `Deutsch` culture.

### **INDEX.TS**

```
import { L10n } from '@syncfusion/ej2-base';
import { TreeGrid, Toolbar, Page, Filter } from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(Toolbar, Filter, Page);
L10n.load({
 'de-DE': {
 'treegrid': {
 'EmptyRecord': 'Keine Aufzeichnungen angezeigt',
 'Expand All': 'Alle erweitern',
 'Collapse All': 'Alles einklappen',
 'Print': 'Drucken',
 'Pdfexport': 'PDF-Export',
 'Excelexport': 'Excel-Export',
 'Wordexport': 'Word-Export',
 'FilterButton': 'Filter',
 'ClearButton': 'klar',
 'StartsWith': 'Beginnt mit',
 'EndsWith': 'Endet mit',
 'Contains': 'Enthält',
 'Equal': 'Gleich',
 'NotEqual': 'Nicht gleich',
 'LessThan': 'Weniger als',
 'LessThanOrEqual': 'Weniger als oder gleich',
 'GreaterThan': 'Größer als',
 }
 }
});
```

```

 "GreaterThanOrEqual": "Größer als oder gleich",
 "EnterValue": "Geben Sie den Wert ein",
 "FilterMenu": "Filter"
 },
 'pager': {
 'currentPageInfo': '{0} von {1} Seiten',
 'totalItemsInfo': '({0} Beiträge)',
 'firstPageTooltip': 'Zur ersten Seite',
 'lastPageTooltip': 'Zur letzten Seite',
 'nextPageTooltip': 'Zur nächsten Seite',
 'previousPageTooltip': 'Zurück zur letzten Seit',
 'nextPagerTooltip': 'Zum nächsten Pager',
 'previousPagerTooltip': 'Zum vorherigen Pager'
 },
 "dropdowns": {
 "noRecordsTemplate": "Keine Aufzeichnungen gefunden"
 },
 "datepicker": {
 "placeholder": "Wählen Sie ein Datum",
 "today": "heute"
 }
}
});
TreeGrid.Inject(Toolbar, Filter);
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 locale: 'de-DE',
 childMapping: 'subtasks',
 toolbar: ['Print'],
 allowFiltering: true,
 filterSettings: {type: 'Menu'},
 height: 220,
 allowPaging: true,
 pageSettings: {pageSize: 7},
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 90, textAlign:
'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 180,
textAlign: 'Left' },
 { field: 'duration', headerText: 'Duration', width: 80,
textAlign: 'Right' }
]
});
treeGridObj.appendTo('#TreeGrid');

```

## INDEX.HTML

}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

\* In the above sample, **Price** column is formatted by **NumberFormatOptions**.

\* By default, **locale** value is **en-US**. If you want to change the **en-US** culture to a different culture, you have to change the **locale** accordingly.

### Right to left (RTL)

RTL provides an option to switch the text direction and layout of the TreeGrid component from right to left. It improves the user experiences and accessibility for users who use right-to-left languages (Arabic, Farsi, Urdu, etc.). To enable RTL Grid, set the **enableRtl** to true.

### INDEX.TS

### Accessibility in EJ2 JavaScript Treegrid control

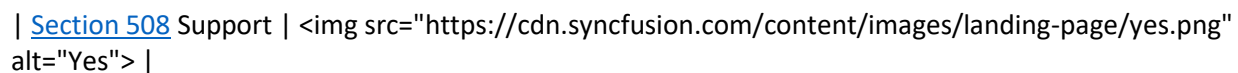

The Tree Grid component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

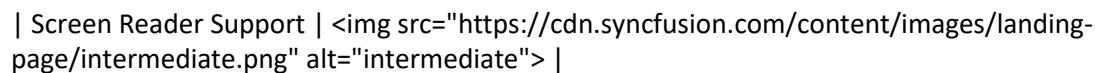

The accessibility compliance for the Tree Grid component is outlined below.

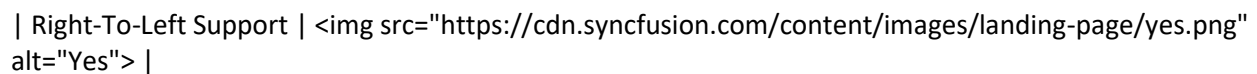

| Accessibility Criteria | Compatibility |

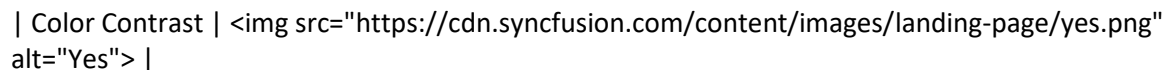

| -- | -- |

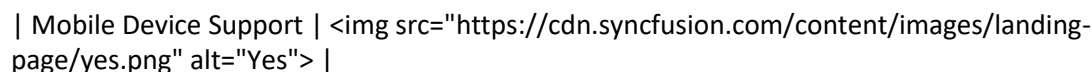

| [WCAG 2.2](#) Support |  |

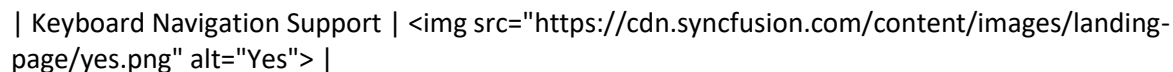

| [Section 508](#) Support |  |

| Screen Reader Support |  |

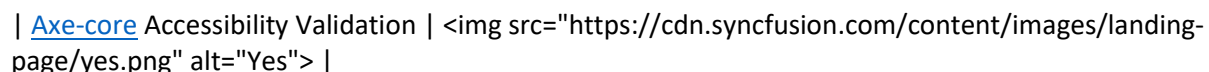

| Right-To-Left Support |  |

| Color Contrast |  |

| Mobile Device Support |  |

| Keyboard Navigation Support |  |

| [Accessibility Checker](#) Validation |  |

| [Axe-core](#) Accessibility Validation |  |

<style>

```
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
```

</style>

<div> - All features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

### WAI-ARIA attributes

The Tree Grid component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Tree Grid component:

Attributes	Purpose
---	---
<code>role=treegrid</code>	Used to convey a significant and contextual message to the user.
<code>aria-selected</code>	Accurately reflect the selection state, whether it's single-select or multi-select.
<code>aria-expanded</code>	It can be used to show whether a node is expanded or collapsed, making it easier for screen reader users to navigate and understand the hierarchy.
<code>aria-sort</code>	Indicate the current sorting order of a table column for users with disabilities, facilitating accessible data presentation and interaction.
<code>aria-busy</code>	Loading state to improve accessibility for users, particularly those relying on screen readers.
<code>aria-invalid</code>	To indicate whether the user's input in a form field is valid or invalid, aiding users, including those with disabilities, in understanding and correcting their input.
<code>aria-grabbed</code>	Provides accessibility information for users interacting with draggable elements.
<code>aria-owns</code>	Establishing relationships between an element and the elements it owns or controls.
<code>aria-label</code>	Provides an accessible name for the close icon.

### Keyboard interaction

The Tree Grid component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Tree Grid component.

Interaction Keys | Description

<code>PageDown</code>	Goes to the next page.
<code>PageUp</code>	Goes to the previous page.
<code>Ctrl + Alt + PageDown</code>	Goes to the last page.
<code>Ctrl + Alt + PageUp</code>	Goes to the first page.
<code>Alt + PageDown</code>	Goes to the next page.
<code>Alt + PageUp</code>	Goes to the previous page.
<code>Home</code>	Goes to the first cell.
<code>End</code>	Goes to the last cell.
<code>Ctrl + Home</code>	Goes to the first row.
<code>Ctrl + End</code>	Goes to the last row.

DownArrow | Moves the cell focus downward.

UpArrow | Moves the cell focus upward.

LeftArrow | Moves the cell focus left side.

RightArrow | Moves the cell focus right side.

Shift + DownArrow | Extends the row/cell selection downwards.

Shift + UpArrow | Extends the row/cell selection upwards.

Shift + LeftArrow | Extends the cell selection to the left side.

Shift + RightArrow | Extends the cell selection to the right side.

Enter | Moves the row/cell selection downward. If current cell is in edit state, then completes the editing. If the current cell is a header then performs sorting.

Shift + Enter | Moves the row/cell selection upward. If the current cell is a header then clears sorting for the selected column.

Ctrl + Enter | If the current cell is a header then performs multi-sorting.

Tab | Moves the cell selection right side.

Shift + Tab | Moves the cell selection left side.

Esc | Deselects all the rows/cells.

Ctrl + A | Selects all the rows/cells.

UpArrow | Moves up a row/cell selection.

DownArrow | Moves down a row/cell selection.

RightArrow | Moves to the right cell selection.

LeftArrow | Moves to the left cell selection.

Ctrl + Shift + DownArrow | Expands the selected group.

Ctrl + DownArrow | Expands all the visible groups.

Ctrl + Shift + UpArrow | Collapses the selected group.

Ctrl + UpArrow | Collapses all the visible groups.

Ctrl + P | Prints the TreeGrid.

### Ensuring accessibility

The Tree Grid component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Tree Grid component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Tree Grid component with accessibility tools.

### Clipboard in EJ2 JavaScript Treegrid control

The clipboard provides an option to copy selected rows or cells data into the clipboard.

The following list of keyboard shortcuts is supported in the Tree Grid to copy selected rows or cells data into the clipboard.

Interaction keys | Description

**Ctrl + C | Copy selected rows or cells data into clipboard.**

**Ctrl + Shift + H | Copy selected rows or cells data with header into clipboard.**

#### INDEX.TS

```
import { TreeGrid, Page, Selection } from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(Page, Selection);
let treegrid: TreeGrid = new TreeGrid(
 {
 dataSource: sampleData,
 childMapping: 'subtasks',
 treeColumnIndex: 1,
 allowSelection: true,
 allowPaging: true,
 pageSettings: { pageSize: 10 },
 selectionSettings: { type: 'Multiple', mode: 'Row' },
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 70, textAlign:
'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 200,
textAlign: 'Left' },
 { field: 'startDate', headerText: 'Start Date', width: 90,
textAlign: 'Right', type: 'date', format: 'yMd' },
 { field: 'duration', headerText: 'Duration', width: 80,
textAlign: 'Right' },
 { field: 'progress', headerText: 'Progress', width: 80,
textAlign: 'Right' },
],
 height: 260
 });
treegrid.appendTo('#TreeGrid');
```

```

## Copy Hierarchy Modes

Tree Grid provides support for a set of copy modes with [copyHierarchyMode](#) property.

The below are the type of filter mode available in TreeGrid.

- **Parent** : This is the default copy hierarchy mode in Tree Grid. Clipboard value have the selected records with its parent records. If the selected records not have any parent record then the selected record will be in clipboard.
- **Child** : Clipboard value have the selected records with its child record. If the selected records do not have any child record then the selected records will be in clipboard.
- **Both** : Clipboard value have the selected records with its both parent and child record. If the selected records do not have any parent and child record then the selected records alone in clipboard.
- **None** : Only the Selected records will be in clipboard.

## INDEX.TS

```
import { TreeGrid, Page, Selection } from '@syncfusion/ej2-treegrid';
import { DropDownList, ChangeEventArgs } from '@syncfusion/ej2-dropdowns';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(Page, Selection);
let treegrid: TreeGrid = new TreeGrid(
 {
 dataSource: sampleData,
 childMapping: 'subtasks',
 treeColumnIndex: 1,
 copyHierarchyMode: 'Parent',
 allowSelection: true,

 </script>
 <script src="index.js" type="text/javascript"></script>
</body></html>
```

### Limitations of Copy Functionality

- Only current view records will be available in copy clipboard.

### AutoFill

AutoFill Feature allows you to copy the data of selected cells and paste it to another cells by just dragging the autofill icon of the selected cells up to required cells. This feature is enabled by defining `enableAutoFill` property as true.

## INDEX.TS

```
import { TreeGrid, Page, Selection, Edit, Toolbar } from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(Page, Selection, Edit, Toolbar);
let treegrid: TreeGrid = new TreeGrid(
 {
 dataSource: sampleData,
 childMapping: 'subtasks',
 treeColumnIndex: 1,
 enableAutoFill: true,
 enableHover: false,
 allowSelection: true,
 toolbar: ['Add', 'Update', 'Cancel'],
 selectionSettings: { type: 'Multiple', mode: 'Cell',
cellSelectionMode: 'Box' },
 editSettings: { allowEditing: true, allowAdding: true,
allowDeleting: true, mode: 'Batch' },
 allowPaging: true,
 pageSettings: { pageSize: 10 },
 columns: [
 { field: 'taskID', headerText: 'Task ID', isPrimaryKey: true,
width: 70, textAlign: 'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 200,
textAlign: 'Left' },
 { field: 'startDate', headerText: 'Start Date', width: 90,
textAlign: 'Right', type: 'date', format: 'yMd' },
 { field: 'duration', headerText: 'Duration', width: 80,
textAlign: 'Right' },
 { field: 'progress', headerText: 'Progress', width: 80,
textAlign: 'Right' },
],
 height: 220
 });
treegrid.appendTo('#TreeGrid');
```

## INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
 <title>EJ2 Tree Grid</title>
 <meta charset="utf-8">
 <meta name="viewport" content="width=device-width, initial-scale=1.0">
 <meta name="description" content="Typescript Tree Grid Control">
 <meta name="author" content="Syncfusion">
 <link href="index.css" rel="stylesheet">
 <!-- Syncfusion Essential JS 2 Styles -->
 <link rel="stylesheet"
href="https://cdn.syncfusion.com/ej2/material.css">

 <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
 <script src="es5-datasource.js" type="text/javascript"></script>
 <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>
```

```

 <div id="TreeGrid"></div>
<script>
var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

\* If **enableAutoFill** is set to true, then the autofill icon will be displayed on cell selection to copy cells.

\* It requires the selection **mode** to be **Cell**, **cellSelectionMode** to be **Box** and also Batch Editing should be enabled.

#### *Limitations of AutoFill*

- Since the string values are not parsed to number and date type, so when the selected string type cells are dragged to number type cells then it will display as **NaN**. For date type cells, when the selected string type cells are dragged to date type cells then it will display as an **empty cell**.
- Linear series and the sequential data generations are not supported in this autofill feature.

#### *Paste*

You can able to copy the content of a cell or a group of cells by selecting the cells and pressing Ctrl + C shortcut key and paste it to another set of cells by selecting the cells and pressing Ctrl + V shortcut key.

#### INDEX.TS

```

import { TreeGrid, Page, Selection, Edit, Toolbar } from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(Page, Selection, Edit, Toolbar);
let treegrid: TreeGrid = new TreeGrid(
 {
 dataSource: sampleData,
 childMapping: 'subtasks',
 treeColumnIndex: 1,
 enableHover: false,
 allowSelection: true,
 toolbar: ['Add', 'Update', 'Cancel'],
 selectionSettings: { type: 'Multiple', mode: 'Cell',
cellSelectionMode: 'Box' },
 editSettings: { allowEditing: true, allowAdding: true,
allowDeleting: true, mode: 'Batch' },
 allowPaging: true,
 pageSettings: { pageSize: 10 },
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 70, textAlign:
'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 200,
textAlign: 'Left' },

```

```

 { field: 'startDate', headerText: 'Start Date', width: 90,
textAlign: 'Right', type: 'date', format: 'yMd' },
 { field: 'duration', headerText: 'Duration', width: 80,
textAlign: 'Right' },
 { field: 'progress', headerText: 'Progress', width: 80,
textAlign: 'Right' },
],
 height: 220
});
treegrid.appendTo('#TreeGrid');

```

## INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
 <title>EJ2 Tree Grid</title>
 <meta charset="utf-8">
 <meta name="viewport" content="width=device-width, initial-scale=1.0">

var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

To perform paste functionality, it requires the selection **mode** to be **Cell**, **cellSelectionMode** to be **Box** and also Batch Editing should be enabled.

### *Limitations of Paste Functionality*

- Since the string values are not parsed to number and date type, so when the copied string type cells are pasted to number type cells then it will display as **NaN**. For date type cells, when the copied string format cells are pasted to date type cells then it will display as an **empty cell**.

You can refer to our [JavaScript Tree Grid](#) feature tour page for its groundbreaking feature representations. You can also explore our JavaScript Tree Grid example [JavaScript Tree Grid example](#) to know how to present and manipulate data.

### Context menu in EJ2 JavaScript Treegrid control

The TreeGrid has options to show the context menu when right clicked on it. To enable this feature, you need to define either default or custom item in the [contextMenuItems](#).

To use the context menu, inject the **ContextMenu** module in the treegrid.

The default items are in the following table.

Items	Description
<b>AutoFit</b>	Auto fit the current column.
<b>AutoFitAll</b>	Auto fit all columns.
<b>Edit</b>	Edit the current record.
<b>Delete</b>	Delete the current record.
<b>Save</b>	Save the edited record.
<b>Cancel</b>	Cancel the edited state.
<b>PdfExport</b>	Export the treegrid data as Pdf document.
<b>ExcelExport</b>	Export the treegrid data as Excel document.
<b>CsvExport</b>	Export the treegrid data as CSV document.
<b>SortAscending</b>	Sort the current column in ascending order.
<b>SortDescending</b>	Sort the current column in descending order.
<b>FirstPage</b>	Go to the first page.
<b>PrevPage</b>	Go to the previous page.
<b>LastPage</b>	Go to the last page.
<b>NextPage</b>	Go to the next page.
<b>AddRow</b>	Add new row to the treegrid.
<b>Indent</b>	Indents the record to one level of hierarchy.
<b>Outdent</b>	Outdents the record to one level of hierarchy.

### Custom context menu items

The custom context menu items can be added by defining the [contextMenuItems](#) as a collection of [contextMenuItemModel](#).

Actions for this customized items can be defined in the [contextMenuClick](#) event.

In the below sample, we have shown context menu item for parent rows to expand or collapse child rows.

### INDEX.TS

```

import { TreeGrid, ContextMenu, Page } from '@syncfusion/ej2-treegrid';
import { getValue, isNullOrUndefined } from '@syncfusion/ej2-base';
import { sampleData } from './datasource.ts';
import { BeforeOpenCloseEventArgs } from '@syncfusion/ej2-inputs';
import { MenuEventArgs } from '@syncfusion/ej2-navigations';
TreeGrid.Inject(ContextMenu, Page);
let treeGridObj: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 allowPaging: true,
 pageSettings: { pageSize: 7 },
 contextMenuItems: [
 { text: 'Collapse the Row', target: '.e-content', id:
'collapserow'},

```

```

 {text: 'Expand the Row', target: '.e-content', id:
'expandrow'}
],
 contextMenuClick: (args?: MenuEventArgs) => {
 treeGridObj.getColumnByField('taskID');
 if (args.item.id === 'collapserow') {
 treeGridObj.collapseRow(<HTMLTableRowElement>(treeGridObj.getSelectedRows()[0]));
 } else {
 treeGridObj.expandRow(<HTMLTableRowElement>(treeGridObj.getSelectedRows()[0]));
 }
 },
 contextMenuOpen: (arg?: BeforeOpenCloseEventArgs) => {
 let elem: Element = arg.event.target as Element;
 let uid: string = elem.closest('.e-row').getAttribute('data-uid');
 if (isNullOrUndefined(getValue('hasChildRecords', treeGridObj.grid.getRowObjectFromUID(uid).data))) {
 arg.cancel = true;
 } else {
 let flag: boolean = getValue('expanded', treeGridObj.grid.getRowObjectFromUID(uid).data);
 let val: string = flag ? 'none' : 'block';

 document.querySelectorAll('li#expandrow')[0].setAttribute('style', 'display: ' + val + ';');
 val = !flag ? 'none' : 'block';

 document.querySelectorAll('li#collapserow')[0].setAttribute('style', 'display: ' + val + ';');
 }
 },
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 90,
 textAlign: 'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 180,
 textAlign: 'Left' },
 {
 field: 'startDate', headerText: 'Start Date', width: 90,
 textAlign: 'Right', type: 'date', format: 'yMd'
 },
 { field: 'duration', headerText: 'Duration', width: 80,
 textAlign: 'Right' }
]
});
treeGridObj.appendTo('#TreeGrid');

```

```

You can hide or show an item in context menu for specific area inside of treegrid by defining the [target](#) property.

You can refer to our [JavaScript Tree Grid](#) feature tour page for its groundbreaking feature representations. You can also explore our JavaScript Tree Grid example [JavaScript Tree Grid example](#) to know how to present and manipulate data.

### Adaptive in EJ2 JavaScript Treegrid control

The Tree Grid user interface (UI) was redesigned to provide an optimal viewing experience and improve usability on small screens. This interface will render the filter, edit dialog and other features adaptively. For example, Filtering opens the UI for user in a pop-up occupying the entire screen.

To make the tree grid adaptive, set the [enableAdaptiveUI](#) to true.

### INDEX.TS

```

import { TreeGrid, Filter, Sort, Edit, Toolbar, Page } from
 '@syncfusion/ej2-treegrid';
import { Browser } from '@syncfusion/ej2-base';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(Filter, Sort, Edit, Toolbar, Page);
let treegrid: TreeGrid = new TreeGrid({

### Loading animation in EJ2 JavaScript Treegrid control

The Tree Grid displays a loading indicator while the data is being fetched and bound to the tree grid during initial rendering, refreshing, and after performing any tree grid actions like sorting, paging and more.

The tree grid supports two indicator types, which can be enabled by setting the `loadingIndicator.indicatorType` property to `Spinner` or `Shimmer`. The default value of the indicator type is `Spinner`.

In the following sample, the Shimmer indicator is displayed while the tree grid is loading and refreshing when using the remote data.

#### INDEX.TS

```

import { TreeGrid, Page, Sort } from '@syncfusion/ej2-treegrid';
import { DataManager, WebApiAdaptor } from '@syncfusion/ej2-data';
TreeGrid.Inject(Page, Sort);
let data = new DataManager({
 url: 'https://ej2services.syncfusion.com/production/web-
services/api/SelfReferenceData',
 adaptor: new WebApiAdaptor(),

## Test Helpers

### Helpers in EJ2 JavaScript Treegrid control

Essential JS 2 components packages provide the testing helper APIs for testing the Essential JS 2 components. The following helper APIs are available for the Tree Grid component's testing helpers in Essential JS 2.

Helper Methods	Description
:-----: -----	
<code>getTreeGridElement</code>	This function helps you to get the treegrid element of the Tree Grid. <b>Syntax:</b> <code>curObj.getTreeGridElement()</code>
<code>getHeaderElement</code>	This function helps you to get the header element of the Tree Grid. <b>Syntax:</b> <code>curObj.getHeaderElement()</code>
<code>getContentElement</code>	This function helps you to get the content element of the Tree Grid. <b>Syntax:</b> <code>curObj.getContentElement()</code>
<code>getFooterElement</code>	This function helps you to get the footer element of the Tree Grid when Aggregates are enabled. <b>Syntax:</b> <code>curObj.getFooterElement()</code>
<code>getPagerElement</code>	This function helps you to get the pager element of the Tree Grid when paging feature is enabled. <b>Syntax:</b> <code>curObj.getPagerElement()</code>
<code>getFilterPopUpElement</code>	This function helps you to get the Filter Dialog element of the Columns in Tree Grid. <b>Syntax:</b> <code>curObj.getFilterPopUpElement()</code>
<code>getDialogElement</code>	This function helps you to get the Edit Dialog element of Tree Grid when the Edit Mode is Dialog. <b>Syntax:</b> <code>curObj.getDialogElement()</code>
<code>getCurrentPagerElement</code>	This function helps you to get the current page indicator element of the Tree Grid. <b>Syntax:</b> <code>curObj.getCurrentPagerElement()</code>
<code>getPagerDropDownElement</code>	This function helps you to get the page size dropdownlist element of the TreeGrid. <b>Syntax:</b> <code>curObj.getPagerDropDownElement()</code>
<code>getExpandedElements</code>	This function helps you to get all the expanded icon elements in the current page of Tree Grid. <b>Syntax:</b> <code>curObj.getExpandedElements()</code>
<code>getCollapsedElements</code>	This function helps you to get all the collapsed icon elements in the current page of Tree Grid. <b>Syntax:</b> <code>curObj.getCollapsedElements()</code>

### Cypress in EJ2 JavaScript Treegrid control

This section describes how to create a Cypress project and test the Tree Grid component using the Tree Grid Test Helper.

#### Setting up the Cypress Project

To set the cypress project, follow these steps to create a project:

- Open the command prompt and set up the root project directory.
- Run the **npm init** command.

```

D:\Development\test\cypress>npm init
This utility will walk you through creating a package.json file.
It only covers the most common items, and tries to guess sensible defaults.

See `npm help json` for definitive documentation on these fields
and exactly what they do.

Use `npm install <pkg>` afterwards to install a package and
save it as a dependency in the package.json file.

Press ^C at any time to quit.
package name: (cypress) cypressstesting
version: (1.0.0)
description: initializing the cypress installation
entry point: (index.js)
test command: npm run cypress: open
git repository:
keywords:
author:
license: (ISC)
About to write to D:\Development\test\cypress\package.json:
{
 "name": "cypressstesting",
 "version": "1.0.0",
 "description": "initializing the cypress installation",
 "main": "index.js",
 "scripts": {
 "test": "npm run cypress: open"
 },
 "author": "",
 "license": "ISC"
}

Is this OK? (yes) yes
D:\Development\test\cypress>

```

- Install Cypress to the project. Refer to the Cypress [installation link](#) to install.
- Start writing [your testcase](#).

### Installing syncfusion package

The test helpers are available in the Syncfusion default component packages. Here, Tree Grid component is tested. So, run the following command to install the Syncfusion Tree Grid component.

```
npm install @syncfusion/ej2-treegrid --save
```

### Importing Test Helper from the package

You can test the drop-down components by using the `TreeGridHelper` class that is imported from the `@syncfusion/ej2-treegrid` package. The helper class is available in the `helpers/e2e` folder in every Syncfusion components package.

- Create a `sample_spec.js` file in the `cypress/integration/` folder.
- Import the testinghelper class name which is to be tested in the created file.

*Syntax:*

```

`ts
import { TestHelperClassName } from '{ helperPath }'
,

```

*For example,*

```

`ts
import { TreeGridHelper } from '@syncfusion/ej2-treegrid/helpers/e2e'

```

,

### Initializing the test helper

After importing the testing helper, follow these steps:

- Set the website page URL or local sample path that you want to test in browser. Here, the demo site is used for example.

`ts

```
cy.visit('https://ej2.syncfusion.com/demos/tree-grid/default-paging/index.html')
```

,

- Initialize the helpers as follows.

`ts

```
var curTreeGrid = new TreeGridHelper('TreeGrid', cy.get)
```

,

Refer to the following screenshot for detailed helper class initiation.

```
describe('The Home Page', function(e){
 var treegridobj;
 it('on successful load', function(done){
 cy.visit("https://ej2.syncfusion.com/javascript/demos/#/material/tree-grid/default-paging.html").then(function(){
 treegridobj = new TreeGridHelper('TreeGrid', cy.get);
 done();
 });
 });
});
```

### Write test case using helper methods

After initializing the helpers, you can write the test cases. Following are some of the simple examples for helper functions with test cases.

#### Using getModel setModel

After the visiting page is loaded, write the test case to get and set the values.

For example,

If you need to set the element's value, then you can use this `setModel` helper function.

Similarly, the element's value is tested by the `getModel` helper function.

`ts

```
it('getting setting model', function () {
 curTreeGrid.setModel("allowPaging", false);
 curTreeGrid.getModel("allowPaging").should('eq', false);
});
```

,

#### Using Invoke function

If you want to invoke some functions, you can use the `invoke` helper function.

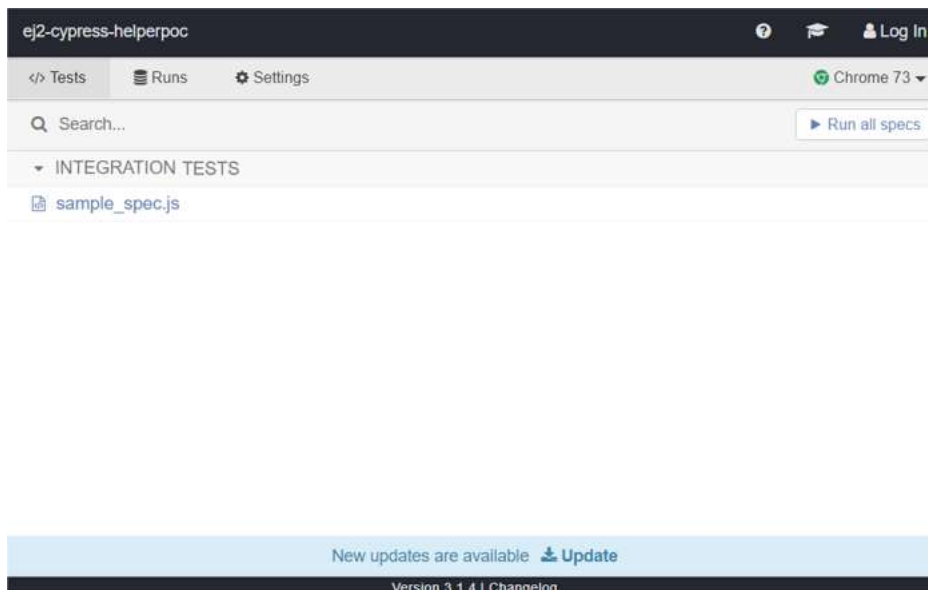

```
`ts
it('invoke function', function () {
 curTreeGrid.invoke("collapseAll");
});
`
```

Here, the `collapseAll` method is used to collapse all the parent records in the Tree Grid component.

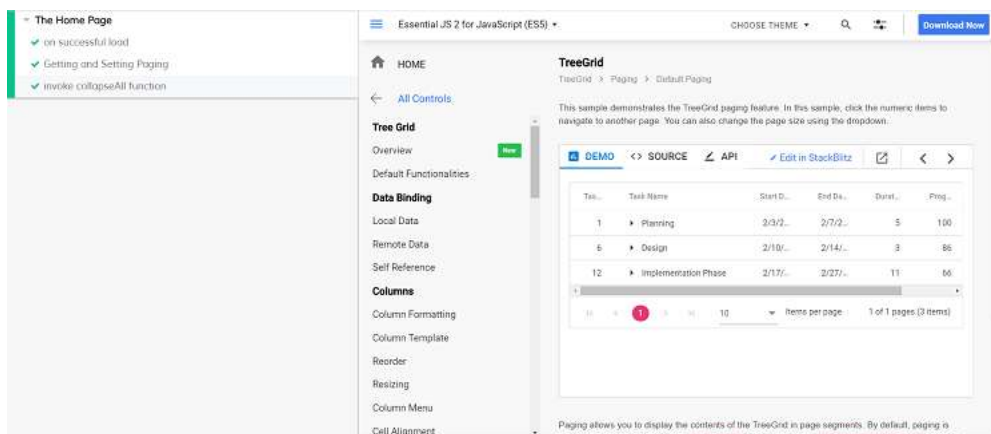

### Running Cypress

To run the Cypress, follow these steps:

- Run the `npm run cypress:open` terminal command from the root directory to open the Cypress test runner application. The Cypress application will open as follows.

- Now, the `sample_spec.js` file will show in the Cypress application window. Click that file to get the output window as follows.

Note: Refer to the GitHub samples for quick implementation and testing from [here](#).

### Treegrid styling in EJ2 JavaScript Treegrid control

To modify the TreeGrid appearance, you need to override the default CSS of treegrid. Please find the list of CSS classes and its corresponding section in treegrid. Also, you have an option to create your own custom theme for all the JavaScript controls using our [Theme Studio](#).

Section | CSS class | Purpose of CSS class

**Root** | e-treegrid | This classes are in this root element (div) of the treegrid control.

**Header** | e-gridheader | This class is added in the root element of header element. In this class, You can override thin line between header and content of the treegrid.

| e-table | This class is added at 'table' of the treegrid header. This CSS class makes table width as 100 %.

| e-columnheader | This class is added at 'tr' of the treegrid header.

| e-headercell | This class is added in 'th' element of treegrid header. You can override background color of header and border color.

| e-headercelldiv | This class is add in div which present 'th' element in the header. we recommend you to use the e-headercelldiv to override skeleton of header.

**Body** | e-gridcontent | This class is added at root of body content. This is to override background color of the body.

| e-table | This class is added to table of content. This CSS class makes table width as 100 %.

| e-altrow | This class is added to alternate rows of treegrid. This is to override alternate row color of the treegrid.

| e-rowcell | This class is added to all cells in the treegrid. This is to override cells appearance and styling.

| e-groupcaption | This class is added to the 'td' of group caption which is to change the background color of caption cell.

| e-selectionbackground | This class is added to rowcell's of the treegrid. This is override selection.

| e-hover | This class adds to row of treegrid, while hovering the treegrid rows.

**Pager** | e-pager | This class is added to root element of the pager. This to change appearance of the background color and color of font.

| e-pagercontainer | This class is added to numeric items of the pager.

| e-parentmsgbar | This class is added to pager info of the pager.

**Summary** | e-gridfooter | This class is added to root of the summary div.

| e-summaryrow | This class is added to rows of treegrid summary.

| e-summarycell | This class is added to cells of summary row. This to override background color of summary.

You can refer to our [JavaScript Tree Grid](#) feature tour page for its groundbreaking feature representations. You can also explore our JavaScript Tree Grid example [JavaScript Tree Grid example](#) to knows how to present and manipulate data.

## How To

### Refresh the data source in EJ2 JavaScript Treegrid control

#### *How to refresh the datasource*

You can add/delete the datasource records through an external button. To reflect the datasource changes in Tree Grid, you need to assign the modified data to dataSource property.

Please follow the below steps to refresh the Tree Grid after datasource change.

#### Step 1:

Add/delete the data source record by using the following code.

```
`ts
treegrid.dataSource.unshift(data); // add a new record.
treegrid.dataSource.splice(selectedRow, 1); // delete a record.
`
```

#### Step 2:

Refresh the Tree Grid after the data source change by using the [refresh](#) method.

```
`ts
treegrid.refresh(); // refresh the Grid.
`
```

#### INDEX.TS

```
import { TreeGrid ,extendArray} from '@syncfusion/ej2-treegrid';
import { Button } from '@syncfusion/ej2-buttons';
import { projectData } from './datasource.ts';
let treegrid: TreeGrid = new TreeGrid({
 dataSource: projectData,
 idMapping: 'TaskID',
 parentIdMapping: 'parentID',
 treeColumnIndex: 1,
 columns: [
 { field: 'TaskID', headerText: 'Task ID', width: 70, textAlign: 'Right' },
 { field: 'TaskName', headerText: 'Task Name', width: 100, textAlign: 'Left' },
 { field: 'StartDate', headerText: 'Start Date', width: 90, textAlign: 'Right', type: 'date', format: 'yMd' },
 { field: 'EndDate', headerText: 'End Date', width: 90, textAlign: 'Right', type: 'date', format: 'yMd' },
 { field: 'Duration', headerText: 'Duration', width: 90, textAlign: 'Right' },
 { field: 'Priority', headerText: 'Priority', width: 90, textAlign: 'Right' }
],
});
treegrid.appendTo('#TreeGrid');
let add: Button = new Button({}, '#add');
let dele: Button = new Button({}, '#delete');
document.getElementById('add').onclick = () => {
```

```

 let treegrid = document.getElementsByClassName("e-
treegrid")[0].ej2_instances[0]; //take treegrid instance here
 let dataSource = extendArray(treegrid.dataSource);
 dataSource.unshift({ TaskID: 99, TaskName: "New Data", StartDate: new
Date('09/07/2020'), Duration: 10, Priority: "High" }); // Add record
 treegrid.dataSource = dataSource; // Refresh the TreeGrid.
};
document.getElementById('delete').onclick = () => {
 let treegrid = document.getElementsByClassName("e-
treegrid")[0].ej2_instances[0]; //take treegrid instance here
 let selectedRow = treegrid.getSelectedRowIndex().length;
 let selectedRowIndex = treegrid.getSelectedRowIndex()[0];
 let dataSource = extendArray(treegrid.dataSource);
 if (selectedRow > 0) {
 dataSource.splice(selectedRowIndex, 1); // Delete record.
 }
 else {
 alert("No records selected for delete operation");
 }
 treegrid.dataSource = dataSource; // Refresh the TreeGrid.
};

```

if(ele) {
 ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

You can refer to our [JavaScript Tree Grid](#) feature tour page for its groundbreaking feature representations. You can also explore our JavaScript Tree Grid example [JavaScript Tree Grid example](#) to know how to present and manipulate data.

[Enable/disable treegrid and its actions in EJ2 JavaScript Treegrid control](#)

You can enable/disable the Tree Grid and its actions by applying/removing corresponding CSS styles.

To enable/disable the Tree Grid and its actions, follow the given steps:

#### Step 1:

Create CSS class with custom style to override the default style of Tree Grid.

```

,

.disabletreegrid {
 pointer-events: none;
 opacity: 0.4;
}

.wrapper {
 cursor: not-allowed;
}
,

```

#### Step 2:

Add/Remove the CSS class to the Tree Grid in the click event handler of Button.

```
`ts
document.getElementById('primarybtn').addEventListener('click', () => {
 if (treegrid.element.classList.contains('disabletreegrid')) {
 treegrid.element.classList.remove('disabletreegrid');
 document.getElementById("TreeGridParent").classList.remove('wrapper');
 }
 else {
 treegrid.element.classList.add('disabletreegrid');
 document.getElementById("TreeGridParent").classList.add('wrapper');
 }
});
`
```

In the below demo, the button click will enable/disable the Tree Grid and its actions.

#### INDEX.TS

```
import { TreeGrid, Edit, Toolbar } from '@syncfusion/ej2-treegrid';
import { Button } from '@syncfusion/ej2-buttons';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(Edit, Toolbar);
let button: Button = new Button();
button.appendTo('#primarybtn');
let treegrid: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 treeColumnIndex: 1,
 height: 220,
 toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel'],
 editSettings: { allowAdding: true, allowEditing: true, allowDeleting: true
},
 columns: [
 { field: 'taskID', headerText: 'Task ID', isPrimaryKey: true, width:
90, textAlign: 'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 180, textAlign:
'Left' },
 { field: 'startDate', headerText: 'Start Date', width: 90, textAlign:
'Right', type: 'date', format: 'yMd' },
 { field: 'duration', headerText: 'Duration', width: 80, textAlign:
'Right' }
],
});
treegrid.appendTo('#TreeGrid');
document.getElementById('primarybtn').addEventListener('click', () => {
 if (treegrid.element.classList.contains('disabletreegrid')) {
 treegrid.element.classList.remove('disabletreegrid');
 }
 document.getElementById("TreeGridParent").classList.remove('wrapper');
```

```

 }
 else {
 treegrid.element.classList.add('disabletreegrid');
 document.getElementById("TreeGridParent").classList.add('wrapper');
 }
});

```

 <button id="primarybtn">Enable/Disable TreeGrid</button>
 <div id="TreeGridParent">

```

```

 <div id="TreeGrid"></div>
 </div>
</div>
<script>
var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

You can refer to our [JavaScript Tree Grid](#) feature tour page for its groundbreaking feature representations. You can also explore our JavaScript Tree Grid example [JavaScript Tree Grid example](#) to know how to present and manipulate data.

Change header text dynamically in EJ2 JavaScript Treegrid control

You can change the column [headerText](#) dynamically through an external button.

Follow the given steps to change the header text dynamically:

#### Step 1:

Get the column object corresponding to the field name by using the [getColumnByField](#) method. Then, change the header text value.

```

`ts
let column = treegrid.getColumnByField("taskName"); // Get column object.
column.headerText = 'Changed Text';
`

```

#### Step 2:

To reflect the changes in the treegrid header, invoke the [refreshColumns](#) method.

```

`ts
treegrid.refreshColumns();
`

```

#### INDEX.TS

```

import { TreeGrid, Page, Column } from '@syncfusion/ej2-treegrid';
import { Button } from '@syncfusion/ej2-buttons';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(Page);
let button: Button = new Button();
button.appendTo("#change-text");
let treegrid: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: 'subtasks',
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 90, textAlign: 'Right'
 },

```

```

 { field: 'taskName', headerText: 'Task Name', width: 180, textAlign:
 'Left' },
 { field: 'startDate', headerText: 'Start Date', width: 90, textAlign:
 'Right', type: 'date', format: 'yMd'},
 { field: 'duration', headerText: 'Duration', width: 80, textAlign:
 'Right' }
],
});
treegrid.appendTo('#TreeGrid');
document.getElementById("change-text").addEventListener("click", () => {
 let column = treegrid.getColumnByField("taskName"); // get the JSON object
of the column corresponding to the field name.
 column.headerText = "Changed Text"; // assign a new header text to the
column.
 treegrid.refreshColumns();
});

```

```

You can refer to our [JavaScript Tree Grid](#) feature tour page for its groundbreaking feature representations. You can also explore our JavaScript Tree Grid example [JavaScript Tree Grid example](#) to know how to present and manipulate data.

#### Customize column styles in EJ2 JavaScript Treegrid control

You can customise the appearance of the header and content of a particular column using the [customAttributes](#) property.

To customize the Tree Grid column, follow the given steps:

##### Step 1:

Create a CSS class with custom style to override the default style for rowcell and header cell.

```

.e-treegrid .e-rowcell.customcss{
background-color: #ecedee;
color: 'red';
font-family: 'Bell MT';
font-size: 20px;
}
.e-treegrid .e-headercell.customcss{
background-color: #2382c3;
color: white;
font-family: 'Bell MT';
font-size: 20px;
}

```

**Step 2:**

Add the custom CSS class to the specified column by using the [customAttributes](#) property.

```
`ts
```

```
{ field: 'taskName', headerText: 'Task Name', customAttributes: {class: 'customcss'}, width: 100 },
```

**INDEX.TS**

```
import { TreeGrid } from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
let treegrid: TreeGrid = new TreeGrid(
 {
 dataSource: sampleData,
 childMapping: 'subtasks',
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 70,
textAlign: 'Right' },
 { field: 'taskName', headerText: 'Task Name', width:
200,customAttributes: { class: 'customcss' }, textAlign: 'Left' },
 { field: 'startDate', headerText: 'Start Date', width: 90,
textAlign: 'Right', type: 'date', format: 'yMd' },
 { field: 'duration', headerText: 'Duration', width: 80,
textAlign: 'Right' },
]
 });
treegrid.appendTo('#TreeGrid');
```

#### Custom tool tip for columns in EJ2 JavaScript Treegrid control

You can show the tooltip content in Tree Grid using `[queryCellInfo]` event of Tree Grid.

In the below demo, hover over the cell shows the tooltip content .

#### INDEX.TS

```

import { TreeGrid, Page, QueryCellInfoEventArgs } from '@syncfusion/ej2-
treegrid';
import { Tooltip } from '@syncfusion/ej2-popups';
import { sampleData } from './datasource.ts';
TreeGrid.Inject(Page);
let treegrid: TreeGrid = new TreeGrid(
{
 dataSource: sampleData,
 childMapping: 'subtasks',
 allowPaging: true,

```

```

 queryCellInfo: tooltip,
 pageSettings: {pageSize: 10},
 treeColumnIndex: 1,
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 70,
textAlign: 'Right' },
 { field: 'taskName', headerText: 'Task Name', width: 200,
textAlign: 'Left' },
 { field: 'startDate', headerText: 'Start Date', width: 90,
textAlign: 'Right', type: 'date', format: 'yMd' },
 { field: 'endDate', headerText: 'End Date', width: 90,
textAlign: 'Right', type: 'date', format: 'yMd' },
 { field: 'duration', headerText: 'Duration', width: 80,
textAlign: 'Right' },
 { field: 'priority', headerText: 'Priority', width: 90 }
]
 });
 treegrid.appendTo('#TreeGrid');
 function tooltip(args: QueryCellInfoEventArgs): void { // event triggers
on every cell render.
 let tooltip: Tooltip = new Tooltip({
 content: args.data[args.column.field].toString() // add Essential
JS2 tooltip for every cell.
 }, <HTMLElement>args.cell);
 }

```

Change orientation of header text in EJ2 JavaScript Treegrid control

You can change the orientation of the header text by using the [customAttributes](#) property.

Ensure the following steps:

#### Step 1:

Create a CSS class with orientation style for the treegrid header cell.

```

,

.orientationcss .e-headercelldiv {
transform: rotate(90deg);
}
,

```

#### Step 2:

Add the custom CSS class to a particular column by using the [customAttributes](#) property.

```

`ts

```

```
{ field: 'taskName', headerText: 'Task Name', textAlign: 'Center', customAttributes: {class: 'orientationcss'}, width: 80 }
```

```
,
```

### Step 3:

Resize the header cell height by using the following code.

```
`ts
```

```
function setHeaderHeight(args) {
```

```
let textWidth: number = document.querySelector(".orientationcss > div").scrollWidth; //Obtain the width of the headerText content.
```

```
let headerCell: NodeList = document.querySelectorAll(".e-headercell");
```

```
for(let i: number = 0; i < headerCell.length; i++) {
```

```
(<HTMLElement>headerCell.item(i)).style.height = textWidth + 'px'; //Assign the obtained textWidth as the height of the headerCell.
```

```
}
```

```
}
```

```
,
```

### INDEX.TS

```
import { TreeGrid, ActionEventArgs } from '@syncfusion/ej2-treegrid';
import { sampleData } from './datasource.ts';
let treegrid: TreeGrid = new TreeGrid(
{
 dataSource: sampleData,
 childMapping: "subtasks",
 treeColumnIndex: 1,
 height: 100,
 created: setHeaderHeight,
 columns: [
 { field: 'taskID', headerText: 'Task ID', width: 70,
 textAlign: 'Right' },
 { field: 'taskName', headerText: 'Task Name', textAlign:
 'Center', customAttributes: {class: 'orientationcss'}, width: 80 },
 { field: 'startDate', headerText: 'Start Date', width: 90,
 textAlign: 'Right', type: 'date', format: 'yMd' },
 { field: 'duration', headerText: 'Duration', width: 80,
 textAlign: 'Right' }
]
});
treegrid.appendTo('#TreeGrid');
function setHeaderHeight(args: ActionEventArgs): void {
let textWidth: number = document.querySelector(".orientationcss >
div").scrollWidth; // obtain the width of the headerText content.
let headerCell: NodeList = document.querySelectorAll(".e-headercell");
for (let i: number = 0; i < headerCell.length; i++) {
 (<HTMLElement>headerCell.item(i)).style.height = textWidth + 'px';
 // assign the obtained textWidth as the height of the headerCell.
}
}
```

```
}
```

### Render other component in column in EJ2 JavaScript Treegrid control

You can render any components in a Tree Grid column using the template property.

Initialize the column template for your custom component. The template property renders the custom component.

In the following sample, the DropDownList is rendered in the **Priority** column.

#### INDEX.TS

```
import { TreeGrid, Edit, Toolbar } from "@syncfusion/ej2-treegrid";
import { projectData } from '../datasource.ts';
import { DropDownList } from "@syncfusion/ej2-dropdowns";
import { QueryCellInfoEventArgs } from "@syncfusion/ej2-grids";
let dropData = ["Normal", "Low", "High", "Critical", "Breaker"];
let treegrid: TreeGrid = new TreeGrid({
 dataSource: projectData,
 idMapping: "TaskID",
 parentIdMapping: "parentID",
 treeColumnIndex: 1,
 queryCellInfo: dropdown,
 height: 273,
 columns: [
 { field: "TaskID", headerText: "Task ID", textAlign: "Right", width: 70 },
 { field: "TaskName", headerText: "Task Name", width: 100 },
 { field: "StartDate", headerText: "Start Date", textAlign: "Right", width: 100,
 format: { skeleton: "yMd", type: "date" } },
 { field: "EndDate", headerText: "End Date", textAlign: "Right", width: 90,
 format: { skeleton: "yMd", type: "date" } },
 { field: "Duration", headerText: "Duration", textAlign: "Right", width: 90 },
 { headerText: "Priority", width: 90, template: `<input type="text"
 tabindex="1" id='ddlelement' />` }
]
});
treegrid.appendTo("#TreeGrid");
function dropdown(args: QueryCellInfoEventArgs) {
 let ele: HTMLSelectElement = args.cell.querySelector("#ddlelement");
 let drop: DropDownList = new DropDownList({
 dataSource: dropData,
 value: args.data["Priority"],
 popupHeight: 150,
 popupWidth: 150,
 change: valueChange
 });
}
```

```

 drop.appendTo(ele);
}
function valueChange(args) {
 /** Event will trigger when you have change the value in dropdown column
 */
 alert(args.value);
}

```

### Customize the icon for column menu in EJ2 JavaScript Treegrid control

You can customize the column menu icon by overriding the default Tree Grid class **.e-icons.e-columnmenu** with a custom property **content** as mentioned below,

```

,
.e-treegrid .e-columnheader .e-icons.e-columnmenu::before {
content: "\e903";
}
,

```

In the below sample, Tree Grid is rendered with a customized column menu icon.

### INDEX.TS

```

import { TreeGrid, ColumnMenu } from "@syncfusion/ej2-treegrid";
import { projectData } from '../datasource.ts';
TreeGrid.Inject(ColumnMenu);
let treegrid: TreeGrid = new TreeGrid({
 dataSource: projectData,
 idMapping: "TaskID",
 parentIdMapping: "parentID",
 treeColumnIndex: 1,
 height: 315,
 showColumnMenu: true,
 columns: [
 { field: "TaskID", headerText: "Task ID", textAlign: "Right", width: 70 },
],
 { field: "TaskName", headerText: "Task Name", width: 100 },
 { field: "StartDate", headerText: "Start Date", textAlign: "Right",
width: 90,
 format: { skeleton: "yMd", type: "date" } },
 { field: "EndDate", headerText: "End Date", textAlign: "Right", width:
90,
 format: { skeleton: "yMd", type: "date" } },
 { field: "Duration", headerText: "Duration", textAlign: "Right", width:
90 },
 { field: "Priority", headerText: "Priority", width: 90 }
]
});

```

```
treegrid.appendTo("#TreeGrid");
```

## INDEX.HTML

### Customize the edit dialog in EJ2 JavaScript Treegrid control

You can customize the appearance of the edit dialog in the [actionComplete](#) event based on **requestType** as **beginEdit** or **add**.

In the below example, we have changed the dialog's header text for editing and adding records.

### INDEX.TS

```

import { TreeGrid, Toolbar, Edit } from "@syncfusion/ej2-treegrid";
import { projectData } from './datasource.ts';
import { DialogEditEventArgs } from "@syncfusion/ej2-grids";
import { Dialog } from "@syncfusion/ej2-popups";
TreeGrid.Inject(Toolbar, Edit);
let treegrid: TreeGrid = new TreeGrid({
 dataSource: projectData,
 idMapping: "TaskID",
 parentIdMapping: "parentID",
 treeColumnIndex: 1,
 height: 250,
 editSettings: {
 allowAdding: true,
 allowEditing: true,
 allowDeleting: true,
 mode: "Dialog"
 },
 toolbar: ["Add", "Edit", "Delete", "Update", "Cancel"],
 actionComplete: actionComplete,
 columns: [
 { field: "TaskID", headerText: "Task ID", isPrimaryKey: true, textAlign: "Right", width: 70 },
 { field: "TaskName", headerText: "Task Name", width: 100 },
 { field: "StartDate", headerText: "Start Date", textAlign: "Right", width: 90, editType: "datepickeredit",
 format: { skeleton: "yMd", type: "date" }, edit: { params: { format: "y/M/d" } } },
 { field: "EndDate", headerText: "End Date", textAlign: "Right", width: 90, editType: "datepickeredit",
 format: { skeleton: "yMd", type: "date" }, edit: { params: { format: "y/M/d" } } },
 { field: "Duration", headerText: "Duration", textAlign: "Right", width: 90 },
 { field: "Priority", headerText: "Priority", width: 90 }
]
});
treegrid.appendTo("#TreeGrid");
function actionComplete(args: DialogEditEventArgs) {
 if (args.requestType === "beginEdit" || args.requestType === "add") {
 const dialog = args.dialog as Dialog;

```

```

const TaskName = "TaskName";
dialog.height = 400;
// change the header of the dialog
dialog.header =
 args.requestType === "beginEdit"
 ? "Record of " + args.rowData[TaskName]
 : "New Customer";
}
}

```

Cascading drop down list with treegrid editing in EJ2 JavaScript Treegrid control

You can achieve the Cascading DropDownList with Tree Grid Editing by using the Cell Edit Template feature.

In the below demo, Cascading DropDownList rendered for **Priority** and **Duration** column.

#### INDEX.TS

```

import { TreeGrid, Edit, Toolbar } from "@syncfusion/ej2-treegrid";
import { projectData } from '../datasource.ts';
import { DropDownList } from "@syncfusion/ej2-dropdowns";
import { DataManager, Query } from "@syncfusion/ej2-data";
let priorityData: { [key: string]: Object }[] = [
 { priorityName: "Normal", priorityId: "1" },
 { priorityName: "High", priorityId: "2" }
];
let durationData: { [key: string]: Object }[] = [
 { durationValue: 2, priorityId: "1", durationId: 2 },
 { durationValue: 3, priorityId: "1", durationId: 3 },
 { durationValue: 4, priorityId: "1", durationId: 4 },
 { durationValue: 11, priorityId: "2", durationId: 11 },
 { durationValue: 15, priorityId: "2", durationId: 15 },
 { durationValue: 20, priorityId: "2", durationId: 20 }
];
let priorityElem: HTMLElement;
let priorityObj: DropDownList;
let durationElem: HTMLElement;
let durationObj: DropDownList;
TreeGrid.Inject(Edit, Toolbar);
let treegrid: TreeGrid = new TreeGrid({
 dataSource: projectData,
 idMapping: "TaskID",
 parentIdMapping: "parentID",
 treeColumnIndex: 1,
 height: 273,
 toolbar: ["Add", "Edit", "Delete", "Update", "Cancel"],
 editSettings: {
 allowEditing: true,
 allowAdding: true,
 allowDeleting: true,

```

```

 mode: "Row"
 },
 columns: [

You can refer to our [JavaScript Tree Grid](#) feature tour page for its groundbreaking feature representations. You can also explore our JavaScript Tree Grid example [JavaScript Tree Grid example](#) to know how to present and manipulate data.

Provide custom data source and enabling filtering to drop down list in EJ2 JavaScript Treegrid control

You can provide data source to the DropDownList by using the **params** of [columns.edit](#) property.

While setting new data source using edit params, you must specify a new **query** property for the DropDownList as follows,

```

`ts
edit: {
params: {
actionComplete: () => false,
allowFiltering: true,
dataSource: new DataManager(priorityData),
fields: { text: "priorityName", value: "priorityName" },
query: new Query()
}
}
`

```

You can also enable filtering for the DropDownList by passing the [allowFiltering](#) as **true** to the edit params.

In the below demo, DropDownList is rendered with custom [dataSource](#) for the *Priority* column and enabled filtering to search DropDownList items.

### INDEX.TS

```
import { TreeGrid, Edit, Toolbar } from "@syncfusion/ej2-treegrid";
import { projectData } from './datasource.ts';
import { Query, DataManager } from "@syncfusion/ej2-data";
import { IEditCell } from "@syncfusion/ej2-grids";
TreeGrid.Inject(Edit, Toolbar);
let priorityData: object[] = [
 { priorityName: "Normal", priorityId: "1" },
 { priorityName: "High", priorityId: "2" },
 { priorityName: "Low", priorityId: "3" },
 { priorityName: "Critical", priorityId: "4" },
 { priorityName: "Breaker", priorityId: "5" }
];
let treegrid: TreeGrid = new TreeGrid({
 dataSource: projectData,

### Use wizard like dialog editing in EJ2 JavaScript Treegrid control

Wizard helps you create intuitive step-by-step forms to fill. You can achieve the wizard like editing by using the dialog template feature. It support your own editing template by defining [editSettings.mode](#) as **Dialog** and [editSetting.template](#) as SCRIPT element ID or HTML string which holds the template.

The following example demonstrate the wizard like editing in the Tree Grid with the obtrusive Validation.

### Restrict decimal points while treegrid editing in EJ2 JavaScript Treegrid control

By default, the number of decimal places will be restricted to two in the NumericTextBox while editing the numeric column. We can restrict to type the decimal points in a NumericTextBox by using the **validateDecimalOnType** and **decimals** properties of NumericTextBox.

In the below demo, while editing the row we have restricted to type the decimal point value in the NumericTextBox of **Price** column.

### INDEX.TS

```

import { TreeGrid, Edit, Toolbar } from "@syncfusion/ej2-treegrid";
import { stackedData } from './datasource.ts';
TreeGrid.Inject(Edit, Toolbar);
let treegrid: TreeGrid = new TreeGrid({
 dataSource: stackedData,
 childMapping: "subtasks",
 treeColumnIndex: 1,
 height: 265,
 editSettings: { allowEditing: true, allowAdding: true, allowDeleting: true },
 toolbar: ["Add", "Delete", "Update", "Cancel"],
 columns: [
 { field: "orderID", headerText: "Order ID", textAlign: "Right",
isPrimaryKey: true, width: 70 },
 { field: "orderName", headerText: "Order Name", width: 100 },
 { field: "orderDate", headerText: "Order Date", textAlign: "Right",
width: 100, editType: "datepickeredit",

```

```

 format: { skeleton: "yMd", type: "date" } },
 { field: "shippedDate", headerText: "Shipped Date", textAlign: "Right",
width: 100,
 editType: "datepickeredit", format: { skeleton: "yMd", type: "date" }
 },
 { field: "shipMentCategory", headerText: "Shipment Category", textAlign:
"Right", width: 100 },
 { field: "units", headerText: "Units", width: 90, editType:
"numericedit" },
 { field: "price", headerText: "Price", width: 90, editType:
"numericedit",
 edit: {
 params: {
 validateDecimalOnType: true,
 decimals: 0,
 format: "N"
 }
 }
 }
]
});
treegrid.appendTo("#TreeGrid");

```

### Exporting filtered data in EJ2 JavaScript Treegrid control

You can export the filtered data by defining the resulted data in [PdfExportProperties.dataSource](#) before export.

In the below Pdf exporting demo, We have gotten the filtered data from the filteredResult of Tree Grid filterModule and then defines the resulted data in [PdfExportProperties.dataSource](#) and pass it to [pdfExport](#) method.

### INDEX.TS

```

import { TreeGrid, Page, Toolbar, PdfExport, Filter } from "@syncfusion/ej2-treegrid";
import { projectData } from './datasource.ts';
import { ClickEventArgs } from "@syncfusion/ej2-navigations";
TreeGrid.Inject(Page, Filter, Toolbar, PdfExport);
let treegrid: TreeGrid = new TreeGrid({
 dataSource: projectData,
 idMapping: "TaskID",
 parentIdMapping: "parentID",
 treeColumnIndex: 1,
 allowPaging: true,
 allowFiltering: true,
 pageSettings: { pageSize: 5, pageCount: 5 },
 allowExcelExport: true,
 allowPdfExport: true,
 toolbar: ["PdfExport"],

```

```

toolbarClick: toolbarClick,
columns: [
 { field: "TaskID", headerText: "Task ID", textAlign: "Right", width: 70,
 { field: "TaskName", headerText: "Task Name", width: 100 },
 { field: "StartDate", headerText: "Start Date", textAlign: "Right",
width: 100,
 format: { skeleton: "yMd", type: "date" } },
 { field: "EndDate", headerText: "End Date", textAlign: "Right", width:

#### Show spinner while exporting in EJ2 JavaScript Treegrid control

You can show/ hide spinner component while exporting the Tree Grid using [showSpinner/ hideSpinner](#) methods. You can use [toolbarClick](#) event to show spinner before exporting and hide a spinner in the [pdfExportComplete](#) or [excelExportComplete](#) event after the exporting.

In the [toolbarClick](#) event, based on the parameter **args.item.text** as **PDF Export** or **Excel Export** we can call the [showSpinner](#) method from Tree Grid instance.

In the [pdfExportComplete](#) or [excelExportComplete](#) event, We can call the [hideSpinner](#) method.

In the below demo, we have rendered the default spinner component when exporting the Tree Grid.

#### INDEX.TS

```

import { TreeGrid, Page, Toolbar, PdfExport, ExcelExport } from
"@syncfusion/ej2-treegrid";
import { projectData } from '../datasource.ts';
import { ClickEventArgs } from "@syncfusion/ej2-navigations";

### Customize pager drop down in EJ2 JavaScript Treegrid control

To customize default values of pager dropdown, you need to define [pageSizes](#) as array of strings.

#### INDEX.TS

```
import { TreeGrid, Page } from "@syncfusion/ej2-treegrid";
import { projectData } from '../datasource.ts';
TreeGrid.Inject(Page);
let treegrid: TreeGrid = new TreeGrid({
 dataSource: projectData,
 idMapping: "TaskID",
 parentIdMapping: "parentID",
 treeColumnIndex: 1,
 height: 260,
 allowPaging: true,
 pageSettings: { pageSizes: ["5", "10", "All"] },
 columns: [
 { field: "TaskID", headerText: "Task ID", textAlign: "Right", width: 70 },
 { field: "TaskName", headerText: "Task Name", width: 200 },
 { field: "StartDate", headerText: "Start Date", textAlign: "Right", width: 90,
 format: { skeleton: "yMd", type: "date" } },
 { field: "EndDate", headerText: "End Date", textAlign: "Right", width: 90,
 format: { skeleton: "yMd", type: "date" } },
 { field: "Duration", headerText: "Duration", textAlign: "Right", width: 90 },
 { field: "Priority", headerText: "Priority", width: 90 }
]
});
treegrid.appendTo("#TreeGrid");
```

#### Add parameter for filtering in EJ2 JavaScript Treegrid control

You can customize the default settings of the components which are used in Menu filter by using params of filter property in column definition.

In the below sample, TaskID and Duration Columns are numeric columns, while opening the filter dialog you can see that NumericTextBox with spin button is displayed to change/set the filter value. Now using the params option we hide the spin button in NumericTextBox for TaskID Column.

#### INDEX.TS

```

import { TreeGrid, Filter } from "@syncfusion/ej2-treegrid";
import { projectData } from './datasource.ts';
TreeGrid.Inject(Filter);

```

```

let treegrid: TreeGrid = new TreeGrid({
 dataSource: projectData,
 idMapping: "TaskID",
 parentIdMapping: "parentID",
 treeColumnIndex: 1,
 height: 273,
 allowFiltering: true,
 filterSettings: { type: "Menu" },
 columns: [
 { field: "TaskID", headerText: "Task ID", textAlign: "Right", width: 70,
 filter: { params: { showSpinButton: false } } },
 { field: "TaskName", headerText: "Task Name", width: 100 },
 { field: "StartDate", headerText: "Start Date", textAlign: "Right",
width: 90, format: { skeleton: "yMd", type: "date" } },
 { field: "EndDate", headerText: "End Date", textAlign: "Right", width:
90, format: { skeleton: "yMd", type: "date" } },
 { field: "Duration", headerText: "Duration", textAlign: "Right", width:
90 },
 { field: "Priority", headerText: "Priority", width: 90 }
]

Select treegrid rows based on certain condition in EJ2 JavaScript Treegrid control

You can select the specific row in the Tree Grid based on a certain condition by using the [selectRows](#) method in the [dataBound](#) event of Tree Grid.

In the below demo, we have selected the Tree Grid rows only when *Duration* column value greater than 4.

#### INDEX.TS

```

import { TreeGrid, Page } from "@syncfusion/ej2-treegrid";
import { projectData } from './datasource.ts';
import { RowDataBoundEventArgs } from "@syncfusion/ej2-grids";
import { getValue } from "@syncfusion/ej2-base";
TreeGrid.Inject(Page);
let selIndex = [];
let treegrid: TreeGrid = new TreeGrid({
 dataSource: projectData,
 idMapping: "TaskID",
 parentIdMapping: "parentID",
 treeColumnIndex: 1,
 height: 269,
 allowPaging: true,
 selectionSettings: { type: "Multiple" },
 dataBound: dataBound,
 rowDataBound: rowDataBound,
 columns: [
 { field: "TaskID", headerText: "Task ID", textAlign: "Right", width: 70 },
 { field: "TaskName", headerText: "Task Name", width: 150 },
 { field: "StartDate", headerText: "Start Date", textAlign: "Right", width: 90,
 format: { skeleton: "yMd", type: "date" } },
 { field: "EndDate", headerText: "End Date", textAlign: "Right", width: 90,
 format: { skeleton: "yMd", type: "date" } },
 { field: "Duration", headerText: "Duration", textAlign: "Right", width: 80 },
 { field: "Progress", headerText: "Progress", width: 80, textAlign: "Right" },
 { field: "Priority", headerText: "Priority", width: 90 }
]
});
treegrid.appendTo("#TreeGrid");
function dataBound(args) {
 if (this && selIndex.length) {

```

```

 this.selectRows(selIndex);
 selIndex = [];
 }
}
function rowDataBound(args: RowDataBoundEventArgs) {
 if (getValue("Duration", args.data as object) > 4) {
 selIndex.push(
 parseInt(
 (args.row as HTMLTableRowElement).getAttribute(
 "aria-rowindex"
) as string,
 0
)
);
 }
}
}

```

#### Get row cell index in EJ2 JavaScript Treegrid control

You can get the specific row and cell index of the Tree Grid by using [rowSelected](#) event of the treegrid. Here, we can get the row and cell index by using *aria-rowindex* (get row Index from *tr* element) and *aria-colindex* (column index from *td* element) attribute.

#### INDEX.TS

```

import { TreeGrid } from "@syncfusion/ej2-treegrid";
import { projectData } from './datasource.ts';
import { RowSelectEventArgs } from "@syncfusion/ej2-grids";
let treegrid: TreeGrid = new TreeGrid({
 dataSource: projectData,
 idMapping: "TaskID",
 parentIdMapping: "parentID",
 treeColumnIndex: 1,
 height: 267,
 rowSelected: rowSelected,
 columns: [
 { field: "TaskID", headerText: "Task ID", textAlign: "Right", width: 70
 },
 { field: "TaskName", headerText: "Task Name", width: 150 },
 { field: "StartDate", headerText: "Start Date", textAlign: "Right",
width: 90,
 format: { skeleton: "yMd", type: "date" } },
 { field: "EndDate", headerText: "End Date", textAlign: "Right", width:
90,
 format: { skeleton: "yMd", type: "date" } },
 { field: "Duration", headerText: "Duration", textAlign: "Right", width:
80 },
 { field: "Progress", headerText: "Progress", width: 80, textAlign:
"Right" },
]

```

```

 { field: "Priority", headerText: "Priority", width: 90 }
]
});
treegrid.appendTo("#TreeGrid");
function rowSelected(args: RowSelectEventArgs) {
 alert("row index: " + " " + (args.row as
HTMLTableRowElement).getAttribute("aria-rowindex"));
 alert("column index: " + " " +
args.target.closest("td").getAttribute("aria-colindex"));
}

```

### Display foreign key values in treegrid in EJ2 JavaScript Treegrid control

Since Tree Grid Databinding concept is of hierarchy relationship, we do not provide in-built support for foreignKey datasource.

To display the foreignKey value at initial rendering, we can use the [queryCellInfo](#) event of the Tree Grid and also by using the [editType](#) and [columns.edit](#) properties of Tree Grid Column, we can render Dropdownlist with external or foreign dataSource.

### INDEX.TS

```

import { TreeGrid, Edit, Toolbar, ITreeData } from "@syncfusion/ej2-treegrid";
import { foreignKeyData, dropData } from '../datasource.ts';
import { DataManager, Query } from "@syncfusion/ej2-data";
import { QueryCellInfoEventArgs, Column, IEditCell } from "@syncfusion/ej2-grids";
TreeGrid.Inject(Edit, Toolbar);
let treegrid: TreeGrid = new TreeGrid({
 dataSource: foreignKeyData,
 childMapping: "Children",
 treeColumnIndex: 1,
 height: 269,
 editSettings: {
 allowEditing: true,
 allowAdding: true,
 allowDeleting: true,
 mode: "Cell"
 },
 toolbar: ["Add", "Delete", "Update", "Cancel"],
 queryCellInfo: queryCellInfo,
 columns: [
 { field: "EmpID", headerText: "EmpID", textAlign: "Right", isPrimaryKey: true, width: 70 },
 { field: "Name", headerText: "Employee Name", width: 70 },
 { field: "DOB", headerText: "DOB", textAlign: "Right", width: 70,
 editType: "datepickeredit",
 format: { skeleton: "yMd", type: "date" } },
 { field: "EmployeeID", headerText: "EmployeeID", textAlign: "Right",
 editType: "dropdownedit",

```

```

 edit: {
 params: {
 dataSource: new DataManager(dropData),
 fields: { text: "EmployeeName", value: "EmployeeID" },
 query: new Query()
 }
 },
 width: 70 },
 { field: "Country", headerText: "Country", width: 90, textAlign: "Right"
 }
]
});
treegrid.appendTo("#TreeGrid");
function queryCellInfo(args: QueryCellInfoEventArgs) {
 if ((args.column as Column).field === "EmployeeID") {
 for (var i = 0; i < dropData.length; i++) {
 let data: Object = args.data as Object;
 if (data[(args.column as Column).field] === dropData[i]["EmployeeID"])
 {
 (args.cell as HTMLElement).innerText = dropData[i]["EmployeeName"];
 // assign the foreignkey field value to the innertext
 }
 }
 }
}
}

```

#### Row cell customization in EJ2 JavaScript Treegrid control

In Tree Grid we can customize the row and cell using [queryCellInfo](#) and [rowDataBound](#) events of Tree Grid.

In the below demo, we customize and show the command buttons only for the parent rows using [queryCellInfo](#) and [rowDataBound](#) events of Tree Grid.

#### INDEX.TS

```

import { TreeGrid, CommandColumn, Column, ITreeData } from "@syncfusion/ej2-treegrid";
import { sampleData } from './datasource.ts';
import { QueryCellInfoEventArgs, RowDataBoundEventArgs } from "@syncfusion/ej2-grids";
TreeGrid.Inject(CommandColumn);
let treegrid: TreeGrid = new TreeGrid({
 dataSource: sampleData,
 childMapping: "subtasks",
 treeColumnIndex: 1,
 height: 280,
 rowDataBound: rowDataBound,
 queryCellInfo: queryCellInfo,
 columns: [

```

```

 { field: "taskID", headerText: "Task ID", isPrimaryKey: true, width: 80,
 textAlign: "Right" },
 { field: "taskName", headerText: "Task Name", width: 200 },
 { field: "startDate", headerText: "Start Date", textAlign: "Right",
 width: 90,
 format: { skeleton: "yMd", type: "date" } },
 { field: "endDate", headerText: "End Date", textAlign: "Right", width:
 90,

## Treemap

### Data binding in EJ2 JavaScript Treemap control

The TreeMap control supports data binding using the dataSource property.

### Populate data

The `dataSource` property accepts collection values as input. For example, a list of objects can be provided as input. Data can be given as either flat or hierarchical collection to the `dataSource` property.

### Flat collection

The following code shows, how to bind a flat collection as data source to the TreeMap control.

#### INDEX.TS

```
import { TreeMap } from '@syncfusion/ej2-treemap';
let treemap: TreeMap = new TreeMap({
 dataSource: [
 {State:"United States", GDP:17946, percentage:11.08, Rank:1},
 {State:"China", GDP:10866, percentage: 28.42, Rank:2},
 {State:"Japan", GDP:4123, percentage:-30.78, Rank:3},
 {State:"Germany", GDP:3355, percentage:-5.19, Rank:4},
 {State:"United Kingdom", GDP:2848, percentage:8.28, Rank:5},
 {State:"France", GDP:2421, percentage:-9.69, Rank:6},
 {State:"India", GDP:2073, percentage:13.65, Rank:7},
 {State:"Italy", GDP:1814, percentage:-12.45, Rank:8},
 {State:"Brazil", GDP:1774, percentage:-27.88, Rank:9},
 {State:"Canada", GDP:1550, percentage:-15.02, Rank:10}
],
 weightValuePath: 'GDP',
 leafItemSettings: {
 labelPath: 'State'
 },
}, '#container');
```

```

## Layout in EJ2 JavaScript Treemap control

Determine the visual representation of nodes belonging to all the TreeMap levels using the `layoutType` property.

### Types of layout

The available layout types are,

- Squarified
- SliceAndDiceVertical

- SliceAndDiceHorizontal
- SliceAndDiceAuto

### Squarified

The **Squarified** layout displays the nested rectangles based on aspect ratio in the TreeMap. The rectangles will be split based on the height and width of the parent. The default rendering type of layout is **Squarified**.

### INDEX.TS

```
import { TreeMap } from '@syncfusion/ej2-treemap';
let treemap: TreeMap = new TreeMap({
 dataSource: [
 {State:"United States", GDP:17946, percentage:11.08, Rank:1},
 {State:"China", GDP:10866, percentage: 28.42, Rank:2},
 {State:"Japan", GDP:4123, percentage:-30.78, Rank:3},
 {State:"Germany", GDP:3355, percentage:-5.19, Rank:4},
 {State:"United Kingdom", GDP:2848, percentage:8.28, Rank:5},
 {State:"France", GDP:2421, percentage:-9.69, Rank:6},
 {State:"India", GDP:2073, percentage:13.65, Rank:7},
 {State:"Italy", GDP:1814, percentage:-12.45, Rank:8},
 {State:"Brazil", GDP:1774, percentage:-27.88, Rank:9},
 {State:"Canada", GDP:1550, percentage:-15.02, Rank:10}
],
 weightValuePath: 'GDP'
}, '#container');
```

### INDEX.HTML

## Leaf item in EJ2 JavaScript Treemap control

A leaf item defines a visualized data element and does not contain child nodes but contains parent node if the levels are specified in the TreeMap.

### Leaf label

Label is represented by item name or value. Label will be appeared by specifying the `labelPath` property and customize the label style using the `labelStyle` property.

### INDEX.TS

```
import { TreeMap } from '@syncfusion/ej2-treemap';
let treemap: TreeMap = new TreeMap({
 dataSource: [
 {State:"United States", GDP:17946, percentage:11.08, Rank:1},
 {State:"China", GDP:10866, percentage: 28.42, Rank:2},
 {State:"Japan", GDP:4123, percentage:-30.78, Rank:3},
 {State:"Germany", GDP:3355, percentage:-5.19, Rank:4},
 {State:"United Kingdom", GDP:2848, percentage:8.28, Rank:5},
 {State:"France", GDP:2421, percentage:-9.69, Rank:6},
 {State:"India", GDP:2073, percentage:13.65, Rank:7},
 {State:"Italy", GDP:1814, percentage:-12.45, Rank:8},
 {State:"Brazil", GDP:1774, percentage:-27.88, Rank:9},
 {State:"Canada", GDP:1550, percentage:-15.02, Rank:10}
],
 weightValuePath: 'GDP',
 leafItemSettings: {
 labelPath: 'State',
 labelStyle: {
 color: '#000000'
 },
 border: {
 color: '#000000',
 width: 0.5
 }
 },
}, '#container');
```

### INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
 <title>Essential JS 2 for Treemap </title>
 <meta charset="utf-8">
 <meta name="viewport" content="width=device-width, initial-scale=1.0">

## Levels in EJ2 JavaScript Treemap control

Treemap supports a number of levels and each level is separated by using the `groupPath` property.

### Group path

The `groupPath` property is used to separate each level of the Treemap by specifying the property from the data source.

In the following example, three levels are added and each level is configured using the `groupPath` property.

## INDEX.TS

```

let jobData:Object[] = [
 { Category: 'Employees', Country: 'USA', JobDescription: 'Sales',

## Color mapping in EJ2 JavaScript Treemap control

Color mapping is used to customize the color for each group or item based on the specified types. The following options are available to customize the group and leaf items in the TreeMap.

### Range color mapping

Range color mapping is used to apply color to the items by giving specific ranges in the DataSource, and it should be specifying the data source properties to the `rangeColorValuePath`. The color mapping ranges to be specified in the `from` and `to` properties of the `colorMapping`.

## INDEX.TS

```

let fruits:Object[] = [{ fruit:'Apple', count:5000 },

```

```

 { fruit: 'Mango', count: 3000 },
 { fruit: 'Orange', count: 2300 },
 { fruit: 'Banana', count: 500 },
 { fruit: 'Grape', count: 4300 },
 { fruit: 'Papaya', count: 1200 },
 { fruit: 'Melon', count: 4500 }
];
import { TreeMap } from '@syncfusion/ej2-treemap';
let treemap: TreeMap = new TreeMap({
 dataSource: fruits,
 weightValuePath: 'count',
 rangeColorValuePath: 'count',
 leafItemSettings: {
 labelPath: 'fruit',
 colorMapping: [
 {
 from: 500,
 to: 3000,
 color: 'orange'
 },
 {
 from: 3000,
 to: 5000,
 color: 'green'
 }
]
 }
}, '#container');
```

## INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
 <title>Essential JS 2 for Treemap </title>
 <meta charset="utf-8">
 <meta name="viewport" content="width=device-width, initial-scale=1.0">
 <meta name="description" content="Essential JS 2 for treemap UI
Control">
 <meta name="author" content="Syncfusion">
 <link href="index.css" rel="stylesheet">

 <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
 <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

 <div id="container">
 </div>
<script>

if(ele) {
 ele.style.visibility = "visible";
}
</script>
```

```
<script src="index.js" type="text/javascript"></script>
</body></html>
```

### Equal color mapping

Equal color mapping is used to fill colors to each item by specifying equal value present in the data source, that can be specified in the `equalColorValuePath` property.

#### INDEX.TS

```
let CarDetails:Object[] = [{ Car:'Mustang', Brand:'Ford', count:232 },
 { Car:'EcoSport', Brand:'Ford', count:121 },
 { Car:'Swift', Brand:'Maruti', count:143 },
 { Car:'Baleno', Brand:'Maruti', count:454 },
 { Car:'Vitara Brezza', Brand:'Maruti', count:545 },
 { Car:'A3 Cabriolet', Brand:'Audi', count:123 },
 { Car:'RS7 Sportback', Brand:'Audi', count:523 }
];
import { TreeMap } from '@syncfusion/ej2-treemap';
let treemap: TreeMap = new TreeMap({
 dataSource: CarDetails,
 weightValuePath: 'count',
 equalColorValuePath: 'Brand',
 leafItemSettings: {
 labelPath: 'Car',
 colorMapping:[
 {
 value:'Ford',
 color:'green'
 },
 {
 value:'Audi',
 color:'red'
 },
 {
 value:'Maruti',
 color:'orange'
 }
]
 },
}, '#container');
```

#### INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
 <title>Essential JS 2 for Treemap </title>

if(ele) {
 ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

### Desaturation color mapping

Desaturation color mapping is used to apply colors to the items based on the `minOpacity` and `maxOpacity` properties in the `colorMapping`.

#### INDEX.TS

```

let fruits:Object[] = [{ fruit:'Apple', count:5000 },
 { fruit:'Mango', count:3000 },
 { fruit:'Orange', count:2300 },
 { fruit:'Banana', count:500 },
 { fruit:'Grape', count:4300 },
 { fruit:'Papaya', count:1200 },
 { fruit:'Melon', count:4500 }
];

import { TreeMap } from '@syncfusion/ej2-treemap';
let treemap: TreeMap = new TreeMap({
 dataSource: fruits ,
 weightValuePath: 'count',
 rangeColorValuePath: 'count',
 leafItemSettings: {
 labelPath: 'fruit',
 colorMapping:[
 {
 from:500,
 to:3000,
 minOpacity:0.2,
 maxOpacity:0.5,
 color:'orange'
 },
 {
 from:3000,
 to:5000,
 minOpacity:0.5,
 maxOpacity:0.8,
 color:'green'
 }
]
 }
}, '#container');

```

**INDEX.HTML**

## Data label in EJ2 JavaScript Treemap control

Data Labels are used to identify the name of items or groups in the TreeMap component. Data Labels will be shown by specifying the data source properties in the `labelPath` of the `leafItemSettings`.

### Format

Customize the labels for each item using the `labelFormat` property in the `leafItemSettings`.

### INDEX.TS

```
let CarDetails:Object[] = [{ Car:'Mustang', Brand:'Ford', count:232 },
 { Car:'EcoSport', Brand:'Ford', count:121 },
 { Car:'Swift', Brand:'Maruti', count:143 },
 { Car:'Baleno', Brand:'Maruti', count:454 },
 { Car:'Vitara Brezza', Brand:'Maruti', count:545 },
 { Car:'A3 Cabriolet', Brand:'Audi', count:123 },
 { Car:'RS7 Sportback', Brand:'Audi', count:523 }
];
import { TreeMap } from '@syncfusion/ej2-treemap';
let treemap: TreeMap = new TreeMap({
 dataSource: CarDetails,
 weightValuePath: 'count',
 leafItemSettings: {
 labelPath: 'Car',
 labelFormat: '${Car}-${Brand}'
 }
}, '#container');
```

### INDEX.HTML

 <title>Essential JS 2 for Treemap </title>
 <meta charset="utf-8">
 <meta name="viewport" content="width=device-width, initial-scale=1.0">
 <meta name="description" content="Essential JS 2 for treemap UI
Control">
 <meta name="author" content="Syncfusion">
 <link href="index.css" rel="stylesheet">

 <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
 type="text/javascript"></script>
 <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
 ="text/javascript"></script>
</head>
<body>

 <div id="container">
 </div>
<script>
var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
</script>
```

```
<script src="index.js" type="text/javascript"></script>
</body></html>
```

### Template

The template supports customizing labels of each leaf node using the `labelTemplate` property. It uses Essential JS2 template engine to render elements and the position of templates can be customize using the `templatePosition` property.

### INDEX.TS

```
let CarDetails:Object[] = [{ Car:'Mustang', Brand:'Ford', count:232 },
 { Car:'EcoSport', Brand:'Ford', count:121 },
 { Car:'Swift', Brand:'Maruti', count:143 },
 { Car:'Baleno', Brand:'Maruti', count:454 },
 { Car:'Vitara Brezza', Brand:'Maruti', count:545 },
 { Car:'A3 Cabriolet', Brand:'Audi', count:123 },
 { Car:'RS7 Sportback', Brand:'Audi', count:523 }
];

import { TreeMap } from '@syncfusion/ej2-treemap';
let treemap: TreeMap = new TreeMap({
 dataSource: CarDetails,
 weightValuePath: 'count',
 leafItemSettings: {
 labelPath: 'Car',
 labelTemplate: '<div>{{:Car}}-{{:Brand}}</div>',
 templatePosition: 'Center'
 }
}, '#container');
```

### INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
 <title>Essential JS 2 for Treemap </title>
 <meta charset="utf-8">
 <meta name="viewport" content="width=device-width, initial-scale=1.0">
 <meta name="description" content="Essential JS 2 for treemap UI
Control">
 <meta name="author" content="Syncfusion">
 <link href="index.css" rel="stylesheet">

 <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
 <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

 <div id="container">
 </div>
<script>
var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
```

```

</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

### InterSectAction

When the label size in each item exceeds the actual size, use the `interSectAction` property in the `leafItemSettings` to customise the labels.

### INDEX.TS

```

let CarDetails:Object[] = [{ Car:'Mustang', Brand:'Ford', count:232 },
 { Car:'EcoSport', Brand:'Ford', count:121 },
 { Car:'Swift', Brand:'Maruti', count:143 },
 { Car:'Baleno', Brand:'Maruti', count:454 },
 { Car:'Vitara Brezza', Brand:'Maruti', count:545 },
 { Car:'A3 Cabriolet Purvis Eureka LIoyd-Hartnett',
Brand:'Audi',count:123 },
 { car:'RS7 Sportback', Brand:'Audi', count:523 }
];
import { TreeMap } from '@syncfusion/ej2-treemap';
let treemap: TreeMap = new TreeMap({
 dataSource: CarDetails ,
 weightValuePath: 'count',
 leafItemSettings: {
 labelPath: 'Car',
 labelFormat: '${Car}-${Brand}',
 interSectAction: 'WrapByWord'
 }
}, '#container');

```

### INDEX.HTML

## Legend in EJ2 JavaScript Treemap control

Legend is used to provide valuable information for interpreting what the TreeMap displays. The legends can be represented in various colors, shapes or other identifiers based on the data.

### Position and alignment

Legend position is used to place legend in various positions. Based on the legend position, the legend item will be aligned. For example, if the position is top or bottom, the legend items are placed by rows. If the position is left or right, the legend items are placed by columns.

The following options are available to customize the legend position:

- Top
- Bottom
- Left
- Right
- Float

### INDEX.TS

```

let fruits:Object[] = [{ fruit:'Apple', count:5000 },
 { fruit:'Mango', count:3000 },
 { fruit:'Orange', count:2300 },
 { fruit:'Banana', count:500 },
 { fruit:'Grape', count:4300 },
 { fruit:'Papaya', count:1200 },
 { fruit:'Melon', count:4500 }
];

import { TreeMap, TreeMapLegend } from '@syncfusion/ej2-treemap';
TreeMap.Inject(TreeMapLegend);
let treemap: TreeMap = new TreeMap({
 dataSource: fruits,
 weightValuePath: 'count',
 rangeColorValuePath: 'count',
 legendSettings: {
 visible: true,
 position: 'Top'
 },
 leafItemSettings: {
 labelPath: 'fruit',
 colorMapping:[
 {
 from:500,
 to:3000,
 color:'orange'
 },
 {
 from:3000,
 to:5000,
 color:'green'
 }
]
 }
});

```

```

 }
]
}
}, '#container');

```

## INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
 <title>Essential JS 2 for Treemap </title>
 <meta charset="utf-8">
 <meta name="viewport" content="width=device-width, initial-scale=1.0">

if(ele) {
 ele.style.visibility = "visible";
}
 </script>
 <script src="index.js" type="text/javascript"></script>
</body></html>

```

Legend Alignment is used to align the legend items in specific location. The following options are available to customize the legend alignment:

- Near
- Center
- Far

## INDEX.TS

```

let fruits:Object[] = [{ fruit:'Apple', count:5000 },
 { fruit:'Mango', count:3000 },
 { fruit:'Orange', count:2300 },
 { fruit:'Banana', count:500 },
 { fruit:'Grape', count:4300 },
 { fruit:'Papaya', count:1200 },
 { fruit:'Melon', count:4500 }
];
import { TreeMap, TreeMapLegend } from '@syncfusion/ej2-treemap';
TreeMap.Inject(TreeMapLegend);

```

```
let treemap: TreeMap = new TreeMap({
 dataSource: fruits ,
 weightValuePath: 'count',
 rangeColorValuePath: 'count',
 legendSettings: {
 visible: true,
 alignment: 'Far',
 },
 leafItemSettings: {
 labelPath: 'fruit',
 colorMapping: [
 {
 from: 500,
 to: 3000,
 color: 'orange'
 },
 {
 from: 3000,
 to: 5000,
 color: 'green'
 }
]
 }
}, '#container');
```

## INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>

if(ele) {
 ele.style.visibility = "visible";
}
 </script>
 <script src="index.js" type="text/javascript"></script>
</body></html>
```

## Legend mode

The TreeMap control supports two different types of legend rendering modes such as **Default** and **Interactive**.

### Default mode

In default mode, the legends have symbols with legend labels that are used to identify the items in the TreeMap.

#### INDEX.TS

```
let CarDetails:Object[] = [{ Car:'Mustang', Brand:'Ford', count:232 },
 { Car:'EcoSport', Brand:'Ford', count:121 },
 { Car:'Swift', Brand:'Maruti', count:143 },
 { Car:'Baleno', Brand:'Maruti', count:454 },
 { Car:'Vitara Brezza', Brand:'Maruti', count:545 },
 { Car:'A3 Cabriolet', Brand:'Audi',count:123 },
 { Car:'RS7 Sportback', Brand:'Audi', count:523 }
];
import { TreeMap } from '@syncfusion/ej2-treemap';
let treemap: TreeMap = new TreeMap({
 dataSource: CarDetails ,
 weightValuePath: 'count',
 equalColorValuePath:'Brand',
 legendSettings: {
 visible: true,
 position:'Top',
 border:{color:'black',width:2}
 },
 leafItemSettings: {
 labelPath: 'Car',
 colorMapping:[
 {
 value:'Ford',
 color:'green'
 },
 {
 value:'Audi',
 color:'red'
 },
 {
 value:'Maruti',
 color:'orange'
 }
]
 },
}, '#container');
```

#### INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
 <title>Essential JS 2 for Treemap </title>
 <meta charset="utf-8">
 <meta name="viewport" content="width=device-width, initial-scale=1.0">
 <meta name="description" content="Essential JS 2 for treemap UI
Control">
 <meta name="author" content="Syncfusion">
```

```

<link href="index.css" rel="stylesheet">

<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

 <div id="container">
 </div>
<script>
var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
 </script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

### Interactive mode

The legends can be made interactive with an arrow mark that indicates exact range color in the legend when the mouse hovers on the TreeMap item. Enable this option by setting the `mode` property in the `legendSettings` to **Interactive**.

### INDEX.TS

```

let CarDetails:Object[] = [{ Car:'Mustang', Brand:'Ford', count:232 },
 { Car:'EcoSport', Brand:'Ford', count:121 },
 { Car:'Swift', Brand:'Maruti', count:143 },
 { Car:'Baleno', Brand:'Maruti', count:454 },
 { Car:'Vitara Brezza', Brand:'Maruti', count:545 },
 { Car:'A3 Cabriolet', Brand:'Audi', count:123 },
 { Car:'RS7 Sportback', Brand:'Audi', count:523 }
];

import { TreeMap } from '@syncfusion/ej2-treemap';
let treemap: TreeMap = new TreeMap({
 dataSource: CarDetails,
 weightValuePath: 'count',
 equalColorValuePath: 'Brand',
 legendSettings: {
 visible: true,
 mode: 'Interactive',
 position: 'Top',
 border: { color: 'black', width: 2 }
 },
 leafItemSettings: {
 labelPath: 'Car',
 colorMapping: [
 {
 value: 'Ford',
 color: 'green'
 },
 {
 value: 'Audi',

```

```

 color: 'red'
 },
 {
 value: 'Maruti',
 color: 'orange'
 }
]
},
}, '#container');

```

## INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
 <title>Essential JS 2 for Treemap </title>
 <meta charset="utf-8">
 <meta name="viewport" content="width=device-width, initial-scale=1.0">
 <meta name="description" content="Essential JS 2 for treemap UI Control">

 <div id="container">
 </div>
<script>
var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
```

```

</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

### Paging support

Treemap support legend paging, if the legend items cannot be placed within the provided **height** and **width** of the legend.

### INDEX.TS

```

let CarDetails:Object[] = [{ Car:'Mustang', Brand:'Ford', count:232 },
 { Car:'EcoSport', Brand:'Ford', count:121 },
 { Car:'Swift', Brand:'Maruti', count:143 },
 { Car:'Baleno', Brand:'Maruti', count:454 },
 { Car:'Vitara Brezza', Brand:'Maruti', count:545 },
 { Car:'A3 Cabriolet', Brand:'Audi', count:123 },
 { Car:'RS7 Sportback', Brand:'Audi', count:523 }
];

import { TreeMap } from '@syncfusion/ej2-treemap';
let treemap: TreeMap = new TreeMap({
 dataSource: CarDetails,
 weightValuePath: 'count',
 equalColorValuePath: 'Brand',
 legendSettings: {
 visible: true,
 height: '50px',
 width: '100px',
 border: {color: 'black', width: 2}
 },
 leafItemSettings: {
 labelPath: 'Car',
 colorMapping: [
 {
 value: 'Ford',
 color: 'green'
 },
 {
 value: 'Audi',
 color: 'red'
 },
 {
 value: 'Maruti',
 color: 'orange'
 }
]
 }
}, '#container');

```

### INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

### Legend for items excluded from color mapping

Based on the mapping ranges in the data source, get the excluded ranges from the color mapping, and show the legend with the excluded range values that are bound to the specific legend.

#### INDEX.TS

```

let fruits:Object[] = [{ fruit:'Apple', count:5000 },
 { fruit:'Mango', count:3000 },
 { fruit:'Orange', count:2300 },
 { fruit:'Banana', count:500 },
 { fruit:'Grape', count:4300 },
 { fruit:'Papaya', count:1200 },
 { fruit:'Melon', count:4500 }
];
import { TreeMap } from '@syncfusion/ej2-treemap';
let treemap: TreeMap = new TreeMap({
 dataSource: fruits,
 weightValuePath: 'count',
 rangeColorValuePath: 'count',
 legendSettings:{
 visible:true
 },
 leafItemSettings: {
 labelPath: 'fruit',
 colorMapping:[
 {
 from:500,
 to:2500,
 minOpacity:0.2,
 maxOpacity:0.5,
 color:'orange'
 },

```

```

 {
 from: 3000,
 to: 4000,
 minOpacity: 0.5,
 maxOpacity: 0.8,
 color: 'green'
 },
 {
 color: 'red'
 }
]
}
}, '#container');

```

## INDEX.HTML

```

<script src="index.js" type="text/javascript"></script>
</body></html>

```

## Hide desired legend items

To enable or disable the desired legend item for each color mapping, set the `showLegend` property to `true` in the `colorMapping`.

## INDEX.TS

```

let fruits:Object[] = [{ fruit:'Apple', count:5000 },
 { fruit:'Mango', count:3000 },
 { fruit:'Orange', count:2300 },
 { fruit:'Banana', count:500 },
 { fruit:'Grape', count:4300 },

```

```

 { fruit:'Papaya', count:1200 },
 { fruit:'Melon', count:4500 }
];
import { TreeMap } from '@syncfusion/ej2-treemap';
let treemap: TreeMap = new TreeMap({
 dataSource: fruits ,
 weightValuePath: 'count',
 rangeColorValuePath: 'count',
 legendSettings:{
 visible:true
 },
 leafItemSettings: {
 labelPath: 'fruit',
 colorMapping:[
 {
 from:500,
 to:2500,
 color:'orange',
 showLegend: true
 },
 {
 from:3000,
 to:4000,
 color:'green',
 showLegend: false
 },
 {
 color:'red',
 showLegend: true
 }
]
 }
}, '#container');
```

## INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
 <title>Essential JS 2 for Treemap </title>

 </div>
<script>
var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

### Hide duplicate legend items

To enable or disable the duplicate legend items, set the `removeDuplicateLegend` property to **true** in the `legendSettings`.

#### INDEX.TS

```

let fruits:Object[] = [{ fruit:'Apple', count:5000, visibility: true ,
color: '#71B081' },
 { fruit:'Grape', count:3000, visibility: false,
color: '#5A9A77' },
 { fruit:'Apple', count:2300, visibility: true, color:
'#498770' },
 { fruit:'Banana', count:500, visibility: false,
color: '#39776C' },
 { fruit:'Grape', count:4300, visibility: true, color:
'#266665' },
 { fruit:'Papaya', count:1200, visibility: false,
color: '#124F5E' }
];
import { TreeMap } from '@syncfusion/ej2-treemap';
let treemap: TreeMap = new TreeMap({
 dataSource: fruits ,
 weightValuePath: 'count',
 colorValuePath: 'color',
 palette: [],
 legendSettings:{
 visible:true,
 valuePath:'fruit',
 removeDuplicateLegend: true
 }
});

```

```

 },
 leafItemSettings: {
 labelPath: 'fruit',
 }
}, '#container');

```

## INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
 <title>Essential JS 2 for Treemap </title>

## Drilldown in EJ2 JavaScript Treemap control

The TreeMap supports drill-down to expose the hierarchy, achieved by clicking a node. If an item is clicked in the TreeMap, it will be moved to the next level or sub level hierarchy and returned back to the previous level by clicking the node.

### Perform drill-down action

The TreeMap items can be drilled by setting the `enableDrillDown` property to **true**.

## INDEX.TS

### Breadcrumb support

TreeMap items are drilled, up to any level of parent using breadcrumb navigation and the level from root parent to current level is displayed at the top of item layout. It can be enabled by using the `enableBreadcrumb` property to **true** and customize the breadcrumb connector using the `breadcrumbConnector` property. By default, `-(hyphen)` is the connector.

### INDEX.TS

## Tooltip in EJ2 JavaScript Treemap control

Tooltip is used to display details about the items in the TreeMap. When space constraints prevent us from displaying the information using Data Labels, the tooltip comes in handy.

### Default tooltip

The tooltip is not visible by default, to make it visible, set the `visible` property in the `tooltipSettings` to `true` and injecting the `TreeMapTooltip` module using the `TreeMap.Inject(TreeMapTooltip)`.

## INDEX.JS

```

var treemap = new ej.treemap.TreeMap({
 dataSource: [
 { fruit: 'Apple', count: 5000 },
 { fruit: 'Mango', count: 3000 },

```

```

 { fruit: 'Orange', count: 2300 },
 { fruit: 'Banana', count: 500 },
 { fruit: 'Grape', count: 4300 },
 { fruit: 'Papaya', count: 1200 },
 { fruit: 'Melon', count: 4500 }
],
 weightValuePath: 'count',
 tooltipSettings: {
 visible: true
 },
 leafItemSettings: {
 labelPath: 'fruit'
 }
}, '#container');

```

## INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
 <title>Essential JS 2 for Treemap </title>
 <meta charset="utf-8">
 <meta name="viewport" content="width=device-width, initial-scale=1.0">
 <meta name="description" content="Essential JS 2 for treemap UI
Control">

 ="text/javascript"></script>
</head>
<body>

 <div id="container">
 </div>
 <script>
var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
 </script>
 <script src="index.js" type="text/javascript"></script>
</body></html>

```

## Format tooltip

The tooltip content is displayed by default based on the `weightValuePath`. In addition, to show more information in the tooltip, use the `format` property and define field from the data source as `${datafield}`.

## INDEX.JS

```

var treemap = new ej.treemap.TreeMap({
 dataSource: [
 { fruit: 'Apple', count: 5000 },

```

```

 { fruit: 'Mango', count: 3000 },
 { fruit: 'Orange', count: 2300 },
 { fruit: 'Banana', count: 500 },
 { fruit: 'Grape', count: 4300 },
 { fruit: 'Papaya', count: 1200 },
 { fruit: 'Melon', count: 4500 }
],
 weightValuePath: 'count',
 tooltipSettings: {
 visible: true,
 format: 'Name: ${fruit} - TotalCount: ${count}'
 },
 leafItemSettings: {
 labelPath: 'fruit'
 }
}, '#container');

```

## INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
 <title>Essential JS 2 for Treemap </title>

</body></html>

```

## Tooltip template

Tooltip can be rendered as a custom component using the `template` property in the `tooltipSettings` which accepts one or more UI elements as an input, that can be rendered as a part of the tooltip rendering. You can use `${datafield}` as placeholder in HTML element to display the values from data source.

## INDEX.JS

```

var treemap = new ej.treemap.TreeMap({
 dataSource: [
 { fruit: 'Apple', count: 5000 },
 { fruit: 'Mango', count: 3000 },
 { fruit: 'Orange', count: 2300 },
 { fruit: 'Banana', count: 500 },
 { fruit: 'Grape', count: 4300 },
 { fruit: 'Papaya', count: 1200 },
 { fruit: 'Melon', count: 4500 }
],
 weightValuePath: 'count',
 tooltipSettings: {

```

## Selection and highlight in EJ2 JavaScript Treemap control

### Selection

Selection is used to select a particular group or item to differentiate from other items. Each item or each group can be selected and deselected while interacting with the items. The corresponding Treemap items are also selected while tapping a specific legend item, and vice versa.

The `fill` property is used to change the selected item color. The `color` and the `width` properties are used to customize the selected item border, and the selection is enabled by using the `enable` property to `true` in the `selectionSettings`.

### INDEX.JS

```
var treemap = new ej.treemap.TreeMap({
 dataSource: [
 { dataType: "Import", type: "Animal products", product:

## Print and export in EJ2 JavaScript Treemap control

### Print

To use the print functionality, we should set the [allowPrint](#) property to **true**. The rendered treemap can be printed directly from the browser by calling the method [print](#).

### INDEX.JS

```

var treemap = new ej.treemap.TreeMap({
 allowPrint: true,
 dataSource: [
 {State:"United States", GDP:17946, percentage:11.08, Rank:1},
 {State:"China", GDP:10866, percentage: 28.42, Rank:2},
 {State:"Japan", GDP:4123, percentage:-30.78, Rank:3},
 {State:"Germany", GDP:3355, percentage:-5.19, Rank:4},
 {State:"United Kingdom", GDP:2848, percentage:8.28, Rank:5},
 {State:"France", GDP:2421, percentage:-9.69, Rank:6},
 {State:"India", GDP:2073, percentage:13.65, Rank:7},
 {State:"Italy", GDP:1814, percentage:-12.45, Rank:8},
 {State:"Brazil", GDP:1774, percentage:-27.88, Rank:9},
 {State:"Canada", GDP:1550, percentage:-15.02, Rank:10}
],
 weightValuePath: 'GDP',
 leafItemSettings: {
 labelPath: 'State',
 labelFormat: '$ {State}
${GDP} Trillion
(${percentage}
%) ',
 labelStyle: {
 color: '#000000'

```

```

 },
 border: {
 color: '#000000',
 width: 0.5
 },
 }
}, '#container');
document.getElementById('print').onclick = () => {
 treemap.print();
};

```

## INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
 <title>Essential JS 2 for Treemap </title>

 ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

## Export

### Image Export

To use the image export functionality, we should set the [allowImageExport](#) property to **true**. The rendered treemap can be exported as an image using the [export](#) method. The method requires two parameters: image type and file name. The treemap can be exported as an image in the following formats.

- JPEG
- PNG
- SVG

**INDEX.JS**

```

var treemap = new ej.treemap.TreeMap({
 allowImageExport: true,
 dataSource: [
 {State:"United States", GDP:17946, percentage:11.08, Rank:1},
 {State:"China", GDP:10866, percentage: 28.42, Rank:2},
 {State:"Japan", GDP:4123, percentage:-30.78, Rank:3},
 {State:"Germany", GDP:3355, percentage:-5.19, Rank:4},
 {State:"United Kingdom", GDP:2848, percentage:8.28, Rank:5},
 {State:"France", GDP:2421, percentage:-9.69, Rank:6},
 {State:"India", GDP:2073, percentage:13.65, Rank:7},
 {State:"Italy", GDP:1814, percentage:-12.45, Rank:8},
 {State:"Brazil", GDP:1774, percentage:-27.88, Rank:9},
 {State:"Canada", GDP:1550, percentage:-15.02, Rank:10}
],
 weightValuePath: 'GDP',
 leafItemSettings: {
 labelPath: 'State',
 labelFormat: '${State}
$$${GDP} Trillion
(${percentage}
%) ',
 labelStyle: {
 color: '#000000'
 },
 border: {
 color: '#000000',
 width: 0.5
 },
 },
}, '#container');
document.getElementById('export').onclick = () => {
 treemap.export('PNG', 'TreeMap');
};

```

**INDEX.HTML**

```

<!DOCTYPE html><html lang="en"><head>
 <title>Essential JS 2 for Treemap </title>
 <meta charset="utf-8">
 <meta name="viewport" content="width=device-width, initial-scale=1.0">
 <meta name="description" content="Essential JS 2 for treemap UI
Control">
 <meta name="author" content="Syncfusion">
 <link href="index.css" rel="stylesheet">

 <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
 type="text/javascript"></script>
 <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
 ="text/javascript"></script>
</head>
<body>

 <div id="container">
 </div>

```

```

<button id="export" type="button" width="15%" style="float:
right">Export</button>
<script>
var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

We can get the image file as base64 string for the JPEG and PNG formats. The treemap can be exported to image as a base64 string using the [export](#) method. There are four parameters required: image type, file name, orientation of the exported PDF document which must be set as **null** for image export and finally **allowDownload** which should be set as **false** to return base64 string.

### INDEX.JS

```

var treemap = new ej.treemap.TreeMap({
 allowImageExport: true,
 dataSource: [
 {State:"United States", GDP:17946, percentage:11.08, Rank:1},
 {State:"China", GDP:10866, percentage: 28.42, Rank:2},
 {State:"Japan", GDP:4123, percentage:-30.78, Rank:3},
 {State:"Germany", GDP:3355, percentage:-5.19, Rank:4},
 {State:"United Kingdom", GDP:2848, percentage:8.28, Rank:5},
 {State:"France", GDP:2421, percentage:-9.69, Rank:6},
 {State:"India", GDP:2073, percentage:13.65, Rank:7},
 {State:"Italy", GDP:1814, percentage:-12.45, Rank:8},
 {State:"Brazil", GDP:1774, percentage:-27.88, Rank:9},
 {State:"Canada", GDP:1550, percentage:-15.02, Rank:10}
],
 weightValuePath: 'GDP',
 leafItemSettings: {
 labelPath: 'State',
 labelFormat: '$${State}
$$${GDP} Trillion
($${percentage}
%) ',
 labelStyle: {
 color: '#000000'
 },
 border: {
 color: '#000000',
 width: 0.5
 },
 },
}, '#container');
document.getElementById('export').onclick = () => {
 treemap.export('JPEG', 'TreeMap', null, false).then((data) => {
 var base64 = data;
 document.writeln(base64);
 });
};

```

### INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
 <title>Essential JS 2 for Treemap </title>
 <meta charset="utf-8">
 <meta name="viewport" content="width=device-width, initial-scale=1.0">

var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
 </script>
 <script src="index.js" type="text/javascript"></script>
</body></html>

```

### PDF Export

To use the PDF export functionality, we should set the [allowPdfExport](#) property to **true**. The rendered treemap can be exported as PDF using the [export](#) method. The [export](#) method requires three parameters: file type, file name and orientation of the PDF document. The orientation setting is optional and **0** indicates portrait and **1** indicates landscape.

### INDEX.JS

```

var treemap = new ej.treemap.TreeMap({
 allowPdfExport: true,
 dataSource: [
 {State:"United States", GDP:17946, percentage:11.08, Rank:1},
 {State:"China", GDP:10866, percentage: 28.42, Rank:2},
 {State:"Japan", GDP:4123, percentage:-30.78, Rank:3},
 {State:"Germany", GDP:3355, percentage:-5.19, Rank:4},
 {State:"United Kingdom", GDP:2848, percentage:8.28, Rank:5},
 {State:"France", GDP:2421, percentage:-9.69, Rank:6},
 {State:"India", GDP:2073, percentage:13.65, Rank:7},
 {State:"Italy", GDP:1814, percentage:-12.45, Rank:8},
 {State:"Brazil", GDP:1774, percentage:-27.88, Rank:9},
 {State:"Canada", GDP:1550, percentage:-15.02, Rank:10}
],
 weightValuePath: 'GDP',
 leafItemSettings: {
 labelPath: 'State',

```

```

 labelFormat: '${State}
$$GDP Trillion
($percentage
%) ',
 labelStyle: {
 color: '#000000'
 },
 border: {
 color: '#000000',
 width: 0.5
 },
 }
}, '#container');
document.getElementById('export').onclick = () => {
 treemap.export("PDF", "TreeMap", 0);
};

```

## INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
 <title>Essential JS 2 for Treemap </title>
 <meta charset="utf-8">
 <meta name="viewport" content="width=device-width, initial-scale=1.0">
 <meta name="description" content="Essential JS 2 for treemap UI
Control">
 <meta name="author" content="Syncfusion">
 <link href="index.css" rel="stylesheet">

<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

 <div id="container">
 </div>
 <button id="export" type="button" width="15%" style="float:
right">Export</button>
<script>
var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

The exporting of the treemap as base64 string is not supported in the PDF export.

## Accessibility in EJ2 JavaScript TreeMap control

TreeMap has built-in accessibility features like screen reading and WAI-ARIA attributes.

### WAI-ARIA attributes

The TreeMap control follows the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the TreeMap control:

| Attributes | Purpose |

| --- | --- |

| **role=region** | It specifies the TreeMap areas that do not support interactive functions like selection and highlight. |

| **role=button** | It specifies the TreeMap areas where interactive functions such as selection and highlight are available. |

| **aria-label** | Provides an accessible name for the data labels, legend title, and legend item labels. |

### Screen reading in TreeMap

Accessibility in the TreeMap control ensures that all users, regardless of ability or disability, can use screen reading. The following TreeMap elements will be read aloud using screen reading software, such as Narrator for Windows.

| Elements | Description |

| --- | --- |

| Data labels | Reads the labels displayed on leaf items of the TreeMap. |

| Legend title | Reads the title of the legend in the TreeMap. |

| Legend item label | Reads the label of the legend item in the TreeMap. |

### Ensuring accessibility

The TreeMap control's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the TreeMap control is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the TreeMap control with accessibility tools.

See also

- [Accessibility in Syncfusion EJ2 JavaScript controls](#)

## Internationalization in EJ2 JavaScript Treemap control

The TreeMap control supports internationalization for the following elements:

- Data label
- Tooltip

For more information about number and date formatter, refer to [internationalization](#).

### Globalization

Globalization is the process of designing and developing a component that works in different cultures/locales. Internationalization library is used to globalize number, date, and time values in the TreeMap control using the **format** property in the TreeMap.

### Numeric format

In the following code example, tooltip is globalized to Deutsch culture.

```
`ts
```

```
import { TreeMap, TreeMapTooltip } from '@syncfusion/ej2-treemap';
import { NumericTextBox } from '@syncfusion/ej2-inputs';
import { loadCldr, Ajax, setCulture, setCurrencyCode } from '@syncfusion/ej2-base';
TreeMap.Inject(TreeMapTooltip);
loadCultureFiles("de");
setCulture("de");
setCurrencyCode('EUR');
let treemap: TreeMap = new TreeMap({
 locale: "de",
 format: "c",
 dataSource: [
 {State:"United States", GDP:17946, percentage:11.08, Rank:1},
 {State:"China", GDP:10866, percentage: 28.42, Rank:2},
 {State:"Japan", GDP:4123, percentage:-30.78, Rank:3},
 {State:"Germany", GDP:3355, percentage:-5.19, Rank:4},
 {State:"United Kingdom", GDP:2848, percentage:8.28, Rank:5},
 {State:"France", GDP:2421, percentage:-9.69, Rank:6},
 {State:"India", GDP:2073, percentage:13.65, Rank:7},
 {State:"Italy", GDP:1814, percentage:-12.45, Rank:8},
 {State:"Brazil", GDP:1774, percentage:-27.88, Rank:9},
 {State:"Canada", GDP:1550, percentage:-15.02, Rank:10}
],
 tooltipSettings: {
 visible: true,
 },
 weightValuePath: 'GDP'
}, '#container');
function loadCultureFiles(name: string) {
 var files = ['currencies.json', 'numbers.json'];
 var loadCulture = function (prop: number) {
 let val: any, ajax: Ajax;
 // ajax = new Ajax('http://ej2.syncfusion.com/javascript/demos/' + 'src/common/cldr-data/main/' +
 name + '/' + files[prop], 'GET', false);
```

```

ajax = new Ajax('/node_modules/cldr-data/main/' + name + '/' + files[prop], 'GET', false);
ajax.onSuccess = function (value: any) {
 val = value;
};
ajax.send();
loadCldr(JSON.parse(val));
};
for (var prop = 0; prop < files.length; prop++) {
 loadCulture(prop);
}
}
,

```

### Right-to-left rendering

The TreeMap control supports right-to-left rendering for all its elements such as nodes, tooltip, data labels, and legends.

### Legend with Rtl support

If set the `enableRtl` property to **true**, then the legend icon will be rendered on the right and the legend text will be rendered on the left of the legend icon.

### INDEX.TS

```

let CarDetails:Object[] = [{ Car:'Mustang', Brand:'Ford', count:232, color:
'#71B081' },
 { Car:'EcoSport', Brand:'Ford', count:121, color:
'#5A9A77' },
 { Car:'Swift', Brand:'Maruti', count:143, color:
'#498770' },
 { Car:'Baleno', Brand:'Maruti', count:454, color:
'#39776C' },
 { Car:'Vitara Brezza', Brand:'Maruti', count:545 ,
color: '#266665' },
 { Car:'A3 Cabriolet', Brand:'Audi',count:123, color:
'#124F5E' }
];
import { TreeMap } from '@syncfusion/ej2-treemap';
let treemap: TreeMap = new TreeMap({
 dataSource: CarDetails ,
 weightValuePath: 'count',
 colorValuePath: 'color',
 enableRtl:true,
 legendSettings: {
 visible: true,
 position:'Top'
 },
 leafItemSettings: {
 labelPath: 'Car'
 },

```

```
}, '#container');
```

## INDEX.HTML

```

## Treemap Item Rendering Direction

The direction of TreeMap item is **TopLeftBottomRight** by default and customize the rendering direction of the TreeMap item by setting the **renderDirection** property.

The TreeMap can be rendered in the following directions:

- TopLeftBottomRight
- TopRightBottomLeft
- BottomRightTopLeft
- BottomLeftTopRight

The following example demonstrate, how to render the treemap in the RTL direction with **TopLeftBottomRight**.

## INDEX.TS

```

let fruits:Object[] = [{ fruit:'Apple', count:5000 },
 { fruit:'Mango', count:3000 },

```

```

 { fruit:'Orange', count:2300 },
 { fruit:'Banana', count:500 },
 { fruit:'Grape', count:4300 },
 { fruit:'Papaya', count:1200 },
 { fruit:'Melon', count:4500 }
];
import { TreeMap, TreeMapTooltip } from '@syncfusion/ej2-treemap';
TreeMap.Inject(TreeMapTooltip);
let treemap: TreeMap = new TreeMap({
 dataSource: fruits,
 weightValuePath: 'count',
 palette:['#71B081','#5A9A77', '#498770', '#39776C',
 '#266665','#124F5E'],
 renderDirection:'TopLeftBottomRight',
 leafItemSettings: {
 labelPath: 'fruit'
 }
}, '#container');

```

var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

The following example demonstrate, how to render the treemap in the RTL direction with BottomRightTopLeft.

### INDEX.TS

```

let fruits:Object[] = [{ fruit:'Apple', count:5000 },
 { fruit:'Mango', count:3000 },
```

```

 { fruit:'Orange', count:2300 },
 { fruit:'Banana', count:500 },
 { fruit:'Grape', count:4300 },
 { fruit:'Papaya', count:1200 },
 { fruit:'Melon', count:4500 }
];
import { TreeMap, TreeMapTooltip } from '@syncfusion/ej2-treemap';
TreeMap.Inject(TreeMapTooltip);
let treemap: TreeMap = new TreeMap({
 dataSource: fruits,
 weightValuePath: 'count',
 palette:['#71B081','#5A9A77', '#498770', '#39776C',
 '#266665','#124F5E'],
 renderDirection:'BottomRightTopLeft',
 leafItemSettings: {
 labelPath: 'fruit'
 }
}, '#container');
```

### INDEX.HTML

```

if(ele) {
 ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

## Right-to-left rendering

The TreeMap control supports right-to-left rendering for all its elements such as nodes, tooltip, data labels, and legends.

### Legend with Rtl support

If you set the `enableRtl` property to true, then the legend icon will be rendered on the right and the legend text will be rendered on the left of the legend icon.

### INDEX.TS

```
let CarDetails:Object[] = [{ Car:'Mustang', Brand:'Ford', count:232, color:
'#71B081' },
 { Car:'EcoSport', Brand:'Ford', count:121, color:
'#5A9A77' },
 { Car:'Swift', Brand:'Maruti', count:143, color:
'#498770' },
 { Car:'Baleno', Brand:'Maruti', count:454, color:
'#39776C' },
 { Car:'Vitara Brezza', Brand:'Maruti', count:545,
color: '#266665' },
 { Car:'A3 Cabriolet', Brand:'Audi',count:123, color:
'#124F5E' }
];
import { TreeMap } from '@syncfusion/ej2-treemap';
let treemap: TreeMap = new TreeMap({
 dataSource: CarDetails,
 weightValuePath: 'count',
 colorValuePath: 'color',
 enableRtl:true,
 legendSettings: {
 visible: true,
 position:'Top'
 },
 leafItemSettings: {
 labelPath: 'Car'
 },
}, '#container');
```

### INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
 <title>Essential JS 2 for Treemap </title>
 <meta charset="utf-8">
 <meta name="viewport" content="width=device-width, initial-scale=1.0">
 <meta name="description" content="Essential JS 2 for treemap UI
Control">
 <meta name="author" content="Syncfusion">
 <link href="index.css" rel="stylesheet">

 <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
 <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

 <div id="container">
 </div>
<script>
```

```

var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

### Tooltip with Rtl support

If the `enableRtl` property is set to true, the tooltip data will be rendered in reverse direction.

The following example shows the format of the tooltip.

#### INDEX.TS

```

let fruits:Object[] = [{ fruit:'Apple', count:5000 },
 { fruit:'Mango', count:3000 },
 { fruit:'Orange', count:2300 },
 { fruit:'Banana', count:500 },
 { fruit:'Grape', count:4300 },
 { fruit:'Papaya', count:1200 },
 { fruit:'Melon', count:4500 }
];

import { TreeMap, TreeMapTooltip } from '@syncfusion/ej2-treemap';
TreeMap.Inject(TreeMapTooltip);
let treemap: TreeMap = new TreeMap({
 dataSource: fruits,
 weightValuePath: 'count',
 palette:['#71B081', '#5A9A77', '#498770', '#39776C',
 '#266665', '#124F5E'],
 tooltipSettings: {
 visible: true,
 format:'${count} : ${fruit}'
 },
 leafItemSettings: {
 labelPath: 'fruit'
 }
}, '#container');

```

#### INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
 <title>Essential JS 2 for Treemap </title>

<script>
var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

### Treemap Item Rendering Direction

By default, the direction of tree map item is **TopLeftBottomRight**. You can customize the rendering direction of the tree map item by setting the **renderDirection** property.

The TreeMap can be rendered in the following four different directions.

**TopLeftBottomRight**

**TopRightBottomLeft**

**BottomRightTopLeft**

**BottomLeftTopRight**

The following example demonstrate how to render the treemap in the RTL direction with **TopLeftBottomRight**.

#### INDEX.TS

```
let fruits:Object[] = [{ fruit:'Apple', count:5000 },
 { fruit:'Mango', count:3000 },
 { fruit:'Orange', count:2300 },
 { fruit:'Banana', count:500 },
 { fruit:'Grape', count:4300 },
 { fruit:'Papaya', count:1200 },
 { fruit:'Melon', count:4500 }
];
import { TreeMap, TreeMapTooltip } from '@syncfusion/ej2-treemap';
TreeMap.Inject(TreeMapTooltip);
let treemap: TreeMap = new TreeMap({
 dataSource: fruits,
 weightValuePath: 'count',
 palette:['#71B081', '#5A9A77', '#498770', '#39776C',
'#266665', '#124F5E'],
 renderDirection:'TopLeftBottomRight',
 leafItemSettings: {
 labelPath: 'fruit'
 }
}, '#container');
```

#### INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
```

```

## Ej1 api migration in EJ2 JavaScript Treemap control

This article describes the API migration process of Accordion component from Essential JS 1 to Essential JS 2.

### Data Binding

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| DataSource | **Property:** *dataSource* <br/> <br/> var populationdata = [{ <br/> &#160; Continent: "Asia", <br/> &#160; Population: 1749046000 }], <br/> \$("#container").ejTreeMap({ <br/> dataSource: populationdata }) | **Property:** *dataSource* <br/> <br/> var populationdata = [{ Continent: "Asia", <br/> &#160; Population: 1749046000 }], <br/> var treemap = new ej.treemap.TreeMap({ <br/> &#160; dataSource: populationdata <br/> }); <br/> treemap.appendTo('#container'); |

### Appearance

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Layout | **Property:** *itemsLayoutMode* <br/> <br/> \$("#container").ejTreeMap({ <br/> itemsLayoutMode: "sliceanddiceauto" }) | **Property:** *layoutType* <br/> <br/> var treemap = new ej.treemap.TreeMap({ <br/> &#160; layoutType: 'SliceAndDiceAuto' <br/> }); <br/> treemap.appendTo('#container'); |

| Weight Value Path | **Property:** *weightValuePath* <br/> <br/> \$("#container").ejTreeMap({ <br/> weightValuePath: "Population" }) | **Property:** *weightValuePath* <br/> <br/> var treemap = new ej.treemap.TreeMap({ <br/> &#160; weightValuePath: 'Population' <br/> }); <br/> treemap.appendTo('#container'); |

|Range Color Value Path| **Property:** *colorValuePath*<br/><br/> \$("#container").ejTreeMap({ <br/> colorValuePath: "Continent" })|**Property:** *rangeColorValuePath*<br/><br/> var treemap = new ej.treemap.TreeMap({ <br/> &#160; rangeColorValuePath: 'Continent' <br/> }); <br/> treemap.appendTo('#container');|

|Equal Color Value Path| Not Applicable|**Property:** *equalColorValuePath*<br/><br/> var treemap = new ej.treemap.TreeMap({ <br/> &#160; equalColorValuePath: 'Asia' <br/> }); <br/> treemap.appendTo('#container');|

|Height| **Property:** *height*<br/><br/> \$("#container").ejTreeMap({ <br/> height: 50 })|**Property:** *height*<br/><br/> var treemap = new ej.treemap.TreeMap({ <br/> &#160; height: '50px' <br/> }); <br/> treemap.appendTo('#container');|

|Width| **Property:** *width*<br/><br/> \$("#container").ejTreeMap({ <br/> width: 400 })|**Property:** *width*<br/><br/> var treemap = new ej.treemap.TreeMap({ <br/> &#160; width: '400px' <br/> }); <br/> treemap.appendTo('#container');|

|Theme| Not Applicable|**Property:** *theme*<br/><br/> var treemap = new ej.treemap.TreeMap({ <br/> &#160; theme: 'Highcontrast' <br/> }); <br/> treemap.appendTo('#container');|

|Localization| **Property:** *locale*<br/><br/> \$("#container").ejTreeMap({ <br/> locale: "en-US" })|**Property:** *locale*<br/><br/> var treemap = new ej.treemap.TreeMap({ <br/> &#160; locale: 'en-US' <br/> }); <br/> treemap.appendTo('#container');|

|Palette Colors| **Property:** *paletteColorMapping.colors*<br/><br/> \$("#container").ejTreeMap({ <br/> paletteColorMapping: { colors: ['red','green'] } })|**Property:** *palette*<br/><br/> var treemap = new ej.treemap.TreeMap({ <br/> &#160; palette: ['#C33764', '#AB3566'] <br/> }); <br/> treemap.appendTo('#container');|

|Margin| Not Applicable|**Property:** *margin*<br/><br/> var treemap = new ej.treemap.TreeMap({ <br/> &#160; margin: { left: 5, top: 8 } <br/> }); <br/> treemap.appendTo('#container');|

|Resize| **Property:** *enableResize*<br/><br/> \$("#container").ejTreeMap({ <br/> enableResize: true })| Not Applicable|

|Responsive| **Property:** *isResponsive*<br/><br/> \$("#container").ejTreeMap({ <br/> isResponsive: true })| Not Applicable|

## Leaf Items

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

|Border Color| **Property:** *leafItemSettings.borderBrush*<br/><br/> \$("#container").ejTreeMap({ <br/> &#160; leafItemSettings: { showLabels: true, <br/> &#160; borderBrush: "blue" } <br/> })|**Property:** *leafItemSettings.border*<br/><br/> var treemap = new ej.treemap.TreeMap({ <br/> &#160; leafItemSettings: { border: { color: 'white' } } <br/> }); <br/> treemap.appendTo('#container');|

|Border Width| **Property:** *leafItemSettings.borderThickness*<br/><br/> \$("#container").ejTreeMap({ <br/> &#160; leafItemSettings: { showLabels: true, <br/> &#160; borderThickness: 5 } <br/> })|**Property:** *leafItemSettings.border*<br/><br/> var treemap = new ej.treemap.TreeMap({ <br/> &#160; leafItemSettings: { border: { width: 5 } } <br/> }); <br/> treemap.appendTo('#container');|

|Gap Value| **Property:** *leafItemSettings.gap*<br/><br/> \$("#container").ejTreeMap({ <br/> &#160; leafItemSettings: { showLabels: true, <br/> &#160; gap: 5 } <br/> })|**Property:**

```

leafItemSettings.gap

 var treemap = new ej.treemap.TreeMap({

leafItemSettings: { gap: 5 }
 });
 treemap.appendTo('#container');|

| Leaf Item Label| Property: leafItemSettings.itemTemplate

 $("#container").ejTreeMap({

 leafItemSettings: { showLabels: true,
 itemTemplate: "template" }

})| Property: leafItemSettings.labelTemplate

 var treemap = new ej.treemap.TreeMap({

 leafItemSettings: { labelTemplate: 'template' }
 });
 treemap.appendTo('#container');|

| Leaf Label Path| Property: leafItemSettings.labelPath

 $("#container").ejTreeMap({

 leafItemSettings: { showLabels: true,
 labelPath: "GameName" }
 })| Property:
leafItemSettings.labelPath

 var treemap = new ej.treemap.TreeMap({

leafItemSettings: { labelPath: 'GameName' }
 });
 treemap.appendTo('#container');|

| Leaf Label Position| Property: leafItemSettings.labelPosition

 $("#container").ejTreeMap({

 leafItemSettings: { showLabels: true,
 labelPosition: "topcenter" }

})| Property: leafItemSettings.labelPosition

 var treemap = new ej.treemap.TreeMap({

 leafItemSettings: { labelPosition: 'Center' }
 });
 treemap.appendTo('#container');|

| Leaf Label Color| Not Applicable| Property: leafItemSettings.fill

 var treemap = new
ej.treemap.TreeMap({
 leafItemSettings: { fill: 'red' }
 });

treemap.appendTo('#container');|

| Random Colors| Not Applicable| Property: leafItemSettings.autoFill

 var treemap = new
ej.treemap.TreeMap({
 leafItemSettings: { autoFill: true }
 });

treemap.appendTo('#container');|

| Format| Not Applicable| Property: leafItemSettings.labelFormat

 var treemap = new
ej.treemap.TreeMap({
 leafItemSettings: { labelFormat: '${Continent}-${Population}' }

});
 treemap.appendTo('#container');|

| Labels Visibility| Property: leafItemSettings.showLabels

 $("#container").ejTreeMap({

 leafItemSettings: { showLabels: true }
 })| Property: leafItemSettings.showLabels

var treemap = new ej.treemap.TreeMap({
 leafItemSettings: { showLabels: false }
 });

 treemap.appendTo('#container');|

| Opacity| Not Applicable| Property: leafItemSettings.opacity

 var treemap = new
ej.treemap.TreeMap({
 leafItemSettings: { opacity: 0.7 }
 });

treemap.appendTo('#container');|

| Padding| Not Applicable| Property: leafItemSettings.padding

 var treemap = new
ej.treemap.TreeMap({
 leafItemSettings: { padding: 5 }
 });

treemap.appendTo('#container');|

| Font Customization| Not Applicable| Property: leafItemSettings.labelStyle

 var treemap =
new ej.treemap.TreeMap({
 leafItemSettings: { labelStyle: { size: '12px', color: 'red', opacity:
0.5 } }
 });
 treemap.appendTo('#container');|

| Position of Template| Not Applicable| Property: leafItemSettings.templatePosition

 var
treemap = new ej.treemap.TreeMap({
 leafItemSettings: { templatePosition: 'Center' }

 });
 treemap.appendTo('#container');|

```

## Legend

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Legend Alignment | **Property:** *legendSettings.alignment*  
 \$("#container").ejTreeMap({  
 legendSettings: { alignment: "far" }  
 }) | **Property:** *legendSettings.alignment* var treemap = new ej.treemap.TreeMap({  
 legendSettings: { alignment: 'Near' }  
 }); treemap.appendTo('#container');

| Legend Visibility | **Property:** *showLegend*  
 \$("#container").ejTreeMap({  
 showLegend: false  
 }) | **Property:** *legendSettings.visible* var treemap = new  
 ej.treemap.TreeMap({  
 legendSettings: { visible: true }  
 }); treemap.appendTo('#container');

| Legend Position | **Property:** *legendSettings.dockPosition*  
 \$("#container").ejTreeMap({  
 legendSettings: { dockPosition: "bottom" }  
 }) | **Property:** *legendSettings.position*  
 var treemap = new ej.treemap.TreeMap({  
 legendSettings: { position: 'Top' }  
 }); treemap.appendTo('#container');

| Legend Height | **Property:** *legendSettings.height*  
 \$("#container").ejTreeMap({  
 legendSettings: { height: 40 }  
 }) | **Property:** *legendSettings.height* var treemap = new  
 ej.treemap.TreeMap({  
 legendSettings: { height: '40px' }  
 }); treemap.appendTo('#container');

| Legend Width | **Property:** *legendSettings.width*  
 \$("#container").ejTreeMap({  
 legendSettings: { width: 100 }  
 }) | **Property:** *legendSettings.width* var treemap = new  
 ej.treemap.TreeMap({  
 legendSettings: { width: '100px' }  
 }); treemap.appendTo('#container');

| Shape Height | **Property:** *legendSettings.iconHeight*  
 \$("#container").ejTreeMap({  
 legendSettings: { iconHeight: 15 }  
 }) | **Property:** *legendSettings.shapeHeight* var  
 treemap = new ej.treemap.TreeMap({  
 legendSettings: { shapeHeight: '40px' }  
 });  
 treemap.appendTo('#container');

| Shape Width | **Property:** *legendSettings.iconWidth*  
 \$("#container").ejTreeMap({  
 legendSettings: { iconWidth: 8 }  
 }) | **Property:** *legendSettings.shapeWidth* var  
 treemap = new ej.treemap.TreeMap({  
 legendSettings: { shapeWidth: '40px' }  
 });  
 treemap.appendTo('#container');

| Padding | Not Applicable | **Property:** *legendSettings.shapePadding*  
 var treemap = new  
 ej.treemap.TreeMap({  
 legendSettings: { shapePadding: 10 }  
 }); treemap.appendTo('#container');

 ej.treemap.TreeMap({ <br/> &#160; levels: [{ headerAlignment: 'Center' }] <br/> }); <br/>  
 treemap.appendTo('#container');|

## Selection

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Selection | **Property:** *selectionMode*  
 \$("#container").ejTreeMap({   
 &#160; selectionMode: "default"   
 }) | **Property:** *selectionSettings.mode*  
 var treemap = new ej.treemap.TreeMap({   
 &#160; selectionSettings: { enable: true, mode: 'Item' }   
 });   
 treemap.appendTo('#container');

| Selection Color | Not Applicable | **Property:** *selectionSettings.fill*  
 var treemap = new ej.treemap.TreeMap({   
 &#160; selectionSettings: { enable: true, fill: 'blue' }   
 });   
 treemap.appendTo('#container');

| Selection Color Opacity | Not Applicable | **Property:** *selectionSettings.opacity*  
 var treemap = new ej.treemap.TreeMap({   
 &#160; selectionSettings: { enable: true, fill: 'blue', opacity: 0.6 }   
 });   
 treemap.appendTo('#container');

| Border for selection | Not Applicable | **Property:** *selectionSettings.border*  
 var treemap = new ej.treemap.TreeMap({   
 &#160; selectionSettings: { border: { color: 'red', width: 2 } }   
 });   
 treemap.appendTo('#container');

## Highlight

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Highlight Group Selection Mode | **Property:** *highlightGroupOnSelection*  
 \$("#container").ejTreeMap({   
 &#160; highlightGroupOnSelection: true   
 }) | **Property:** *highlightSettings.mode*  
 var treemap = new ej.treemap.TreeMap({   
 &#160; highlightSettings: { enable: true, mode: 'All' }   
 });   
 treemap.appendTo('#container');

| Highlight Selection Mode | **Property:** *highlightOnSelection*  
 \$("#container").ejTreeMap({   
 &#160; highlightOnSelection: true   
 }) | **Property:** *highlightSettings.mode*  
 var treemap = new ej.treemap.TreeMap({   
 &#160; highlightSettings: { enable: true, mode: 'Item' }   
 });   
 treemap.appendTo('#container');

| Highlight Group Border Color | **Property:** *highlightGroupBorderBrush*  
 \$("#container").ejTreeMap({   
 &#160; highlightGroupBorderBrush: 'gray'   
 }) | **Property:** *highlightSettings.border.color*  
 var treemap = new ej.treemap.TreeMap({   
 &#160; highlightSettings: { enable: true, mode: 'All',   
 &#160; &#160; border: { color: 'gray' } }   
 });   
 treemap.appendTo('#container');

| Highlight Group Border Width | **Property:** *highlightGroupBorderThickness*  
 \$("#container").ejTreeMap({   
 &#160; highlightGroupBorderThickness: 3   
 }) | **Property:** *highlightSettings.border.width*  
 var treemap = new ej.treemap.TreeMap({   
 &#160; highlightSettings: { enable: true, mode: 'All',   
 &#160; &#160; border: { width: 3 } }   
 });   
 treemap.appendTo('#container');

| Highlight Selection Border Color | **Property:** *highlightBorderBrush*  
 \$("#container").ejTreeMap({   
 &#160; highlightBorderBrush: 'gray'   
 }) | **Property:** *highlightSettings.border.color*  
 var treemap = new ej.treemap.TreeMap({   
 &#160; highlightSettings: { enable: true, mode: 'Item',   
 &#160; &#160; border: { color: 'gray' } }   
 });   
 treemap.appendTo('#container');

| Highlight Selection Border Width | **Property:** *highlightBorderThickness*  
 \$("#container").ejTreeMap({   
 &#160; highlightBorderThickness: 3   
 }) | **Property:** *highlightSettings.border.width*  
 var treemap = new ej.treemap.TreeMap({   
 &#160; highlightSettings: { enable: true, mode: 'Item',   
 &#160; &#160; border: { width: 3 } }   
 });   
 treemap.appendTo('#container');

| Highlight Color | Not Applicable | **Property:** *highlightSettings.fill*  
 var treemap = new ej.treemap.TreeMap({   
 &#160; highlightSettings: { enable: true, fill: 'red' }   
 });   
 treemap.appendTo('#container');

| Highlight Color Opacity | Not Applicable | **Property:** *highlightSettings.opacity*  
 var treemap = new ej.treemap.TreeMap({   
 &#160; highlightSettings: { enable: true, fill: 'red', opacity: 0.5 }   
 });   
 treemap.appendTo('#container');

### Range ColorMapping

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| From value | **Property:** *rangeColorMapping.from*  
 \$("#container").ejTreeMap({   
 &#160; rangeColorMapping: [{ from: 1000 } ]   
 }) | **Property:** *leafItemSettings.colorMapping.from*  
 var treemap = new ej.treemap.TreeMap({   
 &#160; leafItemSettings: { colorMapping: [{ from: 1000 } ] }   
 });   
 treemap.appendTo('#container');

| To value | **Property:** *rangeColorMapping.to*  
 \$("#container").ejTreeMap({   
 &#160; rangeColorMapping: [{ to: 100000 } ]   
 }) | **Property:** *leafItemSettings.colorMapping.to*  
 var treemap = new ej.treemap.TreeMap({   
 &#160; leafItemSettings: { colorMapping: [{ to: 100000 } ] }   
 });   
 treemap.appendTo('#container');

| Color | **Property:** *rangeColorMapping.color*  
 \$("#container").ejTreeMap({   
 &#160; rangeColorMapping: [{ color: "#77D8D8" } ]   
 }) | **Property:** *leafItemSettings.colorMapping.color*  
 var treemap = new ej.treemap.TreeMap({   
 &#160; leafItemSettings: { colorMapping: [{ color: "#77D8D8" } ] }   
 });   
 treemap.appendTo('#container');

| Legend Label | **Property:** *rangeColorMapping.legendLabel*  
 \$("#container").ejTreeMap({   
 &#160; rangeColorMapping: [{ legendLabel: "Growth" } ]   
 }) | **Property:** *leafItemSettings.colorMapping.label*  
 var treemap = new ej.treemap.TreeMap({   
 &#160; leafItemSettings: { colorMapping: [{ label: "Growth" } ] }   
 });   
 treemap.appendTo('#container');

### Desaturation ColorMapping

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| From value | **Property:** *desaturationColorMapping.from*  
 \$("#container").ejTreeMap({   
 &#160; desaturationColorMapping: [{ from: 1000 } ]   
 }) | **Property:** *leafItemSettings.colorMapping.from*  
 var treemap = new ej.treemap.TreeMap({   
 &#160; leafItemSettings: { colorMapping: [{ from: 1000 } ] }   
 });   
 treemap.appendTo('#container');

| To value | **Property:** *desaturationColorMapping.to*  
 \$("#container").ejTreeMap({   
 &#160; desaturationColorMapping: [{ to: 10000 } ]   
 }) | **Property:**

*leafItemSettings.colorMapping.to*<br/><br/> var treemap = new ej.treemap.TreeMap({ <br/> &#160;  
leafItemSettings: { colorMapping: [{ to: 10000 }] } <br/> }); <br/> treemap.appendTo('#container');|

|Color| **Property:** *desaturationColorMapping.color*<br/><br/> \$("#container").ejTreeMap({ <br/>  
&#160; desaturationColorMapping: [{ color: "#77D8D8" }] <br/> })| **Property:**  
*leafItemSettings.colorMapping.color*<br/><br/> var treemap = new ej.treemap.TreeMap({ <br/> &#160;  
leafItemSettings: { colorMapping: [{ color: "#77D8D8" }] } <br/> }); <br/>  
treemap.appendTo('#container');|

|Value| Not Applicable| **Property:** *leafItemSettings.colorMapping.value*<br/><br/> var treemap = new  
ej.treemap.TreeMap({ <br/> &#160; leafItemSettings: { colorMapping: [{ value: "Population" }] } <br/> });  
<br/> treemap.appendTo('#container');|

|Minimum Opacity| Not Applicable| **Property:** *leafItemSettings.colorMapping.minOpacity*<br/><br/>  
var treemap = new ej.treemap.TreeMap({ <br/> &#160; leafItemSettings: { colorMapping: [{ minOpacity:  
0.7 }] } <br/> }); <br/> treemap.appendTo('#container');|

|Maximum Opacity| Not Applicable| **Property:** *leafItemSettings.colorMapping.maxOpacity*<br/><br/>  
var treemap = new ej.treemap.TreeMap({ <br/> &#160; leafItemSettings: { colorMapping: [{  
maxOpacity: 1 }] } <br/> }); <br/> treemap.appendTo('#container');|

## Tooltip

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

|Tooltip| **Property:** *showTooltip*<br/><br/> \$("#container").ejTreeMap({ <br/> &#160; showTooltip:  
true <br/> })| **Property:** *tooltipSettings.visible*<br/><br/> var treemap = new ej.treemap.TreeMap({  
<br/> &#160; tooltipSettings: { visible: true } <br/> }); <br/> treemap.appendTo('#container');|

|Tooltip Template| **Property:** *tooltipTemplate*<br/><br/> \$("#container").ejTreeMap({ <br/> &#160;  
tooltipTemplate: 'template' <br/> })| **Property:** *tooltipSettings.template*<br/><br/> var treemap = new  
ej.treemap.TreeMap({ <br/> &#160; tooltipSettings: { template: 'template' } <br/> }); <br/>  
treemap.appendTo('#container');|

|Tooltip Border| Not Applicable| **Property:** *tooltipSettings.border*<br/><br/> var treemap = new  
ej.treemap.TreeMap({ <br/> &#160; tooltipSettings: { border: { color: 'red', width: 2 } } <br/> }); <br/>  
treemap.appendTo('#container');|

|Tooltip Color| Not Applicable| **Property:** *tooltipSettings.fill*<br/><br/> var treemap = new  
ej.treemap.TreeMap({ <br/> &#160; tooltipSettings: { fill: 'gray' } <br/> }); <br/>  
treemap.appendTo('#container');|

|Tooltip Format| Not Applicable| **Property:** *tooltipSettings.format*<br/><br/> var treemap = new  
ej.treemap.TreeMap({ <br/> &#160; tooltipSettings: { format: '\${Population}' } <br/> }); <br/>  
treemap.appendTo('#container');|

|Tooltip Marker Shape| Not Applicable| **Property:** *tooltipSettings.markerShapes*<br/><br/> var treemap  
= new ej.treemap.TreeMap({ <br/> &#160; tooltipSettings: { markerShapes: 'Circle' } <br/> }); <br/>  
treemap.appendTo('#container');|

|Tooltip Color Opacity| Not Applicable| **Property:** *tooltipSettings.opacity*<br/><br/> var treemap = new  
ej.treemap.TreeMap({ <br/> &#160; tooltipSettings: { opacity: 0.5 } <br/> }); <br/>  
treemap.appendTo('#container');|

| Tooltip Text Style | Not Applicable | **Property:** *tooltipSettings.textStyle*  
 ej.treemap.TreeMap({ tooltipSettings: { textStyle: { Color: 'red', opacity: 0.5, size: '12px' } } }); treemap.appendTo('#container');

### Drilldown

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Drilldown | **Property:** *enableDrillDown*  
 enableDrillDown: true | **Property:** *enableDrillDown*  
 ej.treemap.TreeMap({ enableDrillDown: true }); treemap.appendTo('#container');

| Drilldown Level | **Property:** *drillDownLevel*  
 drillDownLevel: 1 | **Property:** *InitialDrillSettings.groupIndex*  
 ej.treemap.TreeMap({ InitialDrillSettings: { groupIndex: 1 } }); treemap.appendTo('#container');

### Methods

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Treemap Refresh Method | **Method:** *refresh*  
 refresh | **Method:** *refresh*  
 ej.treemap.TreeMap({ refresh: true }); treemap.appendTo('#container');

| Method to Drilldown | **Method:** *drillDown*  
 drillDown | **Method:** *drillDown*  
 ej.treemap.TreeMap({ drillDown: true }); treemap.appendTo('#container');

| Append to Method | Not Applicable | **Method:** *appendTo*  
 appendTo | **Method:** *appendTo*  
 ej.treemap.TreeMap({ appendTo: true }); treemap.appendTo('#container');

| Add Event Listener Method | Not Applicable | **Method:** *addEventListener*  
 addEventListener | **Method:** *addEventListener*  
 ej.treemap.TreeMap({ addEventListener: true }); treemap.appendTo('#container');

| Treemap Destroy Method | Not Applicable | **Method:** *destroy*  
 destroy | **Method:** *destroy*  
 ej.treemap.TreeMap({ destroy: true }); treemap.appendTo('#container');

| Treemap Exporting Method | Not Applicable | **Method:** *export*  
 export | **Method:** *export*  
 ej.treemap.TreeMap({ export: true }); treemap.appendTo('#container');

| Get the Module Name | Not Applicable | **Method:** *getModuleName*  
 getModuleName | **Method:** *getModuleName*  
 ej.treemap.TreeMap({ getModuleName: true }); treemap.appendTo('#container');

| Printing the Treemap | Not Applicable | **Method:** *print*  
 print | **Method:** *print*  
 ej.treemap.TreeMap({ print: true }); treemap.appendTo('#container');

| Resizing the Treemap | Not Applicable | **Method:** *resizeOnTreeMap*  
 resizeOnTreeMap | **Method:** *resizeOnTreeMap*  
 ej.treemap.TreeMap({ resizeOnTreeMap: true }); treemap.appendTo('#container');

| Inject Method (Tooltip) | Not Applicable | **Method:** *resizeOnTreeMap*  
 TreeMap.Inject(TreeMapTooltip);  
 var treemap = new ej.treemap.TreeMap({ });  
 treemap.appendTo('#container');

| Remove Event Listener Method | Not Applicable | **Method:** *removeEventListener*  
 var treemap = new ej.treemap.TreeMap({  
 treemap.removeEventListener();  
 treemap.appendTo('#container');

## Events

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Treemap Load Event | Not Applicable | **Event:** *load*  
 var treemap = new ej.treemap.TreeMap({  
 load: function(e: ILoadEventArgs): void { }  
 treemap.appendTo('#container');

| Treemap Loaded Event | Not Applicable | **Event:** *loaded*  
 var treemap = new ej.treemap.TreeMap({  
 loaded: function(e: ILoadedEventArgs): void { }  
 treemap.appendTo('#container');

| Event Before Print | Not Applicable | **Event:** *beforePrint*  
 var treemap = new ej.treemap.TreeMap({  
 beforePrint: function(e: IPrintEventArgs): void { }  
 treemap.appendTo('#container');

| Click Event | **Event:** *click*  
 \$("#container").ejTreeMap({  
 click: function (args) { }  
 treemap = new ej.treemap.TreeMap({  
 click: function(e: IItemClickEventArgs): void { }  
 treemap.appendTo('#container');

| Drill Start Event | **Event:** *drillStarted*  
 \$("#container").ejTreeMap({  
 drillStarted: function (args) { }  
 treemap = new ej.treemap.TreeMap({  
 drillStart: function(e: IDrillStartEventArgs): void { }

## How To

### Drilldown in EJ2 JavaScript Treemap control

#### *Customize the header for treemap drilldown*

You can add a header element as `<div>` and customize it to show the population of a particular country or continent on treemap drill-down.

To customize the header for treemap drill-down, follow the given steps:

#### **Step 1:**

Initialize the treemap and enable the drill-down option.

```
`javascript
// Initialize the treemap control
var treemap = new ej.treemap.TreeMap({
 palette: ['#9999ff', '#CCFF99', '#FFFF99', '#FF9999', '#FF99FF', '#FFCC66'],
 enableDrillDown: true,
 format: 'n',
```

```

useGroupingSeparator: true,
dataSource: DrillDown,
weightValuePath: 'Population',
tooltipSettings: {
 visible: true,
 format: '${Name} : ${Population}'
},
leafItemSettings: {
 labelPath: 'Name',
 showLabels: false,
 labelStyle: { size: '0px' },
 border: { color: 'black', width: 0.5 }
},
levels: [
 { groupPath: 'Continent', fill: '#336699', border: { color: 'black', width: 0.5 } },
 { groupPath: 'States', fill: '#336699', border: { color: 'black', width: 0.5 } },
 { groupPath: 'Region', showHeader: false, fill: '#336699', border: { color: 'black', width: 0.5 } },
],
});
// Render the initialized treemap
treemap.appendTo('#container');
`

```

**Step 2:**

Show the population of a particular continent in the treemap **loaded** event. In this event, you can get the header element.

```

`javascript
loaded: function (args) {
 var header = document.getElementById('header');
 var population = 0;
 for (var i = 0; i < args.treemap.layout.renderItems[0]['parent'].Continent.length; i++) {
 population += +(args.treemap.layout.renderItems[0]['parent'].Continent[i]['data'].Population);
 }
 header.innerHTML = 'Continent - Population : ' + population
}

```

```

}
,

```

**Step 3:**

Customize the population for drilled countries or states in the header element when drill-down the treemap. The `drillEnd` event will be triggered when treemap is drilled.

**INDEX.JS**

```

var treemap = new ej.treemap.TreeMap(
{
 palette: ['#9999ff', '#CCFF99', '#FFFF99', '#FF9999', '#FF99FF',
 '#FFCC66'],
 enableDrillDown: true,
 format: 'n',
 useGroupingSeparator: true,
 dataSource: drillDown,
 weightValuePath: 'Population',
 tooltipSettings: {
 visible: true,
 format: '${Name} : ${Population}',
 },
 leafItemSettings: {
 labelPath: 'Name',
 showLabels: false,
 labelStyle: { size: '0px' },
 border: { color: 'black', width: 0.5 },
 },
 levels: [
 {
 groupPath: 'Continent',
 fill: '#336699',
 border: { color: 'black', width: 0.5 },
 },
 {
 groupPath: 'States',
 fill: '#336699',
 border: { color: 'black', width: 0.5 },
 },
 {
 groupPath: 'Region',
 showHeader: false,
 fill: '#336699',
 border: { color: 'black', width: 0.5 },
 },
],
 loaded: function (args) {
 var header = document.getElementById('header');
 var population = 0;
 for (var i = 0; i <
args.treemap.layout.renderItems[0]['parent'].Continent.length; i++) {
 population +=
args.treemap.layout.renderItems[0]['parent'].Continent[i]['data']
 .Population;
 }
 }
}

```

```

 header.innerHTML = 'Continent - Population : ' + population;
 },
 drillEnd: function (args) {
 var header = document.getElementById('header');
 var layout = document.getElementById(
 'container_TreeMap_Squarified_Layout'
);
 var population = 0;
 if (args.treemap.layout.renderItems[0]['isDrilled']) {
 for (var i = 0; i < args.treemap.layout.renderItems.length;
i++) {
 population +=
args.treemap.layout.renderItems[i]['data'].Population;
 }
 header.innerHTML =
 layout.children[0].children[1].innerHTML.split(' ')[1] +
 ' - ' +
 population;
 } else if
(args.treemap.layout.renderItems[0]['parent'].Continent) {
 for (
 var i = 0;
 i <
args.treemap.layout.renderItems[0]['parent'].Continent.length;
 i++
) {
 population +=
args.treemap.layout.renderItems[0]['parent'].Continent[i]['data']
 .Population;
 }
 header.innerHTML = 'Continent - Population : ' + population;
 } else {
 population =
args.treemap.layout.renderItems[0]['data'].Population;
 header.innerHTML =
 layout.children[0].children[1].innerHTML.split(' ')[1] +
 ' - Population : ' +
 population;
 }
 },
 '#container'
);

```

## INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
 <title>Essential JS 2 for Treemap </title>

 ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

### Drilldown with label in EJ2 JavaScript Treemap control

You can add a label template as `<div>` element to the tree map control when using the label template. To add a label template to the tree map control, you have to hide another labels by setting the `showLabels` property to **false** in `leafItemSettings` to show only the label template.

To add label template to tree map drilldown, follow the given steps:

#### Step 1:

Create a tree map control and enable the drill-down option.

```

`javascript
var treemap = new ej.treemap.TreeMap({
dataSource: CarSales,
enableDrillDown: true,
weightValuePath: 'Sales',
palette: ["white"],
levels: [
{
groupPath: 'Continent',
border: { width: 0.5, color: 'black' }
},
{
groupPath: 'Company',
border: { width: 0.5, color: 'black' }
},
]
}

```

```
}, '#container');
```

## Step 2:

Add the label template in the `leafItemSettings` options, and then set the `showLabels` property to `false` to hide another labels and show only label template.

## INDEX.JS

```
var treemap = new ej.treemap.TreeMap({
 dataSource: [
 { Continent: "China", Company: "Volkswagen", Sales: 3005994 },
 { Continent: "China", Company: "General Motors", Sales: 1230044 },
 { Continent: "China", Company: "Honda", Sales: 1197023 },
 { Continent: "United States", Company: "General Motors", Sales:
3042775 },
 { Continent: "United States", Company: "Ford", Sales: 2599193 },
 { Continent: "United States", Company: "Toyota", Sales: 2449587 },
 { Continent: "Japan", Company: "Toyota", Sales: 1527977 },

 { Continent: "United Kingdom", Company: "Vauxhall", Sales: 251146 },
 { Continent: "United Kingdom", Company: "Volkswagen", Sales: 206994
 }
],
 enableDrillDown: true,
 weightValuePath: 'Sales',
 drillStart: function(args) {
 var labelElementGroup =
document.getElementById('container_Label_Template_Group');
 labelElementGroup.remove();
 },
 palette: ["white"],
 leafItemSettings: {
 showLabels: false,
 labelTemplate: '<div style="background-color: red">{:Company}</div>',
 templatePosition: 'Center'
 },
 levels: [
 {
 groupPath: 'Continent',
 border: { width: 0.5, color: 'black' }
 },
 {
 groupPath: 'Company',
 border: { width: 0.5, color: 'black' }
 }
]
}, '#container');
```

## TreeView

### Data binding in EJ2 JavaScript Treeview control

The TreeView component provides the option to load data either from local data sources or from remote data services. This can be done through `dataSource` property that is a member of the `fields` property. The `dataSource` property supports array of JavaScript objects and `DataManager`. It also supports different kinds of data services such as OData, OData V4, Web API, URL, and JSON with the help of `DataManager` adaptors.

TreeView has `load on demand` (Lazy load), by default. It reduces the bandwidth size when consuming huge data. It loads first level nodes initially, and when parent node is expanded, loads the child nodes based on the `parentID/child` member.

By default, the `loadOnDemand` is set to true. By disabling this property, all the tree nodes are rendered at the beginning itself.

You can use the `dataBound` event to perform actions. This event will be triggered once the data source is populated in the TreeView.

### Local data

To bind local data to the TreeView, you can assign a JavaScript object array to the `dataSource` property. The TreeView component requires three fields (ID, text, and parentID) to render local data source. When mapper fields are not specified, it takes the default values as the mapping fields. Local data source can also be provided as an instance of the `DataManager`. It supports two kinds of local data binding methods.

- Hierarchical data
- Self-referential data

### Hierarchical data

TreeView can be populated with hierarchical data source that contains nested array of JSON objects. You can directly assign hierarchical data to the [dataSource](#) property, and map all the field members with corresponding keys from the hierarchical data to **fields** property.

In the following example, **code**, **name**, and **countries** columns from hierarchical data have been mapped to **id**, **text**, and **child** fields, respectively.

### INDEX.TS

```
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
import { TreeView } from '@syncfusion/ej2-navigations';
//define the nested array of JSON objects
let continents: { [key: string]: Object; }[] = [
 {
 code: 'AF', name: 'Africa', countries: [
 { code: 'NGA', name: 'Nigeria' },
 { code: 'EGY', name: 'Egypt' },
 { code: 'ZAF', name: 'South Africa' }
]
 },
 {
 code: 'AS', name: 'Asia', expanded: true, countries: [
 { code: 'CHN', name: 'China' },
 { code: 'IND', name: 'India', selected: true },
 { code: 'JPN', name: 'Japan' }
]
 },
 {
 code: 'EU', name: 'Europe', countries: [
 { code: 'DNK', name: 'Denmark' },
 { code: 'FIN', name: 'Finland' },
 { code: 'AUT', name: 'Austria' }
]
 },
 {
 code: 'NA', name: 'North America', countries: [
 { code: 'USA', name: 'United States of America' },
 { code: 'CUB', name: 'Cuba' },
 { code: 'MEX', name: 'Mexico' }
]
 },
 {
 code: 'SA', name: 'South America', countries: [
 { code: 'BRA', name: 'Brazil' },
 { code: 'COL', name: 'Colombia' },
 { code: 'ARG', name: 'Argentina' }
]
 },
 {
 code: 'OC', name: 'Oceania', countries: [
 { code: 'AUS', name: 'Australia' },

```

```

 { code: 'NZL', name: 'New Zealand' },
 { code: 'WSM', name: 'Samoa' }
]
},
{
 code: 'AN', name: 'Antarctica', countries: [
 { code: 'BVT', name: 'Bouvet Island' },
 { code: 'ATF', name: 'French Southern Lands' }
]
},
];
let treeObj: TreeView = new TreeView({
 fields: { dataSource: continents, id: 'code', text: 'name', child:
'countries' }
});
treeObj.appendTo('#tree');
```

## INDEX.HTML

```

<html lang="en"><head><script
src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head><body>
 <title>Essential JS 2 for TreeView </title>
 <meta charset="utf-8">

var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

### Self-referential data

TreeView can be populated from self-referential data structure that contains array of JSON objects with **parentID** mapping.

You can directly assign self-referential data to the **dataSource** property, and map all the field members with corresponding keys from self-referential data to **fields** property.

To render the root level nodes, specify the **parentID** as null or no need to specify the **parentID** in **dataSource**.

In the following example, **id**, **pid**, **hasChild**, and **name** columns from self-referential data have been mapped to **id**, **parentID**, **hasChildren**, and **text** fields, respectively.

### INDEX.TS

```
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
import { TreeView } from '@syncfusion/ej2-navigations';
let localData: { [key: string]: Object }[] = [
 { id: 1, name: 'Discover Music', hasChild: true, expanded: true },
 { id: 2, pid: 1, name: 'Hot Singles' },
 { id: 3, pid: 1, name: 'Rising Artists' },
 { id: 4, pid: 1, name: 'Live Music' },
 { id: 6, pid: 1, name: 'Best of 2017 So Far' },
 { id: 7, name: 'Sales and Events', hasChild: true },
 { id: 8, pid: 7, name: '100 Albums - $5 Each' },
 { id: 9, pid: 7, name: 'Hip-Hop and R&B Sale' },
 { id: 10, pid: 7, name: 'CD Deals' },
 { id: 11, name: 'Categories', hasChild: true },
 { id: 12, pid: 11, name: 'Songs' },
 { id: 13, pid: 11, name: 'Bestselling Albums' },

if(ele) {
 ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

### Remote data

TreeView can also be populated from a remote data service with the help of [DataManager](#) component and [Query](#) property.

It supports different kinds of data services such as OData, OData V4, Web API, URL, and JSON with the help of [DataManager](#) adaptors.

You can assign service data as an instance of [DataManager](#) to the [dataSource](#) property. To interact with remote data source, you have to provide the endpoint url.

The [DataManager](#) that acts as an interface between the service endpoint and the TreeView requires the following information to interact with service endpoint properly.

- [DataManager->url](#): Defines the service endpoint to fetch data.
- [DataManager->adaptor](#): Defines the adaptor option. By default, [ODataAdaptor](#) is used for remote binding.

Adaptor is responsible for processing response and request from/to the service endpoint. The [@syncfusion/ej2-data](#) package provides some predefined adaptors designed to interact with service endpoints. They are,

- [UrlAdaptor](#): Used to interact with remote services. This is the base adaptor for all remote based adaptors.

- **ODataAdaptor**: Used to interact with OData endpoints.
- **ODataV4Adaptor**: Used to interact with OData V4 endpoints.
- **WebApiAdaptor**: Used to interact with Web API created under OData standards.
- **WebMethodAdaptor**: Used to interact with web methods.

In the following example, **ODataV4Adaptor** is used to fetch data from remote services. The **EmployeeID**, **FirstName**, and **EmployeeID**

columns from Employees table have been mapped to **id**, **text**, and **hasChildren** fields respectively for first level nodes.

The **OrderID**, **EmployeeID**, and **ShipName** columns from orders table have been mapped to **id**, **parentID**, and **text** fields respectively for second level nodes.

#### INDEX.TS

```
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
import { TreeView } from '@syncfusion/ej2-navigations';

### Check box in EJ2 JavaScript Treeview control

The TreeView component allows you to check more than one node in TreeView without affecting the UI's appearance by enabling the [showCheckBox](#) property. When this property is enabled, checkbox appears before each TreeView node text.

- If one of the child nodes is not in a checked state, then the parent node will be in an intermediate state.
- If all the child nodes are in checked state, then the parent node's state will also be checked.
- If a parent node is checked, then all the child nodes' state will also be checked.

By default, the checkbox state of parent and child nodes are dependent on each other. If you need independent checked state, you can achieve it using the [autoCheck](#) property.

Using the [checkedNodes](#) property, you can set the nodes that need to be checked or get the ID of nodes that are currently checked in the TreeView component.

If you need to prevent the node check action for a particular node, the [nodeChecking](#) event can be used which is triggered before the TreeView node is checked/unchecked. The [nodeChecked](#) event will be triggered when the TreeView node is checked/unchecked successfully.

In the following example, the `showCheckBox` property is enabled.

### INDEX.TS

</body></html>

```

### Checked nodes

You can get or set the checked nodes in TreeView at initial rendering and dynamically by using the [checkedNodes](#) property. It returns the checked nodes' ID as an array.

In the following example, the **New South Wales** and **Western Australia** nodes are checked at initial rendering. If any more nodes are checked, the checked nodes' IDs will be displayed in alert.

### INDEX.TS

```

import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
import { TreeView, NodeCheckEventArgs } from '@syncfusion/ej2-navigations';
let countries: { [key: string]: Object }[] = [

## Node editing in EJ2 JavaScript Treeview control

The TreeView allows you to edit nodes by setting the [allowEditing](#) property to **true**.

To directly edit the nodes in place, **double click** the TreeView node or **select** the node and press **F2** key.

When editing is completed by focus out or by pressing the **Enter** key, the modified node's text saves automatically. If you do not want to save the modified node's text in TreeView node, press **Escape** key. It does not save the edited text to the TreeView node.

- Node editing can also be performed programmatically by using the [beginEdit](#) method. On passing the node ID or element through this method, the edit textbox will be created for the particular node thus allowing us to edit it.
- If you need to validate or prevent editing, the [nodeEditing](#) event can be used which is triggered before the TreeView node is renamed. On successfully renaming a node the [nodeEdited](#) event will be triggered.

In the following example, the first level node's text cannot be changed, but all other level nodes' text can be changed.

## Multiple selection in EJ2 JavaScript Treeview control

Selection provides an interactive support and highlights the node that you select. Selection can be done through simple mouse down or keyboard interaction.

The TreeView also supports selection of multiple nodes by setting [allowMultiSelection](#) to **true**.

To multi-select, press and hold **CTRL** key and click the desired nodes. To select range of nodes, press and hold the **SHIFT** key and click the nodes.

In the following example, the `allowMultiSelection` property is enabled.

Multi selection is not applicable through touch interactions.

### Selected nodes

You can get or set the selected nodes in TreeView at initial rendering and dynamically by using the [selectedNodes](#) property. It will return the selected node's ID as an array.

- The [nodeselecting](#) event is triggered before a node is selected/unselected which can be used to prevent the selection.
- The [nodeSelected](#) event is triggered once a node is successfully selected/unselected.

In the following example, **New South Wales** and **Western Australia** nodes are selected at initial rendering. When a node is selected, the selected node's ID is displayed in alert.

### INDEX.TS

### Drag and drop in EJ2 JavaScript Treeview control

The TreeView component allows you to drag and drop any node by setting [allowDragAndDrop](#) to **true**. Nodes can be dragged and dropped at all levels of the same TreeView.

The dragged nodes can be dropped at any level by indicator lines with **line**, **plus/minus**, and **restrict** icons. It represents the exact position where the node is to be dropped as sibling or child.

The following table explains the usage of indicator icons.

Icons	Description
----- -----	
Plus icon	Indicates that the dragged node is to be added as child of target node.
Minus or restrict icon	Indicates that the dragged node is not to be dropped at the hovered region.
In between icon	Indicates that the dragged node is to be added as siblings of hovered region.

- If you need to prevent dragging action for a particular node, the [nodeDragStart](#) event can be used which is triggered when the node drag is started. If you need to prevent dropping action for a particular node, the [nodeDragStop](#) event can be used which is triggered when the drag is stopped.
- The [nodeDragging](#) event is triggered when the TreeView node is being dragged. You can customize the cloned element in this event.
- The [nodeDropped](#) event is triggered when the TreeView node is dropped on the target element successfully.

In the following sample, the [allowDragAndDrop](#) property is enabled.

#### INDEX.TS

```

import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
import { TreeView } from '@syncfusion/ej2-navigations';

### Template in EJ2 JavaScript Treeview control

The TreeView component allows you to customize the look of TreeView nodes by using the [nodeTemplate](#) property. This property accepts either [template string](#) or HTML element ID.

In the following sample, employee information such as employee photo, name, and designation have been included using the `nodeTemplate` property.

The template expression should be provided inside the `${...}` interpolation syntax.

#### INDEX.TS

```
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
import { TreeView } from '@syncfusion/ej2-navigations';
let employees: { [key: string]: Object }[] = [
 { id: 1, name: 'Steven Buchanan', eimg: '10', job: 'CEO', hasChild:
true, expanded: true },
 { id: 2, pid: 1, name: 'Laura Callahan', eimg: '2', job: 'Product
Manager', hasChild: true },
 { id: 3, pid: 2, name: 'Andrew Fuller', eimg: '7', job: 'Team Lead',
hasChild: true },
 { id: 4, pid: 3, name: 'Anne Dodsworth', eimg: '1', job: 'Developer' },
 { id: 5, pid: 1, name: 'Nancy Davolio', eimg: '4', job: 'Product
Manager', hasChild: true },
 { id: 6, pid: 5, name: 'Michael Suyama', eimg: '9', job: 'Team Lead',
hasChild: true },
 { id: 7, pid: 6, name: 'Robert King', eimg: '8', job: 'Developer' },
 { id: 8, pid: 7, name: 'Margaret Peacock', eimg: '6', job: 'Developer'
},
 { id: 9, pid: 1, name: 'Janet Leverling', eimg: '3', job: 'HR' },
];
let treeObj: TreeView = new TreeView({
 fields: { dataSource: employees, id: 'id', parentID: 'pid', text:
'name', hasChildren: 'hasChild' },
 cssClass: 'custom',
 nodeTemplate: '#treeTemplate'
});
treeObj.appendTo('#tree');
```

### Accessibility in EJ2 JavaScript Treeview component

The TreeView component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the TreeView component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support |  |

| [Section 508](#) Support |  |

| Screen Reader Support |  |

| Right-To-Left Support |  |

| Color Contrast |  |

| Mobile Device Support |  |

| Keyboard Navigation Support |  |

| [Accessibility Checker](#) Validation |  |

| [Axe-core](#) Accessibility Validation |  |

<style>

```
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
```

</style>

<div> - All features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

### WAI-ARIA attributes

The TreeView component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the TreeView component:

| Attributes | Purpose |

| --- | --- |

| **role=tree** | All tree nodes are contained within the element. |

| **role=treeitem** | Specifies the role of each tree node in a selectable TreeView and its containment within the tree. |

| **role=group** | Specifies the role of each parent node container. |

| **role=checkbox** | Indicates checkbox control along with treeitem element. |

| **aria-multiselectable** | Indicates whether the TreeView enables multiple selection or not. |

| **aria-expanded** | Indicates whether the parent node has expanded or not. |

| **aria-selected** | Indicates the selected node. |

| **aria-grabbed** | Indicates the selected state on drag-and-drop of node. |

| **aria-level** | Indicates the level of node in TreeView. |

| **aria-checked** | Indicates the current checked state of TreeView checkbox. |

- | `aria-label` | Indicates the contextual message for the TreeView checkbox. |
- | `aria-activedescendant` | Identifies the currently active element when focusing on the TreeView. |
- | `aria-disabled` | Indicates element is perceivable but disabled. |

### Keyboard interaction

The TreeView component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the TreeView component.

Interaction Keys	Description
----- -----	
Arrow Up	Goes to the previous node.
Arrow Down	Goes to the next node.
Arrow Right	Expands the current node.
Arrow Left	Collapses the current node.
Home	Goes to the first node.
End	Goes to the last node.
F2	Edits the focused node.
Esc	Focuses out the edit state without saving the edited text.
Enter	Selects the focused node/saves the edited text.
Space	Checks the current node.
Ctrl + A	Selects all nodes.

### Ensuring accessibility

The TreeView component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the TreeView component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the TreeView component with accessibility tools.

### How To

Customize the expand and collapse icons in EJ2 JavaScript Treeview control

You can customize TreeView expand and collapse icons by using the `cssClass` property of TreeView.

Refer to the sample to customize expand/collapse icons.

### INDEX.TS

```

## Process the tree node operations using context menu in EJ2 JavaScript Treeview control

You can intergrade the context menu with 'TreeView' component in order to perform the tree view related operations like add, remove and renaming node.

Following is an example which demonstrates the above cases which are used to manipulate tree view operations in the 'select ' event of context menu.

## INDEX.TS

```
import { enableRipple } from '@syncfusion/ej2-base';
import { ContextMenu, MenuEventArgs, MenuItemModel, ContextMenuModel,
TreeView, BeforeOpenCloseMenuEventArgs, NodeClickEventArgs } from
 '@syncfusion/ej2-navigations';
enableRipple(true);
/**
 * The node operation in tree view using context menu
 */
//define the data source for TreeView
let data: { [key: string]: Object } [] = [
 { id: '1', name: 'Local Disk (C:)', hasAttribute: { class: 'remove
rename' }, hasChild: true, expanded: true, },
 { id: '2', name: 'Program Files', pid: '1', hasChild: true },
 { id: '3', name: 'Windows NT', pid: '2' },
 { id: '4', name: 'Windows Mail', pid: '2' },
 { id: '5', name: 'Windows Photo Viewer', pid: '2' },
```

```

 { id: '6', name: 'Users', pid: '1', hasChild: true, expanded: true },
 { id: '7', name: 'Smith', pid: '6' },
 { id: '8', name: 'Public', pid: '6' },
 { id: '9', name: 'Admin', pid: '6' },
 { id: '10', name: 'Windows', pid: '1', hasChild: true },
 { id: '11', name: 'Boot', pid: '10' },
 { id: '12', name: 'FileManager', pid: '10' },
 { id: '13', name: 'System32', pid: '10' },
 { id: '14', name: 'Local Disk (D:)', hasAttribute: { class: 'remove' },
hasChild: true},
 { id: '15', name: 'Personals', pid: '14', hasChild: true },
 { id: '16', name: 'My photo.png', pid: '15' },
 { id: '17', name: 'Rental document.docx', pid: '15' },
 { id: '18', name: 'Pay slip.pdf', pid: '15' },
 { id: '19', name: 'Projects', pid: '14', hasChild: true },
 { id: '20', name: 'ASP Application', pid: '19' },
 { id: '21', name: 'TypeScript Application', pid: '19' },
 { id: '22', name: 'React Application', pid: '19' },
 { id: '23', name: 'Office', pid: '14', hasChild: true },
 { id: '24', name: 'Work details.docx', pid: '23' },
 { id: '25', name: 'Weekly report.docx', pid: '23' },

### Accordion tree in EJ2 JavaScript Treeview control

Accordion is an interface where a list of items can be collapsed or expanded, but only one list can be collapsed or expanded at a time. You can customize the TreeView to make it behave as an accordion. Refer to the following code sample to create an accordion tree.

#### INDEX.TS

```
import { TreeView } from '@syncfusion/ej2-navigations';
/**
 * Accordion tree sample
 */
// Hierarchical data source for TreeView component
let continents: { [key: string]: Object; }[] = [
 {
 code: "AF", name: "Africa", countries: [
 { code: "NGA", name: "Nigeria" },
 { code: "EGY", name: "Egypt" },
 { code: "ZAF", name: "South Africa" }
]
 },
 {
 code: "AS", name: "Asia", countries: [
 { code: "CHN", name: "China" },
 { code: "IND", name: "India", selected: true },
 { code: "JPN", name: "Japan" }
]
 },
 {
 code: "EU", name: "Europe", countries: [
 { code: "DNK", name: "Denmark" },
 { code: "FIN", name: "Finland" },
 { code: "AUT", name: "Austria",
 }
]
 },
 {
 code: "NA", name: "North America", countries: [
 { code: "USA", name: "United States of America" },
 { code: "CUB", name: "Cuba" },
 { code: "MEX", name: "Mexico" }
]
 },
 {
 code: "OC", name: "Oceania", countries: [
 { code: "AUS", name: "Australia" },
 { code: "NZL", name: "New Zealand" },
 { code: "WSM", name: "Samoa" }
]
 },
];
// Render treeview with cssClass
let tree1: TreeView = new TreeView({
 fields: { dataSource: continents, id: "code", text: "name", child:
"countries" },
 nodeSelected: nodeSelect,
 cssClass: ("accordiontree")
});
```

```
tree1.appendTo('#tree');
function nodeSelect (args: NodeSelectEventArgs) {
 if (args.node.classList.contains('e-level-1')) {
 this.collapseAll();
 this.expandAll([args.node]);
 }
}
```

## INDEX.HTML

### Filtering tree nodes in EJ2 JavaScript Treeview control

You can filter the tree nodes based on their text using the **DataManager** plugin and the **fields** property of the TreeView.

The following code example demonstrates how to filter the tree nodes in a TreeView.

#### INDEX.TS

```

import { enableRipple } from '@syncfusion/ej2-base';
import { TreeView } from '@syncfusion/ej2-navigations';
import { MaskedTextBox } from '@syncfusion/ej2-inputs';
import { DataManager, Query, Predicate } from '@syncfusion/ej2-data';
enableRipple(true);

// local data source for TreeView component
let localData: { [key: string]: Object }[] = [
 { id: 1, name: "Australia", hasChild: true },
 { id: 2, pid: 1, name: "New South Wales" },
 { id: 3, pid: 1, name: "Victoria" },
 { id: 4, pid: 1, name: "South Australia" },
 { id: 6, pid: 1, name: "Western Australia" },
 { id: 7, name: "Brazil", hasChild: true },
 { id: 8, pid: 7, name: "Paraná" },
 { id: 9, pid: 7, name: "Ceará" },
 { id: 10, pid: 7, name: "Acre" },
 { id: 11, name: "China", hasChild: true },
 { id: 12, pid: 11, name: "Guangzhou" },
 { id: 13, pid: 11, name: "Shanghai" },
 { id: 14, pid: 11, name: "Beijing" },
 { id: 15, pid: 11, name: "Shantou" },
 { id: 16, name: "France", hasChild: true },
 { id: 17, pid: 16, name: "Pays de la Loire" },
 { id: 18, pid: 16, name: "Aquitaine" },
 { id: 19, pid: 16, name: "Brittany" },
 { id: 20, pid: 16, name: "Lorraine" },
 { id: 21, name: "India", hasChild: true },
 { id: 22, pid: 21, name: "Assam" },
 { id: 23, pid: 21, name: "Bihar" },
 { id: 24, pid: 21, name: "Tamil Nadu" },
 { id: 25, pid: 21, name: "Punjab" }
];

// Render the TreeView with image icons
let listTreeObj: TreeView = new TreeView({
 fields: { dataSource: localData, id: 'id', parentID: 'pid', text:
'name', hasChildren: 'hasChild' },
});
listTreeObj.appendTo('#treeView');
let mask: MaskedTextBox = new MaskedTextBox({
 placeholder: "Enter the tree node to search",
 change: searchNodes
});
mask.appendTo('#mask');

```

```

//Change the dataSource for TreeView
function changeDataSource(data) {
 listTreeObj.fields = {
 dataSource: data, id: 'id', text: 'name',
 parentID: 'pid', hasChildren: 'hasChild'
 }
}

//Filtering the TreeNodes
function searchNodes(args) {
 let _text = mask.element.value;
 let predicats = [], _array = [], _filter = [];
 if (_text == "") {
 changeDataSource(localData);
 }
 else {
 let predicate = new Predicate('name', 'contains', _text, true);
 let filteredList = new DataManager(localData).executeLocal(new
Query().where(predicate));
 for (let j = 0; j < filteredList.length; j++) {
 _filter.push(filteredList[j]["id"]);
 let filters = getFilterItems(filteredList[j], localData);
 for (let i = 0; i < filters.length; i++) {
 if (_array.indexOf(filters[i]) == -1 && filters[i] !=
null) {
 _array.push(filters[i]);
 predicats.push(new Predicate('id', 'equal',
filters[i], false));
 }
 }
 if (predicats.length == 0) {
 changeDataSource([]);
 }
 else {
 let query = new Query().where(new Predicate.or(predicats));
 let newList = new
DataManager(localData).executeLocal(query);
 changeDataSource(newList);
 setTimeout(function () {
 listTreeObj.expandAll();
 }, 400);
 }
 }
 }
}

//Find the Parent Nodes for corresponding childs
function getFilterItems(fList, list) {
 let nodes = [];
 nodes.push(fList["id"]);
 let query2 = new Query().where('id', 'equal', fList["pid"], false);
 let fList1 = new DataManager(list).executeLocal(query2);
 if (fList1.length != 0) {
 let pNode = getFilterItems(fList1[0], list);
 for (let i = 0; i < pNode.length; i++) {
 if (nodes.indexOf(pNode[i]) == -1 && pNode[i] != null)
 nodes.push(pNode[i]);
 }
 return nodes;
 }
}

```

```

 return nodes;
 }

```

### Set tool tip for tree nodes in EJ2 JavaScript Treeview control

TreeView control allows you to set tooltip option to tree nodes using the [tooltip](#) property. The following code example demonstrates how to set tooltip for TreeView nodes.

#### INDEX.TS

```
import { enableRipple } from '@syncfusion/ej2-base';
import { TreeView } from '@syncfusion/ej2-navigations';
enableRipple(true);
/**
 * TreeView tooltip sample
 */
// Hierarchical data source for TreeView component
let hierarchicalData: { [key: string]: Object }[] = [
 { id: '01', name: 'Local Disk (C:)', expanded: true, tooltip: 'This is
parent directory',
 subChild: [
 {
 id: '01-01', name: 'Program Files', tooltip: 'This is child
directory',
 subChild: [
 { id: '01-01-01', name: 'Windows NT' },
 { id: '01-01-02', name: 'Windows Mail' },
 { id: '01-01-03', name: 'Windows Photo Viewer' },
]
 },
 {
 id: '01-02', name: 'Users', expanded: true, tooltip: 'This
is child directory',
 subChild: [
 { id: '01-02-01', name: 'Smith' },
 { id: '01-02-02', name: 'Public' },
 { id: '01-02-03', name: 'Admin' },
]
 },
 {
 id: '01-03', name: 'Windows', tooltip: 'This is child
directory',
 subChild: [
 { id: '01-03-01', name: 'Boot' },
 { id: '01-03-02', name: 'FileManager' },
 { id: '01-03-03', name: 'System32' },
]
 }
]
 },
 {
```

```

 id: '02', name: 'Local Disk (D:)', tooltip: 'This is parent
directory',
 subChild: [
 {
 id: '02-01', name: 'Personals', tooltip: 'This is child
directory',
 subChild: [

### Sorting treeview level wise in EJ2 JavaScript Treeview control

You can sort the TreeView nodes based on their level. When using the `sortOrder` property, the whole TreeView is sorted. When you sort a particular level, you can use the following code sample. The following code sample demonstrates how to sort the parent node alone in TreeView.

#### INDEX.TS

```
import { enableRipple } from '@syncfusion/ej2-base';
import { TreeView } from '@syncfusion/ej2-navigations';
import { DataManager, Query } from '@syncfusion/ej2-data';
enableRipple(true);

/**
 * TreeView Sort treeview level wise
 */
// List data source for TreeView component
let countries: { [key: string]: Object }[] = [
 { id: 1, name: 'India', hasChild: true },
 { id: 2, pid: 1, name: 'Assam' },
 { id: 3, pid: 1, name: 'Bihar' },
 { id: 4, pid: 1, name: 'Tamil Nadu' },
 { id: 6, pid: 1, name: 'Punjab' },
 { id: 7, name: 'Brazil', hasChild: true },
 { id: 8, pid: 7, name: 'Paraná' },
 { id: 9, pid: 7, name: 'Ceará' },
 { id: 10, pid: 7, name: 'Acre' },
 { id: 11, name: 'France', hasChild: true },
 { id: 12, pid: 11, name: 'Pays de la Loire' },
 { id: 13, pid: 11, name: 'Aquitaine' },
 { id: 14, pid: 11, name: 'Brittany' },
 { id: 15, pid: 11, name: 'Lorraine' },
 { id: 16, name: 'Australia', hasChild: true },
 { id: 17, pid: 16, name: 'New South Wales' },
 { id: 18, pid: 16, name: 'Victoria' },
 { id: 19, pid: 16, name: 'South Australia' },
 { id: 20, pid: 16, name: 'Western Australia' },
 { id: 21, name: 'China', hasChild: true },
 { id: 22, pid: 21, name: 'Guangzhou' },
 { id: 23, pid: 21, name: 'Shanghai' },
 { id: 24, pid: 21, name: 'Beijing' },
 { id: 25, pid: 21, name: 'Shantou' }
];

let tree1: TreeView = new TreeView({
 fields: { dataSource: countries, id: 'id', parentID: 'pid', text:
 'name', hasChildren: 'hasChild' },
 created: onCreate,
 nodeExpanding: onNodeExpand
});

tree1.appendTo('#tree');
function changeDataSource(data) {
 tree1.fields = {
 dataSource: data, id: 'id', text: 'name', parentID: 'pid',
 hasChildren: 'hasChild'
 }
}
let newData;
function onCreate() {
```

```

newData = this.fields.dataSource;
// Selects the first level nodes alone
let resultData = new DataManager(this.getTreeData()).executeLocal(new
Query().where(this.fields.parentID, 'equal', undefined, false));
let name = [];
for (let i = 0; i < resultData.length; i++){
 name.push(resultData[i][this.fields.text]);
}
name.sort();
let arr = [];
for (let j = 0; j < name.length; j++) {
 let sortedData = new
DataManager(this.getTreeData()).executeLocal(new
Query().where(this.fields.text, 'equal', name[j], false));
 let childData = new DataManager(newData).executeLocal(new
Query().where(this.fields.parentID, 'equal',
parseInt(sortedData[0][this.fields.id]), false));
 arr.push(sortedData[0]);
}
// Renders treeview with sorted Nodes
changeDataSource(arr);
tree1.dataBind();
}
function onNodeExpand(args: NodeExpandEventArgs){
 if (args.isInteracted && args.node.querySelector('li') === null){
 let childData = new DataManager(newData).executeLocal(new
Query().where(this.fields.parentID, 'equal', parseInt(args.nodeData.id),
false));
 tree1.addNodes(childData, args.node, null)
 }
}
}

```

### Remove parent checkbox in EJ2 JavaScript Treeview control

By enabling the `showCheckBox` property, you can render check box before each node of TreeView. However, some application needs to render check box in child nodes alone. In such case, you can remove the check box of the parent node by customizing the CSS.

#### INDEX.TS

```

import { enableRipple } from '@syncfusion/ej2-base';
import { TreeView } from '@syncfusion/ej2-navigations';
enableRipple(true);
/**
 * Removing checkbox of parent nodes TreeView sample
 */
// List data source for TreeView component
let countries: { [key: string]: Object }[] = [
 { id: 1, name: 'India', hasChild: true, expanded: true },
 { id: 2, pid: 1, name: 'Assam' },
 { id: 3, pid: 1, name: 'Bihar' },
 { id: 4, pid: 1, name: 'Tamil Nadu' },
 { id: 6, pid: 1, name: 'Punjab' },
 { id: 7, name: 'Brazil', hasChild: true },
 { id: 8, pid: 7, name: 'Paraná' },
 { id: 9, pid: 7, name: 'Ceará' },
 { id: 10, pid: 7, name: 'Acre' },
 { id: 11, name: 'France', hasChild: true },
 { id: 12, pid: 11, name: 'Pays de la Loire' },
 { id: 13, pid: 11, name: 'Aquitaine' },
 { id: 14, pid: 11, name: 'Brittany' },
 { id: 15, pid: 11, name: 'Lorraine' },
 { id: 16, name: 'Australia', hasChild: true },
 { id: 17, pid: 16, name: 'New South Wales' },
 { id: 18, pid: 16, name: 'Victoria' },
 { id: 19, pid: 16, name: 'South Australia' },
 { id: 20, pid: 16, name: 'Western Australia' },
 { id: 21, name: 'China', hasChild: true },
 { id: 22, pid: 21, name: 'Guangzhou' },
 { id: 23, pid: 21, name: 'Shanghai' },
 { id: 24, pid: 21, name: 'Beijing' },
 { id: 25, pid: 21, name: 'Shantou' }
];
let tree1: TreeView = new TreeView({

```

```

 fields: { dataSource: countries, id: 'id', text: 'name', parentID:
'pid', hasChildren: 'hasChild' },
 showCheckBox: true,
 cssClass: 'custom'
 });
 tree1.appendTo('#tree');

```

### Get dynamic icon in EJ2 JavaScript Treeview control

In TreeView component, you can get the original bound data using the `getTreeData` method. For this method, if you pass the id of the tree node, it returns the corresponding node information, or otherwise the overall tree nodes information will be returned. You can use this method to get the bound iconCss class in the `nodeChecking` event. Please refer to the following sample.

#### INDEX.TS

```

import { enableRipple } from '@syncfusion/ej2-base';
import { TreeView } from '@syncfusion/ej2-navigations';
enableRipple(true);
/**
 * TreeView dynamic iconCss sample
 */
// List data source for TreeView component
let treeData: { [key: string]: Object }[] = [
 {
 "nodeId": "01", "nodeText": "Music", "icon": "folder", "expanded": true,
 "nodeChild": [
 { "nodeId": "01-01", "nodeText": "Gouttes.mp3", "icon": "audio" }
]
 },
 {
 "nodeId": "02", "nodeText": "Videos", "icon": "folder", "expanded":
true,
 "nodeChild": [
 { "nodeId": "02-01", "nodeText": "Naturals.mp4", "icon": "video" },
 { "nodeId": "02-02", "nodeText": "Wild.mpeg", "icon": "video" }
]
 }
];
let tree1: TreeView = new TreeView({
 fields: { dataSource: treeData, id: 'nodeId', text: 'nodeText', child:
'nodeChild', iconCss: 'icon', expanded: 'expanded' },
 showCheckBox: true,
 nodeChecking: onNodeChecking,

```

```
 autoCheck: false
 });
 tree1.appendTo('#tree');
 function onNodeChecking(args) {
 let nodeId = args.data[0].id;
 // To get the iconCss
 let iconClass = this.getTreeData(nodeId)[0].icon;
 alert('Icon class is ' + iconClass);
 }
```

## INDEX.HTML

### Hover multi line tree node in EJ2 JavaScript Treeview control

This section demonstrates how to hover and select a multi-line tree node. Here, you can set the row height (element class: `e-fullrow`) to be the same as the row content (element class: `e-text-content`)

#### INDEX.TS

```

import { enableRipple } from '@syncfusion/ej2-base';
import { TreeView } from '@syncfusion/ej2-navigations';
enableRipple(true);
/**
 * Hovering multiple line TreeView sample
 */
// List data source for TreeView component

```

### Select one child in EJ2 JavaScript Treeview control

TreeView allows both single and multiple selections. If your application needs to select one child at a time under one specific parent, refer to the following example. Here, you can achieve this in the `nodeSelecting` event of TreeView. However, you can reset the selected child and make another selection by pressing Ctrl + selected nodes.

### INDEX.TS

```

import { TreeView } from '@syncfusion/ej2-navigations';
/**
 * Single child selection at a time
 */
// List data source for TreeView component
let localData: { [key: string]: Object }[] = [
 { id: 1, name: 'Parent 1', hasChild: true, expanded: true },
 { id: 2, pid: 1, name: 'Child 1' },
 { id: 3, pid: 1, name: 'Child 2' },
 { id: 4, pid: 1, name: 'Child 3' },
 { id: 7, name: 'Parent 2', hasChild: true, expanded: true },
 { id: 8, pid: 7, name: 'Child 1' },
 { id: 9, pid: 7, name: 'Child 2' },
 { id: 10, pid: 7, name: 'Child 3' },
];
let tree1: TreeView = new TreeView({
 fields: { dataSource: localData, id: 'id', text: 'name', parentID:
'pid', hasChildren: 'hasChild' },
 loadOnDemand: false,
 allowMultiSelection: true
 nodeSelecting: onNodeSelecting
});
tree1.appendTo('#tree');
let parent, child;
let count: boolean = false;
let childCount: boolean = false;
function onNodeSelecting(args: NodeSelectEventArgs) {
 let id = args.nodeData.parentID;
 if (!count) {
 parent = id;
 count = true;
 }
 if (!childCount) {
 child = args.nodeData.id;
 childCount = true
 }
 if (id !== null && id === parent) {
 let element: HTMLElement = tree1.element.querySelector('[data-uid="' +
id + '"]');
 let liElements = element.querySelectorAll('ul li');
 for (let i: number = 0; i < liElements.length; i++) {
 let nodeData = tree1.getNode(liElements[i]);
 if (nodeData.selected && args.action === "select" && child !==
args.nodeData.id) {
 args.cancel = true;
 }
 // For unselect the selectedNodes
 else if (args.action === "un-select" && child === args.nodeData.id)
{
 childCount = false;
 child = null;
 parent = null;
 count = false;
 }
 }
 }
 else if (id !== parent && id !== null) {
 if(args.action === "select"){

```

```

 args.cancel = true
 }
 } else if (id === null) {
 childCount = false;
 child = null;
 parent = null;
 count = false
 }
}

```

### Get all child nodes in EJ2 JavaScript Treeview control

This section demonstrates how to get the child nodes from corresponding parent ID. Using the `getNode` method, you can get the node details of TreeView. Please refer to the following sample.

## INDEX.TS

```

import { enableRipple } from '@syncfusion/ej2-base';
import { TreeView } from '@syncfusion/ej2-navigations';
enableRipple(true);
/**
 * TreeView get child nodes from parent id sample
 */
// List data source for TreeView component
let data: { [key: string]: Object }[] = [
{
 code: "AF", name: "Africa", countries: [
 { code: "NGA", name: "Nigeria" },
 { code: "EGY", name: "Egypt" },
 { code: "ZAF", name: "South Africa" }
]
},
{
 code: "AS", name: "Asia", countries: [
 { code: "CHN", name: "China" },
 { code: "IND", name: "India", countries: [
 {code: "TN", name: "TamilNadu" }
]},
 { code: "JPN", name: "Japan" }
]
},
{
 code: "EU", name: "Europe", countries: [
 { code: "DNK", name: "Denmark" },
 { code: "FIN", name: "Finland" },
 { code: "AUT", name: "Austria" }
]
},
{
 code: "NA", name: "North America", countries: [
 { code: "USA", name: "United States of America" },
 { code: "CUB", name: "Cuba" },
 { code: "MEX", name: "Mexico" }
]
},
{
 code: "SA", name: "South America", countries: [
 { code: "BR", name: "Brazil" },
 { code: "COL", name: "Colombia" },
 { code: "ARG", name: "Argentina" }
]
},
];
let tree1: TreeView = new TreeView({
 fields: { dataSource: data, id: 'code', text: 'name', child: 'countries'
},
 loadOnDemand: false,
 created: onCreate
});
tree1.appendTo('#tree');
function onCreate() {
 let proxy = this;
 document.getElementById("btn").addEventListener("click", (event)=>{
 let id = document.getElementById('Nodes').value

```

```

 let element= proxy.element.querySelector('[data-uid="' + id +
 '"]');
 // Gets the child Element
 let liElements = element.querySelectorAll('ul li');
 let arr= [];
 for (let i = 0; i < liElements.length; i++) {
 let nodeData= proxy.getNode(liElements[i]);
 arr.push(nodeData);
 }
 alert(JSON.stringify(arr));
 })
}

```

## INDEX.HTML

### Disable checkbox of the tree node in EJ2 JavaScript Treeview control

You can disable the check box alone in TreeView instead of disabling the whole node. You need to include the `e-checkbox-disabled` class into the check box element using the `drawNode` event. Please refer to the following sample to disable the check box of the tree nodes.

#### INDEX.TS

```
import { enableRipple } from '@syncfusion/ej2-base';
import { TreeView } from '@syncfusion/ej2-navigations';
enableRipple(true);
/**
 * Treeview Disable check box of parent nodes sample
 */
// List data source for TreeView component
let countries: { [key: string]: Object }[] = [
 { id: 1, name: 'India', hasChild: true, expanded: true },
 { id: 2, pid: 1, name: 'Assam' },
 { id: 3, pid: 1, name: 'Bihar' },
 { id: 4, pid: 1, name: 'Tamil Nadu' },
 { id: 6, pid: 1, name: 'Punjab' },
 { id: 7, name: 'Brazil', hasChild: true },
 { id: 8, pid: 7, name: 'Paraná' },
 { id: 9, pid: 7, name: 'Ceará' },
 { id: 10, pid: 7, name: 'Acre' },
 { id: 11, name: 'France', hasChild: true },
 { id: 12, pid: 11, name: 'Pays de la Loire' },
 { id: 13, pid: 11, name: 'Aquitaine' },
 { id: 14, pid: 11, name: 'Brittany' },
 { id: 15, pid: 11, name: 'Lorraine' },
 { id: 16, name: 'Australia', hasChild: true },

[Ej1 api migration in EJ2 JavaScript Treeview control](#)

This article describes the API migration process of TreeView component from Essential JS 1 to Essential JS 2.

[Add nodes](#)

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Add node | **Method:** `addNode`  
`$("#tree").ejTreeView({fields: {dataSource: treeData, id: "id", parentId: "pid", text: "name", hasChild: "hasChild"}});`  
`var treeObj = $("#tree").data("ejTreeView");`  
`treeObj.addNode("Node", "#book");` | **Method:** `addNodes`  
`var treeObj = new ej.navigations.TreeView({fields: {dataSource: treeData, id: "id", parentId: "pid", text: "name", hasChildren:`

```
"hasChild"},
});
treeObj.appendTo("#tree");
var object = [{ id: "temp", name: "New node"
}, { id: "new", name: "New node 1" }];
treeObj.addNodes(object, "book"); |
```

| Triggers before adding node | **Event:** *beforeAdd*<br/><br/>\$("#tree").ejTreeView({<br/>fields: {dataSource: treeData, id: "id", parentId: "pid", text: "name", hasChild: "hasChild"},<br/>beforeAdd: function() {}<br/>}); | Not Applicable |

| Adding node after a particular node | **Method:**

```
insertAfter

$("#tree").ejTreeView({
fields: {dataSource: treeData, id: "id", parentId: "pid",
text: "name", hasChild: "hasChild"}
});
var treeObj =
$("#tree").data("ejTreeView");
treeObj.insertAfter("node", "book"); | Can be achieved
using

var treeObj = new ej.navigations.TreeView({
fields: {dataSource: treeData, id: "id",
parentId: "pid", text: "name", hasChildren:
"hasChild"},
});
treeObj.appendTo("#tree");
var object = [{ id: "1", name: "node"
}];
var child = treeObj.element.querySelector('[data-uid="book"]');
var parent =
child.parentElement.closest('.e-list-item');
var level = parseInt(parent.getAttribute('aria-
level'))+1;
var childNodes = Array.from(parent.querySelectorAll('.e-list-item.e-level-
'+level))
var index = childNodes.indexOf(child)
treeObj.addNodes(object, "book", index+1); |
```

| Adding node before a particular node | **Method:**

```
insertBefore

$("#tree").ejTreeView({
fields: {dataSource: treeData, id: "id", parentId:
"pid", text: "name", hasChild: "hasChild"}
});
var treeObj =
$("#tree").data("ejTreeView");
treeObj.insertBefore("node", "book"); | Can be achieved
using

var treeObj = new ej.navigations.TreeView({
fields: {dataSource: treeData, id: "id",
parentId: "pid", text: "name", hasChildren:
"hasChild"},
});
treeObj.appendTo("#tree");
var object = [{ id: "1", name: "node"
}];
var child = treeObj.element.querySelector('[data-uid="book"]');
var parent =
child.parentElement.closest('.e-list-item');
var level = parseInt(parent.getAttribute('aria-
level'))+1;
var childNodes = Array.from(parent.querySelectorAll('.e-list-item.e-level-
'+level))
var index = childNodes.indexOf(child)
treeObj.addNodes(object, "book", index-1); |
```

| Triggers when node is added successfully | **Event:**

```
nodeAdd

$("#tree").ejTreeView({
fields: {dataSource: treeData, id: "id", parentId: "pid",
text: "name", hasChild: "hasChild"},
nodeAdd: function() {}
}); | Event:
dataSourceChanged

var treeObj = new ej.navigations.TreeView({
fields: {dataSource:
treeData, id: "id", parentId: "pid", text: "name", hasChildren: "hasChild"},
dataSourceChanged:
function() {}
});
treeObj.appendTo("#tree"); |
```

## Common

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Keyboard Navigation | **Property:**

```
allowKeyboardNavigation

$("#tree").ejTreeView({
fields: {dataSource: treeData, id: "id",
parentId: "pid", text: "name", hasChild: "hasChild"},
allowKeyboardNavigation: false
}); | Can
be achieved using,

var treeObj = new ej.navigations.TreeView({
fields: {dataSource:
treeData, id: "id", parentId: "pid", text: "name", hasChildren: "hasChild"},
keyPress: function(args)
{
args.cancel = true;
}
});
treeObj.appendTo("#tree"); |
```

| Triggers before node is cut | **Event:** *beforeCut*  
{dataSource: treeData, id: "id", parentId: "pid", text: "name", hasChild: "hasChild"},  
function() {}  
| Not Applicable |

| Triggers before node is deleted | **Event:** *beforeDelete*  
{dataSource: treeData, id: "id", parentId: "pid", text: "name", hasChild: "hasChild"},  
function() {}  
| Not Applicable |

| Triggers before loading nodes | **Event:** *beforeLoad*  
{dataSource: treeData, id: "id", parentId: "pid", text: "name", hasChild: "hasChild"},  
function() {}  
| Not Applicable |

| Triggers before node is pasted | **Event:** *beforePaste*

```

### CheckBox

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Prevent auto-check of child and parent | **Property:**

```
autoCheck

$("#tree").ejTreeView({
fields: {dataSource: treeData, id: "id", parentId: "pid",
text: "name", hasChild: "hasChild"},
showCheckbox: true,
autoCheck: false
}); | Property:
autoCheck

var treeObj = new ej.navigations.TreeView({
fields: {dataSource: treeData, id:
"id", parentId: "pid", text: "name", hasChildren: "hasChild"},
showCheckBox: true,
autoCheck:
false
});
treeObj.appendTo("#tree"); |
```

| Prevent indeterminate state in parent node | **Property:**

```
autoCheckParentNode

$("#tree").ejTreeView({
fields: {dataSource: treeData, id: "id",
parentId: "pid", text: "name", hasChild: "hasChild"},
showCheckbox:
true,
autoCheckParentNode: true
}); | Can be achieved using,

var treeObj = new
ej.navigations.TreeView({
fields: {dataSource: treeData, id: "id", parentId: "pid", text: "name",
hasChildren: "hasChild"},
showCheckBox: true,
autoCheck: false,
nodeChecked:
function(args){
var child = treeObj.element.querySelector('[data-uid="'+ args.data[0]['id'] +
"']);
var checkNodes = [];
var element = child.parentNode;
while ((element !== null ||
element !== undefined) && !element.parentNode.classList.contains('e-treeview')) {
element =
element.parentNode;
var id = element.getAttribute('data-uid');
if (id !== null)
checkNodes.push(element.getAttribute('data-uid'))

if (child.querySelector('.e-list-item') !==
null && args.isInteracted === true && args.action === 'check') {
treeObj.autoCheck =
true;
treeObj.checkAll(child.getAttribute('data-uid'));
} else if (child.querySelector('.e-list-item')
!== null && args.isInteracted === true && args.action === 'uncheck') {
treeObj.autoCheck =
true;
treeObj.uncheckAll(child.getAttribute('data-uid'));

treeObj.autoCheck =
false;
if (args.action === 'check') {
treeObj.checkAll(checkNodes)

else if (args.action
=== 'uncheck' && child.parentNode.querySelector('.e-check') === null)
{
treeObj.uncheckAll(checkNodes)

});
treeObj.appendTo("#tree"); |
```

| Check all nodes | **Method:** *checkAll*<br/><br/>\$("#tree").ejTreeView({<br/>fields: {dataSource:
treeData, id: "id", parentId: "pid", text: "name", hasChild: "hasChild"},<br/>showCheckbox:

treeObj.appendTo("#tree"); |
```

```
| Triggers before nodes are checked/ unchecked | Not Applicable | Event: nodeChecking

var
treeObj = new ej.navigations.TreeView({
fields: {dataSource: treeData, id: "id", parentId: "pid", text:
"name", hasChildren: "hasChild"},

showCheckBox: true,
nodeChecking: function(args)
{
if (args.action == "check") {

}}
treeObj.appendTo("#tree"); |
```

## Drag and Drop

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

```
| Drag and drop | Property: allowDragAndDrop

$("#tree").ejTreeView({
fields:
{dataSource: treeData, id: "id", parentId: "pid", text: "name", hasChild:
"hasChild"},
allowDragAndDrop: true
}); | Property: allowDragAndDrop

var treeObj
= new ej.navigations.TreeView({
fields: {dataSource: treeData, id: "id", parentId: "pid", text:
"name", hasChildren: "hasChild"},
allowDragAndDrop:
true
});
treeObj.appendTo("#tree"); |
```

```
| Prevent Drag and drop to another Treeview | Property:
allowDragAndDropAcrossControl

$("#tree").ejTreeView({
fields: {dataSource: treeData,
id: "id", parentId: "pid", text: "name", hasChild: "hasChild"},
allowDragAndDrop:
true,
allowDragAndDropAcrossControl: false
}); | Can be achieved using,

var
treeObj = new ej.navigations.TreeView({
fields: {dataSource: treeData, id: "id", parentId: "pid", text:
"name", hasChildren: "hasChild"},
allowDragAndDrop: true,
nodeDragStop: function(args)
{
if (args.draggedParentNode.closest('.e-treeview') !== args.dropTarget.closest('.e-treeview'))
{
args.cancel = true;
}}
});
treeObj.appendTo("#tree"); |
```

```
| Prevent sibling drop | Property: allowDropSibling

$("#tree").ejTreeView({
fields:
{dataSource: treeData, id: "id", parentId: "pid", text: "name", hasChild:
"hasChild"},
allowDragAndDrop: true,
allowDropSibling: false
}); | Can be achieved
using,

var treeObj = new ej.navigations.TreeView({
fields: {dataSource: treeData, id: "id",
parentId: "pid", text: "name", hasChildren: "hasChild"},
nodeDragStop: function(args)
{
if(args.dropIndicator === "e-drop-next") {
args.cancel =
true;

}}
treeObj.appendTo("#tree"); |
```

| Prevent child drop | **Property:** `allowDropChild`  
`$("#tree").ejTreeView({fields: {dataSource: treeData, id: "id", parentId: "pid", text: "name", hasChild: "hasChild"}, allowDragAndDrop: true, allowDropChild: false});` | **Can be achieved using,**  
`var treeObj = new ej.navigations.TreeView({fields: {dataSource: treeData, id: "id", parentId: "pid", text: "name", hasChildren: "hasChild"}, nodeDragStop: function(args) {if(args.dropIndicator === "e-drop-in") {args.cancel = true;}}});` `treeObj.appendTo("#tree");` |

| Triggers when node is dragged | **Event:** `nodeDrag`  
`$("#tree").ejTreeView({fields: {dataSource: treeData, id: "id", parentId: "pid", text: "name", hasChild: "hasChild"}, allowDragAndDrop: true, nodeDrag: function() {}});` | **Event:** `nodeDragging`  
`var treeObj = new ej.navigations.TreeView({fields: {dataSource: treeData, id: "id", parentId: "pid", text: "name", hasChildren: "hasChild"}, allowDragAndDrop: true, nodeDragging: function() {}});` `treeObj.appendTo("#tree");` |

| Triggers when node drag is started successfully | **Event:** `nodeDragStart`  
`$("#tree").ejTreeView({fields: {dataSource: treeData, id: "id", parentId: "pid", text: "name", hasChild: "hasChild"}, allowDragAndDrop: true, nodeDragStart: function() {}});` | **Event:** `nodeDragStart`  
`var treeObj = new ej.navigations.TreeView({fields: {dataSource: treeData, id: "id", parentId: "pid", text: "name", hasChildren: "hasChild"}, allowDragAndDrop: true, nodeDragStart: function() {}});` `treeObj.appendTo("#tree");` |

| Triggers before dragged node drag is stopped | **Event:** `nodeDragStop`  
`$("#tree").ejTreeView({fields: {dataSource: treeData, id: "id", parentId: "pid", text: "name", hasChild: "hasChild"}, allowDragAndDrop: true, nodeDragStop: function() {}});` | **Event:** `nodeDragStop`  
`var treeObj = new ej.navigations.TreeView({fields: {dataSource: treeData, id: "id", parentId: "pid", text: "name", hasChildren: "hasChild"}, allowDragAndDrop: true, nodeDragStop: function() {}});` `treeObj.appendTo("#tree");` |

| Triggers when node is dropped successfully | **Event:** `nodeDropped`  
`$("#tree").ejTreeView({fields: {dataSource: treeData, id: "id", parentId: "pid", text: "name", hasChild: "hasChild"}, allowDragAndDrop: true, nodeDropped: function() {}});` | **Event:** `nodeDropped`  
`var treeObj = new ej.navigations.TreeView({fields: {dataSource: treeData, id: "id", parentId: "pid", text: "name", hasChildren: "hasChild"}, allowDragAndDrop: true, nodeDropped: function() {}});` `treeObj.appendTo("#tree");` |

### Expand/Collapse nodes

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Triggers before node is collapsed | **Event:** `beforeCollapse`  
`$("#tree").ejTreeView({fields: {dataSource: treeData, id: "id", parentId: "pid", text: "name", hasChild: "hasChild"}, beforeCollapse: function() {}});` | **Event:** `nodeCollapsing`  
`var treeObj = new ej.navigations.TreeView({fields: {dataSource: treeData, id: "id", parentId: "pid", text: "name", hasChildren: "hasChild"}, nodeCollapsing: function() {}});` `treeObj.appendTo("#tree");` |

| Triggers before node is expanded | **Event:** *beforeExpand*

```

## Template

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Custom template | **Property:** `template`  
`<#tree>$.ejTreeView({fields: {dataSource: treeData, id: "id", parentId: "pid", text: "name", hasChild: "hasChild"},</>template: "#templateData",</>});` | **Property:** `nodeTemplate`  
`<#tree>var treeObj = new ej.navigations.TreeView({fields: {dataSource: treeData, id: "id", parentId: "pid", text: "name", hasChildren: "hasChild"},</>nodeTemplate: "#templateData",</>});</>treeObj.appendTo("#tree");` |

## Uploader

### Async in EJ2 JavaScript Uploader control

The uploader component allows you to upload the files asynchronously. The upload process requires save and remove action URL to manage the upload process in the server.

- The save action is necessary to handle the upload operation
- The remove action is optional, can handle the removed files from server

The name attribute must match the name of a parameter in the POST method. For more information, refer [hear](#). The name attribute is automatically generated from the control's ID property. If the name attribute to be different from the ID property, then you can use the `htmlAttributes` property to set the name attribute directly

to the input element. For more information refer [hear](#).

The File can be uploaded automatically or manually. For more information, you can refer to the [Auto Upload](#) section from the documentation.

### Multiple file upload

By Default, the uploader component allows you to select and upload multiple files simultaneously. The selected files are organized in a list for every file selection until you clear it by clicking clear button that is shown in footer. You can add the multiple attributes to original input element of file by enabling the multiple file selection. The following example explains about [multiple](#) file upload settings.

In the following example, explains about multiple file upload settings.

#### INDEX.TS

```
import { Uploader } from '@syncfusion/ej2-inputs';
// initialize Uploader component
let uploadObject: Uploader = new Uploader({
 asyncSettings: {
 saveUrl: 'https://ej2.syncfusion.com/services/api/uploadbox/Save',
 removeUrl: 'https://ej2.syncfusion.com/services/api/uploadbox/Remove'
 }
});
// render initialized Uploader
uploadObject.appendTo('#fileupload');
```

#### INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
 <title>Essential JS 2 Uploader</title>
 <meta charset="utf-8">
```

```

<meta name="viewport" content="width=device-width, initial-scale=1.0">
<meta name="description" content="Essential JS 2 Uploader Component">

 </div>

<script>
var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

### STYLES.CSS

```

#container {
 visibility: hidden;
 margin: 0 auto;
 width: 400px;
}
#loader {
 color: #008c00;
 font-family: 'Helvetica Neue', 'calibri';
 font-size: 14px;
 height: 40px;
 left: 45%;
 position: absolute;
 top: 45%;
 width: 30%;
}

```

### Single file upload

You can select and upload a single file by disabling the multiple file selection property. The file list item is removed for every selection and it always maintain a single file to upload. You can remove the multiple attributes from the original input element of file by enabling the single file upload property.

The following example explains about single file upload settings.

#### INDEX.TS

```
import { Uploader } from '@syncfusion/ej2-inputs';
// initialize Uploader component
let uploadObject: Uploader = new Uploader({
 asyncSettings: {
 saveUrl: 'https://ej2.syncfusion.com/services/api/uploadbox/Save',
 removeUrl:
'https://ej2.syncfusion.com/services/api/uploadbox/Remove'
 },
 multiple: false
});
// render initialized Uploader
uploadObject.appendTo('#fileupload');
```

#### INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
 <title>Essential JS 2 Uploader</title>

</head>
<body>

 <div id="container">
 <input type="file" id="fileupload" name="UploadFiles">
 </div>

 <script>
var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
```

```

}
 </script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

### STYLES.CSS

```

#container {
 visibility: hidden;
 margin: 0 auto;
 width: 400px;
}
#loader {
 color: #008cff;
 font-family: 'Helvetica Neue', 'calibiri';
 font-size: 14px;
 height: 40px;
 left: 45%;
 position: absolute;
 top: 45%;
 width: 30%;
}

```

### Save Action

The save action handler upload the files that needs to be specified in the [saveUrl](#) property.

The save handler receives the submitted files and manages the save process in server. After uploading the files to server location, the color of the selected file name changes to green and the remove icon is changed as bin icon.

- When the file is uploaded successfully, the event “success” triggers to handle the operation after upload.
- When the file is failed to upload, the event “failure” triggers with information, which cause this failure.

You can cancel the upload process by setting the upload event argument **eventargs.cancel** to true.

### INDEX.TS

```

import { Uploader } from '@syncfusion/ej2-inputs';
// initialize Uploader component
let uploadObject: Uploader = new Uploader({
 asyncSettings: {
 saveUrl: 'https://ej2.syncfusion.com/services/api/uploadbox/Save'
 }
});
// render initialized Uploader
uploadObject.appendTo('#fileupload');

```

if(ele) {
 ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

### STYLES.CSS

```

#container {
 visibility: hidden;
 margin: 0 auto;
 width: 400px;
}
#loader {
 color: #008cff;
 font-family: 'Helvetica Neue', 'calibri';
 font-size: 14px;
 height: 40px;
 left: 45%;
 position: absolute;
 top: 45%;
 width: 30%;
}

```

### *Server-side configuration for save action*

Here's how to handle the server-side action for saving the file in server.

```
`c#
[AcceptVerbs("Post")]
public void Save()
{
 try
 {
 if (HttpContext.Current.Request.Files.AllKeys.Length > 0)
 {
 var httpPostedFile = HttpContext.Current.Request.Files["UploadFiles"];
 if (httpPostedFile != null)
 {
 var fileSave = HttpContext.Current.Server.MapPath("UploadedFiles");
 var fileSavePath = Path.Combine(fileSave, httpPostedFile.FileName);
 if (!File.Exists(fileSavePath))
 {
 httpPostedFile.SaveAs(fileSavePath);
 HttpResponseMessage Response = HttpContext.Current.Response;
 Response.Clear();
 Response.ContentType = "application/json; charset=utf-8";
 Response.StatusDescription = "File uploaded succesfully";
 Response.End();
 }
 }
 else
 {
 HttpResponseMessage Response = HttpContext.Current.Response;
 Response.Clear();
 Response.Status = "400 File already exists";
 Response.StatusCode = 400;
 Response.StatusDescription = "File already exists";
 Response.End();
 }
 }
 }
}
```

```

}
catch (Exception e)
{
 HttpResponseMessage Response = System.Web.HttpContext.Current.Response;
 Response.Clear();
 Response.ContentType = "application/json; charset=utf-8";
 Response.StatusCode = 400;
 Response.Status = "400 No Content";
 Response.StatusDescription = e.Message;
 Response.End();
}
}
`

```

### Remove Action

The remove action is optional. Specify the URL to handle remove process from server. The remove handler receives the posted files and handle the remove operation in server.

- When the files are removed successfully from server, the success event triggers to denote the process has completed.
- When remove action fails, the event “failure” triggers with information, which cause failure in remove process.

You can differentiate the file operation whether the success event triggers from save or remove action in its arguments **eventArgs.operation**.

You can remove the files which is not uploaded locally by clicking the remove icon. In this case, the success or failure events will not be triggered.

### INDEX.TS

```

import { Uploader } from '@syncfusion/ej2-inputs';
// initialize Uploader component
let uploadObject: Uploader = new Uploader({
 asyncSettings: {
 saveUrl: 'https://ej2.syncfusion.com/services/api/uploadbox/Save',
 removeUrl:
'https://ej2.syncfusion.com/services/api/uploadbox/Remove'
 }
});
// render initialized Uploader
uploadObject.appendTo('#fileupload');

```

### INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>

="text/javascript"></script>
</head>
<body>

 <div id="container">
 <input type="file" id="fileupload" name="UploadFiles">
 </div>

<script>
var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

## STYLES.CSS

```

#container {
 visibility: hidden;
 margin: 0 auto;
 width: 400px;
}
#loader {
 color: #008cff;
 font-family: 'Helvetica Neue','calibiri';
 font-size: 14px;
 height: 40px;
 left: 45%;
 position: absolute;
 top: 45%;
 width: 30%;
}

```

*Server-side configuration for remove action*

Here's how to handle the server-side action for removing the file from server.

```
`c#
[AcceptVerbs("Post")]
public void Remove()
{
 try
 {
 var fileSave = "";
 if (HttpContext.Current.Request.Form["cancel-uploading"] != null)
 {
 fileSave = HttpContext.Current.Server.MapPath("UploadingFiles");
 }
 else
 {
 fileSave = HttpContext.Current.Server.MapPath("UploadedFiles");
 }
 var fileName = HttpContext.Current.Request.Files["UploadFiles"].FileName;
 var fileSavePath = Path.Combine(fileSave, fileName);
 if (File.Exists(fileSavePath))
 {
 File.Delete(fileSavePath);
 }
 }
 catch (Exception e)
 {
 HttpResponseMessage Response = HttpContext.Current.Response;
 Response.Clear();
 Response.Status = "404 File not found";
 Response.StatusCode = 404;
 Response.StatusDescription = "File not found";
 Response.End();
 }
}
```

```

}
,

```

### Auto Upload

By default, the uploader processes the files to upload once the files are selected and added in upload queue. To upload manually, disable the [autoUpload](#) property. When you disable this property, you can use the action buttons to call upload all or clear all actions manually. You can change those buttons text using the [buttons](#) property in the Uploader component.

### INDEX.TS

```

import { Uploader } from '@syncfusion/ej2-inputs';
// initialize Uploader component
let uploadObject: Uploader = new Uploader({
 // disable the auto upload functionalities
 autoUpload: false
});
// render initialized Uploader
uploadObject.appendTo('#fileupload');
```

<script src="index.js" type="text/javascript"></script>
</body></html>

```

### STYLES.CSS

```

#container {
 visibility: hidden;
 margin: 0 auto;
 width: 400px;
}
#loader {
 color: #008cff;
 font-family: 'Helvetica Neue', 'calibiri';
 font-size: 14px;
 height: 40px;
 left: 45%;
 position: absolute;
 top: 45%;
 width: 30%;
}

```

### Sequential Upload

By default, the uploader control process multiple files to upload simultaneously. When you enable the [sequentialUpload](#) property, the selected files will process sequentially (one after the other) to the server. If the file uploaded successfully or failed, the next file will upload automatically in this sequential upload. This feature helps to reduce the upload traffic and reduce the failure of file upload.

### INDEX.TS

```

import { Uploader } from '@syncfusion/ej2-inputs';
// initialize Uploader component
let uploadObject: Uploader = new Uploader({
 asyncSettings: {
 saveUrl: 'https://ej2.syncfusion.com/services/api/uploadbox/Save',
 removeUrl:
'https://ej2.syncfusion.com/services/api/uploadbox/Remove'
 },
 // enable the sequential upload functionality
 sequentialUpload: true
});
// render initialized Uploader
uploadObject.appendTo('#fileupload');

```

 left: 45%;
 position: absolute;
 top: 45%;
 width: 30%;
}

```

### Preload Files

The uploader component allows you to preload the list of files that are uploaded in the server. The preloaded files are useful to view and remove the files from server that can be achieved by the [files](#) property. By default, the files are configured with uploaded successfully state on rendering file list. By default, the files are configured with uploaded successfully state on rendering file list. The following properties are mandatory to configure the preloaded files:

- Name
- Size
- Type

## INDEX.TS

```
import { Uploader, FilesPropModel } from '@syncfusion/ej2-inputs';
let preLoadFiles: FilesPropModel[] = [
 {name: 'Books', size: 500, type: '.png'},
 {name: 'Movies', size: 12000, type: '.pdf'},
 {name: 'Study materials', size: 500000, type: '.docx'},
];
// initialize Uploader component
let uploadObject: Uploader = new Uploader({
 asyncSettings: {
 saveUrl: 'https://ej2.syncfusion.com/services/api/uploadbox/Save',
 removeUrl:
'https://ej2.syncfusion.com/services/api/uploadbox/Remove'
 },
 files: preLoadFiles
});
// render initialized Uploader
uploadObject.appendTo('#fileupload');

}

```

### Adding additional HTTP headers with upload action

The Uploader component allows you to add the additional headers with **save** and **remove** action request using **uploading** and **removing** event, which helps to send validation token on file upload. Access the current request and set the request header within these events.

The following code block shows how to add the additional headers with save and remove action request.

```

<div style='margin: auto 30%'>
<input type='file' id='uploader' name="UploadFiles"/>
</div>
`ts
import { Uploader } from '@syncfusion/ej2-inputs';
let uploadObj: Uploader = new Uploader({
 asyncSettings: {
 saveUrl: 'https://ej2.syncfusion.com/services/api/uploadbox/Save',
 removeUrl: 'https://ej2.syncfusion.com/services/api/uploadbox/Remove'
 },
 uploading: addHeaders,

```

removing: addHeaders

});

uploadObj.appendTo('#uploader')

function addHeaders(args: any) {

args.currentRequest.setRequestHeader('custom-header', 'Syncfusion');

}

,

You can also explore [JavaScript File Upload](#) feature tour page for its groundbreaking features. You can also explore our [JavaScript File Upload example](#) to understand how to browse the files which you want to upload to the server.

## Chunk upload in EJ2 JavaScript Uploader control

The Uploader sends the large file split into small chunks and transmits to the server using AJAX. You can also pause, resume, and retry the failed chunk file.

\* The chunk upload works in asynchronous upload only.

- This feature is available from the Essential Studio Vol 2, 2018 release.

To enable the chunk upload, set the size to [chunkSize](#) option of the upload and it receives the value in **bytes**.

### INDEX.TS

```
import { Uploader } from '@syncfusion/ej2-inputs';
// initialize Uploader component
let uploadObject: Uploader = new Uploader({
 asyncSettings: {
 saveUrl: 'https://ej2.syncfusion.com/services/api/uploadbox/Save',
 removeUrl:
'https://ej2.syncfusion.com/services/api/uploadbox/Remove',
 // split the files into chunks of the size 102400 bytes
 chunkSize: 102400
 }
});
// render initialized Uploader
uploadObject.appendTo('#fileupload');
```

### INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
```

```
<title>Essential JS 2 Uploader</title>
<meta charset="utf-8">
<meta name="viewport" content="width=device-width, initial-scale=1.0">

</head>
<body>

 <div id="container" class="fileupload">
 <input type="file" id="fileupload" name="UploadFiles">
 </div>

<script>
var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

## **STYLES.CSS**

```
#container {
 visibility: hidden;
 margin: 0 auto;
 width: 400px;
}
#loader {
 color: #008cff;
 font-family: 'Helvetica Neue','calibiri';
 font-size: 14px;
 height: 40px;
 left: 45%;
 position: absolute;
 top: 45%;
 width: 30%;
}
```

The chunk upload functionality separates the selected files into blobs of the data or chunks. These chunks are transmitted to the server using an AJAX request. The chunks are sent in **sequential** order, and the next chunk can be sent to the server according to the [success](#) of the previous chunk. If any one of the chunk failed, then the remaining chunk cannot be sent to the server.

The [chunkSuccess](#) or [chunkFailure](#) event will be triggered when the chunk is sent to the server successfully or failed. If all the chunks are sent to the server successfully, the uploader [success](#) event is triggered.

Chunk upload will work when the selected file size is greater than the specified chunk size. otherwise, it upload the files normally.

### Additional configurations

To modify the chunk upload, the following options can be used.

- **RetryAfterDelay** - If error occurs while sending any chunk request from JavaScript, hold the operation for 500 milliseconds (by default), and retry the operation using chunk. This can be achieved by using the [asyncSettings.retryAfterDelay](#) property.

You can modify the holding time interval in milliseconds.

- **RetryCount** - Specifies the number of retry actions performed when the file fails to upload. By default, [retry](#) action is performed 3 times.

If the file fails to upload continuously, the request is aborted and the uploader [failure](#) event will trigger.

The following sample specifies the chunk upload delay with 3000 milliseconds and the retry count is 5. The failure event is triggered as the wrong saveUrl is used.

### INDEX.TS

```
import { Uploader } from '@syncfusion/ej2-inputs';
// initialize Uploader component
let uploadObject: Uploader = new Uploader({
 asyncSettings: {
 // provided the wrong url to showcase the chunk upload failure
 // related properties.
 saveUrl:
 'https://aspnetmvc.syncfusion.com/service/api/uploadbox/Save',
 removeUrl:
 'https://aspnetmvc.syncfusion.com/service/api/uploadbox/Remove',
 // set chunk size for enable the chunk upload
 chunkSize: 102400,
 // set count for automatic retry when chunk upload failed
 retryCount: 5,
 // set time delay for automatic retry when chunk upload failed
 retryAfterDelay: 3000
 }
});
// render initialized Uploader
uploadObject.appendTo('#fileupload');
```

 font-size: 14px;
 height: 40px;
 left: 45%;
 position: absolute;
 top: 45%;
 width: 30%;
}
```

### Resumable upload

Allows you to resume an upload operation after a network failure or manually interrupts (pause) the upload. You can perform pause and resume upload actions using public methods ([pause](#) and [resume](#)) and UI interaction. The pause icon is enabled after the upload begins.

This pause and resume features available only when the chunk upload is enabled.

### INDEX.TS

```
import { Uploader } from '@syncfusion/ej2-inputs';
// initialize Uploader component
let uploadObject: Uploader = new Uploader ({
 asyncSettings: {
 saveUrl: 'https://ej2.syncfusion.com/services/api/uploadbox/Save',
 removeUrl:
'https://ej2.syncfusion.com/services/api/uploadbox/Remove',
 // set chunk size for enable the chunk upload
 chunkSize: 102400
 }
});
// render initialized Uploader
uploadObject.appendTo('#fileupload');
```

<script src="index.js" type="text/javascript"></script>
</body></html>

```

### STYLES.CSS

```

#container {
 visibility: hidden;
 margin: 0 auto;
 width: 400px;
}
#loader {
 color: #008cff;
 font-family: 'Helvetica Neue', 'calibiri';
 font-size: 14px;
 height: 40px;
 left: 45%;
 position: absolute;
 top: 45%;
 width: 30%;
}

```

### Cancel upload

The uploader component allows you to cancel the uploading file. This can be achieved by clicking the cancel icon or using the [cancel](#) method. The [canceling](#) event will be fired whenever the file upload request is canceled. While canceling the upload request, the partially uploaded file is removed from the server.

When the request fails, the pause icon is changed to retry icon. By clicking the retry icon, sends the failed chunk request again to the server and upload started from where it is failed. You can retry the canceled upload request again using retry UI or [retry](#) methods. But, if you retry this, the file upload action again starts from initial.

The following example explains about chunk upload with cancel support.

### INDEX.TS

```

import { Uploader } from '@syncfusion/ej2-inputs';
// initialize Uploader component
let uploadObject: Uploader = new Uploader({
 asyncSettings: {
 saveUrl: 'https://ej2.syncfusion.com/services/api/uploadbox/Save',
 removeUrl:
 'https://ej2.syncfusion.com/services/api/uploadbox/Remove',
 // set chunk size for enable the chunk upload
 chunkSize: 102400
 }
});
// render initialized Uploader
uploadObject.appendTo('#fileupload');

```

### INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
 <title>Essential JS 2 Uploader</title>
 <meta charset="utf-8">
 <meta name="viewport" content="width=device-width, initial-scale=1.0">
 <meta name="description" content="Essential JS 2 Uploader Component">
 <meta name="author" content="Syncfusion">

type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

 <div id="container" class="fileupload">
 <input type="file" id="fileupload" name="UploadFiles">
 </div>

<script>
var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

## STYLES.CSS

```
#container {
 visibility: hidden;
 margin: 0 auto;
 width: 400px;
}
#loader {
 color: #008cff;
 font-family: 'Helvetica Neue','calibiri';
 font-size: 14px;
 height: 40px;
 left: 45%;
 position: absolute;
 top: 45%;
 width: 30%;
}
```

The retry action has different working behavior for chunk upload and default upload.

- Chunk upload - Retries to upload the failed request where it is failed previously.
- Default upload - Retries to upload the failed file again from initial.

#### Server-Side configurations

The server-side implementation entirely depends on the application requirements and logic. The following code snippet provides the server-side logic to handle the chunk upload using the uploader components.

```
`c#
// Server configuration for upload a file.
public void Save()
{
 try
 {
 if (HttpContext.Current.Request.Files.AllKeys.Length > 0)
 {
 var httpPostedChunkFile = HttpContext.Current.Request.Files["chunkFile"];
 if (httpPostedChunkFile != null)
 {
 var saveFile = HttpContext.Current.Server.MapPath("UploadingFiles");
 // Save the chunk file in temporary location with .part extension
 var SaveFilePath = Path.Combine(saveFile, httpPostedChunkFile.FileName + ".part");
 var chunkIndex = HttpContext.Current.Request.Form["chunkIndex"];
 if (chunkIndex == "0")
 {
 httpPostedChunkFile.SaveAs(SaveFilePath);
 }
 else
 {
 // Merge the current chunk file with previous uploaded chunk files
 MergeChunkFile(SaveFilePath, httpPostedChunkFile.InputStream);
 var totalChunk = HttpContext.Current.Request.Form["totalChunk"];
 if (Convert.ToInt32(chunkIndex) == (Convert.ToInt32(totalChunk) - 1))
 {
```

```
var savedFile = HttpContext.Current.Server.MapPath("UploadedFiles");
var originalFilePath = Path.Combine(savedFile, httpPostedChunkFile.FileName);
// After all the chunk files completely uploaded, remove the .part extension and move this file into save
location
System.IO.File.Move(SaveFilePath, originalFilePath);
}
}
HttpResponse ChunkResponse = HttpContext.Current.Response;
ChunkResponse.Clear();
ChunkResponse.ContentType = "application/json; charset=utf-8";
ChunkResponse.StatusDescription = "File uploaded succesfully";
ChunkResponse.End();
}
var httpPostedFile = HttpContext.Current.Request.Files["UploadFiles"];
if (httpPostedFile != null)
{
var fileSave = HttpContext.Current.Server.MapPath("UploadedFiles");
var fileSavePath = Path.Combine(fileSave, httpPostedFile.FileName);
if (!File.Exists(fileSavePath))
{
httpPostedFile.SaveAs(fileSavePath);
HttpResponse Response = HttpContext.Current.Response;
Response.Clear();
Response.ContentType = "application/json; charset=utf-8";
Response.StatusDescription = "File uploaded succesfully";
Response.End();
}
else
{
HttpResponse Response = HttpContext.Current.Response;
Response.Clear();
Response.Status = "400 File already exists";
Response.StatusCode = 400;
```

```
Response.StatusDescription = "File already exists";
Response.End();
}
}
}
}
catch (Exception e)
{
 HttpResponseMessage Response = HttpContext.Current.Response;
 Response.Clear();
 Response.ContentType = "application/json; charset=utf-8";
 Response.StatusCode = 400;
 Response.Status = "400 No Content";
 Response.StatusDescription = e.Message;
 Response.End();
}
}
// Server configuration for remove a uploaded file
public void Remove()
{
 try
 {
 var fileSave = "";
 if (HttpContext.Current.Request.Form["cancelUploading"] != null)
 {
 fileSave = HttpContext.Current.Server.MapPath("UploadingFiles");
 } else
 {
 fileSave = HttpContext.Current.Server.MapPath("UploadedFiles");
 }
 var fileName = HttpContext.Current.Request.Files["UploadFiles"].FileName;
 var fileSavePath = Path.Combine(fileSave, fileName);
 if (File.Exists(fileSavePath))
```

```
{
File.Delete(fileSavePath);
}
}
catch (Exception e)
{
HttpResponse Response = HttpContext.Current.Response;
Response.Clear();
Response.Status = "404 File not found";
Response.StatusCode = 404;
Response.StatusDescription = "File not found";
Response.End();
}
}
// Merge the current chunk file with previous uploaded chunk files
public void MergeChunkFile(string fullPath, Stream chunkContent)
{
try
{
using (FileStream stream = new FileStream(fullPath, FileMode.Append, FileAccess.Write,
FileShare.ReadWrite))
{
using (chunkContent)
{
chunkContent.CopyTo(stream);
}
}
}
catch (IOException ex)
{
throw ex;
}
}
```

## File source in EJ2 JavaScript Uploader control

### Paste to upload

The uploader component allows you to upload the files using the select or drop files option from the file explorer. It also supports pasting to upload the image files. You can upload any currently copied images in the clipboard.

When you paste the image, it will be saved in the server with the filename as `image.png`. The file name can be renamed in the server end. You can generate a random name for the file name using `getUniqueID` method. Refer to the following example.

### INDEX.TS

```
import { Uploader, UploadingEventArgs } from '@syncfusion/ej2-inputs';
import { getUniqueID } from '@syncfusion/ej2-base';
// initialize Uploader component
let uploadObject: Uploader = new Uploader({
 autoUpload: false,
 uploading: onUploadBegin
});
// render initialized Uploader
uploadObject.appendTo('#fileupload');
function onUploadBegin(args: UploadingEventArgs): void {
 // check whether the file is uploading from paste.
 if (args.fileData.fileSource === 'paste') {
 let newName: string = getUniqueID(args.fileData.name.substring(0,
args.fileData.name.lastIndexOf('.'))) + '.png';
 args.customFormData = [{ 'fileName': newName }];
 }
}
```

```

### STYLES.CSS

```
#container {
 visibility: hidden;
 margin: 0 auto;
 width: 400px;
}
#loader {
 color: #008cff;
 font-family: 'Helvetica Neue', 'calibri';
 font-size: 14px;
 height: 40px;
 left: 45%;
 position: absolute;
 top: 45%;
 width: 30%;
}
```

*Save action for paste to upload*

`c#

```
public void Save() {
var httpPostedFile = HttpContext.Current.Request.Files["UploadFiles"];
var fileSave = HttpContext.Current.Server.MapPath("UploadedFiles");
var fileSavePath = Path.Combine(fileSave, httpPostedFile.FileName);
if (!System.IO.File.Exists(fileSavePath))
{
httpPostedFile.SaveAs(fileSavePath);
// Get the current file name
var oldName = httpPostedFile.FileName;
```

```
// Get the additional data as name in server end by corresponding key.
var newName = HttpContext.Current.Request.Form["fileName"];
// Rename the file
File.Move(oldName, newName);
HttpResponse Response = System.Web.HttpContext.Current.Response;
Response.Clear();
Response.ContentType = "application/json; charset=utf-8";
// Sending the file path to client side
Response.StatusDescription = fileSavePath;
Response.End();
}
}
,
```

### Directory upload

The uploader component allows you to upload all files in the folders to server by using the [directoryUpload](#) property. When this property is enabled, the uploader component processes the files by iterating through the files and sub-directories in a directory. It allows you to select only folders instead of files to upload.

The directory upload is available only in browsers that supports **HTML5 directory**. The uploader will process directory upload by dragging and dropping in the Edge browser. Refer to the following example to upload files to the server.

### INDEX.TS

```
import { Uploader } from '@syncfusion/ej2-inputs';
// initialize Uploader component
let uploadObject: Uploader = new Uploader({
 asyncSettings: {
 saveUrl: 'https://ej2.syncfusion.com/services/api/uploadbox/Save',
 removeUrl:
'https://ej2.syncfusion.com/services/api/uploadbox/Remove'
 },
 directoryUpload: true
});
// render initialized Uploader
uploadObject.appendTo('#fileupload');
```

*Save action for directory upload*

```
`c#
```

```

public void Save() {
var httpPostedFile = HttpContext.Current.Request.Files["UploadFiles"];

```

```
var fileSave = HttpContext.Current.Server.MapPath("UploadedFiles");
// split the folders by using file name
string[] folders = httpPostedFile.FileName.Split('/');
string fileSavePath = "";
if (folders.Length > 1)
{
 for (var i = 0; i < folders.Length - 1; i++)
 {
 var newFolder = Path.Combine(fileSave, folders[i]);
 // create folder
 Directory.CreateDirectory(newFolder);
 fileSave = newFolder;
 }
 fileSavePath = Path.Combine(fileSave, folders[folders.Length - 1]);
}
else
{
 fileSavePath = Path.Combine(fileSave, httpPostedFile.FileName);
}
if (!System.IO.File.Exists(fileSavePath))
{
 // save file in the corresponding server location
 httpPostedFile.SaveAs(fileSavePath);
 HttpResponse Response = System.Web.HttpContext.Current.Response;
 Response.Clear();
 Response.ContentType = "application/json; charset=utf-8";
 // Sending the file path to client side
 Response.StatusDescription = fileSavePath;
 Response.End();
}
}
```

## Drag and drop

The uploader component allows you to drag and drop the files to upload. You can drag the files from file explorer and drop into the drop area. By default, the uploader component act as drop area element. The drop area gets highlighted when you drag the files over drop area.

## Custom drop area

The uploader component allows you to set external target element as drop area using the [dropArea](#) property. The element can be represented as HTML element or element's id.

## INDEX.TS

```
import { Uploader } from '@syncfusion/ej2-inputs';
// initialize Uploader component
let uploadObject: Uploader = new Uploader({
 autoUpload: false,
 dropArea: document.getElementById('droparea')
});
// render initialized Uploader
uploadObject.appendTo('#fileupload');
```

### Validation in EJ2 JavaScript Uploader control

The uploader component validate the selected files size and extension using the [allowedExtensions](#), [minFileSize](#) and [maxFileSize](#) properties. The files can be validated before uploading to the server and can be ignored on uploading. Also, you can validate the files by setting the HTML attributes to the original input element. The validation process occurs on drag-and-drop the files also.

## File type

You can allow the specific files alone to upload using the [allowedExtensions](#) property. The extension can be represented as collection by comma separators. The uploader component filters the selected or dropped files to match against the specified file types and processes the upload operation. The validation happens when you specify value to inline attribute to accept the original input element.

### INDEX.TS

```
import { Uploader } from '@syncfusion/ej2-inputs';
// initialize Uploader component
let uploadObj: Uploader = new Uploader({
 asyncSettings: {
 saveUrl:
 'https://ej2.syncfusion.com/services/api/uploadbox/Save',
 removeUrl:
 'https://ej2.syncfusion.com/services/api/uploadbox/Remove'
 },
 allowedExtensions: '.jpg,.png'
});
uploadObj.appendTo('#fileupload');
```

### INDEX.HTML

```

 font-size: 14px;
 height: 40px;
 left: 45%;
 position: absolute;
 top: 45%;
 width: 30%;
}

```

### File size

The uploader component allows you to validate the files based on its size. The validation helps to restrict uploading large files or empty files to the server. The size can be represented in **bytes**. By default, the uploader component allows you to upload **minimum file size** as 0 byte and **maximum file size** as 28.4 MB using the [minFileSize](#) and [maxFileSize](#) properties.

### INDEX.TS

```

import { Uploader } from '@syncfusion/ej2-inputs';
// Initialize the uploader component
let uploadObj: Uploader = new Uploader({
 asyncSettings: {
 saveUrl:
'https://ej2.syncfusion.com/services/api/uploadbox/Save',
 removeUrl:
'https://ej2.syncfusion.com/services/api/uploadbox/Remove'
 },
 minFileSize: 10000,
 maxFileSize: 1500000
});
uploadObj.appendTo('#fileupload');

```

## Form support in EJ2 JavaScript Uploader control

The Uploader component works with HTML form like default file input. The following configuration is must to make the Uploader work inside the form.

- `saveUrl` and `removeUrl` must be null.
- `autoUpload` must be disabled.
- `name` attribute must be added in input element.

The selected or dropped files are received as a collection in form action when the form is submitted. The form action handles the server-side operations that manage the file upload process. When you reset the form, the file list and data will be cleared.

You can also explore [JavaScript File Upload](#) feature tour page for its groundbreaking features. You can also explore our [JavaScript File Upload example](#) to understand how to browse the files which you want to upload to the server.

## Template in EJ2 JavaScript Uploader control

You can customize the default appearance of uploader using a template along with buttons.

### File list template

The [template](#) property is used to customize the default appearance of each file in the list. It can be represented as the HTML element or string. The selected or dropped files are displayed as per the template layout provided. The remove and progress bar action is handled using the corresponding events when the template is defined.

For example, you can display file type icon along with default UI elements.

### INDEX.TS

## Custom template

You can design the own template by preventing the default file list including buttons. The [showFileList](#) property used to display whether the default file list or own file list When you use custom template to upload or remove the files, pass the custom UI argument as true to call `upload/remove` public method as follows:

- `UploaderObj.upload(filesData, true);`
- `UploaderObj.remove(filesData, true);`

Refer to the following code sample.

## INDEX.TS

## Localization in EJ2 JavaScript Uploader control

The Localization library allows you to localize static text content of the uploader. The static text contains default text content of action buttons, file status, clear icon title, tooltips, and text content of drag area. Define the [locale](#) object for a culture and assign it to L10n load method.

The following are the list of keys and its values used in the uploader component:

Key	Description
-----	-----
Browse	To customize the browse button text.
Clear	To customize the clear button text.
Upload	To customize the upload button text.
dropFilesHint	To customize the drop area text.
uploadFailedMessage	To customize the status text when the file is failed to upload.
uploadSuccessMessage	To customize the status text when the file is uploaded successfully.
removedSuccessMessage	To customize the status text when the file is removed the successfully from the serve.

- | removedFailedMessage | To customize the status text while the file is failed to remove. |
- | inProgress | To customize the status text while the upload is in progress. |
- | pauseUpload | To customize the status text while the uploading is paused. |
- | fileUploadCancel | To customize the status text when uploading is canceled. |
- | readyToUploadMessage | To customize the status text when the file is selected and ready to upload. |
- | invalidMaxFileSize | To customize the status text when the file size is greater than the maximum file size. |
- | invalidFileType | To customize the status text when the file type is invalid. |
- | invalidMinFileSize | To customize the status text when the file size is less than the minimum file size. |
- | remove | To customize tooltip text for remove icon. |
- | cancel | To customize tooltip text for cancel icon. |
- | delete | To customize tooltip text for delete icon. |
- | totalFiles | To customize tooltip text for total files. |
- | size | To customize tooltip text for size. |

### Wai aria accessibility in EJ2 JavaScript Uploader control

The Uploader component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Uploader component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2 Support](#) |  |

| [Section 508 Support](#) |  |

| [Screen Reader Support](#) |  |

| [Right-To-Left Support](#) |  |

| [Color Contrast](#) |  |

| [Mobile Device Support](#) |  |

| [Keyboard Navigation Support](#) |  |

| [Accessibility Checker Validation](#) |  |

| [Axe-core Accessibility Validation](#) |  |

<style>

```
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
</style>

<div> - All
features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The
component does not meet the requirement.</div>
```

### Keyboard interaction

The uploader component characterized with complete ARIA accessibility support that helps to be accessible by on-screen readers and other assistive technology devices.

The following are the standard keys that works on uploader component:

| **Keyboard shortcuts** | **Actions** |

| --- | --- |

| **Tab** | Move focus to next element. |

| **Shift + Tab** | Move focus to previous element. |

| **Enter** | Triggers corresponding action to button element. |

| **Esc** | Close the file browser dialog alone and cancels the upload on drop the file. |

### INDEX.TS

```
import { Uploader } from '@syncfusion/ej2-inputs';
// initialize Uploader component
let uploadObject: Uploader = new Uploader({
 asyncSettings: {
 saveUrl: 'https://ej2.syncfusion.com/services/api/uploadbox/Save',
 removeUrl:
'https://ej2.syncfusion.com/services/api/uploadbox/Remove'
 }
});
// render initialized Uploader
uploadObject.appendTo('#fileupload');
```

### Style appearance in EJ2 JavaScript Uploader control

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

#### Customizing the appearance of File Upload wrapper element

Use the following CSS to customize the appearance of wrapper element.

```
,
/ To specify height /
.e-upload.e-control-wrapper, .e-bigger.e-small .e-upload.e-control-wrapper {
height: 300px;
width: 300px;
}
,
```

#### Customizing the File Upload browse button

Use the following CSS to customize the File Upload browse button

```
,
/ To specify font size and color /
.e-upload .e-file-select-wrap .e-btn, .e-upload .e-upload-actions .e-btn, .e-bigger.e-small .e-upload .e-
file-select-wrap .e-btn, .e-bigger.e-small .e-upload .e-upload-actions .e-btn {
font-family: cursive;
height: 40px;
background-color: aquamarine;
color: coral;
}
,
```

#### Customizing the File Upload content

Use the following CSS to customize the File Upload content

```
,
```

*/ To specify font size and color /*

```
.e-upload .e-file-select-wrap .e-file-drop, .e-bigger.e-small .e-upload .e-file-select-wrap .e-file-drop {
font-size: 20px;
color: aqua;
}
,
```

### Customizing the uploaded file container in File Upload

Use the following CSS to customize the uploaded file container in File Upload

```
,
/ To specify background color /
.e-upload .e-upload-files .e-upload-file-list {
background-color: beige;
}
,
```

### How To

#### Hide default drop area in EJ2 JavaScript Uploader control

You can achieve this behavior by overriding the corresponding uploader styles. Override the following styles to hide the default drop area behavior.

- .e-upload.e-control
- .e-upload .e-file-select
- .e-upload .e-file-drop

### INDEX.TS

```
import { Uploader } from '@syncfusion/ej2-inputs';
// initialize uploader component
let uploadObject: Uploader = new Uploader({
 asyncSettings: {
 saveUrl: 'https://ej2.syncfusion.com/services/api/uploadbox/Save',
 removeUrl:
'https://ej2.syncfusion.com/services/api/uploadbox/Remove'
 }
});
// render initialized Uploader
uploadObject.appendTo('#fileupload');
```

### Preview images before uploading in EJ2 JavaScript Uploader control

The uploader component allows to create preview images before uploading. The preview images can be created by reading the file using selected event. Also, the user can create preview images after uploading to server using success event. Refer to the following link to learn about how to create image preview.

### [Image Preview](#)

You can also explore [JavaScript File Upload](#) feature tour page for its groundbreaking features. You can also explore our [JavaScript File Upload example](#) to understand how to browse the files which you want to upload to the server.

### Add html attributes in EJ2 JavaScript Uploader control

You can add the additional HTML attributes such as disabled, value, name, and more to the element using the [htmlAttributes](#) property. If you configured both the property and equivalent HTML attribute, then the component considers the property value.

The following example demonstrates how to set attributes in htmlAttributes property in the Uploader.

### INDEX.TS

```
import { Uploader } from '@syncfusion/ej2-inputs';
//Initialize the control by preload files
let uploadObj: Uploader = new Uploader({
 autoUpload: false,
 asyncSettings: {
 saveUrl: 'https://ej2.syncfusion.com/services/api/uploadbox/Save',
 removeUrl:
 'https://ej2.syncfusion.com/services/api/uploadbox/Remove'
 },
 htmlAttributes: { "disabled": "true" }
});
uploadObj.appendTo('#fileupload');
```

 display: none;
}
```

You can also explore [JavaScript File Upload](#) feature tour page for its groundbreaking features. You can also explore our [JavaScript File Upload example](#) to understand how to browse the files which you want to upload to the server.

### Achieve invisible upload in EJ2 JavaScript Uploader control

You can achieve the invisible upload feature by using the selected event in uploader component. Refer to the following example.

#### INDEX.TS

```
import { Uploader, SelectedEventArgs } from '@syncfusion/ej2-inputs';
import { createElement } from '@syncfusion/ej2-base';
let uploadObj: Uploader = new Uploader({
 asyncSettings: {
 saveUrl: 'https://ej2.syncfusion.com/services/api/uploadbox/Save',
 removeUrl:
'https://ej2.syncfusion.com/services/api/uploadbox/Remove'
 },
 selected : onupload,
 locale: 'en-US',
 allowedExtensions: '.png, .jpg, .jpeg'
});
uploadObj.appendTo('#fileupload')
function onupload(args: SelectedEventArgs){
 for(let i = 0; i< args.filesData.length ; i++){
 let liparentDiv = createElement('div', { className: 'image-list'});
 let liImage = createElement('img', { className: 'image'});
 liparentDiv.appendChild(liImage);
 readURL(liImage, args.filesData[i]);
 document.getElementById('preview').appendChild(liparentDiv);
 }
 args.cancel=true;
}
function readURL(liImage: HTMLElement, file: any) {
 let imgPreview: HTMLImageElement = liImage as HTMLImageElement;
 let imageFile: File = file.rawFile;
 let reader: FileReader = new FileReader();
 reader.addEventListener('load', () => {
 imgPreview.src = reader.result;
 }, false);
 if (imageFile) {
 reader.readAsDataURL(imageFile);
 }
}
};
```

#### INDEX.HTML

### Customize progressbar in EJ2 JavaScript Uploader control

You can customize the progress bar's size, color, and background by overriding the styles in uploader component. Refer to the following example.

#### INDEX.TS

```
import { Uploader } from '@syncfusion/ej2-inputs';
// initialize uploader component
let uploadObject: Uploader = new Uploader({
 asyncSettings: {
 saveUrl: 'https://ej2.syncfusion.com/services/api/uploadbox/Save',
 removeUrl:
 'https://ej2.syncfusion.com/services/api/uploadbox/Remove'
 }
});
// render initialized Uploader
uploadObject.appendTo('#fileupload');
```

#### INDEX.HTML

```

### Sort the selected files in EJ2 JavaScript Uploader control

You can sort the selected files in uploader component by using the [selected](#) event. Refer to the following example.

#### INDEX.TS

```
import { Uploader, FileInfo, SelectedEventArgs } from '@syncfusion/ej2-inputs';
import { Event } from '@syncfusion/ej2-base';
let initial: boolean = true;
let uploadObj: Uploader = new Uploader({
 asyncSettings: {
 saveUrl: 'https://ej2.syncfusion.com/services/api/uploadbox/Save',
 removeUrl:
'https://ej2.syncfusion.com/services/api/uploadbox/Remove'
 },
 selected: onSelect
});
uploadObj.appendTo('#fileupload')
function onSelect(args: SelectedEventArgs): void {
 if (initial) { initial = false; return; }
 args.isModified = true;
 let oldFiles: FileInfo[] = uploadObj.GetFilesData();
 let filesData: FileInfo[] = args.filesData.concat(oldFiles);
 let modifiedData: FileInfo[] = sortFileList(filesData);
 args.modifiedFilesData = modifiedData;
}
function sortFileList(filesData: FileInfo[]): FileInfo[] {
 let files: FileInfo[] = filesData;
 let fileNames: string[] = [];
 for (let i: number = 0; i < files.length; i++) {
 fileNames.push(files[i].name);
 }
 let sortedFileNames: string[] = fileNames.sort();
 let sortedFilesData: FileInfo[] = [];
 let index: number = 0;
 for (let name of sortedFileNames) {
 for (let i: number = 0; i < files.length; i++) {
 if (name === files[i].name) {
 sortedFilesData.push(files[i]);
 }
 }
 }
 return sortedFilesData;
}
```

Get the total size of selected files in EJ2 JavaScript Uploader control

You can get the total size of selected files before uploading it to the designated server. This can be achieved by using the selected event. Refer to the following example to calculate the total file size.

### INDEX.TS

```
import { Uploader, FileInfo, SelectedEventArgs } from '@syncfusion/ej2-inputs';
import { Event } from '@syncfusion/ej2-base';
let uploadObj: Uploader = new Uploader({
 asyncSettings: {
 saveUrl: 'https://ej2.syncfusion.com/services/api/uploadbox/Save',
 removeUrl:
'https://ej2.syncfusion.com/services/api/uploadbox/Remove'
 },
 selected: onSelect
});
uploadObj.appendTo('#fileupload')
function onSelect(args: SelectedEventArgs): void {
 let totalSize: number = 0;
 for (let file of args.filesData) {
 totalSize = totalSize + file.size;
 }
 let size: string = uploadObj.bytesToSize(totalSize);
 alert("Total select file's size is " + size);
}
```

### INDEX.HTML

### Customize button with html element in EJ2 JavaScript Uploader control

The uploader component allows you to customize the action buttons by using [buttons](#) property. Refer to the following example.

### INDEX.TS

```
import { Uploader } from '@syncfusion/ej2-inputs';
import { createElement } from '@syncfusion/ej2-base';
let uploadEle = createElement('span', { className: 'upload e-icons' });
uploadEle.innerHTML = 'Upload All';
let clearEle = createElement('span', { className: 'remove e-icons' });
clearEle.innerHTML = 'Clear All';
let uploadObj: Uploader = new Uploader({
 asyncSettings: {
 saveUrl: 'https://ej2.syncfusion.com/services/api/uploadbox/Save',
 removeUrl: 'https://ej2.syncfusion.com/services/api/uploadbox/Remove'
 },
 autoUpload: false,
 buttons: {
 browse: 'Choose file',
 clear: clearEle,
 upload: uploadEle
 }
});
```

```
});
uploadObj.appendTo('#fileupload')
```

Add confirm dialog to remove the files in EJ2 JavaScript Uploader control

You can customize the uploader component using confirm dialog before removing the files. Here, ej2 dialog is used as confirm dialog. Refer to the following example.

#### INDEX.TS

```

import { Uploader, FileInfo } from '@syncfusion/ej2-inputs';
import { createElement } from '@syncfusion/ej2-base';
import { Dialog } from '@syncfusion/ej2-popups';
let removeFile: FileInfo[];
let uploadObj: Uploader = new Uploader({
 asyncSettings: {
 saveUrl: 'https://ej2.syncfusion.com/services/api/uploadbox/Save',
 removeUrl:
 'https://ej2.syncfusion.com/services/api/uploadbox/Remove'
 },
 removing: onremove
});
uploadObj.appendTo('#fileupload');
// Initialize Dialog component
let dialog: Dialog = new Dialog({

```

```

 content: 'Are you sure want to remove the file?',
 buttons: [{ 'click': () => { onClick() }, buttonModel: { content: 'OK',
cssClass: 'e-flat', isPrimary: true }},
 { 'click': () => { dialog.hide(); }, buttonModel: { content: 'Cancel',
cssClass: 'e-flat' } }],
 width: '250px',
 visible: false,
 target: '#container'
 });
 dialog.appendTo('#dialog');
 function onClick() {
 dialog.hide();
 uploadObj.remove(removeFile[0], false, true);
 }
 function onremove(args: any) {
 removeFile=[];
 args.cancel = true;
 removeFile.push(args.filesData);
 dialog.show();
 }
}

```

#### Add additional data on upload in EJ2 JavaScript Uploader control

The uploader component allows you to add additional data on file upload, which is used to get in the server-side. By using [uploading](#) event and its customFormData argument, you can achieve this behavior. Refer to the following example.

In the following code snippet, explains about how to add additional data on file upload.

```

`ts
import { Uploader } from '@syncfusion/ej2-inputs';

let uploadObj: Uploader = new Uploader({
 asyncSettings: {
 saveUrl: 'https://ej2.syncfusion.com/services/api/uploadbox/Save',
 removeUrl: 'https://ej2.syncfusion.com/services/api/uploadbox/Remove'
 },
 uploading: onFileUpload
});

uploadObj.appendTo('#fileupload');

function onFileUpload(args: any) {

```

```
// add additional data as key-value pair.
```

```
args.customFormData = [{ 'name': 'Syncfusion INC' }];
}
`
```

*Server side for adding additional data*

```
`c#
// Get the additional data in server end by corresponding key.
var data = HttpContext.Current.Request.Form["name"];
`
```

You can also explore [JavaScript File Upload](#) feature tour page for its groundbreaking features. You can also explore our [JavaScript File Upload example](#) to understand how to browse the files which you want to upload to the server.

### Validate image on drop in EJ2 JavaScript Uploader control

The uploader component allows you to upload all type of images by setting **image/\*** to [allowedExtensions](#) property.

By default, the behavior is working with select a file using browse button. But, this behavior doesn't support on drag and drop the files. You can handle this behavior manually using **selected** event by filtering the file types from application.

In the following example, validated image files using images/\*. You are able to drag and drop the image files with extension of PNG, JPG, BPG, GIF and TIFF to upload it.

### INDEX.TS

```
import { Uploader } from '@syncfusion/ej2-inputs';
let uploadObj: any = new Uploader({
 asyncSettings: {
 saveUrl: 'https://ej2.syncfusion.com/services/api/uploadbox/Save',
 removeUrl:
'https://ej2.syncfusion.com/services/api/uploadbox/Remove'
 },
 autoUpload: false,
 allowedExtensions: 'image/*',
 selected: onSelect
});
uploadObj.appendTo('#fileupload');
function onSelect(args: any): void {
 if (args.event.type === 'drop') {
 let allImages: Array<string> = ['png', 'jpg', 'jpeg', 'gif', 'tiff',
'bpg'];
 let files = args.filesData;
 let modifiedFiles = [];
 for (let file of files) {
 if (allImages.indexOf(file.type) === -1) {
 file.status = 'File type is not allowed';
 file.statusCode = '0';
 }
 modifiedFiles.push(file);
 }
 }
}
```

```

 args.isModified = true;
 args.modifiedFilesData = modifiedFiles.concat(uploadObj.filesData);
 }
}

```

Achieve file upload programmatically in EJ2 JavaScript Uploader control

You can upload a file programmatically using the [upload](#) method. Get the selected files data from the [getFilesData](#) public method in uploader.

The upload method behaves differently based on its arguments.

- If this method receives any files as arguments, those files only start to upload.
- If it has no argument, all the selected files start to upload.

## INDEX.TS

```

import { Uploader } from '@syncfusion/ej2-inputs';
//Initialize the control by preload files
let uploadObj: Uploader = new Uploader({
 autoUpload: false,
 asyncSettings: {
 saveUrl: 'https://ej2.syncfusion.com/services/api/uploadbox/Save',

```

```

 removeUrl:
 'https://ej2.syncfusion.com/services/api/uploadbox/Remove'
 }
});
uploadObj.appendTo('#fileupload');
document.getElementById('first').onclick = (args) => {
 uploadObj.upload(uploadObj.getFilesData()[0]);
};
document.getElementById('full').onclick = (args) => {
 uploadObj.upload(uploadObj.getFilesData());
};

```

### Check file size before uploading in EJ2 JavaScript Uploader control

By using the [uploading](#) event, you can get the file size before uploading it to the server.

File object contains the file size in bytes only. You can convert the size to standard formats (KB or MB) using [bytesToSize](#) method.

### INDEX.TS

```

import { Uploader } from '@syncfusion/ej2-inputs';
//Initialize the control by preload files
let uploadObj: Uploader = new Uploader({
 autoUpload: false,
 asyncSettings: {

```

```

 saveUrl: 'https://ej2.syncfusion.com/services/api/uploadbox/Save',
 removeUrl:
'https://ej2.syncfusion.com/services/api/uploadbox/Remove'
 },
 uploading: onBeforeUpload
});
uploadObj.appendTo('#fileupload');
function onBeforeUpload(args): void {
 // get the file size in bytes
 let sizeInBytes: number = args.fileData.size;
 // get the file size in standard format
 alert("File size is: " + uploadObj.bytesToSize(sizeInBytes));
}

```

#### Open and edit the uploaded files in EJ2 JavaScript Uploader control

The uploader component allows you to modify the file after uploading to the server, which can be achieved using the `success` event of the uploader.

You can retrieve the saved file path in the uploader success event and assign it to custom attribute (data-file-name) value of the respective file list element to open the uploaded file. Click the respective file element to create a new request along with saved file path using the HTTP header. In the server-side, get the file path from the header and open the file using `process.start` method.

```
`ts
```

```
import { Uploader } from '@syncfusion/ej2-inputs';

let uploadObj: any = new Uploader({
 asyncSettings: {
 saveUrl: 'SaveUrl',
 removeUrl: 'RemoveUrl'
 },

```

```

success: onUploadSuccess
});
uploadObj.appendTo('#fileupload');
function onUploadSuccess(args) {
// fetching the generated li elements
var liElements = this.uploadWrapper.querySelectorAll('.e-upload-file-list');
for (var i = 0; i < liElements.length; i++) {
if (liElements[i].getAttribute('data-file-name') == args.file.name) {
liElements[i].addEventListener('click', () => { openFile(args, event) })
// File path have to update from server end in response status description.
liElements[i].setAttribute('file-path', args.e.target.statusText);
}
}
}
function openFile(args, e) {
if (!e.target.classList.contains('e-file-delete-btn') && !e.target.classList.contains('e-file-remove-btn'))
{
let ajax = new XMLHttpRequest();
// create new request for open the selected file
ajax.open("POST", '/Home/openFile');
var liElements = document.getElementsByClassName('e-upload')[0].querySelectorAll('.e-upload-file-list');
for (var i = 0; i < liElements.length; i++) {
if (liElements[i].getAttribute('data-file-name') == args.file.name) {
// Added the file path in header to get it in server side.
ajax.setRequestHeader('filePath', liElements[i].getAttribute('file-path').toString());
}
}
ajax.send();
}
}
,

```

*Server side for open and edit the uploaded files*

`c#

```

public void Save() {
 if (!System.IO.File.Exists(fileSavePath))
 {
 httpPostedFile.SaveAs(fileSavePath);
 HttpResponseMessage Response = System.Web.HttpContext.Current.Response;
 Response.Clear();
 Response.ContentType = "application/json; charset=utf-8";
 // Sending the file path to client side
 Response.StatusDescription = fileSavePath;
 Response.End();
 }
}

[AcceptVerbs("Post")]
public void openFile()
{
 // Check whether the file is available in the corresponding location
 if (System.IO.File.Exists(Request.Headers.GetValues("filePath").First()))
 {
 // This will open the selected file from server location in desktop
 Process.Start(Request.Headers.GetValues("filePath").First());
 }
}

```

You can also explore [JavaScript File Upload](#) feature tour page for its groundbreaking features. You can also explore our [JavaScript File Upload example](#) to understand how to browse the files which you want to upload to the server.

#### Resize images before uploading it to the server in EJ2 JavaScript Uploader control

You can customize the dimension of the images before uploading it to the server. By using selected event, you can get the selected file information as type of an object. From the obtained image file information, create a new canvas and render an image with the custom dimensions. Refer the corresponding code snippet as follows.

```

<div id='upload'>
<!-- Initialize Uploader -->
<input type='file' id='customUI' name='UploadFiles' />

```

```
</div>
<style>
.upload-success {color: #2bc700;}
.upload {
width: 450px;
margin: auto 400px;
}
.e-upload {
width: 100%;
margin-top: 50px;
}
.upload-list-root {
display: inline-block;
width: 450px;
}
.ul-element {
list-style: none;
padding-left: 0px;
width: 100%;
}
.file-name-container {
width: 100%;
}
.file-name {
padding: 8px 6px 8px 4px;
font-size:13px;
width:100px;
display: inline-block;
text-overflow: ellipsis;
overflow: hidden;
white-space: nowrap;
position: relative;
top: 2px
```

```
}
.file-size {
padding: 4px 0px;
font-size: 13px;
display: initial;
position: relative;
top: -8px;
}
.file-lists {
border: 1px solid lightgray;
padding: 0px 6px 0px 14px;
margin-top: 15px;
position: relative;
background: rgba(0, 0, 0, 0.04);
}
span.file-status-container {
padding: 10px 26px;
font-size: 13px;
position: relative;
top: 0px;
right: 60px;
float: right;
}
.file-status-container, .file-size, .file-name {
font-family: "Helvetica Neue", "Helvetica", "Arial", "sans-serif";
}
span.progress-bar-container {
display: block;
float: right;
height: 20px;
right: 50px;
top: 11px;
position: relative;
```

```
right: 107px;
width: 139px
}
.progress{
width: 100%;
height: 15px;

#### Convert image into binary format after uploading in EJ2 JavaScript Uploader control

By default, the file upload component saves the uploaded image files in physical directories. Also, you can convert the images into binary format at server-side before saving the uploaded images. To retrieve binary format of image files, convert the posted file's input stream into binary reader and read as bytes using ReadBytes method.

Refer to the below server-side code snippet

```
`c#
[AcceptVerbs("Post")]
public void Save()
{
 try
 {
 if (System.Web.HttpContext.Current.Request.Files.AllKeys.Length > 0)
 {
 var httpPostedFile = System.Web.HttpContext.Current.Request.Files["UploadFiles"];
 if (httpPostedFile != null)
 {
 byte[] fileBytes;
 using (BinaryReader br = new BinaryReader(httpPostedFile.InputStream))
 {
 fileBytes = br.ReadBytes((int)httpPostedFile.InputStream.Length);
 // bytes will be stored in variable fileBytes
 }
 HttpResponseMessage Response = System.Web.HttpContext.Current.Response;
 Response.Clear();
 Response.ContentType = "application/json; charset=utf-8";
 Response.StatusCode = 200;
 Response.Status = "200 Success";
 Response.End();
 }
 }
 }
}
```

```

}
catch (Exception e)
{
 HttpResponseMessage Response = System.Web.HttpContext.Current.Response;
 Response.Clear();
 Response.ContentType = "application/json; charset=utf-8";
 Response.StatusCode = 204;
 Response.Status = "204 No Content";
 Response.StatusDescription = e.Message;
 Response.End();
}
}
,

```

### Ej1 api migration in EJ2 JavaScript Uploader control

This article describes the API migration process of File Upload component from Essential JS 1 to Essential JS 2.

#### Accessibility

<!-- markdownlint-disable MD033 -->

Behavior	API in Essential JS 1	API in Essential JS 2
Localization	Property: locale  \$('#uploadBox').ejUploadbox({ locale: 'es-ES' })	Property: locale  var uploader =new ej.inputs.Uploader({ locale: 'es-ES' }) uploader.appendTo('#ej2_Uploader')
Right to left	Property: enableRTL  \$('#uploadBox'). ejUploadbox({ enableRTL: true }) uploader.appendTo('#ej2_Uploader')	Property: enableRtl  var uploader =new ej.inputs.Uploader({ enableRtl: true }) uploader.appendTo('#ej2_Uploader')

### File list

<!-- markdownlint-disable MD033 -->

Behavior	API in Essential JS 1	API in Essential JS 2
Show/Hide the selected files	Property: showFileDetails  \$('#uploadBox').ejUploadbox({ showFileDetails: false })	Property: showFileList  var uploader =new ej.inputs.Uploader({ showFileList: false }) uploader.appendTo('#ej2_Uploader')
Customizing the file list	Not Applicable	Property: template  var uploader =new ej.inputs.Uploader({ template: '#templateId' }) uploader.appendTo('#ej2_Uploader')
Get the files in sorted form	Not Applicable	Method: sortFileList  var uploader =new ej.inputs.Uploader() uploader.appendTo('#ej2_Uploader') uploader.sortFileList(files)
Clearing File List	Not Applicable	Method: clearAll  var uploader =new ej.inputs.Uploader() uploader.appendTo('#ej2_Uploader') uploader.clearAll()
Event triggers when clearing Files	Not Applicable	Event : clearing  var uploader =new ej.inputs.Uploader({ clearing: function() {} }) uploader.appendTo('#ej2_Uploader')

### File selection

<!-- markdownlint-disable MD033 -->

Behavior	API in Essential JS 1	API in Essential JS 2
----------	-----------------------	-----------------------

Select multiple files to upload	Property: multipleFilesSelection  \$('#uploadBox').ejUploadbox({multipleFilesSelection: true})	Property: multiple  var uploader =new ej.inputs.Uploader({multiple: true}) uploader.appendTo('ej2_uploadbox')
Set minimum file size to upload	Not Applicable	Property: minFileSize  var uploader =new ej.inputs.Uploader({minFileSize: 1024}) uploader.appendTo('ej2_uploadbox')
Set maximum file size to upload	Property: fileSize  \$('#uploadBox').ejUploadbox({fileSize: 5000})	Property: maxFileSize  var uploader =new ej.inputs.Uploader({maxFileSize: 5000}) uploader.appendTo('ej2_uploadbox')
Allowed file types to select	Property: extensionsAllow  \$('#uploadBox').ejUploadbox({extensionsAllow: '.zip'})	Property: allowedExtensions  var uploader =new ej.inputs.Uploader({allowedExtensions: '.pdf'}) uploader.appendTo('ej2_uploadbox')
Restricted files types to select	Property:extensionsDeny  \$('#uploadBox').ejUploadbox({extensionsDeny: '.docx'})	Not Applicable
Display only selected details in File list	Property: customFileDetails  \$('#uploadBox').ejUploadbox({customFileDetails: { title: false, name: true, size: true, status: true, action: false } })	Not Applicable
Options to customize File list dialog	Property:dialogAction  \$('#uploadBox').ejUploadbox({dialogAction: { modal: false, closeOnComplete: true, resize: true, drag: false,	Not Applicable

	content: '#dialogTarget' } })	
Customize dialog position	Property:dialogPosition  \$('#uploadBox').ejUploadbox({ dialogPosition: {X: 300, Y 100} })	Not Applicable
Change file list key values	Property:dialogText  \$('#uploadBox').ejUploadbox({ dialogText: { title: 'Upload File List', name: 'File Name', size: 'File Size' } })	Not Applicable
Change drop area text	Property:dropAreaText  \$('#uploadBox').ejUploadbox({ dropAreaText: 'Drop files here' })	No separate property to change dropAreaText.It can be customize using locale Texts
Change drop area height	Property:dropAreaHeight  \$('#uploadBox').ejUploadbox({ dropAreaHeight: '100%' })	Not Applicable
Change drop area width	Property:dropAreaWidth  \$('#uploadBox').ejUploadbox({ dropAreaWidth: '100%' })	Not Applicable
Dynamically push the file	Property:pushFile  \$('#uploadBox').ejUploadbox({ pushFile: files })	Not Applicable
Show the files uploader in server already.	Not Applicable	Property: files  var preloadFiles = [{ name: 'nature', size: 5000, type: '.png' }] var uploader =new ej.inputs.Uploader({ files: preloadFiles }) upload.appendTo('#ej2_uploadBox')

Event triggers when select the file successfully	Event: fileSelect <pre>\$('#uploadBox').ejUploadbox({   fileSelect: function() {} })</pre>	Event: selected <pre>var uploader =new ej.inputs.Uploader({   selected: onFileSelect }) upload.appendTo('#ej2_uploadBox')function onFileSelect() {}</pre>
--------------------------------------------------	-----------------------------------------------------------------------------------------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------

### Upload action

<!-- markdownlint-disable MD033 -->

Behavior	API in Essential JS 1	API in Essential JS 2
Save URL	Property: saveUrl <pre>\$('#uploadBox').ejUploadbox(   ({     saveUrl: 'saveUrl'   }) )</pre>	Property: asyncSettings.saveUrl <pre>var uploader =new ej.inputs.Uploader({   asyncSettings: { saveUrl: 'saveUrl' } }) upload.appendTo('#ej2_uploadBox')</pre>
Remove URL	Property: removeUrl <pre>\$('#uploadBox').ejUploadbox(   ({     removeUrl: 'removeUrl'   }) )</pre>	Property: asyncSettings.removeUrl <pre>var uploader =new ej.inputs.Uploader({   asyncSettings: { removeUrl: 'removeUrl' } })</pre>
Automaticall y upload the file when files added in to upload queue	Property: autoUpload <pre>\$('#uploadBox').ejUploadbox(   ({     autoUpload: false   }) )</pre>	Property: autoUpload <pre>var uploader =new ej.inputs.Uploader({   autoUpload: false })</pre>
Synchronous upload	Property: asynUpload <pre>\$('#uploadBox').ejUploadbox(   ({     ayncUpload: false   }) )</pre>	No Separate property for enabling synchronous upload.It can be enabling by using below configuration <pre>var uploader =new ej.inputs.Uploader({   autoUpload: false })</pre>
Key to get the selected files in server side	Property: uploadName <pre>\$('#uploadBox').ejUploadbox(   ({     saveUrl: 'saveUrl',     uploadName: 'UploadKey'   }) )</pre>	Id of the element used as key value

Upload the files dynamically	Not Applicable	Method: upload()  var uploader =new ej.inputs.Uploader({ asyncSettings: { saveUrl: ""} }) uploader.appendTo('#ej2_Uploader')uploader.upload(filesData)
Event triggers before start to upload the action	Event: beforeSend  \$('#uploader').ejUploadbox({ beforeSend: function () {} })	Event: uploading  var uploader =new ej.inputs.Uploader({ uploading: beforeUploadStart }) uploader.appendTo('#ej2_Uploader')function beforeUploadStart() {}
Event triggers when the upload is in progress	Event: inProgress  \$('#uploader').ejUploadbox({ inProgress: function () {} })	Event: progress  var uploader =new ej.inputs.Uploader({ progress: uploadingInProgress }) uploader.appendTo('#ej2_Uploader')function uploadingInProgress () {}
Event triggers when upload got success	Event: success  \$('#uploader').ejUploadbox({ success: function () {} })	Event: success  var uploader =new ej.inputs.Uploader({ success: uploadingSuccess }) uploader.appendTo('#ej2_Uploader')function uploadingSuccess () {}
Event triggers when upload got failed	Event: error  \$('#uploader').ejUploadbox({ error: function () {} })	Event: failure  var uploader =new ej.inputs.Uploader({ failure: uploadingFails }) uploader.appendTo('#ej2_Uploader')function uploadingFails () {}
Event triggers when the upload got started	Event: begin  \$('#uploader').ejUploadbox({ begin: function () {} })	Not Applicable
Event triggers	Event: cancel  \$('#uploader').ejUploadbox({	Event: canceling  var uploader =new ej.inputs.Uploader({ canceling: uploadingCancel

when cancel the upload	cancel : function () {} })	}) uploader.appendTo('#ej2_Uploader')function uploadingCancel () {}
Event triggers when the upload completed	Event:complete \$('#uploader').ejUploadbox({ complete : function () {} })	Not Applicable

### Chunk upload

<!-- markdownlint-disable MD033 -->

Behavior	API in Essential JS 1	API in Essential JS 2
Enabling the chunk upload	Not Applicable	Property: asyncSettings.chunkSize  var uploader =new ej.inputs.Uploader({ asyncSettings: { saveUrl: 'save url', chunkSize: 50000} }) upload.appendTo('#ej2_uploadBox')
Retry the upload automatically when it's get failed	Not Applicable	Property: asyncSettings.retryCount, asyncSettings.retryAfterDelay  var uploader =new ej.inputs.Uploader({ asyncSettings: { saveUrl: 'save url', chunkSize: 50000, retryCount: 3, retryAfterDelay: 1000} }) upload.appendTo('#ej2_uploadBox')
Pause the uploading file	Not Applicable	Method: pause  var uploader =new ej.inputs.Uploader({ asyncSettings: { saveUrl: 'save url', chunkSize: 50000 } }) upload.appendTo('#ej2_uploadBox') upload.pause(filesData)
Event triggers when pausing the file	Not Applicable	Event: pausing  var uploader =new ej.inputs.Uploader({ asyncSettings: { saveUrl: 'save url', chunkSize: 50000 }, pausing: onFilePause })

		upload.appendTo('#ej2_uploadBox') function onFilePause() {}
Resuming the paused file	Not Applicable	Method: resume  var uploader =new ej.inputs.Uploader({ asyncSettings: { saveUrl: 'save url', chunkSize: 50000, } }) upload.appendTo('#ej2_uploadBox') upload.resume(filesData)
Event triggers when resuming the file	Not Applicable	Event: resuming  var uploader =new ej.inputs.Uploader({ asyncSettings: { saveUrl: 'save url', chunkSize: 50000, }, resuming: onFileResume }) upload.appendTo('#ej2_uploadBox') function onFileResume () {}
Retry the failed file	Not Applicable	Method: retry  var uploader =new ej.inputs.Uploader({ asyncSettings: { saveUrl: 'save url', chunkSize: 50000, } }) upload.appendTo('#ej2_uploadBox') upload.retry(filesData)
Cancel the failed file	Not Applicable	Method: cancel  var uploader =new ej.inputs.Uploader({ asyncSettings: { saveUrl: 'save url', chunkSize: 50000, } }) upload.appendTo('#ej2_uploadBox') upload.cancel(filesData)
Event triggers when cancel the file	Not Applicable	Event: canceling  var uploader =new ej.inputs.Uploader({ asyncSettings: { saveUrl: 'save url', chunkSize: 50000 }, canceling: onFileCancel }) upload.appendTo('#ej2_uploadBox') function onFileCancel(){}

Event triggers when chunk file fails	Not Applicable	Event:chunkFailure  var uploader =new ej.inputs.Uploader({ asyncSettings: { saveUrl: 'save url', chunkSize: 50000 }, chunkFailure: onChunkFail }) upload.appendTo('#ej2_uploadBox') function onChunkFail() {}
Event triggers when chunk file success	Not Applicable	Event: chunkSuccess  var uploader =new ej.inputs.Uploader({ asyncSettings: { saveUrl: 'save url', chunkSize: 50000 }, chunkSuccess: onChunkSuccess }) upload.appendTo('#ej2_uploadBox') function onChunkSuccess () {}

#### Remove action

<!-- markdownlint-disable MD033 -->

Behavior	API in Essential JS 1	API in Essential JS 2
Remove the uploaded file	Not Applicable	Method: remove  var uploader =new ej.inputs.Uploader({ asyncSettings: { saveUrl: 'save url', removeUrl:'removeUrl' } }) upload.appendTo('#ej2_uploadBox') upload.remove(filesData)
Event triggers when the file removing succeed	Event:remove  \$('#uploadBox').ejUploadbox({ remove: function() {} })	Event:success  var uploader =new ej.inputs.Uploader({ asyncSettings: { saveUrl: 'save url' }, Success: onRemoveSuccess }) upload.appendTo('#ej2_uploadBox') function onRemoveSuccess () {}
Event triggers when the file removing fails	Not Applicable	Event: failure var uploader =new ej.inputs.Uploader({

		<pre> asyncSettings: { saveUrl: 'save url', removeUrl: 'remove url' }, failure: onRemoveFailure }) upload.appendTo('#ej2_uploadBox') function onRemoveFailure () {} </pre>
--	--	----------------------------------------------------------------------------------------------------------------------------------------------------------------------------

## Buttons

<!-- markdownlint-disable MD033 -->

Behavior	API in Essential JS 1	API in Essential JS 2
Customize button text	Property: buttonText  <pre> \$('#uploadBox').ejUploadbox({ remove: function() {} }) </pre>	Property: buttons  <pre> var uploader =new ej.inputs.Uploader({ buttons: { browse: 'Choose File', clear: 'Clear files', upload: 'upload Files' } }) </pre>

## Drag and drop

<!-- markdownlint-disable MD033 -->

Behavior	API in Essential JS 1	API in Essential JS 2
Enable drag and drop upload	Property: allowDragAndDrop  <pre> \$('#uploadBox').ejUploadbox({ allowDragAndDrop: true }) </pre>	No separate property to disabling drag and drop
Set custom drop area	Not Applicable	Property: dropArea  <pre> var uploader =new ej.inputs.Uploader({ dropArea: dropElement }) </pre>

## Common

<!-- markdownlint-disable MD033 -->

Behavior	API in Essential JS 1	API in Essential JS 2
Adding custom class to wrapper element	Property: cssClass  <pre> \$('#uploadBox').ejUploadbox({ </pre>	Not Applicable

	cssClass: 'Custom-Class' })	
Enable/Disable the control	Property: enabled  \$('#uploadBox').ejUploadbox({ enabled: false }) Method: enable(), disable()	Property: enabled  var uploader =new ej.inputs.Uploader({ enabled: false })
Set height for uploader	Property:height  \$('#uploadBox').ejUploadbox({ height: '100%' })	Not Applicable
Set width for uploader	Property:width  \$('#uploadBox').ejUploadbox({ width: '100%' })	Not Applicable
Adding HTML attributes	Property:htmlAttributes  \$('#uploadBox').ejUploadbox({ htmlAttributes: {'aria-label': 'UploadBox'} })	Not Applicable
Event triggers when control created successfully	Event:create  \$('#uploadBox').ejUploadbox({ create: function () {} })	Event: created  var uploader =new ej.inputs.Uploader({ created: function() {} })
Event triggers when destroy the control	Event: destroy  \$('#uploadBox').ejUploadbox({ destroy: function () {} })	Not Applicable
Keeping the model values in cookies	Property: enablePersistence  \$('#uploadBox').ejUploadbox({ enablePersistence: true })	Property: enablePersistence  var uploader =new ej.inputs.Uploader({ enablePersistence: true })
Get the selected files data	Not Applicable	Method: getFilesData

		<pre>var uploader =new ej.inputs.Uploader() uploader.appendTo('#uploadbox') uploader.getFilesData()</pre>
Convert bytes in to MB, GB	Not Applicable	<p>Method: bytesToSize</p> <pre>var uploader =new ej.inputs.Uploader() uploader.appendTo('#uploadbox') uploader.bytesToSize(5000)</pre>
